2. **CAUTION: Failure to remove the TP sensor screws in the following manner will result in damage to the screws. First loosen the screws 1-2 full turns using a hand tool and then use a suitable high speed driver to complete the removal.**

   Remove and discard the 2 screws and the TP sensor.

Installation

1. **CAUTION: Do not reuse the TP sensor and screws. A new TP sensor and screws must be installed.**

   CAUTION: Do not use a high speed driver to install the new screws or damage to the TP sensor can occur.

   NOTE: When installing the new TP sensor, make sure that the radial locator tab on the TP sensor is aligned with the radial locator hole on the throttle body.

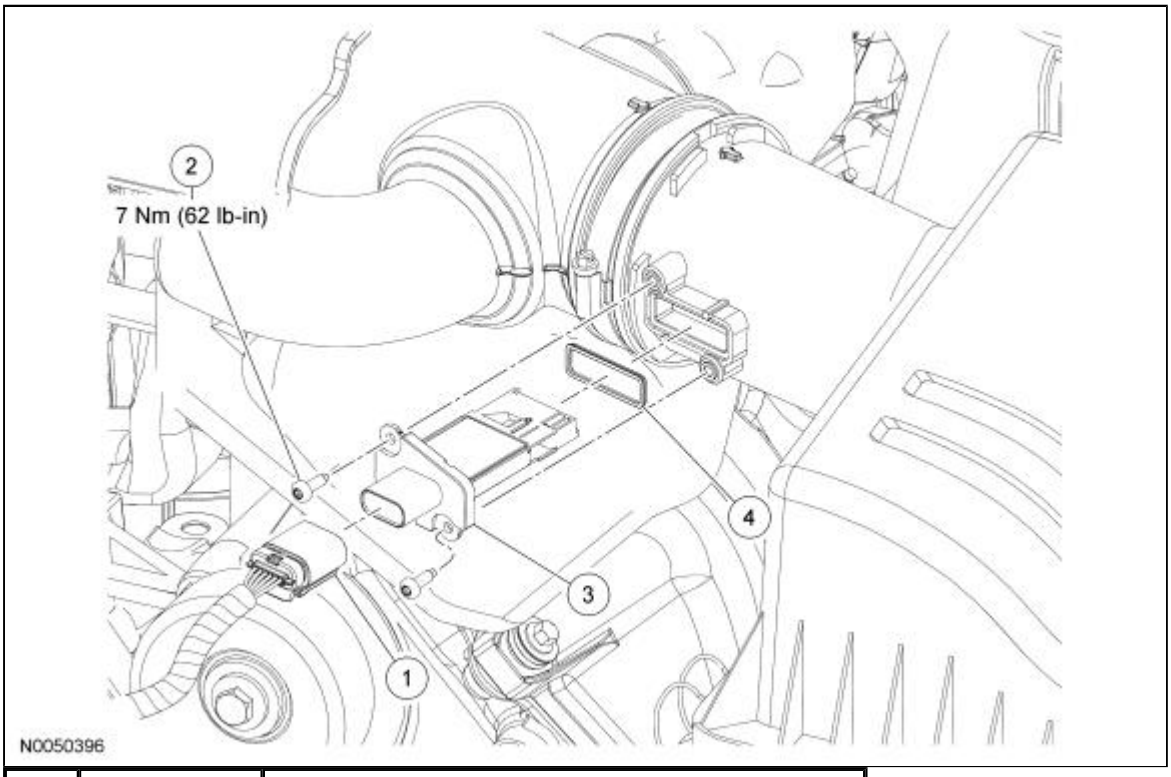
Position the new TP sensor and install the 2 new screws.

- Tighten to 3 Nm (27 lb-in).

2. Install the TB. For additional information, refer to Section 303-04 .

Mass Air Flow (MAF) Sensor

Printable View (182 KB)



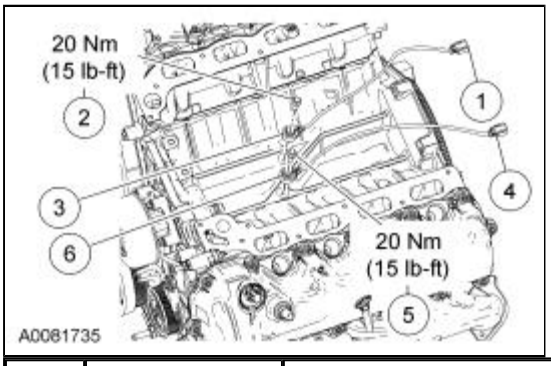
Item	Part Number	Description
1	14A464	Mass air flow (MAF) sensor electrical connector
2	W505562	MAF sensor bolts (2 required)
3	12B579	MAF sensor
4	—	MAF sensor seal (part of 12B579)

Removal and Installation

1. Disconnect the mass air flow (MAF) sensor electrical connector.
2. Remove the 2 bolts and the MAF sensor.
   - To install, tighten to 7 Nm (62 lb-in).
3. To install, reverse the removal procedure.

Knock Sensor (KS)

Printable View (116 KB)



Item	Part Number	Description
1	14A464	RH knock sensor (KS) electrical connector
2	W500225	RH KS bolt
3	12A699	RH KS
4	14A464	LH KS electrical connector
5	W500225	LH KS bolt
6	12A699	LH KS

Removal and Installation

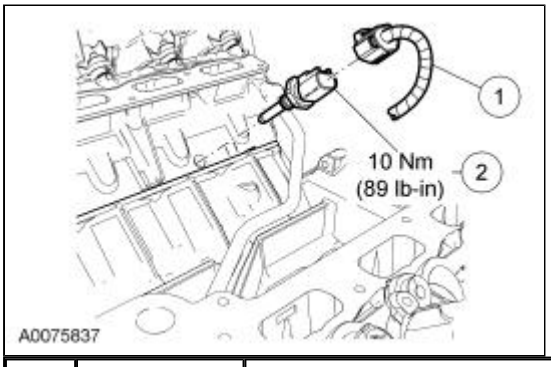
1. Remove the intake manifold. For additional information, refer to Section 303-01 .
2. Disconnect the knock sensor (KS) electrical connectors.
3. Remove the 2 bolts and the 2 knock sensors.
   - To install, tighten to 20 Nm (15 lb-ft).
4. To install, reverse the removal procedure.

Cylinder Head Temperature (CHT) Sensor

Printable View (100 KB)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M99B176-A



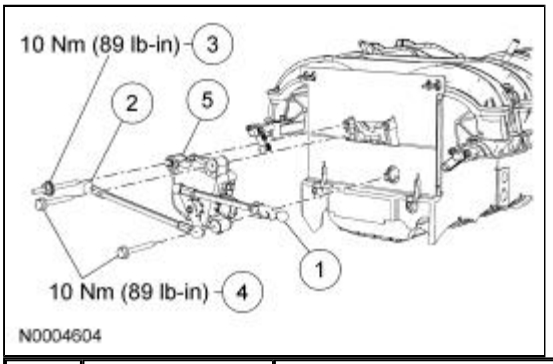
Item	Part Number	Description
1	14B102	Cylinder head temperature (CHT) sensor jumper harness
2	6G004	CHT sensor

Removal and Installation

1. Remove the intake manifold. For additional information, refer to Section 303-01 .
2. Disconnect the cylinder head temperature (CHT) sensor jumper harness electrical connector.
3. Remove and discard the CHT sensor.
   - To install, tighten to 10 Nm (89 lb-in).
   - Coat the CHT sensor threads with high temperature nickel anti-seize lubricant prior to installation.
4. To install, reverse the removal procedure.

Charge Motion Control Valve (CMCV)

Printable View (94 KB)



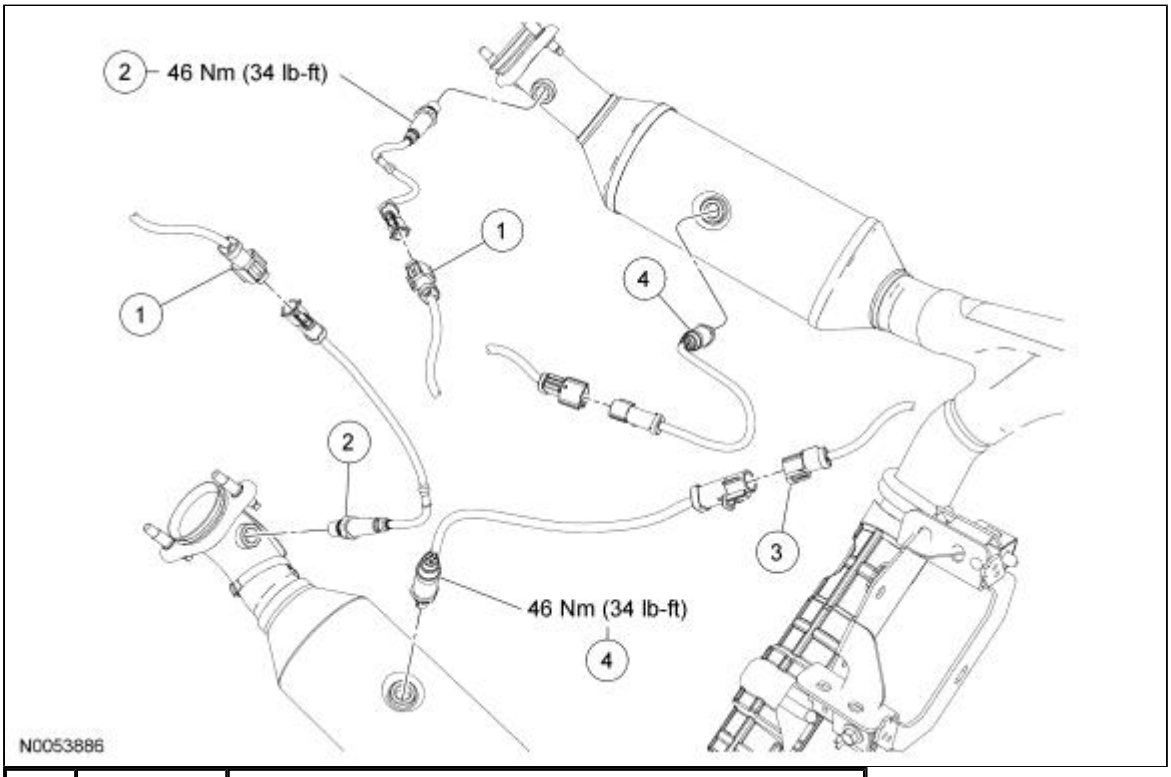
Item	Part Number	Description
1	9B841	Charge motion control valve (CMCV) RH rod
2	9B842	CMCV LH rod
3	W709084	CMCV stud bolt
4	W708165	CMCV bolts (2 required)
5	9L490	CMCV

Removal and Installation

1. Remove the intake manifold. For additional information, refer to Section 303-01 .
2. Disconnect the charge motion control valve (CMCV) RH and LH rods from the intake manifold.
3. Remove the stud bolt, the 2 bolts and the CMCV.
   - To install, tighten to 10 Nm (89 lb-in).
4. To install, reverse the removal procedure.

Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor — Exploded View

Printable View (141 KB)



Item	Part Number	Description
1	—	Heated oxygen sensor (HO2S) electrical connectors (part of 12B637) (2 required)
2	9F472	HO2S (2 required)
3	—	Catalyst monitor sensor electrical connectors (part of 12B637) (2 required)
4	9G444	Catalyst monitor sensor (2 required)

1. For additional information, refer to the procedures in this section.

Heated Oxygen Sensor (HO2S)

Transmission Description

Printable View (108 KB)

This transmission uses planetary gears with hydraulic electronic controls. The transmission control module (TCM) and the main control valve body units form a composite element that is installed as a single unit inside the automatic transmission.

This transmission has the following features:

- Six forward speeds
- Torque converter with an integral converter clutch
- Electronic shift and pressure controls
- Single planetary gear set
- Double planetary gear set
- Two fixed multi-disc clutches
- Three multi-plate clutches

All hydraulic functions are directed by electronic solenoids to control:

- engagement feel.
- shift feel.
- shift scheduling.
- modulated torque converter clutch (TCC) applications.

This transmission has a mechatronic unit also referred to as a transmission control module (TCM) which contains:

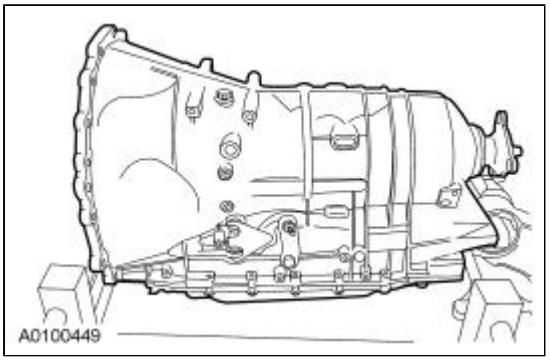
- Turbine shaft speed (TSS) sensor
- Output shaft speed (OSS) sensor
- An internal P, R, N, D selector shaft position sensor
- Transmission fluid temperature (TFT) sensor

Engine power reaches the transmission by a torque converter with an integral converter clutch. The 6 forward gears and one reverse gear are obtained from single planetary sets.

This automatic transmission is a 6-speed electronically controlled transmission comprising the basic elements of a TCM, main control valve body unit, torque converter, one solenoid valve and 6 pressure regulators. Gear selection is achieved by the control of automatic transmission fluid flow to operate various internal clutches. The TCM operates the electrical components and provides for the control of gear selection shift pressure which increases refinement and torque converter slip.

In the event of a system fault, the TCM also provides for failure mode effect management (FMEM) to maintain maximum functional operation of the transmission with a minimum reduction in driver, passenger or vehicle safety. In the event of a total loss of control or electrical power, the basic transmission functions PARK, REVERSE, NEUTRAL and DRIVE are retained. Also 3rd or 5th gear is retained by the hydraulic system. The gear retained is dependent upon the gear selected at the time of the failure.

Automatic Transmission

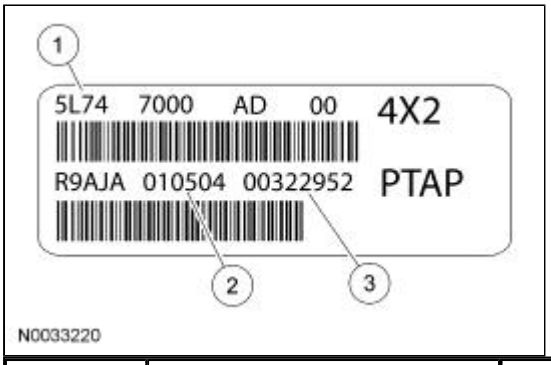


A0100449

Identification Tags

Printable View (75 KB)

The identification tag is located on the left side of the case just rearward of the manual control lever.



Item	Part Number	Description

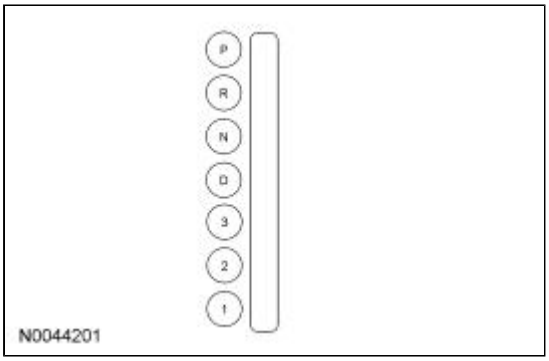
2	—	Build date
3	—	Serial number

Range Selection

Printable View (70 KB)

The transmission has 7 range positions: P, R, N, D, 3, 2 and 1.



Park

In the PARK position:

- there is no power flow through the transmission.
- the parking pawl locks the output shaft to the case.
- the engine can be started.
- the ignition key can be removed.

Reverse

In the REVERSE position:

- the vehicle can be operated in a rearward direction, at a reduced gear ratio.
- backup lamps are illuminated.

Neutral

In the NEUTRAL position:

- there is no power flow through the transmission.
- the output shaft is not held and is free to turn.
- the engine can be started.

D

The D is the normal position for most forward driving.

The D position provides:

- automatic shifts 1-6 and 6-1.
- apply and release of the torque converter clutch.
- maximum fuel economy during normal operation.
- engine braking in all gears.

Manual 3 Position

This position provides:

- manual 3rd gear.
- engine braking in 3rd gear.

Manual 2 Position

This position provides:

- manual 2nd gear.
- engine braking in 2nd gear.

Manual 1 Position

This position provides:

- manual 1st gear.
- engine braking for descending steep grades.

Shift Patterns

Printable View (64 KB)

Downshifts

Under certain conditions, the transmission will downshift automatically to a lower gear range (without moving the range selector lever). There are 3 categories of automatic downshifts:

- Coastdown
- Torque demand
- Forced or kickdown shifts

Coastdown

The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size, engine and transmission calibration requirements.

Torque Converter

Printable View (63 KB)

The torque converter is a 3-element unit containing a dual-plate clutch. The clutch can be controlled and engaged in any gear 1st to 6th. Calibration parameters may be set to allow lock-up in a higher gear only. The clutch is applied by removing fluid pressure from one side of the plate. The torque converter transmits and multiplies torque. The torque converter includes the following 3 elements:

- Impeller assembly
- Turbine assembly
- Reactor assembly

The standard torque converter components operate as follows:

- Rotation of the converter housing and impeller set the fluid in motion.
- The turbine reacts to the fluid motion from the impeller, transferring rotation to the geartrain through the input shaft.
- The reactor redirects fluid going back into the impeller, allowing for torque multiplication.
- Power is transmitted from the torque converter to the planetary gearsets and other components through the input shaft.

Torque Converter Clutch

The torque converter clutch is a device that reduces slip in the torque converter and, therefore, helps to keep fuel consumption to a minimum.

The torque converter clutch is engaged and released by the control system.

Pressure at the torque converter clutch piston is determined by an electronic pressure control valve.

Geartrain

Printable View (64 KB)

Power is transmitted from the torque converter to the planetary gearsets through the input shaft. Clutches are used to hold and drive certain combinations of gearsets. This results in 6 forward ratios and 1 reverse ratio which are transmitted to the output shaft and differential. The ratios are as follows:

Gear Ratio	
1st	4.17 to 1
2nd	2.34 to 1
3rd	1.52 to 1
4th	1.14 to 1
5th	0.87 to 1
6th	0.69 to 1
Reverse	3.40 to 1

Single Planetary Gearset

The single planetary gear overdrive carrier is driven by the input shaft. The single planetary gear set consists of the following components:

- One sun gear
- Four planetary gears meshing with the sun gear
- One planetary carrier
- One ring gear

Ravigenaux Planetary Gearset

The ravigenaux planetary gearset is splined to the output shaft and consists of the following components:

- Two sun gears of different sizes
- Three short planetary gear pinions meshing with the sun gears
- Three long planetary gear pinions meshing with the sun gears
- One planetary carrier
- One ring gear

Output Shaft

The output shaft provides torque to the driveshaft and rear axle assembly. It is driven by the ring gear of the planetary gearset.

Apply Components

Printable View (65 KB)

Shift Elements

In addition to the torque converter, the other shift elements are:

- three rotating multi-plate clutches: forward, direct and overdrive.
- two fixed multi-disc brakes: intermediate and overdrive.

All gear shifts from 1st to 6th or from 6th to 1st are power-on overlapping shifts. That is, during the shift one of the clutches must continue to transmit the drive at lower main pressure until the other clutch is able to accept the input torque.

The shift elements, clutches or brakes are engaged hydraulically. The transmission fluid pressure builds up between the cylinder and the piston, pressing the clutches together.

The purpose of these shift elements is to carry out in-load shifts with no interruption to traction.

Multi-plate clutches, forward, direct and overdrive, supply power from the engine to the planetary geartrain. Multi-disc brakes intermediate and low/reverse press against the transmission housing in order to achieve a torque reaction effect.

Multi-Plate Clutch

Clutches, overdrive, forward and direct, are balanced in terms of dynamic pressure. That is, their piston is exposed to the transmission fluid flow on both sides, in order to prevent pressure buildup in the clutch as speed increases. This equalization process is achieved by a baffle plate and pressure-free transmission fluid supply by a lubricating passage, through which the space between piston and baffle plate is filled with transmission fluid.

The advantages of this dynamic pressure equalization are:

- reliable clutch engagement and release in all speed ranges.
- improved shift refinement.

Shift Overlap Control

The electronic-hydraulic shift action is obtained by means of various valves in the transmission control module (TCM) and main control valve body, actuated by pressure regulators. They engage or disengage the relevant clutches or brakes at the correct moments.

Hydraulic Systems

Fluid Pump

The torque converter is supported in the fluid pump by a needle roller bearing. The fluid pump is driven directly from the engine by the torque converter shell and supplies transmission fluid to the transmission and the hydraulic control unit.

The fluid pump draws in transmission fluid through a filter and delivers it at high pressure to the main pressure valve in the main control valve body unit. The valve adjusts the pressure and returns excess transmission fluid to the fluid pan.

Fluid Pan, Gasket and Filter

This transmission has a unique steel pan with 2 magnets. A single use pan gasket that seals the pan to the case. All transmission fluid is drawn from the transmission fluid pan by the fluid pump and passes through the filter.

Transmission Electronic Control System

Printable View (74 KB)

Transmission Electronic System

The transmission control module (TCM) and its input/output network control the following operations:

- Shift timing
- Clutch pressure (shift feel)
- Line pressure (shift feel)
- Torque converter clutch

In addition, the TCM receives input signals from certain transmission-related sensors. The TCM also uses these signals when determining transmission operating strategy.

Using all of these input signals, the TCM can determine when the time and conditions are right for a shift, or when to apply or release the torque converter clutch. It will also determine the pressure needed to optimize shift feel. To accomplish this, the TCM uses 6 pressure control solenoids and 1 shift solenoid to control transmission operation.

The following provides a brief description of each of the sensors and actuators used to control transmission operation.

Transmission Control Module (TCM) and Main Control Valve Body

The TCM and main control valve body are a combination of hydraulic and electronic control units. Both of these modules are installed in the transmission inside the transmission fluid pan.

Transmission Control Module (TCM)

The TCM for the transmission is mounted on top of the main control valve body. The control module for the transmission has been designed to operate correctly in the environment in which the TCM is located.

The TCM is activated and deactivated by the ignition supply and is connected to the transmission link harness by a 16-pin connector.

The TCM controls the operation of the transmission. The TCM processes information in both analog and digital forms, such as:

- transmission input speed.
- transmission output speed.
- throttle position.
- gear selection.
- engine torque.
- engine speed.
- transmission fluid temperature.
- brake pedal position.
- engine oil temperature.
- engine coolant temperature.
- ABS wheel speed.

The information is then used by the TCM to decide which shift pattern to select and for shift energy

management. Electro-hydraulic solenoid valves and pressure regulators control the transmission gear changes.

Five pressure regulators and one solenoid valve are used to control direct transmission fluid flow to select internal clutches and control the fluid pressure at the clutch. A separate pressure regulator is used exclusively for torque converter clutch control.

The TCM monitors all TCM inputs and outputs to confirm correct system operation. If a fault occurs, the TCM is able to carry out default action. It informs the driver of the problem through the instrument cluster diagnostic MIL light.

The TCM will shut down if the TCM hardware temperature rises above a predetermined temperature. Prior to shutting down, the TCM will log a fault code and enter a mechanical limp home mode.

Solenoids

The hydraulic module contains 1 solenoid valve. The solenoid valve is activated by the TCM and is either open or closed. It is used to switch the position valve.

There are 6 electronic pressure control valves, which convert an electronic current into a proportional hydraulic pressure. They are energized by the TCM and actuate the valves belonging to the relevant switching elements.

Controller Area Network (CAN) Interface

For the transmission control module (TCM) to carry out shift point and shift quality management, a number of external signals are required. For shift point management alone, the TCM requires output speed sensor, throttle pedal position, brake pedal status, gear selection position, transmission fluid temperature, four wheel drive (4WD) position, traction control, engine speed and engine torque. The controller area network (CAN) bus is used to share information between control modules.

Brake Pedal Position (BPP) Switch

The brake pedal position (BPP) switch tells the TCM when the brakes are applied. The torque converter clutch disengages when the brakes are applied. The BPP switch closes when the brakes are applied and opens when they are released.

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor detects the temperature of the engine coolant and supplies the information to the TCM. The ECT is installed in the heater outlet fitting or cooling passage on the engine. For engine control applications, the ECT signal is used to modify ignition timing, EGR flow and air-to-fuel ratio as a function of engine coolant temperature.

Accelerator Pedal Position (APP) Sensor

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal. The APP sensor detects the position of the accelerator pedal and inputs this information as a voltage to the powertrain control module (PCM). The PCM broadcasts the APP on the CAN bus. The transmission control module (TCM) reads APP off the CAN message. The PCM uses the APP sensor information to aid in determining shift scheduling and torque converter (TCC) control.

Turbine Shaft Speed (TSS) Sensor

The turbine shaft speed (TSS) sensor is a Hall-effect type sensor.

The sensor is mounted internally and is located on the transmission control module.

Output Shaft Speed (OSS) Sensor

The output shaft speed (OSS) sensor is a Hall-effect type sensor.

The sensor is mounted internally and is located on the transmission control module.

Transmission Fluid Temperature (TFT) Sensor

The transmission fluid temperature sensor is located on the TCM. The TCM uses the sensor input to activate various shift strategies. The sensor is in the form of a temperature-dependent resistor.

The resistance value of the transmission fluid temperature (TFT) sensor varies with temperature change. The TCM monitors the voltage across the TFT to determine the temperature of the transmission fluid.

The TCM uses this initial signal to determine whether a cold start shift schedule is necessary. The TCM also inhibits torque converter clutch operation at low transmission fluid temperatures.

Transmission Range (TR) Sensor

The TCM uses the position of this switch, housed in the TCM, to determine the selected gear range from the range selector lever.

The sensor completes the start circuit in PARK and NEUTRAL, and the back-up lamp circuit in REVERSE. The sensor also opens/closes a set of switches that are monitored by the TCM to determine the position of the manual lever (P, R, N, D, 3, 2 and 1).

Transmission Operational Strategies

Adaptive Shift Strategy

Adaptive shift strategy is comprised of:

- Shift Energy Management — this function involves reducing or increasing engine output torque during shifting.
    - Reduces excessive energy of the friction packs
    - Increases transmission service life
    - Improves shift quality
    - Unique shift schedules are selected based on vehicle operation conditions and environmental conditions
    - Trailer towing mode
- Pressure Modulation — this function monitors the hydraulic pressure in a shift. This pressure must be matched accurately to the transmission input torque to better provide shift comfort.
- Shift Quality Adapts — is used to provide a higher quality and consistent shift feel. Monitoring and adapting shift pressures and shift energy to overcome hardware variability over time achieve this.
- The TCM has the ability to control the engine output torque during the shift, synchronized with the operation of the transmission clutches.
- Trailer towing mode uses a different shift and converter map. This new map reduces the number of gearshifts when towing, climbing steep hills and while driving at higher altitudes.

TCM Monitoring Functions

The TCM monitors all transmission input and output to identify possible transmission failures. If a fault is detected, the TCM takes the appropriate action to make sure that the transmission enters a safe mode of operation.

- Voltage Supply — this function monitors the vehicle battery voltage.
- Watchdog Monitoring — the watchdog monitoring has 2 functions:
    - Checks for faults in the driver circuits by activating each driver.
    - Checks to see if the safety circuit is functioning correctly.

- TCM Temperature — If the TCM temperature rises above a predetermined temperature, the TCM will shut down. Prior to shutting down, the TCM will log a fault code during shutdown. The transmission will enter a mechanical limp home mode.
- Pressure Regulator/Solenoid — Each pressure regulator and solenoid is monitored for open and short circuits. The TCM also checks that the current being delivered to each solenoid valve or pressure regulator is within limits.
- Torque Converter Control — The TCM checks and verifies that the torque converter has been engaged correctly. If the torque converter has not engaged correctly, the TCM will carry out the fail-safe action of opening the converter clutch.

Diagnostic Strategy

Printable View (80 KB)

Troubleshooting an electronically controlled automatic transmission is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

NOTE: Do not take short cuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To correctly diagnose a concern, have the following publications available:

- Powertrain Control/Emissions Diagnosis (PC/ED) manual
- OASIS Messages
- Technical Service Bulletins (TSBs)
- Wiring Diagram

These publications provide the information required when diagnosing transmission concerns.

Use the Diagnostic Flow Chart as a guide and follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer's concern.
- Verify the concern by operating the vehicle.
- Check the fluid levels and condition.
- Check for non-factory add-on items.
- Check shift linkages for correct adjustment.
- Check TSBs and OASIS messages regarding the concern.

Diagnostics

- Carry out on-board diagnostic procedures Key On/Engine Off (KOEO) and Key On/Engine Running (KOER).
- Record all diagnostic trouble codes (DTCs).
- Repair all non-transmission codes first.
- Repair all transmission codes second.
- Erase all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only pass codes are obtained, go to Diagnosis By Symptom in this section for additional information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

Diagnostic Flow Chart

Printable View (66 KB)

Prior to carrying out the flow test, the following items should be checked:

- Know and understand the customer concerns.
- Check the fluid level and condition.
- Verify the concern by operating the vehicle.
- Check for non-factory-installed items and verify correct installation.
- Check the shift linkage adjustments.
- Check TSBs and OASIS messages for vehicle concerns.
- Carry out quick test both KOER and KOEO.
- Record all codes.
- Verify that the vehicle transmission control module (TCM) is at the latest calibration release level.

Diagnostic Flow Chart		
1) Did you record any diagnostic trouble codes (DTCs)?	Yes	· REPAIR all hard DTCs. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first, then this workshop manual, then GO to Step 2.
	No	· REFER to Diagnosis By Symptom in this section, then GO to Step 5.
2) Are any continuous test memory codes present?	Yes	· CLEAR codes and CARRY OUT drive cycle test, then GO to Step 3.
	No	· GO to Step 4.
3) Did the continuous test memory codes reappear?	Yes	· REPAIR all continuous test memory codes. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, then this workshop manual, then GO to Step 4.
	No	· GO to Step 4.
4) Is the concern repaired?	Yes	· CARRY OUT the final quick test to verify that no DTCs are present. CLEAR memory codes.
	No	· REFER to Diagnosis By Symptom in this section to diagnose and repair the concern, then GO to Step 5.
5) Is the concern repaired?	Yes	· CARRY OUT the final quick test to verify that no DTCs are present. CLEAR memory codes.
	No	· GET assistance from Technical Hotline.

Preliminary Inspection

Printable View (86 KB)

The following items must be checked prior to beginning the diagnostic procedures:

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer complaint or condition. Customer contact may be required in order to begin to verify the concern. Understand the conditions, including when the concern occurs. For example:

- Hot or cold vehicle temperature
- Hot or cold ambient temperature
- Vehicle driving conditions
- Vehicle loaded/unloaded

After understanding when and how the concern occurs, proceed to Verification of Condition.

Verification of Condition

This section provides information that must be used in both determining the actual cause of customer concerns and carrying out the appropriate procedures.

The following procedures must be used when verifying customer concerns for the transmission.

Determine Customer Concern

NOTE: Some transmission conditions can cause engine concerns. An electronic pressure control short circuit can cause engine misfiring. The torque converter clutch not disengaging will stall the engine.

Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperatures
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshifting
- Downshifting
- Coasting
- Engagement
- Noise/vibration — check for dependencies, either rpm dependent, vehicle speed dependent, shift dependent, gear dependent, range dependent or temperature dependent.

Check Fluid Level and Condition

Fluid Level Check

CAUTION: The vehicle should not be driven if the fluid level is low as internal failure could result.

NOTE: The transmission fluid temperature must not be allowed to exceed 50°C (122°F) when checking the fluid level. The fluid temperature should be between 30°C-50°C (86°F-122°F) closer to 50°C (122°F) when checking the fluid level.

This vehicle is not equipped with a fluid level indicator. An incorrect level may affect the transmission operation and can result in transmission failure.

Under normal circumstances, the fluid level should not be checked during normal maintenance. If the transmission starts to slip, shifts slowly or shows signs of fluid leaking, the fluid level should be checked.

1. With the transmission in PARK, the engine at idle (550-750 rpm) and foot pressed on the brake, move the range selector lever through each gear and allow engagement of each gear. Place the transmission range selector lever in the PARK position.

2. With the engine idling (550-750 rpm) in PARK, position it on a hoist.

3. Remove the fluid fill plug located on the side of the transmission case.

4. Partially add fluid until fluid starts to come out. Wait until the fluid stops or just drips from the hole.

5. Install the fluid fill plug.
    - Tighten to 35 Nm (26 lb-ft).

High Fluid Level

CAUTION: A fluid level that is too high can cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission failure.

If an overfill reading is indicated, drain and refill the transmission.

Low Fluid Level

A low fluid level can result in poor transmission engagement, slipping or failure. This may also indicate a leak in one of the transmission seals or gaskets.

Adding Fluid

CAUTION: The use of any other type of transmission fluid than specified can result in transmission failure.

If fluid must be added, add fluid in 0.5 liter (1/2 quart) increments through the fluid fill plug. Do not overfill the fluid. For fluid type, refer to the specification chart.

Fluid Condition Check

1. Check the fluid level.

2. Remove the fluid fill plug and allow the fluid to drip onto a facial tissue and examine the stain.

3. **NOTE:** The transmission fluid could be 2 different colors. The factory fill fluid is amber. The replacement fluid is red.

   Observe the color and the odor. The color under normal circumstances should be dark reddish or clear, not black or have a burnt odor.

4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.

5. If the stain is a foamy pink color, this may indicate coolant in the transmission. The engine cooling system should also be inspected at this time.

6. If fluid contamination or transmission failure is confirmed by the sediment in the bottom of the fluid pan, the transmission must be disassembled and completely cleaned. This includes the torque converter and fluid cooler tubes. A new oil-to-air cooler must be installed.

Shift Point Road Test

Printable View (66 KB)

This test verifies that the shift control system is operating correctly.

1. Bring engine and transmission up to normal operating temperature.
2. Operate vehicle with transmission range selector lever in DRIVE position.
3. Apply minimum throttle and observe speeds at which upshift occurs and torque converter engages. Refer to the Shift Speeds chart in this section.
4. With the transmission in DRIVE, move the range selector lever into the 3 position. The transmission should downshift to 4th gear. Release the accelerator pedal; engine braking should occur.
5. Press the accelerator pedal to the floor, wide open throttle (WOT). Transmission should shift from 4th to 3rd, depending on vehicle speed. The torque converter clutch should disengage and then reapply.
6. With the transmission in DRIVE position and speed above 80 km/h (50 mph) and less than half throttle, move the transmission range selector lever from DRIVE position to manual 2 position and remove pressure from the accelerator pedal. The transmission should downshift into 2nd gear. With the vehicle remaining in manual 2 position, move the transmission range selector lever into manual 1 position and release the accelerator pedal. The transmission should downshift into 1st gear at speeds below approximately 45-56 km/h (28-35 mph).
7. If the transmission fails to upshift/downshift or the torque converter clutch does not apply and release, refer to Diagnosis By Symptom in this section.

Shift Speeds

NOTE: Shift speed ranges are approximate for all applications. For specific applications (engine, axle ratio, tire size and application), refer to the Automatic Transmission Specification booklet.
Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

Throttle Position	Shift	MPH	Km/H
Light Throttle	1-2	7-11	11-18
	2-3	18-22	29-36
30% Pedal Travel	3-4	25-29	40-46
APP_D = 30	4-5	35-40	56-64
	5-6	42-46	68-76
Closed Throttle	6-5	38-44	61-71
	5-4	28-34	45-55
	4-3	18-24	29-38
	3-2	3-8	5-13

	2-1	1-4	1-6
WOT	1-2	20-28	32-45
	2-3	45-59	72-94
	3-4	76-88	120-140

Torque Converter Diagnosis

Printable View (84 KB)

Prior to torque converter installation, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of good torque converters. Only after a complete diagnostic evaluation can the decision be made to install a new torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary inspection.
2. Know and understand the customer's concern.
3. Verify the condition — carry out the torque converter operation test.
4. Carry out diagnostic procedures.

- Carry out On-Board Diagnostics. Refer to Diagnostics in this section.
  - Repair all non-transmission related diagnostic trouble codes (DTCs) first.
  - Repair all transmission DTCs.
  - Rerun on-board diagnostic to verify repair.
- Carry out Stall Speed Test. Refer to Special Testing Procedures in this section.
- Carry out Diagnostic Routines. Refer to Diagnosis By Symptom in this section.
  - Use the Diagnosis by Symptom to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed; diagnose and repair as required before changing the torque converter.

Torque Converter Operation Test

This test verifies that the torque converter clutch control system and the torque converter are operating correctly.

1. Carry out Quick Test with scan tool. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. Check for DTCs.
2. Connect a tachometer to the engine.
3. Bring the engine to normal operating temperature by driving the vehicle at highway speeds for approximately 15 minutes in DRIVE position.
4. After normal operating temperature is reached, maintain a constant speed of about 80 km/h (50 mph) and tap the brake pedal with the left foot.
5. Engine rpm should increase when the brake pedal is tapped and decrease about 5 seconds after the pedal is released. If this does not occur, see Torque Converter Operation Concerns. Refer to Diagnosis By Symptom in this section.
6. If the vehicle stalls in DRIVE or at idle with the vehicle at a stop, move the transmission range selector lever to the manual 1 position. If the vehicle stalls, see Torque Converter Operation Concerns. Refer to Diagnosis By Symptom in this section. If the vehicle does not stall in DRIVE, refer to Diagnosis By Symptom in this section.

NOTE: The following is a list of common vehicle concerns that have been misdiagnosed as torque converter clutch shudder. For diagnosis of the following items, refer to the appropriate sections of the workshop manual and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

- Spark plugs — check for cracks, high resistance or broken insulators
- Plug wires
- Fuel injector — filter may be plugged
- Fuel contamination — engine driveability concerns
- Exhaust gas recirculation (EGR) valve — valve may let in too much exhaust gas and cause engine to run lean
- Vacuum leak — engine will not get correct air/fuel mixture
- Manifold absolute pressure (MAP)/mass air flow (MAF) sensor — incorrect air/fuel mixture
- Heated oxygen sensor (HO2S) — too rich/lean air/fuel mixture
- Fuel pressure — may be too low
- Engine mounts — loose/damaged mounts can cause vibration concerns
- Axle joints — check for vibration

Visual Inspection

Printable View (65 KB)

This inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- Electronic add-on items:
  - Air conditioning
  - Generator (alternator)
  - Engine turbo
  - Cellular telephone
  - Cruise control
  - CB radio
  - Linear booster
  - Backup alarm signal
  - Computer
- Vehicle modification:

These items, if not installed correctly, will affect the powertrain control module (PCM), transmission control module (TCM) or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size or axle ratio changes.

- Leaks; refer to Leakage Inspection in this section.
- Correct linkage adjustments; refer to Section 307-05 .

Shift Linkage Check

Check for a misadjustment in shift linkage by matching the detents in the transmission range selector lever with those of the manual lever in the transmission. If they match, the misadjustment is in the indicator. Do not adjust the shift linkage.

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted. Refer to Section 307-05 for shift linkage adjustment.

Check TSBs and OASIS

Refer to all technical service bulletins (TSB) and OASIS messages that pertain to the transmission concern and follow the procedure as described.

Carry Out On-Board Diagnostics (KOEO, KOER)

After a road test, with the vehicle warm and before disconnecting any connectors, carry out the Quick Test using the scan tool. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Diagnostics

Printable View (96 KB)

Special Tool(s)

ST1565-A	Transmission Fluid Pressure Gauge 307-004 (T57L-77820-A)
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST1137-A	73 III Automotive Meter 105-R0057 or equivalent

Diagnosing an electronically controlled automatic transmission is simplified by using the following procedures. One of the most important things to remember is that there is a definite procedure to follow. DO NOT TAKE SHORTCUTS OR ASSUME THAT CRITICAL CHECKS OR ADJUSTMENTS HAVE ALREADY BEEN MADE. Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostics With Scan Tool

NOTE: For detailed instruction and other diagnostic methods using the scan tool, refer to the scan tool tester manual and the Powertrain Control/Emissions Diagnosis (PC/ED) manual. These quick tests should be used to diagnose the powertrain control module (PCM) and should be carried out in order.

- **Quick Test 1.0 — Visual Inspection**
- **Quick Test 2.0 — Set Up**
- **Quick Test 3.0 — Key On, Engine Off (KOEO)**
- **Quick Test 4.0 — Continuous Memory**
- **Quick Test 5.0 — Key On, Engine Running (KOER)**
  - Special Test Mode
  - Wiggle Test
  - Output Test Mode
  - PCM Reset Mode
  - Clearing DTCs
  - OBD II Drive Cycle
- **Other Scan Tool Features**

For information on other diagnostic testing features using the scan tool, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. Other diagnostic methods include the following:

- Parameter Identification (PID) Access Mode
- Freeze Frame Data Access Mode
- Oxygen Sensor Monitor Mode

Transmission Drive Cycle Test

Printable View (82 KB)

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The Transmission Drive Cycle Test must be followed exactly. Malfunctions must occur 4 times consecutively for shift error diagnostic trouble code (DTC) to be set, and 5 times consecutively for continuous torque convertor clutch (TCC) code to set.

NOTE: When carrying out the Transmission Drive Cycle Test, refer to the Solenoid Application Chart for correct solenoid operation.

After carrying out the Quick Test, use the Transmission Drive Cycle Test for checking continuous codes.

1. Record and then erase Quick Test codes.
2. Warm engine to normal operating temperature.
3. Make sure transmission fluid level is correct.
4. With transmission in DRIVE, moderately accelerate from stop to 80 km/h (50 mph). This allows the transmission to shift into 6th gear. Hold speed and throttle open steady for a minimum of 15 seconds.
5. With transmission in 6th gear and maintaining steady speed and throttle opening, lightly apply and release brake to operate stop lamps. Then, hold speed and throttle steady for a minimum of 5 seconds.
6. Brake to a stop and remain stopped for a minimum of 20 seconds.
7. Repeat Steps 4 through 6 at least 5 times.
8. Carry out Quick Test and record continuous DTCs.
    - If the DTCs are still present, refer to the Diagnostic Trouble Code Chart. Repair all non-transmission DTCs first, as they can directly affect the operation of the transmission. Repeat the Quick Test and the Road Test to verify the correction. Erase the DTCs, carry out the Drive Cycle Test and repeat the Quick Test after completing the repair on the DTC.
    - If the continuous test passes and a concern is still present, refer to Diagnosis By Symptom in this section, OASIS messages and TSBs for concerns.

After On-Board Diagnostic

NOTE: The vehicle wiring harness, powertrain control harness (PCM) and non-transmission sensors

may affect transmission operations. Repair these concerns first.

After the on-board diagnostic procedures are completed, repair all DTCs.

Begin with non-transmission related DTCs, then repair any transmission related DTCs. Use the Diagnostic Trouble Code chart for information on condition and symptoms. This chart will be helpful in referring to the correct manual(s) and aids in diagnosing internal transmission concerns and external non-transmission inputs. The pinpoint tests are used in diagnosing transmission electrical concerns. Make sure that the vehicle wiring harness and the PCM are diagnosed as well. The Powertrain Control/Emissions Diagnosis (PC/ED) manual will aid in diagnosing non-transmission electronic components.

Diagnostic Trouble Code (DTC) Charts

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Diagnostic Trouble Code Chart

Five Digit DTC	Component	Description	Condition	Symptom	Action
P0218	TFT	Transmission fluid over temperature condition.	TCM has detected a TFT that has exceeded a set temperature.	Aggressive lock-up schedule.	Carry out normal diagnostic for an overheating condition. Refer to Diagnosis By Symptom in this section.
P0219	PCM	Engine speed signal on CAN too high.	Engine speed signal on CAN too high.	• May turn on MIL • Only 5th Gear • TCC will not engage	Clear all DTCs. Test the system for normal operation. If the DTC returns, refer to the PCED.
P0562	Battery	System voltage low.	TCM has detected a voltage level below minimum voltage to operate solenoids. Maintains current solenoid state.	• No engagements • No adaptive strategy • No self learning strategy • May turn on MIL • Mechanical limp-home mode • Battery voltage below 9 volts	Monitor the appropriate Parameter Identification (PID) to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0563	Battery	System voltage high.	TCM has detected a voltage level above maximum voltage.	• No adaptive strategy • No self learning strategy • May turn on MIL • Mechanical limp-home mode	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section and the

				• Battery voltage above 16 volts	Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0603	TCM	Powertrain control module EEPROM error.	TCM has detected an internal software concern with KAM.	—	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0605	TCM	The PCM ROM has been corrupted.	PCM has detected an internal software concern with ROM.	• May turn on MIL • Mechanical limp-home mode	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0613	TCM	TCM Processor.	TCM has detected an internal software issue.	• May turn on MIL • Mechanical limp-home mode	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the

					new mechatronics unit, it must be reflashed to the latest level calibration.
P0634	TCM	TCM module temperature.	Internal temperature within TCM too high.	• May turn on MIL • Mechanical limp-home mode • Default to 3rd or 5th gear	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0641	TCM	TCM module sensor voltage failed.	Sensor reference voltage A circuit open.	• May turn on MIL • Mechanical limp-home mode	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0657	TCM	Actuator supply voltage A circuit open.	Power supply actuators open circuit.	• May turn on MIL • Mechanical limp-home mode	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit.

					After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0658	TCM	Actuator supply voltage A circuit low.	Power supply actuators short circuit to ground.	• May turn on MIL • Mechanical limp-home mode	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0659	TCM	Actuator supply voltage A circuit high.	Actuator power supply short circuit to power before key ON.	• May turn on MIL • Mechanical limp-home mode	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0667	TCM-TFT	PCM, ECM, TCM internal temperature sensor range operation.	Substrate temperature sensor.	• Transmission will shut down or will not shift due to a transmission fluid over temperature condition • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new

					mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0701	Transmission control system	Transmission control system. Range operation.	TCM has detected a concern with the operational strategy.	• Dual DTC code causing transmission default to a hydraulic limp-home mode • May turn on MIL • Mechanical limp-home mode	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. Reflash the TCM first. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0705	TR sensor	TR sensor circuit error.	TCM has detected a TR signal (P, R, N, D, 3, 2 or 1) is out of normal range.	• May turn on MIL • Mechanical limp-home mode	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0711	TFT sensor	No change in TFT during operation.	PCM has detected no TFT change during operation. TFT valve stuck at some normal reading.	• Firm shift • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the

					DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0712	TFT sensor	TFT sensor circuit grounded.	PCM has detected a voltage drop across TFT sensor, exceeds scale set for temperature (grounded circuit).	• Firm shift • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0713	TFT sensor	TFT sensor circuit short to power.	TCM has detected a voltage drop across TFT sensor, exceeds scale set for temperature.	—	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0714	TFT sensor	TFT intermittent error.	TCM has detected no TFT intermittent operation.	—	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal

					operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0715	TSS sensor	TSS sensor circuit error.	TSS has detected a short circuit to power.	• No TCC engagements • May turn on MIL • Mechanical limp-home mode in 3rd gear • Max line pressure • No adaptive learning strategy • Automatic mode only	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0716	TSS sensor	TSS range or operation insufficient input from TSS.	PCM has detected a loss or noisy TSS signal during operation.	• No TCC engagements • May turn on MIL • Mechanical limp-home mode in 3rd gear • Max line pressure • No adaptive learning strategy • Automatic mode only	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0717	TSS sensor	No TSS signal.	PCM has not detected a TSS signal. No TSS signal when OSS signal is present.	• No TCC engagements • May turn on MIL • Mechanical limp-home mode in 3rd gear • Max line pressure	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the

				• No adaptive learning strategy • Automatic mode only	system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0720	OSS sensor	No OSS signal.	PCM has detected an OSS short circuit to power.	• No TCC engagements • Substitute wheel speed for OSS • No adaptive learning strategy	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0721	OSS sensor	OSS range or operation insufficient input from OSS.	PCM has detected a loss or noisy OSS signal during operation.	• Harsh shifts • Substitute wheel speed for OSS • No adaptive learning strategy	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0722	OSS sensor	No OSS signal.	PCM has not detected an OSS signal. No OSS signal when OSS signal is present.	• Harsh shifts • Substitute wheel speed for OSS • No adaptive learning strategy	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all

					DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0723	OSS sensor	No OSS signal intermittent.	PCM has detected an intermittent signal.	• Harsh shifts • No TCC engagements • Hold in gear currently selected • Max line pressure • No adaptive learning strategy • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0729	Transmission	Sixth gear ratio error.	No 6th gear ratio detected by the TCM.	• No 6th gear • No TCC engagements • May turn on MIL • No adaptive learning strategy • No self learning strategy • Mechanical limp-home mode in 5th gear	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0731	Transmission	First gear ratio error.	No 1st gear ratio detected by the TCM.	• No 1st gear • No TCC engagements • May turn on MIL • No adaptive	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present.

				learning strategy • No self learning strategy • Mechanical limp-home mode in 3rd gear • Max line pressure	Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must be reflashed to the latest level calibration.
P0781	Transmission	1-2 shift error.	Incorrect ratio calculated during shift 1-2.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • No TCC engagements • No adaptive learning strategy • Hold in 3rd, 2nd or 1st gear • May turn on MIL	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must be reflashed to the latest level calibration.
P0782	Transmission	2-3 shift error.	Incorrect ratio calculated during shift 2-3.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • No TCC engagements • No adaptive learning strategy • Hold in 4th, 3rd	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must be reflashed to the

				or 2nd gear • May turn on MIL	latest level calibration.
P0783	Transmission	3-4 shift error.	Incorrect ratio calculated during shift 3-4.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • No TCC engagements • No adaptive learning strategy • Hold in 4th or 3rd gear • May turn on MIL	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must be reflashed to the latest level calibration.
P0784	Transmission	4-5 shift error.	Incorrect ratio calculated during shift 4-5.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • No TCC engagements • No adaptive learning strategy • Hold in 5th or 4th gear • May turn on MIL	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must be reflashed to the latest level calibration.
P0732	Transmission	Second gear ratio error.	No 2nd gear ratio detected by the TCM.	• No TCC engagements • No adaptive learning strategy • Max line pressure • May turn on MIL	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all

					DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must be reflashed to the latest level calibration.
P0733	Transmission	Third gear ratio error.	No 3rd gear ratio detected by the TCM.	• No TCC engagements • No adaptive learning strategy • Max line pressure • May turn on MIL • Hold in 5th gear	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must be reflashed to the latest level calibration.
P0734	Transmission	Fourth gear ratio error.	No 4th gear ratio detected by the TCM.	• No TCC engagements • No adaptive learning strategy • Max line pressure • May turn on MIL • Hold in 5th gear	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must be reflashed to the latest level calibration.
P0735	Transmission	Fifth gear ratio error.	No 5th gear ratio detected by the TCM.	• No TCC engagements • No adaptive learning	Follow preliminary diagnostics. Monitor the appropriate PID to

				strategy • Max line pressure • May turn on MIL • Hold in 5th gear	validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must be reflashed to the latest level calibration.
P0736	Transmission	Reverse gear ratio error.	No reverse gear ratio detected by the TCM.	• No TCC engagements • No adaptive learning strategy • Max line pressure • May turn on MIL • Hold in 4th gear	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must be reflashed to the latest level calibration.
P0829	Transmission	5-6 shift error.	Incorrect ratio calculated during shift 5-6.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • No TCC engagements • Mechanical limp-home in 3rd gear	Follow preliminary diagnostics. Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new transmission. After installing the new transmission, the TCM module must

				• Mechanical limp-home in 2nd gear • May turn on MIL	be reflashed to the latest level calibration.
P0960	PC A	PC A circuit or solenoid failure or open circuit.	PC A circuit or solenoid (EDS5) failed during operation.	• No adaptive strategy • No self learning strategy • Max line pressure	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0962	PC A	PC A solenoid signal or ground circuits either short or open solenoid circuit failure.	Voltage through PC A solenoid (EDS5) is checked. An error will be noted if tolerance is exceeded.	May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0963	PC A	PC A solenoid short to power circuit failure.	Voltage through PC A solenoid (EDS5) is checked. An error will be noted if tolerance is exceeded.	• Max line pressure • Deactivate clutch adaptations	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit.

					After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0972	SS A	SS A circuit or solenoid failure.	SS A (EDS1) circuit or solenoid failure.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0973	SS A	SS A solenoid or circuit shorted to ground or open.	Voltage through SS A solenoid (EDS1) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0974	SS A	SS A solenoid or circuit shorted to power or open.	Voltage through SS A solenoid (EDS1) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new

					mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0975	SS B	SS B circuit shorted to ground or open.	SS B (EDS2) circuit or solenoid failure.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0976	SS B	SS B solenoid or circuit shorted to ground or open.	Voltage through SS B solenoid (EDS2) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0977	SS B	SS B solenoid or circuit shorted to power or open.	Voltage through SS B solenoid (EDS2) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install

					a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0978	SS C	SS C circuit shorted to ground or open.	SS C (EDS3) circuit or solenoid failure.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0979	SS C	SS C solenoid or circuit shorted to ground or open.	Voltage through SS C solenoid (EDS3) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0980	SS C	SS C solenoid or circuit shorted to power or open.	Voltage through SS C solenoid (EDS3) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the

					DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0981	SS D	SS D circuit shorted to ground or open.	SS D (EDS4) circuit or solenoid failure.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0982	SS D	SS D solenoid or circuit shorted to ground or open.	Voltage through SS D solenoid (EDS4) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0983	SS D	SS D solenoid or circuit shorted to power or open.	Voltage through SS D solenoid (EDS4) is checked. An error will be noted if tolerance is exceeded. Short to ground failure	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal

			detected.		operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0770	SS E	SS E circuit or solenoid failure.	SS E (MV1) circuit or solenoid failure.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0985	SS E	SS E solenoid signal circuit shorted to ground or open.	Voltage through SS E solenoid (MV1) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P0986	SS E	SS E solenoid or circuit shorted to power or open.	Voltage through SS E solenoid (MV1) is checked. An error will be noted if tolerance is exceeded. Short to ground failure	• Mechanical limp-home mode • May turn on MIL	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the

			detected.		system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P1707	Transmission	Park/neutral switch circuit failure.	Circuit or sensor failure.	Engine will not crank in PARK or NEUTRAL or engine will crank in all gears.	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P1719	PCM	Engine torque signal is inaccurate.	TCM received an inaccurate signal via CAN.	• May turn on MIL • No shifts • TCC will not engage • Harsh engagements	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1910	Reverse lamp circuit	Reverse solenoid circuit failure.	Reverse solenoid (MV3) circuit failed open.	• Park lock or interlock switched OFF • Reverse lamps may be on at all times • Reverse may not come on	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all the DTCs. Test system for normal operation. If DTC returns, refer to

					Section 417-01 .
P1911	Reverse lamps	Reverse solenoid signal circuit shorted to ground. Circuit low.	Reverse solenoid (MV3) circuit fails to provide voltage drop across solenoid.	—	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all the DTCs. Test system for normal operation. If DTC returns, refer to Section 417-01 .
P1912	Reverse lamps	Reverse solenoid circuit shorted to power. Circuit high.	Reverse solenoid (MV3) circuit fails to provide voltage drop across solenoid. Circuit shorted to power.	Park lock or interlock switched OFF.	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all the DTCs. Test system for normal operation. If DTC returns, refer to Section 417-01 .
P0740	TCC solenoid	TCC solenoid circuit failure.	TCC solenoid (EDS6) circuit fails. Circuit open.	• May turn on MIL • No adaptive learning strategy	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P2763	TCC	TCC solenoid signal circuit shorted to ground. Circuit high.	TCC solenoid (EDS6) circuit fails to provide voltage drop across solenoid. Circuit shorted to power.	• No TCC engagements • May turn on MIL • No adaptive learning strategy	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal

					operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
P2764	TCC	TCC solenoid circuit shorted to power. Circuit low.	TCC solenoid (EDS6) circuit fails to provide voltage drop across solenoid.	• No TCC engagements • May turn on MIL • No adaptive learning strategy	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all DTCs. Test the system for normal operation. If the DTC returns, install a new mechatronics unit. After installing the new mechatronics unit, it must be reflashed to the latest level calibration.
U0073	CAN	CAN communication link error.	CAN communication bus OFF, short circuit CAN high to CAN low.	May turn on MIL	Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual [a].
U0155	CAN	TCM communication link error.	CAN link error detected by TCM and IP.	• No communication with instrument panel cluster (IPC). • May turn on MIL	Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual [a].
U0100	CAN	TCM communication link error.	CAN link error detected by PCM, between TCM and ECM.	• Mechanical limp-home mode in 3rd gear • Max line pressure • No adaptive learning strategy • May turn on MIL	Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual [a].
U0121	CAN	TCM communication link error.	PCM/TCM have detected an error in the CAN wheel RPM information	—	Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual [a].

			from the ABS system.		
P0219	RPM	Engine RPM for CAN.	Engine RPM signal from CAN to high.	• No TCC engagements • May turn on MIL • Hold in 5th gear	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P062F	TCM	TCM EEPROM error.	Internal PCM error with EEPROM.	• May turn on MIL • Mechanical limp-home mode	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0741	TCC	TCC solenoid circuit stuck open.	TCC solenoid (EDS6), clutch or circuit open.	• No TCC engagements • May turn on MIL	Carry out normal diagnostics for TCC.
P1934	VSS	VSS input signal error.	VSS input does not match OSS signal.	Possible installation of wrong tire or axle. Wrong ratio.	Monitor the appropriate PID to validate that an error is present. Refer to Diagnostic Parameters Identification (PID) Chart in this section. Clear all the DTCs. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P2544	PCM	Torque management request input signal A.	Data received from the PCM or engine components are not correct for the vehicle operating conditions. Incorrect engine torque calculation may result.	Transmission may enable limp-home strategies or increase pressures. Engine components and PCM may or may not set additional DTCs. P2544, fuel monitor error, ETC sensor failure and MAF sensor failures may be present. MIL may illuminate.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U0140	PCM/ABS/BCM	CAN timeout of	TCM received	May turn on MIL or	Clear all DTCs. For

		PCM, ABS or BCM.	incorrect information from other modules due to CAN timeout from PCM, ABS or BCM.	TCIL	PCM, ABS or PCM systems. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U0401	PCM/TCM	Invalid data received from the PCM or engine components.	Data received from the PCM or engine components is not correct for the vehicle operating conditions.	Transmission may enable limp-home strategies or increase pressures. Engine components and PCM may or may not set additional DTCs. P2544, fuel monitor error, ETC sensor failure and MAF sensor failures may be present. MIL may illuminate.	Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Special Testing Procedures

Printable View (133 KB)

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portions of the transmission.

Engine Idle Speed Check

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the engine idle speed.

Stall Speed Test

WARNING: Apply the service and parking brakes firmly while carrying out each stall test.

CAUTION: Carry out the Line Pressure Test prior to carrying out the Stall Speed Test. If line pressure is low at stall, do not carry out the Stall Speed Test or further transmission damage will occur.

NOTE: The stall test should only be carried out with the engine and transmission at normal operating temperatures.

The stall test checks the operation of the following items:

- Torque converter one-way clutch
- Forward clutch
- Low one-way clutch
- Reverse clutch
- Overdrive one-way clutch
- Direct clutch
- Engine driveability concerns

1. Connect a tachometer to the engine.

2. After testing each of the following ranges, D, 3, 2, 1 and R, move the transmission range selector lever to NEUTRAL and run the engine for about 15 seconds to allow the torque converter to cool before testing the next range.

3. **CAUTION: If the engine rpm recorded by the tachometer exceeds the maximum specified rpm, release the accelerator pedal immediately. Clutch slippage is indicated.**

   CAUTION: Do not maintain wide-open throttle (WOT) in any gear range for more than 5 seconds or damage to the transmission may occur.

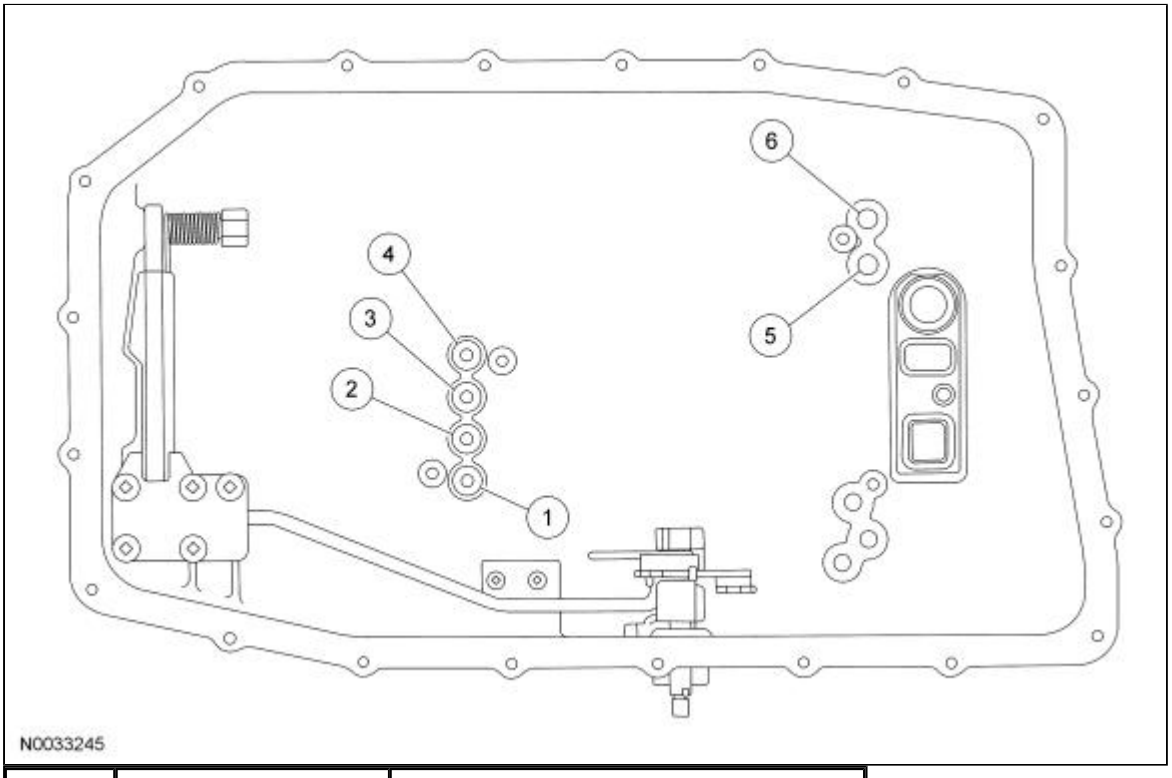
   Press the accelerator pedal to the floor (WOT) in each range. Record the rpm reached in each range. Stall speeds should be in the appropriate range.

Stall Speed Chart

Min.	Max.
2,231	2,631

If the stall speeds were too high, refer to the following Stall Speed Diagnosis Chart. If the stall speeds were too low, check engine tune-up. If the engine is OK, remove the torque converter and check the torque converter reactor one-way clutch for slippage.

Air Pressure Test



Item	Part Number	Description
1	—	Clutch (C) port
2	—	Clutch (D1) port
3	—	Clutch (D2) port
4	—	Direct clutch (B) port
5	—	Overdrive clutch (E) port
6	—	Forward clutch (A) port

A no-drive condition can exist, even with correct transmission fluid pressure, because of inoperative clutches or bands. Refer to the Clutch Application Chart to determine the appropriate elements. A clutch concern can be located through a series of checks by substituting air pressure for fluid pressure to determine the location of the concern.

Example: When the transmission range selector lever is in a forward gear range (D, 3, 2, 1), a no-drive condition may be caused by an inoperative forward clutch.

1. Drain the transmission fluid. Remove the transmission fluid pan.

2. Remove the filter and seal assembly and the mechatronics unit.

3. The inoperative clutches can be located by applying air pressure into the appropriate clutch port.

4. Apply air pressure to the appropriate clutch port. A dull thud may be heard or movement felt when a clutch piston is applied. If the clutch seals or check ball are leaking, a hissing may be heard.

5. If the clutches fail to operate during the air check:
    - the piston seals are not seated, damaged or not installed correctly.
    - plugged feed holes for clutch apply in the case and/or clutch cylinder.
    - damaged piston and/or clutch cylinder.

6. Service as required and recheck.

Leakage Inspection

Printable View (94 KB)

Special Tool(s)

ST1300-A	UV Leak Detector Kit 164-R0756 or equivalent

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP
Automatic Transmission/Power Steering Dye 164-R3701 or equivalent	—

The transmission has the following parts to prevent external fluid leakage:

- Gaskets
- Lip-type seals
- O-ring seals
- Seal rings
- Seal grommets
- Seal washers
- Thread sealant

Leakage at the transmission pan-to-case gasket often can be stopped by tightening the retaining bolts to specification. Refer to Torque Specifications in this section.

When fluid is found to be leaking between the case and the cooler tube fitting, tighten the fitting to maximum specification.

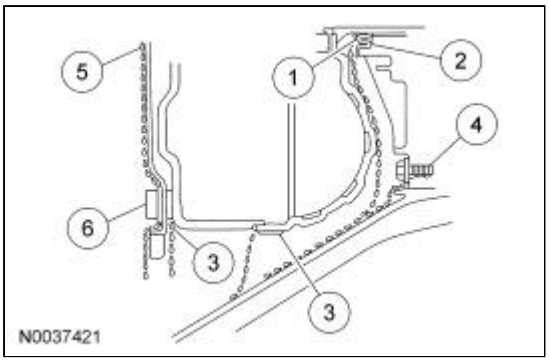
If leakage is found at the manual control lever shaft, install a new seal.

Check for fluid leaking from the end of the extension housing. Leakage can result from a damaged seal, missing garter spring or worn extension bushing. Install a new seal assembly, bushing or both, as necessary.

Fluid Leakage in Torque Converter Area

Leakage at the front of the transmission, as evidenced by fluid around the torque converter housing part of the case, may have several sources. By careful observation it is possible, in many instances, to pinpoint the source of the leak before removing the transmission from the vehicle. The paths which the fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The 5

numbers in the illustration correspond with the 5 flow path steps.



Leak Path	Symptom	Possible Source
1, 2 and 4	Leak at front of transmission	Pump lip seal
1, 2 and 4	Leak at front of transmission	Vent
1, 2 and 4	Leak at front of transmission	Converter hub weld
1, 2 and 4	Leak at front of transmission	External pump seal (large)
1, 2 and 4	Leak at front of transmission	Pump to case screws
1, 2 and 4	Leak at front of transmission	Pump gasket
3	Leak at front of transmission	Torque converter seal weld
5	Leak at front of transmission	Engine oil leak; rear main seal
5	Leak at front of transmission	Engine valve cover
5	Leak at front of transmission	Oil galley
5	Leak at front of transmission	Pump lip seal
5	Leak at front of transmission	Engine oil pressure sensor
6	Leak at front of transmission	Torque converter rivet

Transmission Leak Check Test Procedure

Automatic Transmission/Power Steering Dye 164-R3701 or equivalent (specifically formulated for ATF) is used to detect a transmission fluid leak. Use one ounce of dye for every 3.8 liters (4 quarts) of transmission fluid. Add any additional transmission fluid to bring it to the correct level. Such dyes can be used to determine whether an engine fluid or transmission fluid leak is present, or if the fluid in the transmission fluid cooler hose leaks into the engine coolant system. An ultraviolet light must be used to detect the fluorescent dye solution.

1. Remove the fluid level fill plug and note the color of the fluid that drips out. Original factory fill fluid is clear and red if the fluid has been exchanged.

2. Clean off any fluid from the top and bottom of the torque converter housing, front of the case and rear face of the engine and oil pan. Clean the torque converter area by washing with a suitable non-flammable solvent and blow-dry with compressed air.

3. Wash out the torque converter housing and the front of the flexplate. The torque converter housing may be washed out using clean solvent and a squirt-type oil can. Blow-dry all washed areas with compressed air.

4. Start and run the engine until the transmission reaches its normal operating temperature. Shift the transmission through all the gear ranges to make sure that the dye has circulated through the transmission. Observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Observe the front of the flexplate, back of the cylinder block (in as far

as possible) and inside the torque converter housing and front of the case. Run the engine until fluid leakage is evident and the probable source of leakage can be determined. Repair as required.

External Fluid Leaks

Leak Path	Possible Source
Leaks at the fluid pan to case	• Pan bolts not tightened to specification. • Pan gasket damaged. • Case pan rail damaged.
Fluid cooler tubes or O-rings leaking	• Cooler tube(s), cooler tube O-rings damaged. • Cooler tube hold-down plate damaged.
Leaks at the fluid cooler	• Fluid cooler damaged. • Cooler tube O-rings damaged.
Leaks at the manual control lever	• Manual control lever seal missing or damaged.
Mechatronic harness connector	• O-ring on connector missing or damaged.

Transmission Fluid Cooler Tube Replacement

For installation of new transmission fluid cooler tube, refer to Section 307-02 .

Transmission Fluid Cooler

Printable View (79 KB)

CAUTION: Whenever a transmission has been disassembled to install new parts, the transmission fluid cooler and transmission fluid cooler tubes must be cleaned and backflushed. Use a torque converter/oil cooler cleaner.

NOTE: Cleaning and backflushing the transmission fluid cooling system, along with following all the normal cleaning and inspection procedures during disassembly and reassembly, will keep contaminants from entering the transmission, causing a repeat repair.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material or band material may have been carried into the torque converter and transmission fluid cooler. These contaminants are a major cause of recurring transmission troubles and must be removed from the system before the transmission is put back into use.

Diagnosis By Symptom

Printable View (166 KB)

The Diagnosis By Symptom gives the technician diagnostic information and direction, and suggests possible components using a symptom as a starting point. All routines start out with any potential electrical components that can cause or contribute to the symptom described. The routines then list all possible hydraulic or mechanical components that can cause or contribute the symptom described.

Diagnosis by Symptom Chart Directions

1. Using the Diagnosis by Symptom, select the condition that best describes the condition.

2. Refer to the routine indicated in the Diagnosis by Symptom Index.

3. Always begin diagnosis of a symptom with:
    1. preliminary inspections.
    2. verifications of condition.
    3. checking the fluid levels.
    4. carrying out other test procedures as directed.

4. **NOTE:** Not all concerns and conditions with electrical components will set a diagnostic trouble code (DTC). Be aware that the components listed may still be the cause. Verify correct function of these components prior to proceeding to the Hydraulic/Mechanical Routine listed.

   NOTE: When the battery is disconnected or a new battery is installed, certain transmission operating parameters can be lost. The transmission control module (TCM) must relearn these parameters. During this learning process, you may experience slightly firm shifts, delayed or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the TCM.

   Begin with the ROUTINES, if indicated. Follow the reference or action required statements. Always carry out the on-board diagnostic tests as required. Never skip steps. Repair as required. If the concern is still present after electrical diagnosis, then proceed to the Hydraulic/Mechanical Routine listed.

5. The list contains only possible hydraulic or mechanical components that may cause or contribute to the concern. These components are listed in the removal sequence and by most probable cause. All components listed must be inspected to make sure that repairs are complete.

Diagnosis by Symptom Index

Title	Routines
Engagement Concerns	
No Forward In D	201
No Reverse	202
Harsh Reverse	203
Harsh Forward	204
Delayed/Soft Reverse	205
Delayed/Soft Forward	206

No Forward and No Reverse	207
Harsh Forward and Harsh Reverse	208
Delayed Forward and Delayed Reverse	209
Shift Concerns	
Some/All Shifts Missing	210
Timing — Early/Late	211
Timing — Erratic/Hunting	212
Feel Concerns	
Soft/Slipping (some or all)	213
Harsh (some or all)	214
No 1st Gear, Engages in Higher Gear	215
No Manual 1st Gear	216
No Manual 2nd Gear	217
No Manual 3rd Gear	218
No 1-2 Shift (Automatic)	220
No 2-3 Shift (Automatic)	221
No 3-4 Shift (Automatic)	222
No 4-5 Shift (Automatic)	270
No 5-6 Shift (Automatic)	272
No 6-5 Shift (Automatic)	273
No 5-4 Shift (Automatic)	271
No 4-3 Shift (Automatic)	223
No 3-2 Shift (Automatic)	224
No 2-1 Shift (Automatic)	225
Torque Converter Operation Concerns	
No Apply	240
Cycling/Chatter	241
Always Applied/Stalls Vehicle	242
Other Concerns	
External Leaks	252
Noise/Vibration in Forward or Reverse	254
Noise/Vibration that change with vehicle speed	255
Engine Will Not Crank	257
No Park (P) Range	258
Transmission Overheating	259
Fluid Venting/Foaming	261

Diagnostic Routines

Engagement Concerns: No Forward in D

Possible Component	Reference/Action
201 — ROUTINE	
Fluid	
・Incorrect fluid level	・Check the fluid level. Adjust fluid to correct level. Refer to Preliminary

	Inspection in this section.
Shift Linkage	
· Shift linkage — damage or incorrectly adjusted	· Inspect and repair as required. Verify transmission selector lever cable adjustment. Refer to Section 307-05 . Adjust transmission selector lever cable as necessary.
Mechatronics	
· Defective manual valve	· Inspect connection to shift linkage.
· Defective forward clutch (A) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Forward clutch (A) friction and steel plate — failure	· Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure	· Inspect the low/reverse clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.
Pump	
· Pump gear — failure	· Install a new pump assembly. Refer to Pump Assembly in this section.

Engagement Concerns: No Reverse

Possible Component	Reference/Action
202 — ROUTINE	
Fluid Level	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
Shift Linkage	
· Shift linkage — damage or incorrectly adjusted	· Inspect and repair as required. Verify transmission selector lever cable adjustment. Refer to Section 307-05 . Adjust transmission selector cable as necessary.
Mechatronics	
· Defective direct clutch (B) or low/reverse clutch (D) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
Pump	

· Pump gear — failure	· Install a new pump assembly. Refer to Pump Assembly in this section.

Engagement Concerns: Harsh Reverse

Possible Component	Reference/Action
203 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Driveline	
· Engine driveline looseness in the driveshaft, U-joints or the engine mounts	· Repair as required.

Engagement Concerns: Harsh Forward Only

Possible Component	Reference/Action
204 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
Mechatronics	
· Defective forward clutch (A) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective forward clutch (A) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Driveline	
· Engine driveline looseness in the driveshaft, U-joints or the engine	· Repair as required.

mounts	

Engagement Concerns: Delayed/Soft Reverse Only

Possible Component	Reference/Action
205 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.

Engagement Concerns: Delayed/Soft Forward Only

Possible Component	Reference/Action
206 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Mechatronics	
· Defective forward clutch (A) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.

Engagement Concerns: No Forward and No Reverse

Possible Component	Reference/Action
207 — ROUTINE	
Fluid	

· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
Mechatronics	· Inspect connection to shift linkage.
· Defective manual valve	
Pump	· Install a new pump assembly. Refer to Pump Assembly in this section.
· Pump gear — failure	

Engagement Concerns: Harsh Forward and Harsh Reverse

Possible Component	Reference/Action
208 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses, solenoids, transmission range (TR) sensor, SSA solenoid, PCA solenoid	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
· Multiple shifts missing (more than one gear)	· If some shifts are missing, determine which shifts do not occur. Refer to clutch and solenoid application charts in this section. Monitor appropriate PIDs as listed in diagnostics. Refer to routine 210.
Mechatronics	
· Gears 4-6 default to 5th gear and gears 1-3 default to 3rd gear	· Retrieve DTC codes.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.

Engagement Concerns: Delayed Forward and Delayed Reverse

Possible Component	Reference/Action
209 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Mechatronics	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	

Shift Concerns: Some/All Shifts Missing

Possible Component	Reference/Action
210 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Shift Linkage Damaged or Incorrectly Adjusted	
· External selector lever cable	· Inspect and repair as required. Verify transmission selector lever cable adjustment. Refer to Section 307-05 . Adjust transmission selector lever cable as necessary.
Forward Clutch (A) Assembly (No Shifts)	
· Seals, piston — damaged	· Inspect for damage. Repair as required.
· Friction elements — damaged or worn	· Inspect for damage. Repair as required.
· Return springs — damaged	· Inspect for damage. Repair as required.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses, solenoids, transmission range (TR) sensor, SSA solenoid, PCA solenoid	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
· Multiple shift missing (more than one gear)	· If some shifts are missing, determine which shifts do not occur. Refer to clutch and solenoid application charts in this section. Monitor appropriate PIDs as listed in diagnostics.

Shift Concerns: Timing — Early/Late

Possible Component	Reference/Action
211 — ROUTINE	
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
· Engine driveability concerns	· Refer to Section 303-00 .
Mechatronics	
· Bolts not tightened to specification	· Tighten to specification.
· Mechatronic unit contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	· Inspect for damage. If damaged, install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Incorrect Pressures	
· Application pressures are incorrect	· Incorrect application pressures may be due to non-transmission components, mechatronic assembly or internal transmission damage. Repair all non-transmission components then continue with this routine.

Other	
· Tire size change, axle ratio change	· Verify that the vehicle has the original equipment. Refer to the certification label. Changes in tire size and axle ratio will affect shift timing.

Shift Concerns: Timing — Erratic/Hunting (Some/All)

Possible Component	Reference/Action
212 — ROUTINE	
Fluid	
· Incorrect level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Condition	· Carry out the fluid level check in Preliminary Inspection in this section.
· Fluid over temperature condition	· Refer to transmission overheating.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
Torque Converter Concerns	
· Torque converter clutch	· Refer to torque converter clutch operation concern: cycling shutter chatter.

Shift Concerns: Feel — Soft or Slipping (Some or All)

Possible Component	Reference/Action
213 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
Transmission Fluid Temperature (TFT) Sensor Damaged	
· Mechatronic assembly	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Bolts not tightened to specification	· Tighten to specification.
· Mechatronic unit contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stick or bore damaged	· Inspect for damage. If damaged, install a new mechatronic assembly. Refer to Main Control Valve Body in this section.

Shift Concerns: Feel — Harsh (Some/All)

Possible Component	Reference/Action
214 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Powertrain Control System	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Re-flash mechatronic assembly to the latest level calibration. Carry out road test — adaptive drive cycle, refer to Shift Point Road Test in this section. Road test and carry out on-board diagnostic test again.
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	

Shift Concerns: No 1st Gear in Drive, Engages in a Higher Gear

Possible Component	Reference/Action
215 — ROUTINE	
Powertrain Control System	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	
Incorrect Gear	· Determine which gear the transmission is in. Refer to the Clutch and Solenoid Application Charts in this section.
· Mechatronic failure	

Shift Concerns: No 1st Gear Manual

Possible Component	Reference/Action
216 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Shift Linkage	· Inspect and repair as necessary.
· External selector lever cable system — damaged, misaligned	
Mechatronics	
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Powertrain Control System	· Carry out on-board diagnostic tests. Repair as required.
· PCM electrical inputs/outputs,	

TCM, external vehicle wiring harnesses	Clear DTCs. Road test and carry out on-board diagnostic test again.
Clutch Plates	
· Forward clutch (A) friction and steel plate — failure	· Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure	· Inspect the low/reverse clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.
Pump	
· Pump gear — failure	· Install a new pump assembly. Refer to Pump Assembly in this section.

Shift Concerns: No 2nd Gear Manual

Possible Component	Reference/Action
217 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Shift Linkage	
· External selector lever cable system — damaged, misaligned	· Inspect and repair as necessary.
Mechatronics	
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
Clutch Plates	
· Forward clutch (A) friction and steel plate — failure	· Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure	· Inspect the low/reverse clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.
Pump	
· Pump gear — failure	· Install a new pump assembly. Refer to Pump Assembly in this section.

Shift Concerns: No 3rd Gear Manual

Possible Component	Reference/Action
218 — ROUTINE	

Shift Linkage	
· External selector lever cable system — damaged, misaligned	· Inspect and repair as necessary.
Mechatronics	
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
Clutch Plates	
· Forward clutch (A) friction and steel plate — failure	· Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure.	· Inspect the low/reverse clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.
Pump	
· Pump gear — failure	· Install a new pump assembly. Refer to Pump Assembly in this section.

Shift Concerns: No 1-2 Shift

Possible Component	Reference/Action
220 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective direct clutch (B) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective intermediate clutch (C) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSC (VFS-3) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Defective SSD (VFS-4) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.

Clutch Plates	
· Intermediate clutch (C) friction and steel plate — failure	· Inspect the intermediate clutch assembly for damage. Repair as required. Refer to Intermediate Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure	· Inspect the low/reverse clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.

Shift Concerns: No 2-3 Shift

Possible Component	Reference/Action
221 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective direct clutch (B) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective intermediate clutch (C) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Defective SSC (VFS-3) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Intermediate clutch (C) friction and steel plate — failure	· Inspect the intermediate clutch assembly for damage. Repair as required. Refer to Intermediate Clutch Assembly in this section.

Shift Concerns: No 3-4 Shift

Possible Component	Reference/Action
222 — ROUTINE	
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective direct clutch (B) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective intermediate clutch (E) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.

· Defective solenoid multiplex valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Defective SSD (VFS-4) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Defective SSE (SS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Overdrive clutch (E) friction and steel plate — failure	· Inspect the overdrive clutch assembly for damage. Repair as required. Refer to Overdrive Clutch Assembly in this section.

Shift Concerns: No 4-5 Shift

Possible Component	Reference/Action
270 — ROUTINE	
Mechatronics	
· Defective forward clutch (A) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective forward clutch (A) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Forward clutch (A) friction and steel plate — failure	· Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.

Shift Concerns: No 5-6 Shift

Possible Component	Reference/Action
272 — ROUTINE	

Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective direct clutch (B) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective intermediate clutch (C) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Defective SSC (VFS-3) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Intermediate clutch (C) friction and steel plate — failure	· Inspect the overdrive clutch assembly for damage. Repair as required. Refer to Intermediate Clutch Assembly in this section.

Shift Concerns: No 6-5 Shift

Possible Component	Reference/Action
273 — ROUTINE	
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective direct clutch (B) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective intermediate clutch (C) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSC (VFS-3) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Intermediate clutch (C) friction and steel plate — failure	· Inspect the overdrive clutch assembly for damage. Repair as required. Refer to Intermediate Clutch Assembly in this section.

Shift Concerns: No 5-4 Shift

Possible Component	Reference/Action

271 — ROUTINE	
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective direct clutch (B) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective forward clutch (A) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Forward clutch (A) friction and steel plate — failure	· Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.

Shift Concerns: No 4-3 Shift

Possible Component	Reference/Action
223 — ROUTINE	
Mechatronics	
· Defective overdrive clutch (E) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective overdrive clutch (E) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Solenoid multiplex valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Drive enable valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Defective SSD (VFS-4) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Overdrive clutch (E) friction and steel plate — failure	· Inspect the overdrive clutch assembly for damage. Repair as required. Refer to Overdrive Clutch Assembly in this section.

Shift Concerns: No 3-2 Shift

Possible Component	Reference/Action
224 — ROUTINE	
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective direct clutch (B) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective intermediate clutch (C) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Defective SSC (VFS-3) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Intermediate clutch (C) friction and steel plate — failure	· Inspect the overdrive clutch assembly for damage. Repair as required. Refer to Intermediate Clutch Assembly in this section.

Shift Concerns: No 2-1 Shift

Possible Component	Reference/Action
225 — ROUTINE	
Mechatronics	
· Defective intermediate clutch (C) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective low/reverse clutch (D) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective SSC (VFS-3) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Clutch Plates	
· Direct clutch (C) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.

Torque Converter Clutch Operation Concerns : Does Not Apply

Possible Component	Reference/Action
240 — ROUTINE	
Fluid	
· Fluid condition	· Carry out the fluid level check in Preliminary Inspection in this section.
Mechatronics	
· Defective torque converter apply regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective torque converter release regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective TCC (VFS-6) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Mechatronic assembly bolts — not tightened to specification	· Tighten to specification.
· Mechatronic unit contaminated, solenoid (s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	· Inspect for damage. If damaged, install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Powertrain Control Module	
· Powertrain control system electrical inputs/outputs, TCM, vehicle wiring harnesses, torque converter clutch (TCC) solenoid, transmission fluid temperature (TFT) sensor	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again.
Torque Converter	
· Torque converter components	· Remove the transmission. Inspect for damage. install a new or remanufactured torque converter. Refer to Transmission — Four Wheel Drive (4WD) or Transmission — Rear Wheel Drive (RWD) in this section.

Torque Converter Clutch Operation Concerns : Cycling/Chatter

Possible Component	Reference/Action
241 — ROUTINE	
Fluid	
· Fluid condition	· Carry out the fluid level check in Preliminary Inspection in this section.
Mechatronics	
· Defective torque converter apply regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Main Control Valve Body in this section.
· Defective TCC (VFS-6) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Mechatronic assembly bolts — not	· Tighten to specification.

tightened to specification	
· Mechatronic unit contaminated, solenoid (s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	· Inspect for damage. If damaged, install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Powertrain Control Module	
· Powertrain control system electrical inputs/outputs, TCM, vehicle wiring harnesses, torque converter clutch (TCC) solenoid, transmission fluid temperature (TFT) sensor	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again.
Torque Converter	
· Torque converter components	· Remove the transmission. Inspect for damage. Install a new or remanufactured torque converter. Refer to Transmission — Four Wheel Drive (4WD) or Transmission — Rear Wheel Drive (RWD) in this section.

Torque Converter Clutch Operation Concerns : Always Applied/Stalls Vehicle

Possible Component	Reference/Action
242 — ROUTINE	
Fluid	
· Fluid condition	· Carry out the fluid level check in Preliminary Inspection in this section.
Mechatronics	
· Defective TCC (VFS-6) shift solenoid	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
· Mechatronic assembly bolts — not tightened to specification	· Tighten to specification.
· Mechatronic unit contaminated, solenoid (s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	· Inspect for damage. If damaged, install a new mechatronic assembly. Refer to Main Control Valve Body in this section.
Powertrain Control Module	
· Powertrain control system electrical inputs/outputs, TCM, vehicle wiring harnesses, torque converter clutch (TCC) solenoid, transmission fluid temperature (TFT) sensor	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again.
Torque Converter	
· Torque converter components	· Remove the transmission. Inspect for damage. install a new or remanufactured torque converter. Refer to Transmission — Four Wheel Drive (4WD) or Transmission — Rear Wheel Drive (RWD) in this section.

Other Concerns: External Leaks

Possible Component	Reference/Action

252 — ROUTINE	
Fluid	
· Incorrect level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Transmission case vent — damaged, case porosity	· Inspect for damage. If damaged, repair as necessary.
· Leakage at gaskets, seals, bulkhead connector	· Refer to Leakage Inspection , Fluid Leakage in the Torque Converter Area and Transmission Leak Check Test Procedures in this section for potential leak locations. Remove all traces of lubricant on exposed surface of the transmission. Repair as necessary.
Fluid Cooler Tubes	
· Cooler tube fittings	· Locate leak source. Repair as required. Refer to Section 307-02 .
· Cooler tube O-rings, cooler tubes	· Locate leak source. Repair as required. Refer to Section 307-02 .
Fluid Pump	
· Fluid pump O-ring	· Install a new O-ring. Refer to Pump Assembly in this section.
· Fluid pump seal ring	· Install a new seal ring. Refer to Pump Assembly in this section.
Transmission Case	
· Case — leaking	· Install a new transmission case. Refer to Transmission in this section.
· Transmission electrical bulkhead connector	· Install a new transmission electrical bulkhead connector O-ring.
· Fluid fill plug	· Install a new fill plug.
· Output shaft seal	· Install a new seal. Refer to Output Shaft Seal in this section.
· Manual control lever seal	· Install a new seal.
· Transmission fluid pan seal (gasket)	· Install a new seal.
Torque Converter	
· Torque converter studs	· Install a new torque converter.
· Torque converter hub seal	· Install a new torque converter hub seal.
· Torque converter weld	· Install a new torque converter.

Noise/Vibration in Forward or Reverse

Possible Component	Reference/Action
254 — ROUTINE	
Torque Converter	
· Check the torque converter components/balance weight	· Locate source of disturbance. Repair as required.
Fluid	
· Fluid level (low) pump cavitation.	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.

Engine Driveline	
· Engine drive accessories	· Refer to Section 303-00 .
Fluid Cooler Tubes	
· Cooler line grounding out	· Adjust or reposition cooler tubes.

Noise/Vibration that changes with vehicle speed

Possible Component	Reference/Action
255 — ROUTINE	
Engine Driveline	
· Engine mounts — loose or damaged	· Locate source of disturbance. Repair as required.
· Driveline concerns: ■ U-joints ■ Rear axle ■ Suspension ■ Modifications	· Inspect and repair as required.
· First gear: ■ Torque converter ■ Gearset ■ Friction elements	
· Second gear: ■ Torque converter ■ Gearset ■ Friction elements	
· Third gear: ■ Torque converter ■ Gearset ■ Friction elements	
· Fourth gear: ■ Torque converter ■ Gearset ■ Friction elements	
· Fifth gear: ■ Torque converter ■ Gearset ■ Friction elements	
· Sixth gear: ■ Torque converter ■ Gearset ■ Friction elements	
· Reverse gear: ■ Gearset	

■ Friction elements	
Other Noise/ Vibrations	
· Main control valve resonance	· Locate source of disturbance. Repair as required.
· Output shaft splines — worn or damaged	· Install a new output shaft seal. Refer to Output Shaft Seal in this section.
· Selector lever cable: ■ Vibration ■ Grounding	· Inspect and repair as required.
· Cooler lines: ■ Grounding	· Inspect and repair as required.

Engine Will Not Crank

Possible Component	Reference/Action
257 — ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, TCM, vehicle wiring harnesses, engine starting system, TR sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of engine components. Check PIDs for TR park and neutral positions. Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again
Vehicle Starter	
· Starter system concerns	· Inspect and repair as necessary. Refer to Section 303-06 .
External Selector Lever Cable System	
· Cable system — damaged, misaligned	· Inspect and repair as necessary. Refer to Section 307-05 .
TR Sensor Assembly	
· TR Assembly — damaged	· Inspect and repair as necessary.
Torque Converter	
· Flexplate — damaged	· Inspect for damage. Repair as necessary.
Fluid Pump Assembly	
· Internal parts seized	· Inspect for damage. Repair as necessary.

No Park Range

Possible Component	Reference/Action
258 — ROUTINE	
Selector Lever Cable	
· Cable system — damaged, misaligned	· Inspect and repair as necessary.
· Manual control lever assembly damaged, manual valve inner lever pin bent, manual valve inner lever damaged, spring rod damaged, park pawl pin loose or damaged, park rod actuating plate loose, damaged or missing	· Inspect for damage. If damaged, repair as necessary.

· Transmission case assembly	· Inspect for damage. If damaged, repair as necessary.
· Park gear, parking pawl, parking pawl return spring, part or guide, parking actuating rod, parking pawl shaft, manual lever	· Inspect for damage. If damaged, repair as necessary.
· External linkages/brackets — damaged	· Inspect for damage. If damaged, repair as necessary.
TR Assembly Damaged, Manual Lever Detent Spring Damaged	
· TR assembly	· Install a new mechatronic assembly. Refer to Main Control Valve Body in this section.

Transmission Overheating

Possible Component	Reference/Action
259 — ROUTINE	
Powertrain Control System	
· Electrical inputs/outputs, TCM, vehicle wiring harnesses, TCC solenoid	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of engine components. Check PIDs for TR park and neutral positions. Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again.
Fluid	
· Incorrect level	· Check fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection .
· Fluid condition	· Carry out the fluid level check. Refer to Preliminary Inspection in this section.
Case Vent Damaged	
· Transmission case assembly	· Inspect for damage. If damaged, repair as necessary.
Torque Converter Clutch Not Engaging	
· Torque converter	· Install a new torque converter.
Other	
· Restriction in transmission cooling system	· Check transmission cooling system efficiency. Refer to Section 307-02 for automatic transmission cooling system diagnostic procedures.
· Excessive trailer tow load	· Refer to the Owner Guide for specifications on trailer towing.
· Vehicle heat shield — missing or damaged	· Inspect for damage. If damaged, repair as necessary.
· Vehicle airflow is restricted	· Inspect for damage. If damaged, repair as necessary.

Fluid Venting/Foaming

Possible Component	Reference/Action

Transmission Fluid Cooler — Backflushing and Cleaning

Printable View (80 KB)

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

CAUTION: When internal damage occurs in the transmission, metal particles and clutch plate material can travel into the torque converter and the transmission fluid cooler. These contaminates are a major cause of recurring transmission concerns. To prevent further concerns, remove these contaminates from the cooler lines and install a new cooler before placing the transmission in use.

1. Install a new transmission fluid cooler if any fluid leaks are indicated or a major metallic failure is indicated.

2. Using a suitable torque converter/fluid cooler cleaner, flush the fluid cooler and lines.

3. **NOTE:** Rubber hoses must be attached to the ends of the fluid cooler tubes, to aid in connecting them to the fluid cooler cleaner.

   Connect the cleaner pressure and return lines appropriately.
   1. Connect the pressure line to the fluid cooler inlet tube.
   2. Connect the return line to the fluid cooler outlet tube.
   3. Place the outlet end of the return line in the fluid tank reservoir.

4. **NOTE:** Cycling the fluid pump on and off will help dislodge contaminants in the cooler system.

   Switch the fluid pumps on. Allow the fluid to circulate a minimum of 5 minutes.

5. Switch the fluid pump off.

6. Disconnect the cleaner pressure line at the fluid cooler tube.

7. Using compressed air, blow through the fluid cooler inlet tube until all fluid is removed.

8. Remove the rubber hoses from the fluid cooler tubes.

Transmission Fluid Drain and Refill

Printable View (256 KB)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

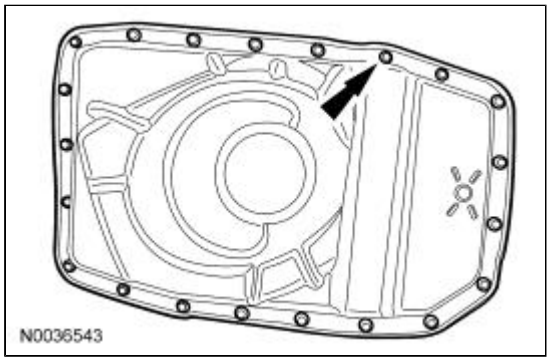
Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

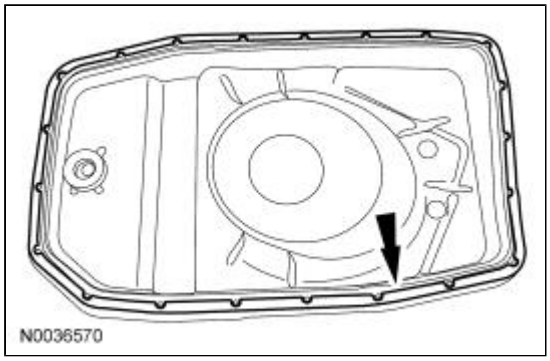
Drain

CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.

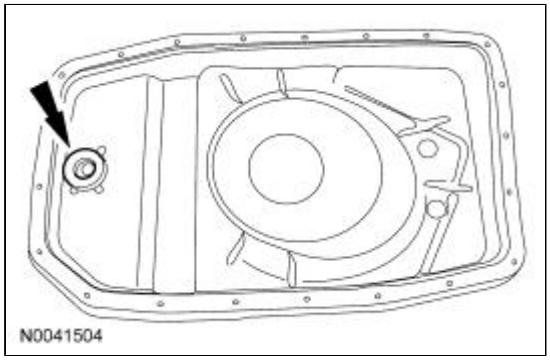
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the transmission fluid pan and allow the fluid to drain.



3. Remove the fluid pan gasket.

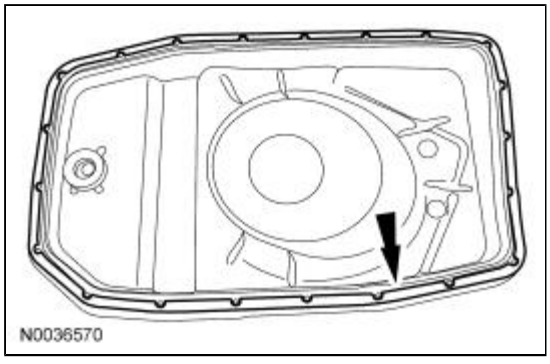


4. Clean and inspect the transmission fluid pan and magnet.

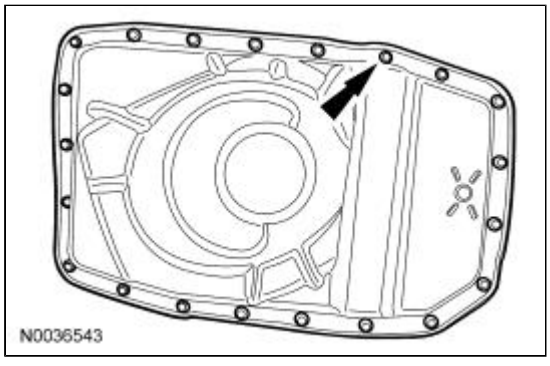


Refill

1. Install the fluid pan gasket.



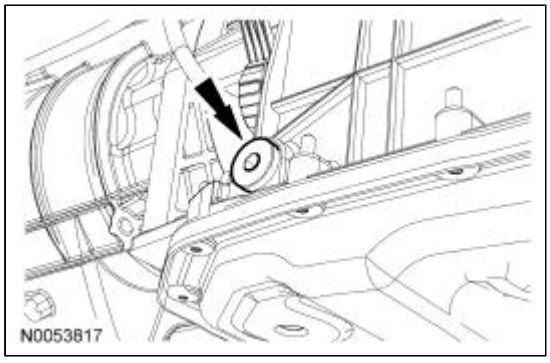
2. Install the fluid pan and bolts.
    - Tighten to 12 Nm (9 lb-ft).



3. **CAUTION: The fluid fill plug located on the side of the transmission is near the**

exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.

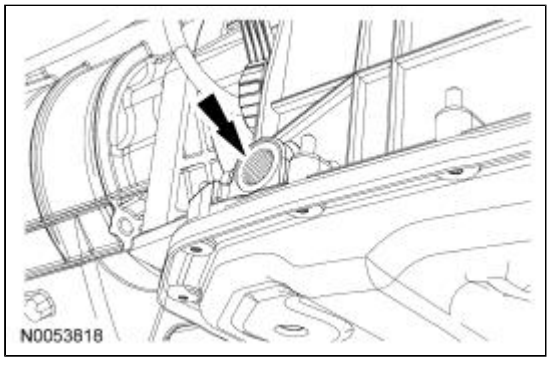
Remove the fluid fill plug located on the RH rear side of the case, near the transmission electrical connector.



4. **CAUTION: The use of any other transmission fluid than specified can result in the transmission failing to operate in a normal manner or transmission failure.**

   CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.

   Fill the transmission.
   - Add 4.7 liters (5 quarts) of clean automatic transmission fluid to the transmission through the fluid fill hole. Stop when the fluid runs out of the bottom of the hole.

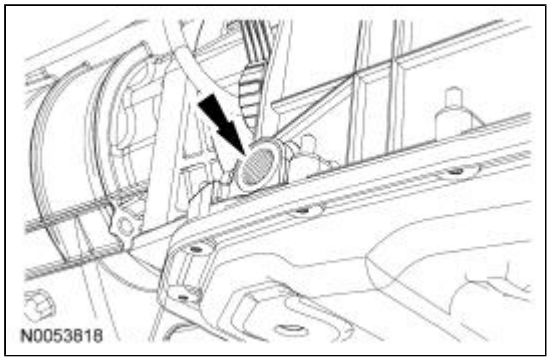


5. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

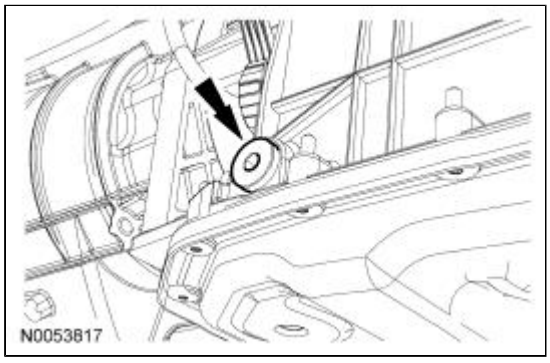
6. With the special tool connected, the engine idling (550-750 rpm) in PARK and the transmission temperature at 30°C-50°C (86°F-122°F), check and adjust the transmission fluid level.

7. **CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.**

   Fill with clean automatic transmission fluid until the fluid runs out of the bottom of the hole.



8. Install the fluid fill plug.
    - Tighten to 35 Nm (26 lb-ft).



Torque Converter

Printable View (63 KB)

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:
    - A torque converter malfunction has been determined based on complete diagnostic procedures.
    - Converter stud or studs, impeller hub or bushing are damaged.
    - Discoloration (due to overheating).
    - Evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes:
        - Major metallic failure.
        - Multiple clutches or clutch plate failures.
        - Sufficient component wear which results in metallic contamination.
        - Internal torque converter contamination present. For additional information, refer to Torque Converter Contamination Inspection in this section.

Torque Converter Contamination Inspection

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

CAUTION: Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission, damage will occur. Use only clean automatic transmission fluid designated for the transmission and converter being serviced.

1. If a new or remanufactured torque converter is not being installed, the following steps must be completed.
2. With the torque converter on a bench, pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or through a paper filter and examine the fluid.
3. **NOTE:** The factory fill fluid is clear, the exchange fluid will be red.

   Observe the color and odor of the fluid. The fluid should be clear or red, not brown or black. Odor may indicate an overheating condition such as clutch disc or band failure.
4. Examine the stain on the tissue for evidence of particles (specks of any kind). Examine the fluid level indicator for signs of antifreeze (gum or varnish). If particles are present in the fluid, a new torque converter must be installed.
5. If there are no particles or contamination present, drain the remainder of the transmission fluid from the torque converter.
6. Add 1.9 liter (2 quarts) of clean automatic transmission fluid into the converter and agitate by hand.
7. Thoroughly drain the fluid.

Main Control Valve Body

Printable View (695 KB)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

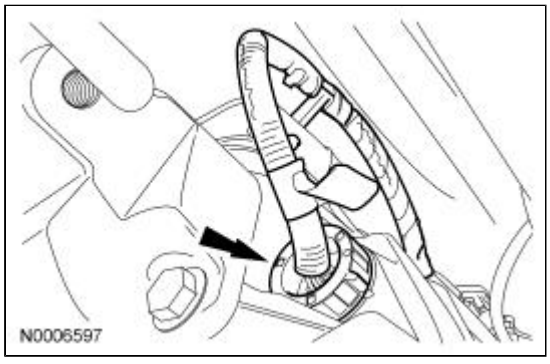
Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Removal

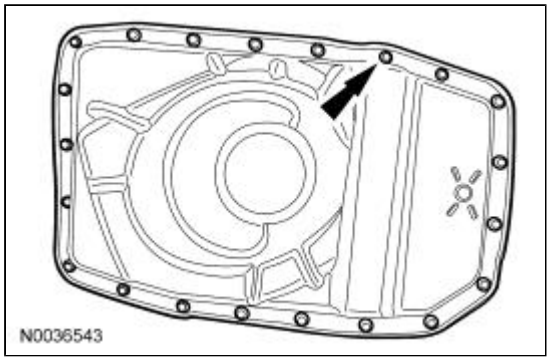
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **CAUTION: Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

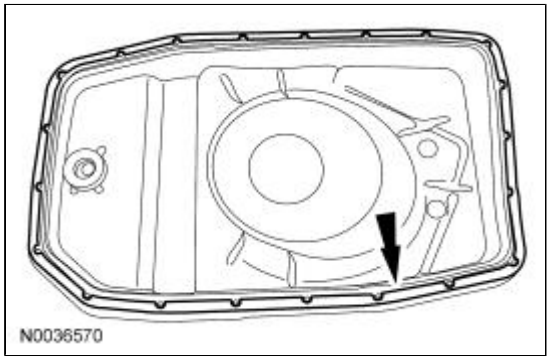
   Disconnect the main transmission electrical harness by twisting the outer shell and pulling back on the connector.

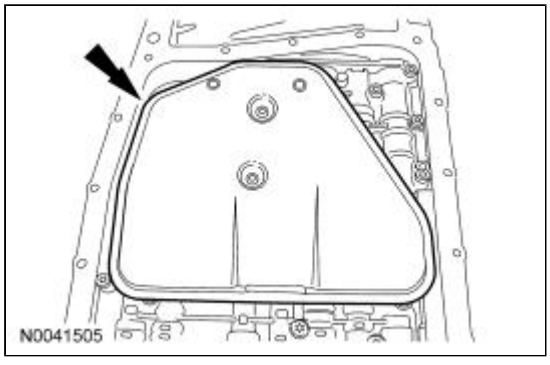
3. Remove the transmission fluid pan and allow the fluid to drain.



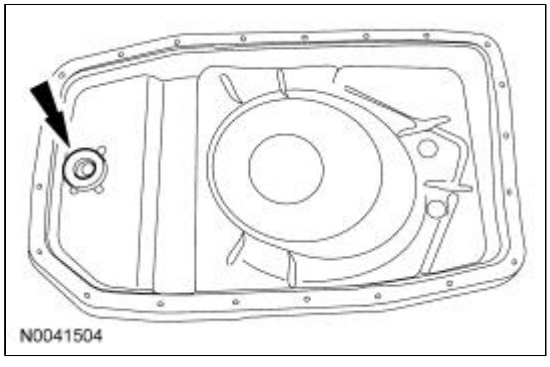
4. Remove the fluid pan gasket.



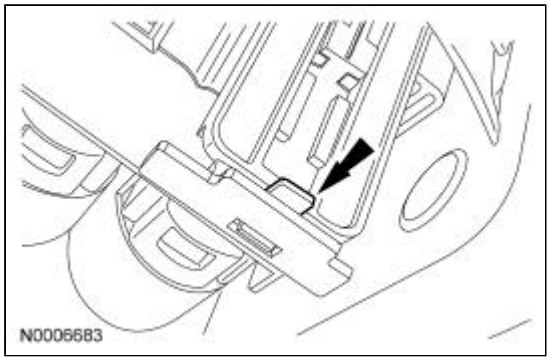
5. Remove and discard the transmission fluid filter.



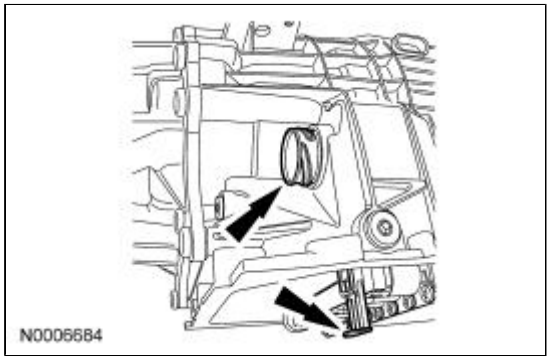
6. Clean and inspect the transmission fluid pan and magnet.



7. Press the release tab and pull down on the bulkhead connector retainer.

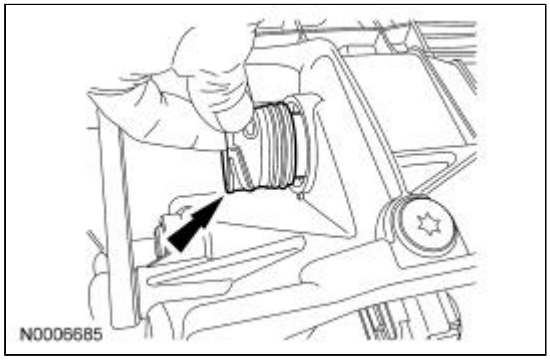


8. With the release tab down, pull the outer shell of the bulkhead electrical connector.



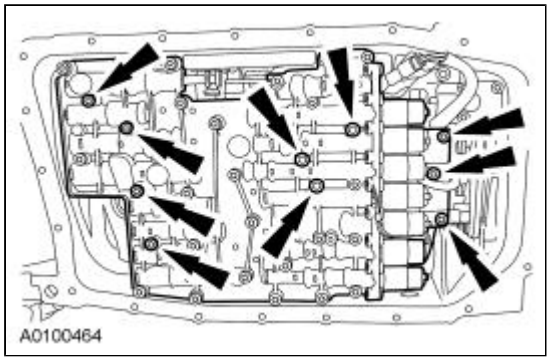
9. **CAUTION: Do not touch the electrical connector pins. Electrostatic charge may occur and will cause damage to the mechatronic unit.**

   Pull the outer shell of the bulkhead electrical connector out of the transmission.



10. **NOTE:** During removal of the mechatronic assembly, the thermal bypass valve, pump adapter seal and one or more center support seals may become dislodged. Save these components for reuse during assembly.

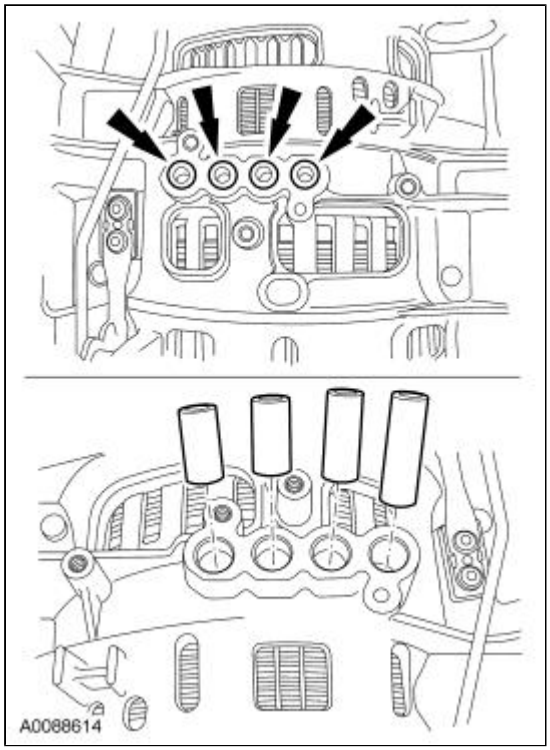
    Remove the 10 bolts from the mechatronic assembly and remove the mechatronic assembly.



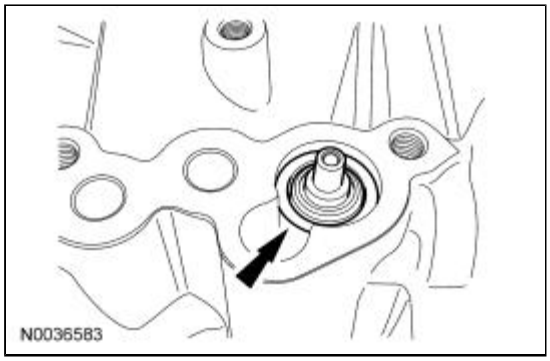
Installation

1. **NOTE:** Before installing the mechatronic assembly into the transmission case, verify presence and correct orientation of the thermal bypass valve, pump adapter seal and center support seals. Also note that one or more of the center support seals may have remained in the mechatronic assembly during removal and should be installed into the transmission case at this time.

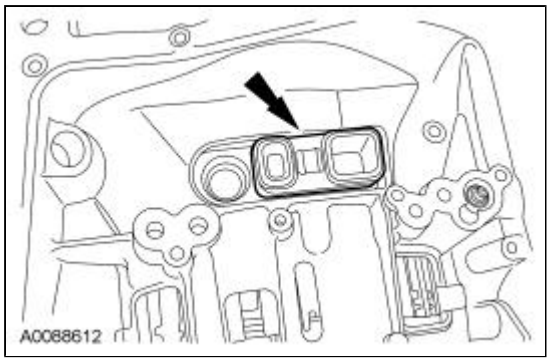
   Verify the 4 rubber feed tubes for the center support are in place.



2. Verify the thermal bypass valve is in the case.

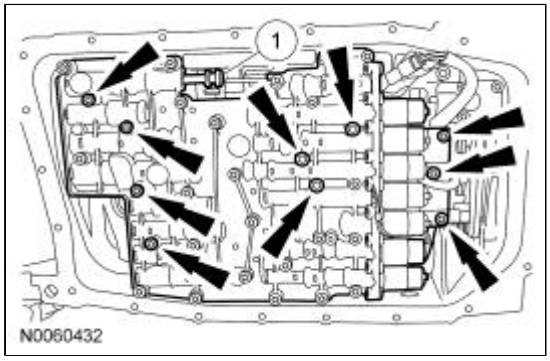


3. Verify the rubber adapter is in place.

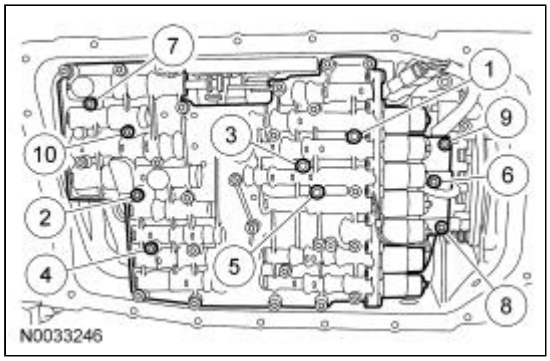


4. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the transmission control module (TCM). Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

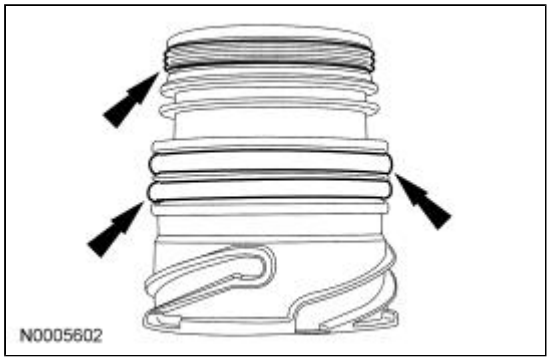
   Position the mechatronic assembly in place and loosely install the 10 bolts.
   1. Align the manual valve and control lever linkage.



5. Tighten the mechatronic bolts in the sequence shown.
   - Tighten to 8 Nm (71 lb-in).

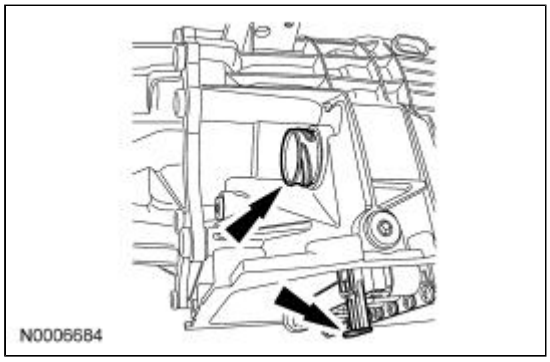


6. Install new O-rings seals on the outer shell of the bulkhead electrical connector.

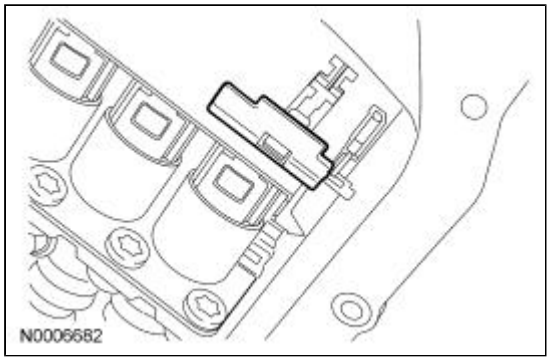


7. **CAUTION: Do not touch the electrical connector pins. Electrostatic charge may occur and will cause damage to the mechatronic unit.**

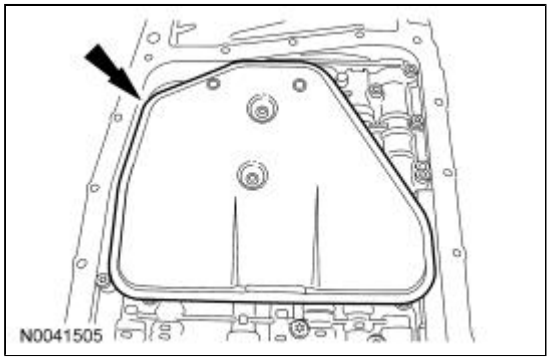
   With the release tab down, push the outer shell of the bulkhead electrical connector into the transmission.



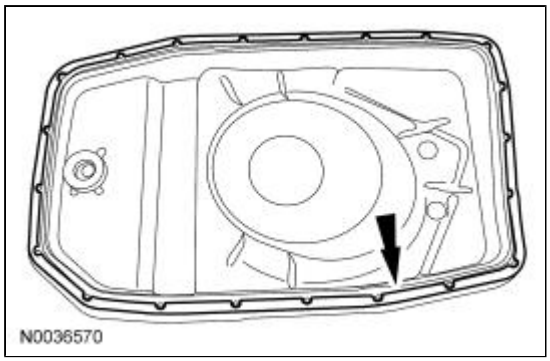
8. Press up on the tab and lock the outer shell of the bulkhead electrical connector in place.



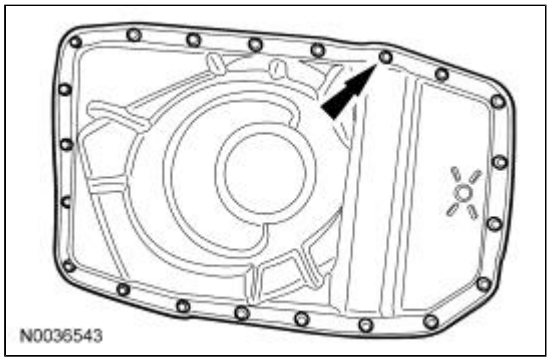
9. Install a new transmission fluid filter.



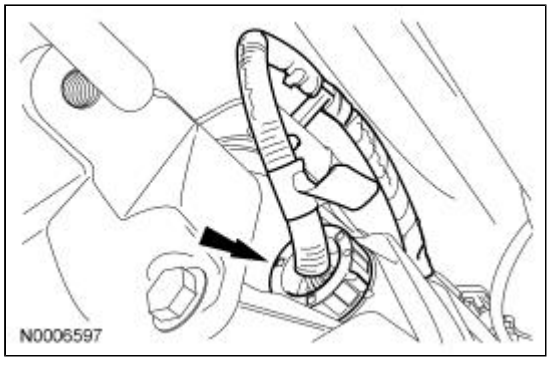
10. Install the fluid pan gasket.



11. Install the fluid pan and bolts.
    - Tighten to 12 Nm (9 lb-ft).

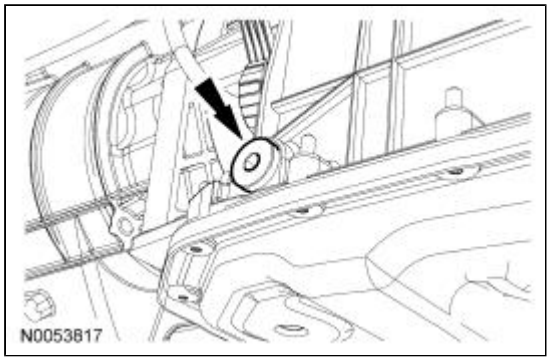


12. Connect the main transmission electrical harness by pushing it in and twisting the outer shell to lock it in place.



13. **CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.**

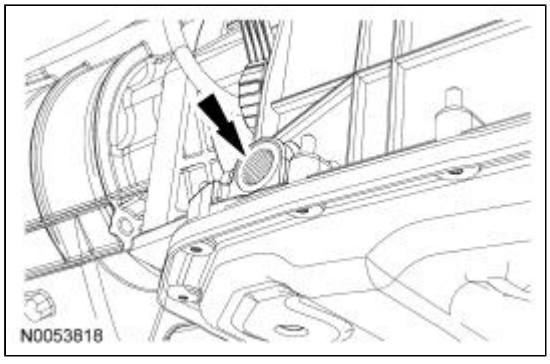
    Remove the fluid fill plug located on the RH rear side of the case near the transmission electrical connector.



14. **CAUTION: The use of any other transmission fluid than specified can result in the transmission failing to operate correctly or transmission failure.**

    CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.

    Fill the transmission.
    - Add 4.7 liters (5 quarts) of clean automatic transmission fluid to the transmission through the fluid fill hole. Stop when the fluid runs out of the bottom of the hole.

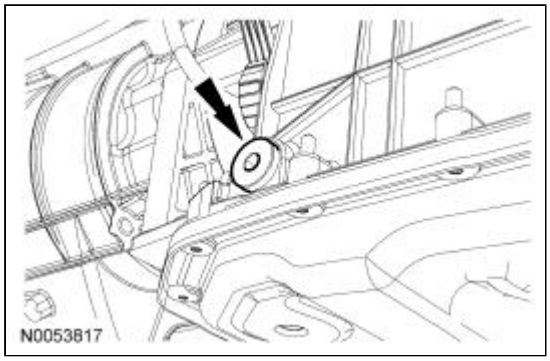


15. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

16. With the special tool connected, the engine idling (550-750 rpm) in PARK and the transmission temperature at 30°C-50°C (86°F-122°F), check and adjust the transmission fluid level.

17. **CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.**

    Fill with clean automatic transmission fluid until the fluid runs out of the bottom of the hole.



18. Install the fluid fill plug.
    - Tighten to 35 Nm (26 lb-ft).

1	—	Rear driveshaft nuts (3 required)
2	—	Rear driveshaft bolts (3 required)
3	7K440	Output shaft flange nut
4	7A021	Output shaft flange
5	7052	Output shaft seal

Removal

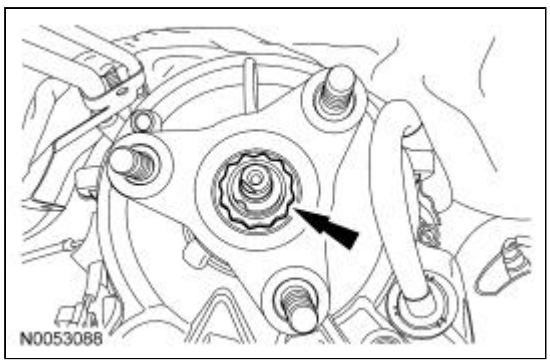
All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

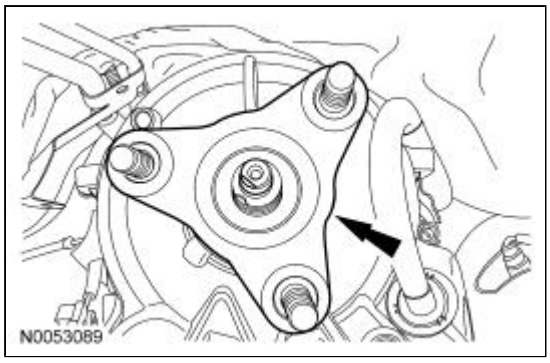
RWD vehicles

2. Remove the rear driveshaft. For additional information, refer to Section 205-01 .

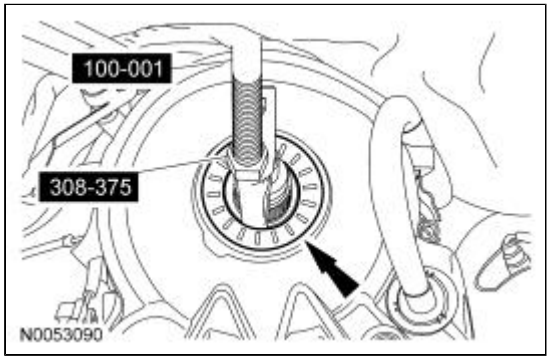
3. Remove and discard the output shaft flange nut.



4. Remove the output shaft flange.



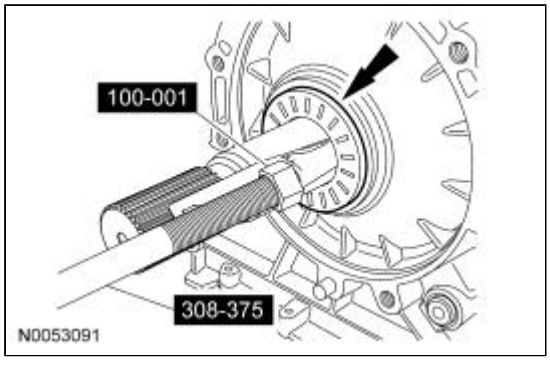
5. Using the special tools, remove the output shaft seal.



4WD vehicles

6. Remove the transfer case. For additional information, refer to Section 308-07B .

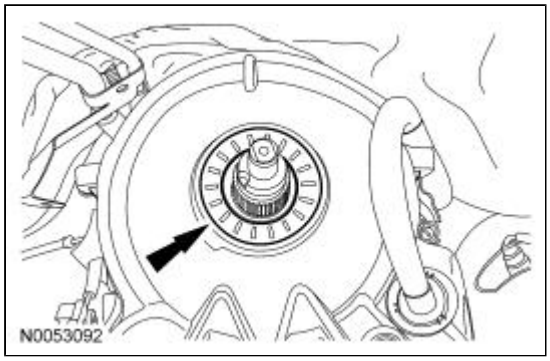
7. Using the special tools, remove the output shaft seal.



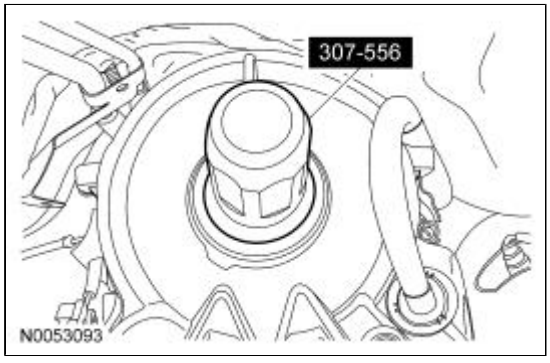
Installation

RWD vehicles

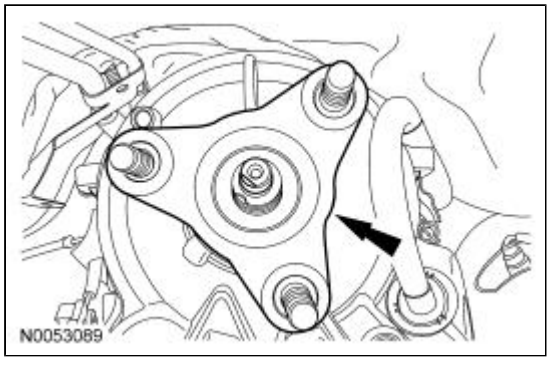
1. Position a new output shaft seal.



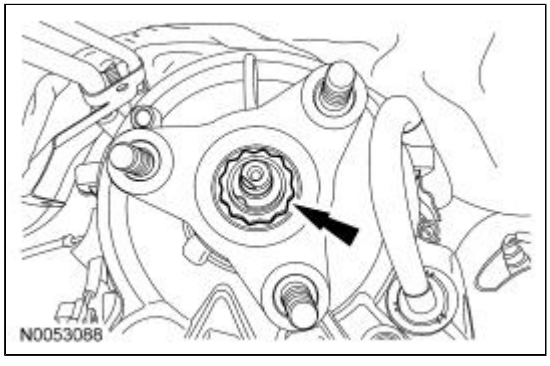
2. Using the special tool, install the output shaft seal.



3. Install the output shaft flange.



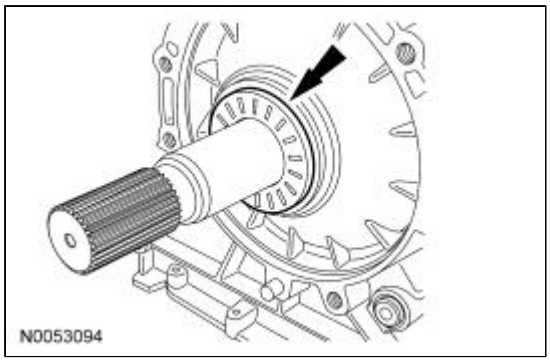
4. Install a new output shaft flange nut.
    - Tighten to 80 Nm (59 lb-ft).



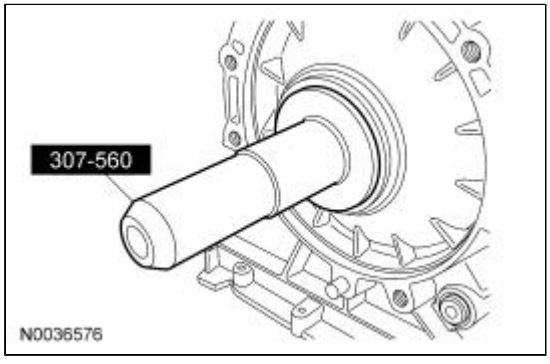
5. Install the rear driveshaft. For additional information, refer to Section 205-01 .

4WD vehicles

6. Position the output shaft seal.



7. Using the special tool, install a new output shaft seal.

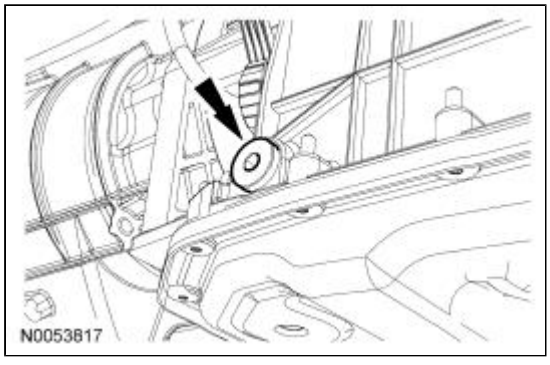


8. Install the transfer case. For additional information, refer to Section 308-07B .

All vehicles

9. **CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.**

   Remove the fluid fill plug located on the RH rear side of the case near the transmission electrical connector.



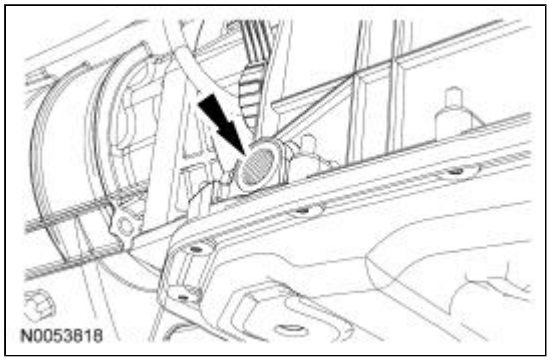
10. **CAUTION: The use of any other transmission fluid than specified can result in the transmission failing to operate correctly or transmission failure.**

    CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when

working near the exhaust and the heat shields.

Fill the transmission.

- Add 4.7 liters (5 quarts) of clean automatic transmission fluid to the transmission through the fluid fill hole. Stop when the fluid runs out of the bottom of the hole.

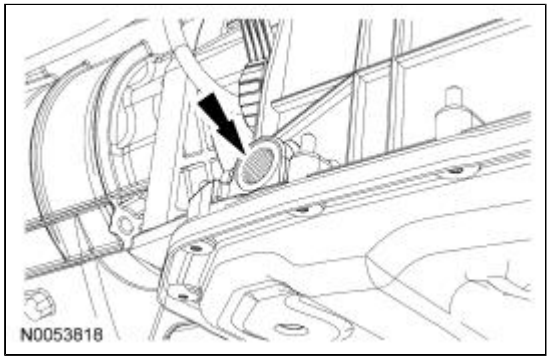


11. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

12. With the special tool connected, the engine idling (550-750 rpm) in PARK and the transmission temperature at 30°C-50°C (86°F-122°F), check and adjust the transmission fluid level.

13. **CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.**

    Fill with clean automatic transmission fluid until the fluid runs out of the bottom of the hole.



14. Install the fluid fill plug.
    - Tighten to 35 Nm (26 lb-ft).

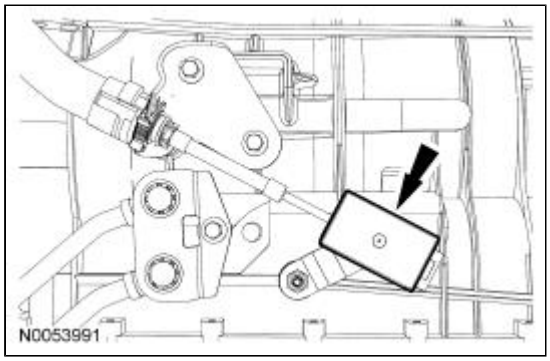
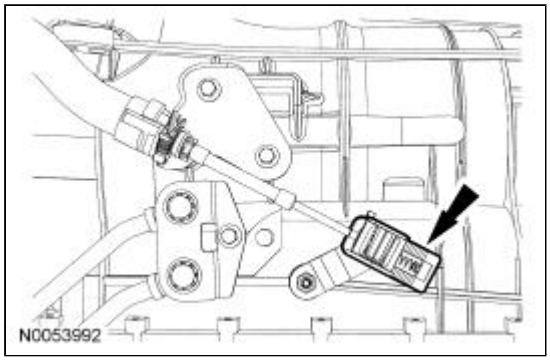
Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. If equipped, remove the heat shield.

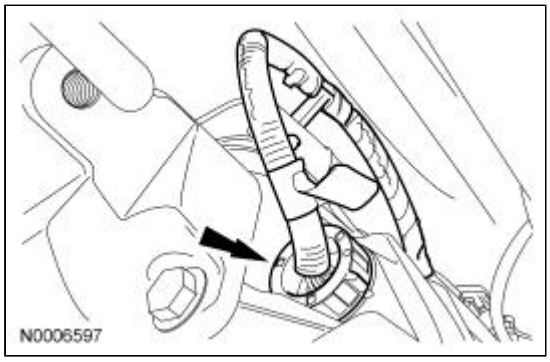


3. Move the locking tab up and disconnect the selector lever cable from the manual lever ball stud.

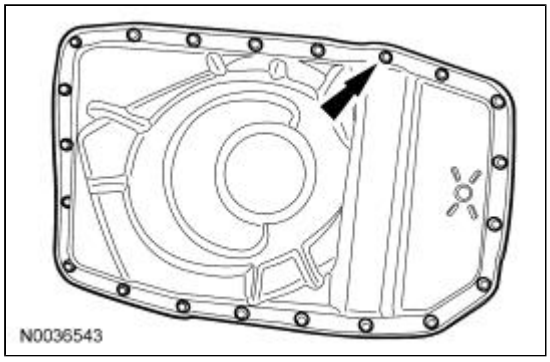


4. **CAUTION: Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

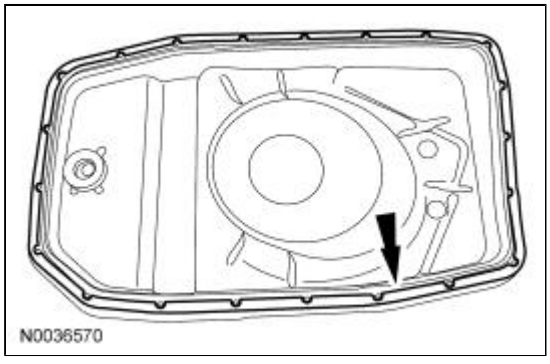
   Disconnect the main transmission electrical harness by twisting the outer shell and pulling back on the connector.



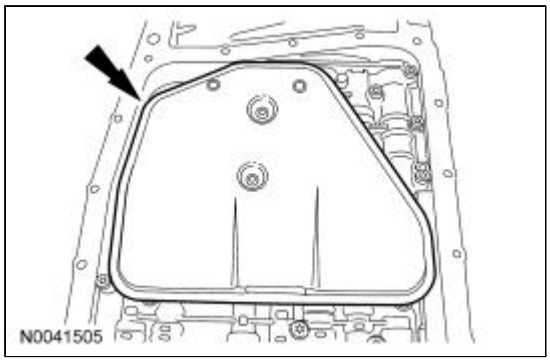
5. Remove the transmission fluid pan and allow the fluid to drain.



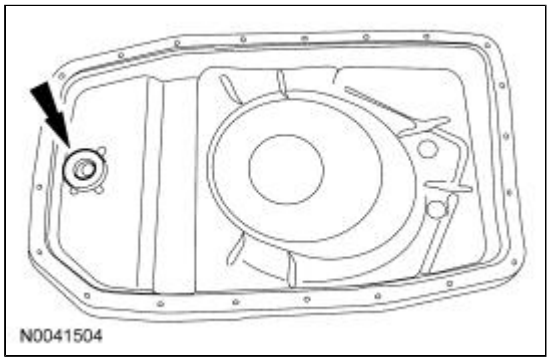
6. Remove the fluid pan gasket.



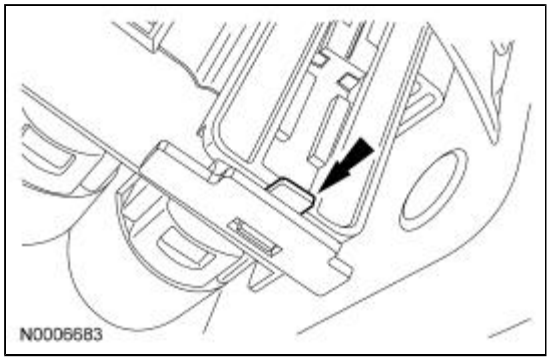
7. Remove and discard the transmission fluid filter.



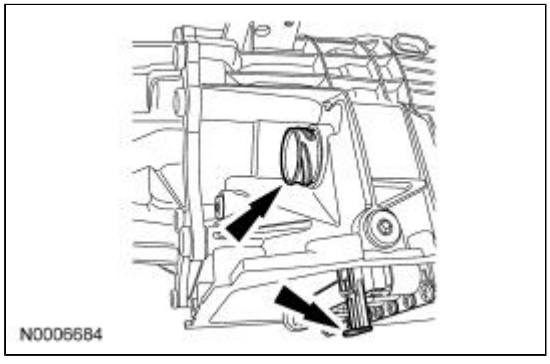
8. Clean and inspect the transmission fluid pan and magnet.



9. Press the release tab and pull down on the bulkhead connector retainer.

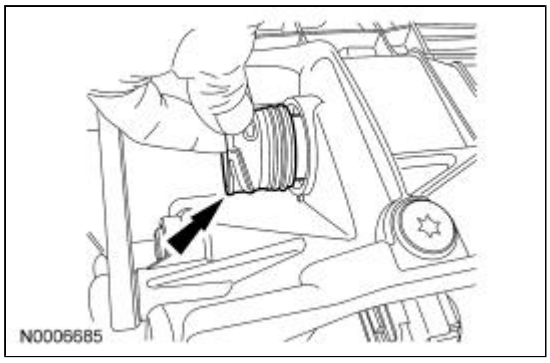


10. With the release tab down, pull the outer shell of the bulkhead electrical connector.



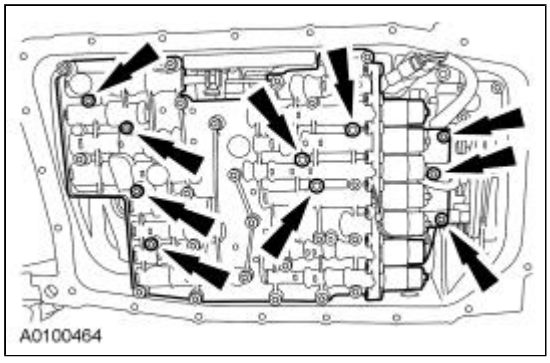
11. **CAUTION: Do not touch the electrical connector pins. Electrostatic charge may occur and will cause damage to the mechatronic unit.**

Pull the outer shell of the bulkhead electrical connector out of the transmission.

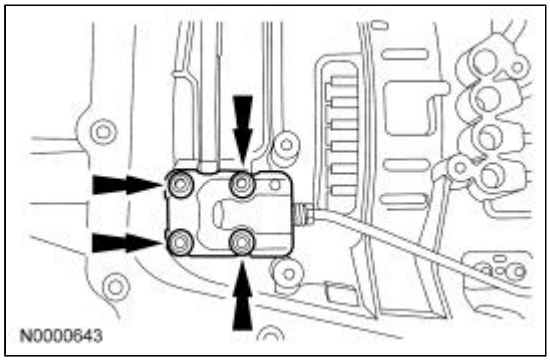


12. **NOTE:** During removal of the mechatronic assembly, the thermal bypass valve, pump adapter seal and one or more center support seals may become dislodged. Save these components for reuse during assembly.

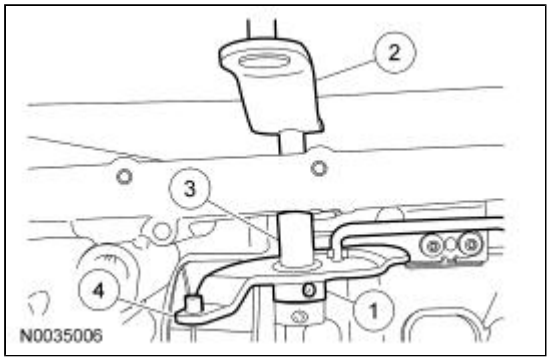
    Remove the 10 bolts from the mechatronic assembly and remove the mechatronic assembly.



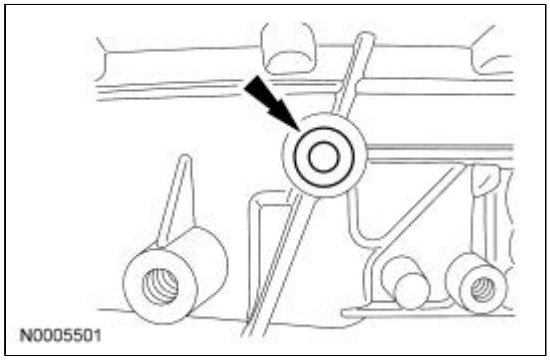
13. Remove the park rod actuating plate.



14. Remove the manual control lever.
    1. Remove the roll pin.
    2. Slide the manual control lever shaft out of the case.
    3. Hold the spacer to keep it from falling out of the case.
    4. Remove the manual valve inner lever and the park rod as an assembly.

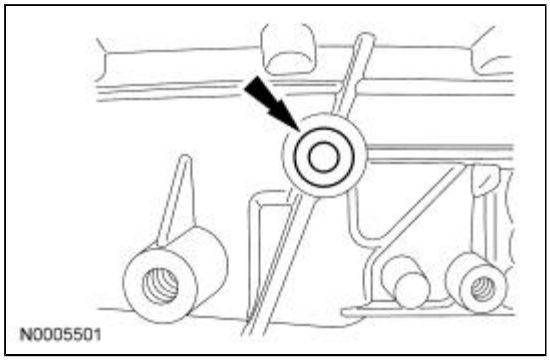


15. Remove and discard the manual control lever seal.

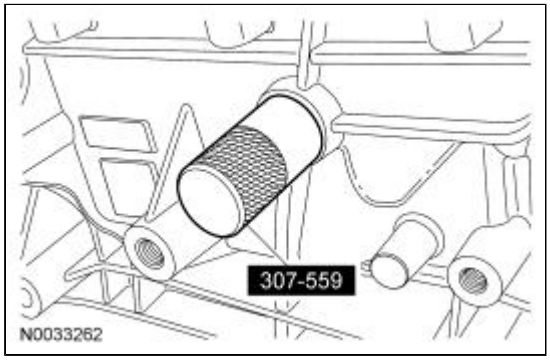


Installation

1. Position a new manual control lever seal in place.

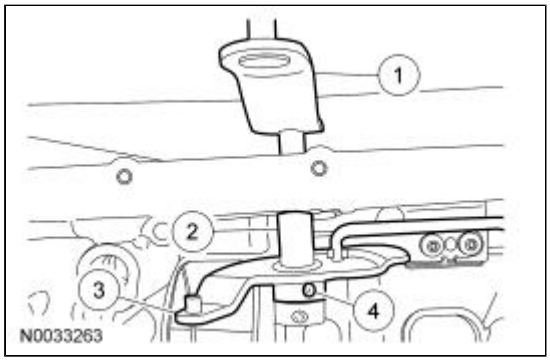


2. Using the special tool, install a new manual control lever shaft seal.



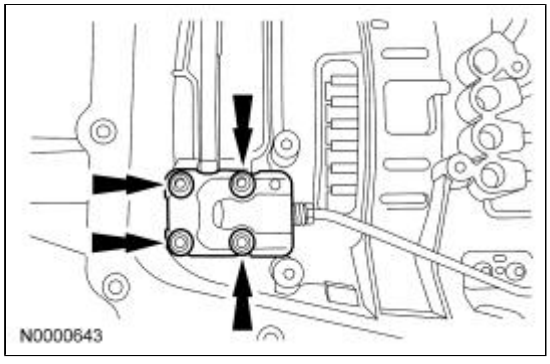
3. Install the manual lever in the case.
    1. Slide the manual lever in the case.
    2. Position the spacer in place while sliding the manual lever into the spacer.

3. Position the manual valve inner lever while sliding the manual lever and lining up the roll pin hole.
4. Install the roll pin.



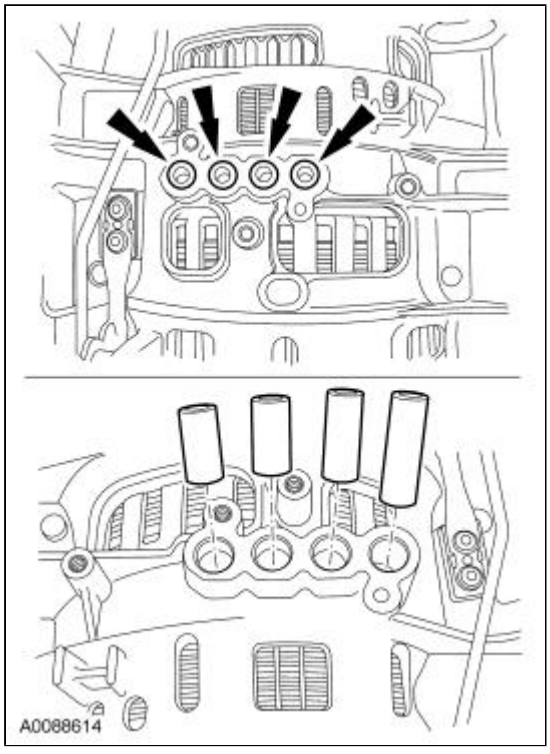
4. Position the park rod in place. Push down on the park pawl and position the park rod in place.

5. While holding the park rod down, install the park rod actuating plate.
   - Tighten to 10 Nm (89 lb-in).

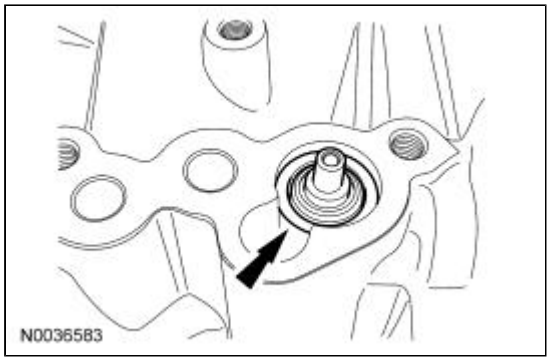


6. **NOTE:** Before installing the mechatronic assembly into the transmission case, verify presence and correct orientation of the thermal bypass valve, pump adapter seal and center support seals. Also note that one or more of the center support seals may have remained in the mechatronic assembly during removal and should be installed into the transmission case at this time.

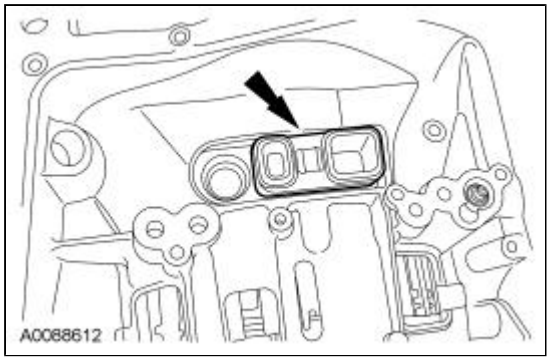
   Verify the 4 rubber feed tubes for the center support are in place.



7. Verify the thermal bypass valve is in the case.



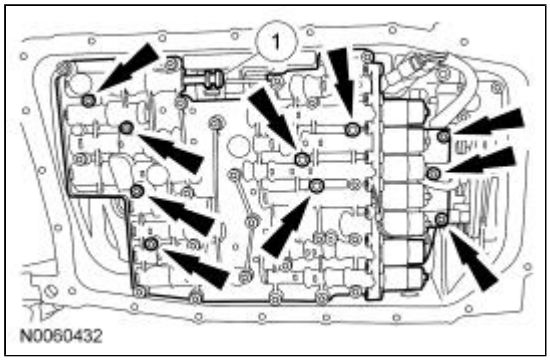
8. Verify the rubber adapter is in place.



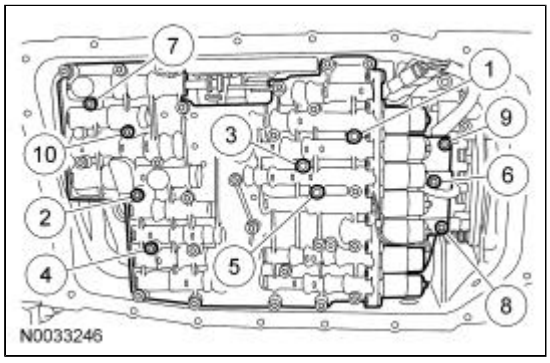
9. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the transmission control module (TCM). Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

Position the mechatronic assembly in place and loosely install the 10 bolts.

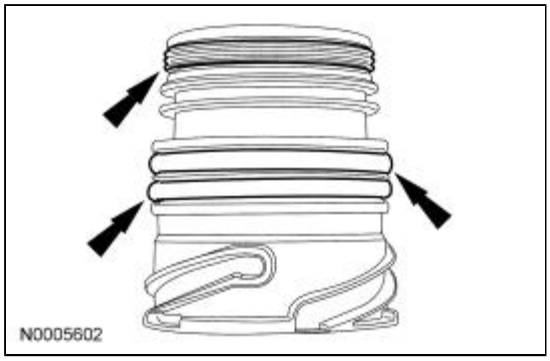
1. Align the manual valve and control lever linkage.



10. Tighten the mechatronic bolts in the sequence shown.
    - Tighten to 8 Nm (71 lb-in).

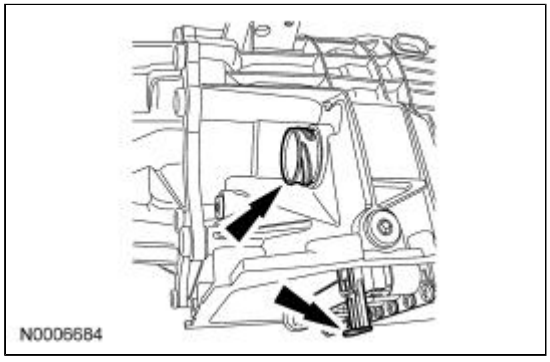


11. Install new O-rings on the outer shell of the bulkhead electrical connector.

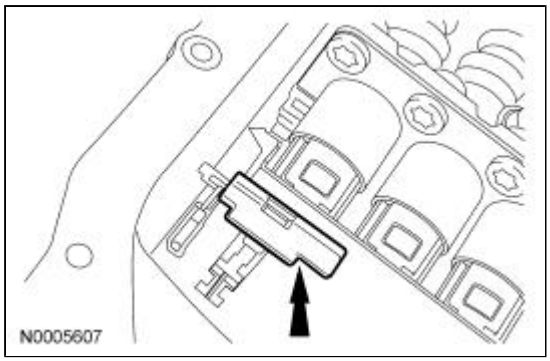


12. **CAUTION: Do not touch the electrical connector pins. Electrostatic charge may occur and will cause damage to the mechatronic unit.**

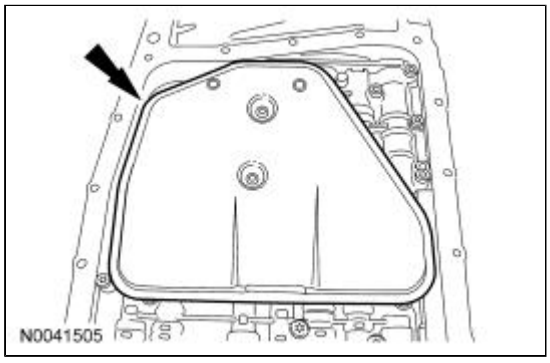
    With the release tab down, push the outer shell of the bulkhead electrical connector into the transmission.



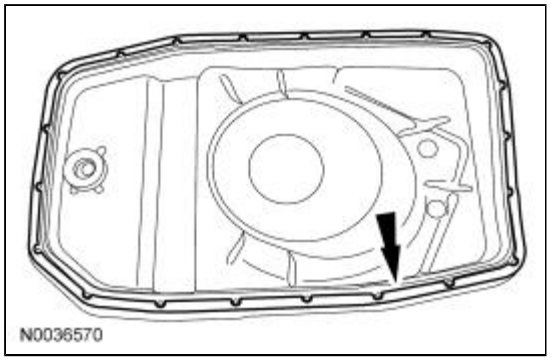
13. Press up on the tab and lock the outer shell of the bulkhead electrical connector in place.



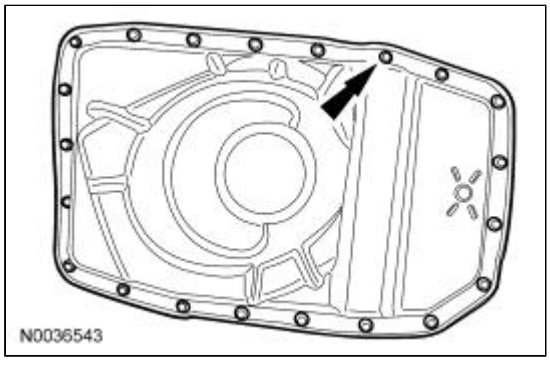
14. Install a new transmission fluid filter.



15. Install the fluid pan gasket.

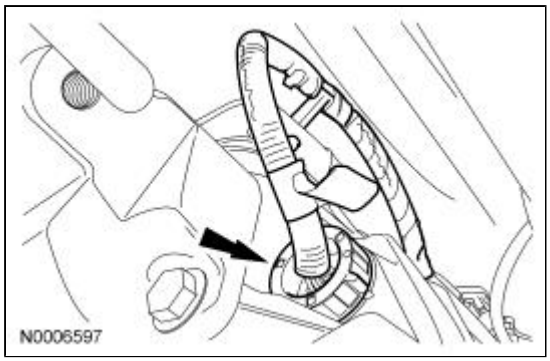


16. Install the fluid pan and bolts.
    - Tighten to 12 Nm (9 lb-ft).



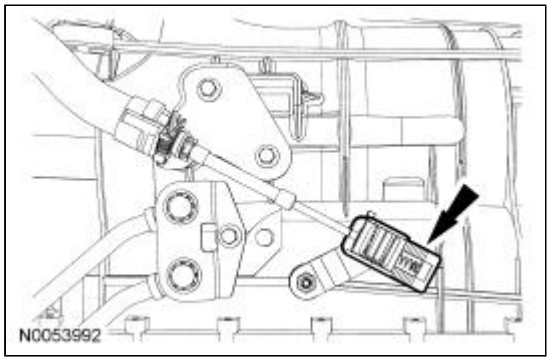
17. Connect the main transmission electrical harness by pushing it in and twisting the outer shell to

lock it in place.

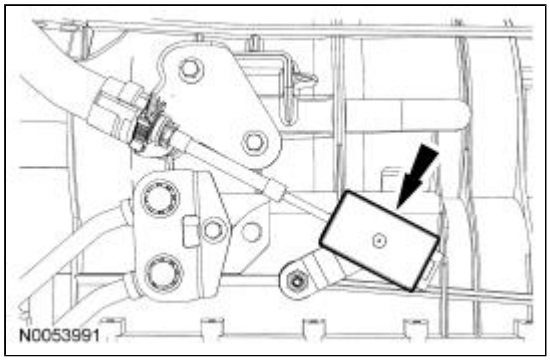


18. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

    Connect the selector lever cable onto the ball stud and move the locking tab down.
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure that it is correctly installed.

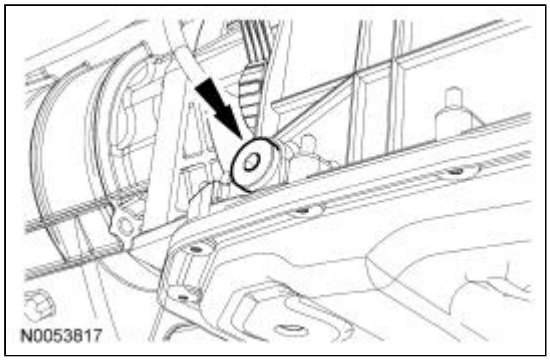


19. If equipped, install the heat shield.



20. **CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.**

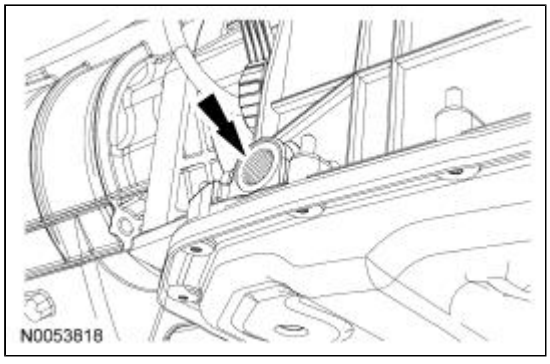
    Remove the fluid fill plug located on the RH rear side of the case near the transmission electrical connector.



21. **CAUTION: The use of any other transmission fluid than specified can result in the transmission failing to operate correctly or transmission failure.**

    CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.

    Fill the transmission.
    - Add 4.7 liters (5 quarts) of clean automatic transmission fluid to the transmission through the fluid fill hole. Stop when the fluid runs out of the bottom of the hole.

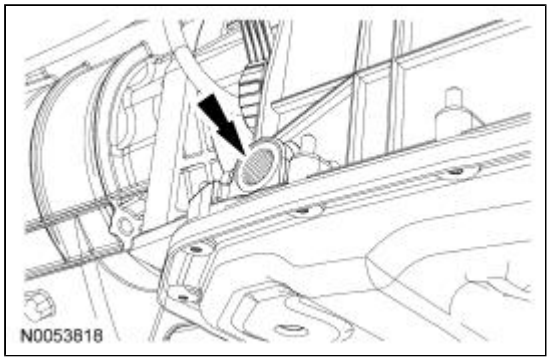


22. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

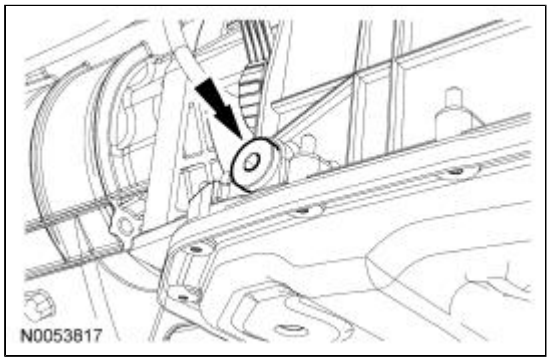
23. With the special tool connected, the engine idling (550-750 rpm) in PARK and the transmission temperature at 30°C-50°C (86°F-122°F), check and adjust the transmission fluid level.

24. **CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.**

    Fill with clean automatic transmission fluid until the fluid runs out of the bottom of the hole.



25. Install the fluid fill plug.
    - Tighten to 35 Nm (26 lb-ft).



Transmission — Four Wheel Drive (4WD)

Printable View (702 KB)

Special Tool(s)

ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

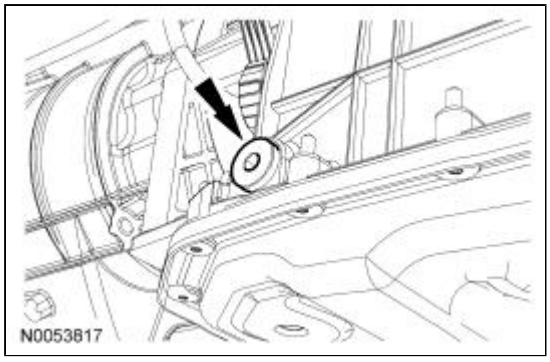
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

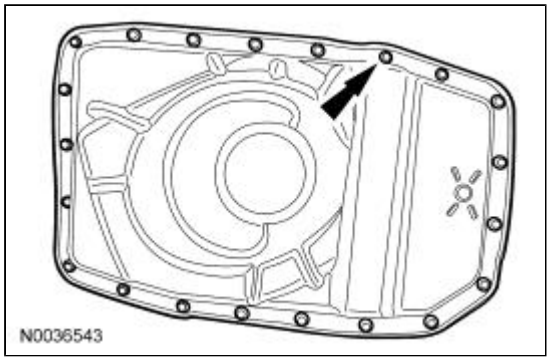
3. **CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.**

   Remove the fluid fill plug located on the passenger side rear portion of the transmission case. Removal of the plug will relieve any vacuum that might have built up in the transmission. This will aid in allowing the fluid pan to be easily removed when the bolts are removed.

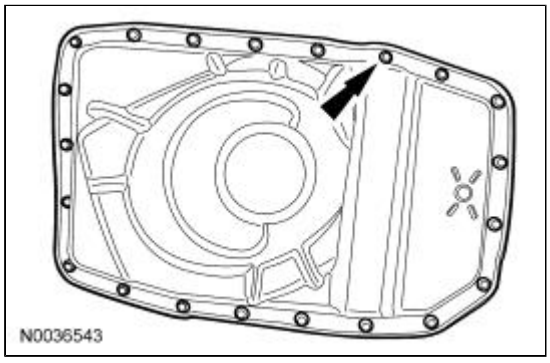


4. **NOTE:** If transmission disassembly or installation of a new transmission is necessary, the transmission fluid will need to be drained.

   Remove the transmission fluid pan and allow the fluid to drain.

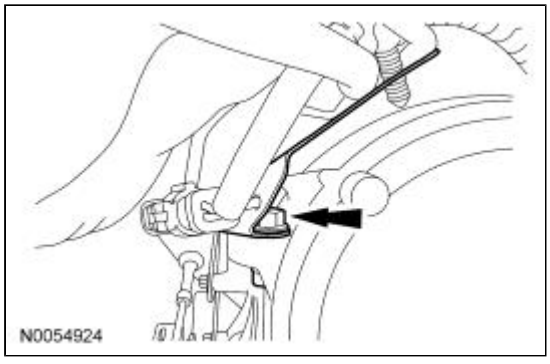


5. Install the fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 12 Nm (9 lb-ft).

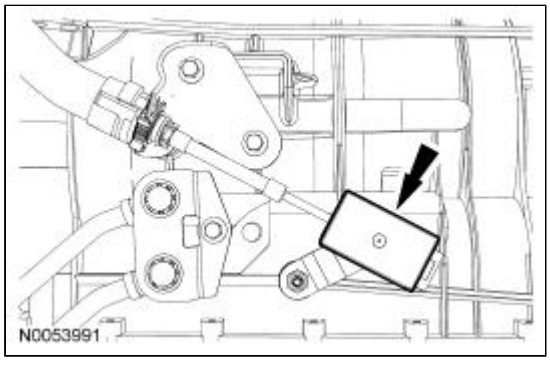


6. Remove the transfer case. For additional information, refer to Section 308-07B .

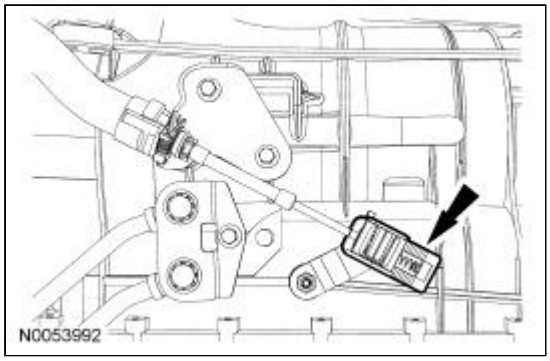
7. Remove the fuel line bracket bolt and position the bracket and lines aside.



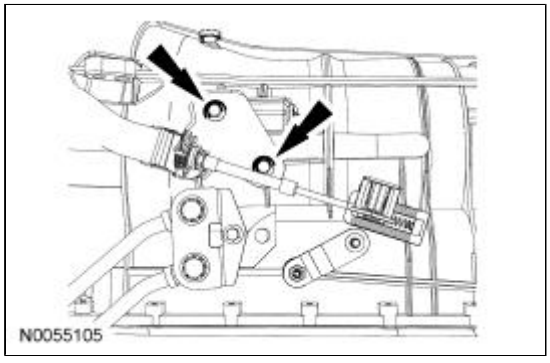
8. If equipped, remove the heat shield.



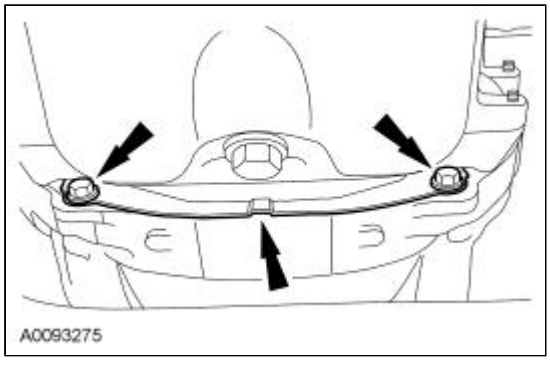
9. Move the locking tab up and disconnect the selector lever cable from the manual lever ball stud.



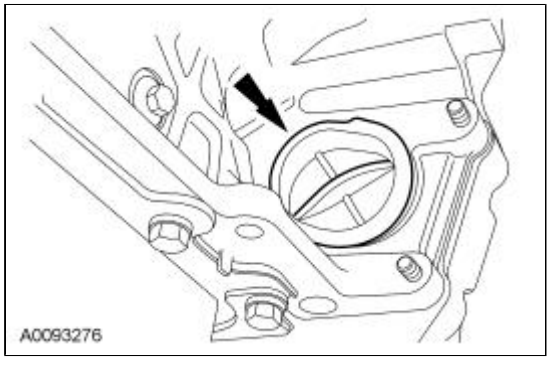
10. Remove the selector lever bracket bolts and remove the bracket.



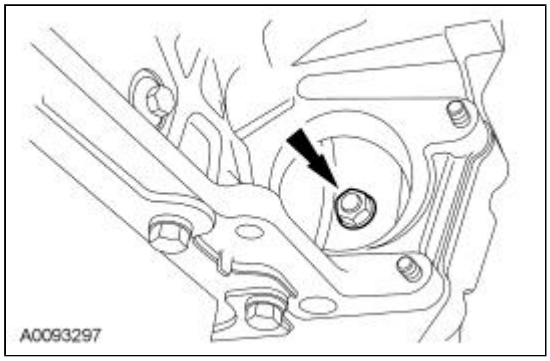
11. Remove the flexplate inspection cover bolts and the inspection cover.



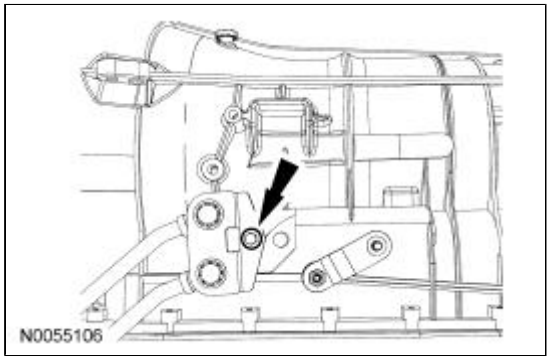
12. Remove the rubber torque converter nut access plug.



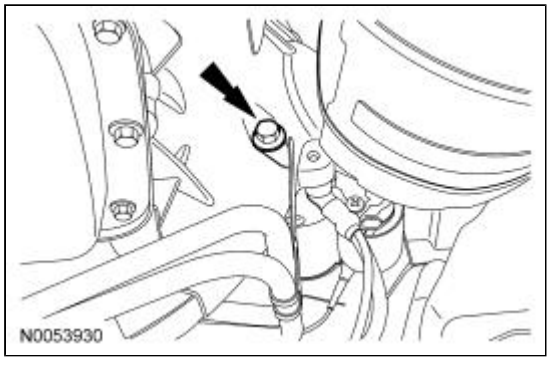
13. Remove and discard the 4 flexplate-to-torque converter nuts.



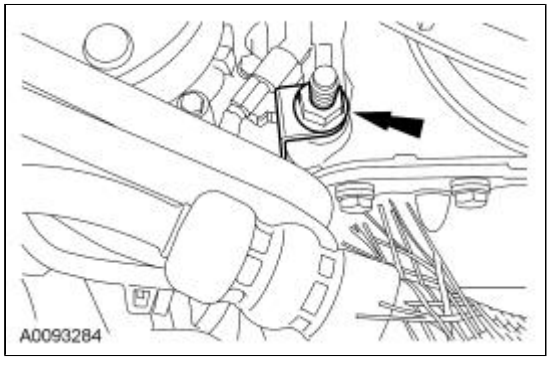
14. Remove the transmission cooler tube bracket bolt.



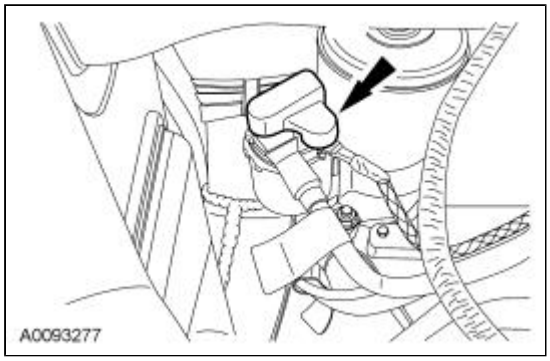
15. Remove the transmission case bolt.



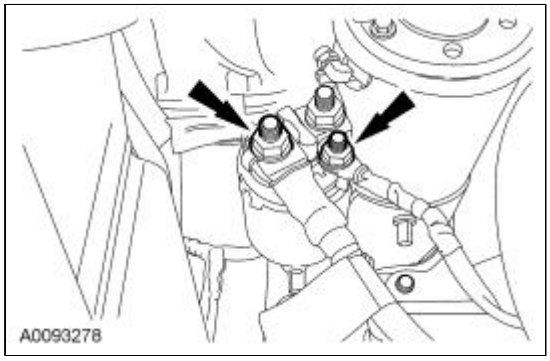
16. Remove the transmission fluid cooler tube bracket nut and position the bracket and tubes aside.



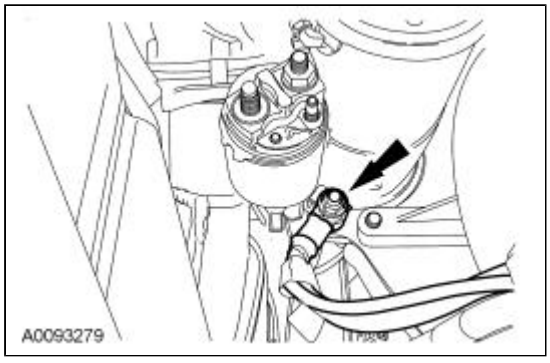
17. Remove the plastic starter motor electrical connector cap.



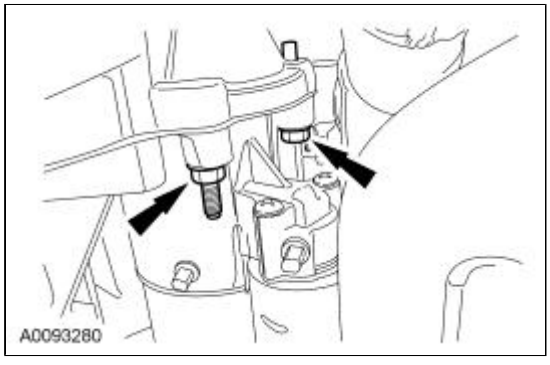
18. Remove the starter motor electrical connectors.



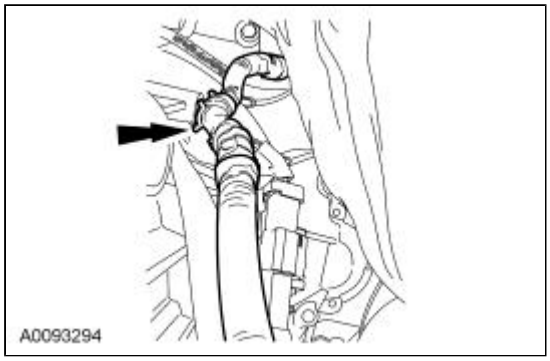
19. Remove the ground wire from the stud.



20. Remove the 3 starter motor bolts and the starter motor.

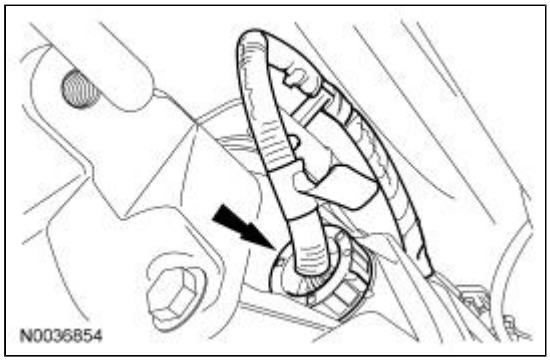


21. Disconnect the wiring harness from the top of the transmission.



22. **CAUTION: Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

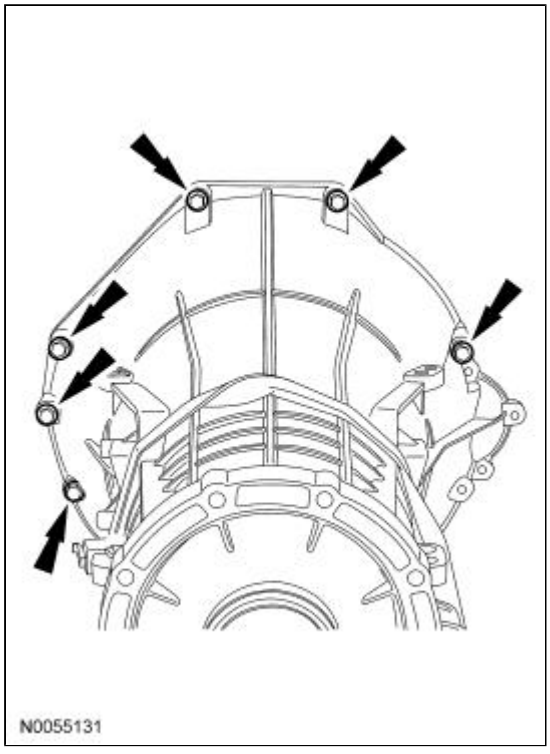
    Disconnect the main transmission electrical harness by twisting the outer shell and pulling back on the connector.



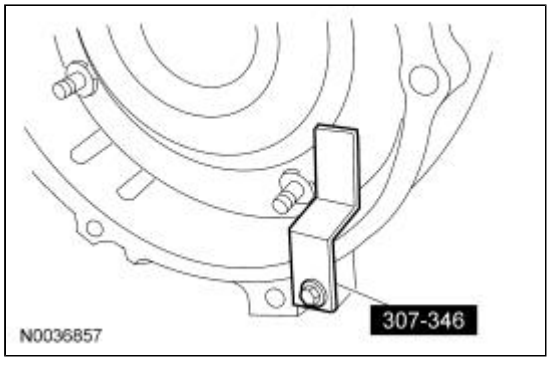
23. **NOTE:** The top 2 transmission case bolts need to be removed prior to removing the rest of the bolts.

    NOTE: The top left bolt secures the fuel line bracket to the transmission case.

    Remove the 6 remaining transmission case bolts.



24. Slide the transmission back enough to install the special tool.



25. Remove the transmission from the vehicle.

26. If the transmission is to be overhauled or if installing a new transmission, carry out transmission fluid cooler backflushing and cleaning. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

Transmission — Rear Wheel Drive (RWD)

Printable View (971 KB)

Special Tool(s)

ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

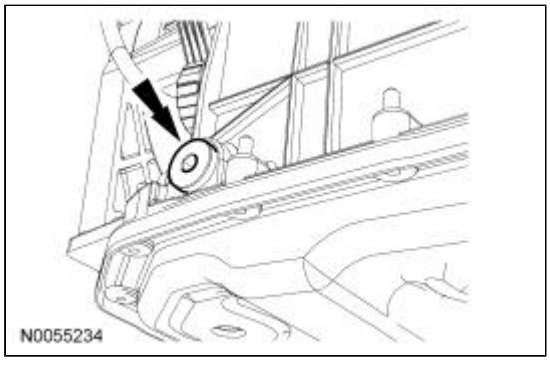
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Remove the driveshaft. For additional information, refer to Section 205-01 .

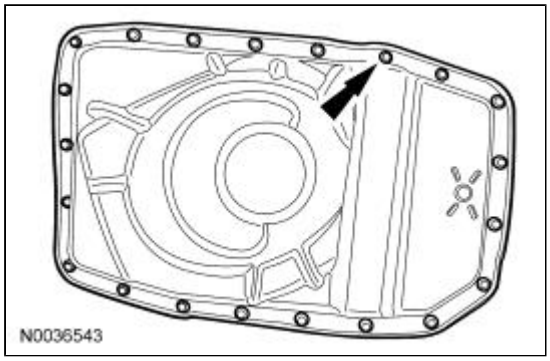
3. **CAUTION: The fluid fill plug located on the side of the transmission is near the exhaust system. The exhaust will be extremely hot during this procedure. Use care when working near the exhaust and the heat shields.**

   Remove the fluid fill plug located on the passenger side rear portion of the transmission case. Removal of the plug will relieve any vacuum that might have built up in the transmission. This will aid in allowing the fluid pan to be easily removed when the bolts are removed.

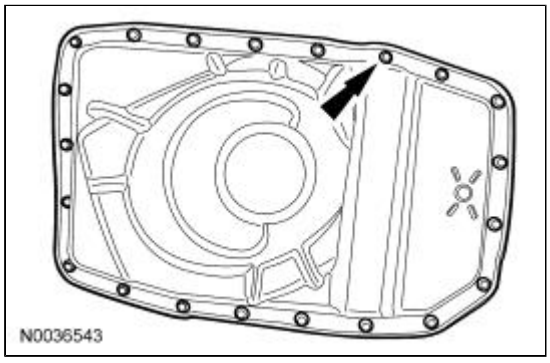


4. **NOTE:** If transmission disassembly, or installation of a new transmission is necessary, the transmission fluid will need to be drained.

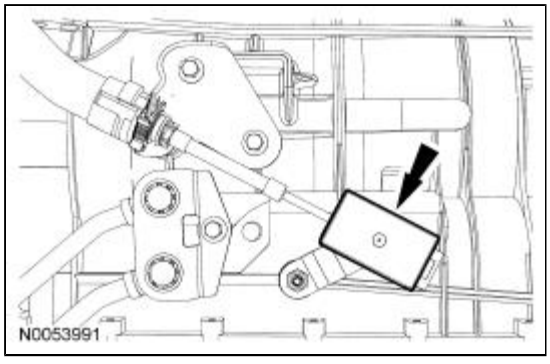
   Remove the transmission fluid pan and allow the fluid to drain.



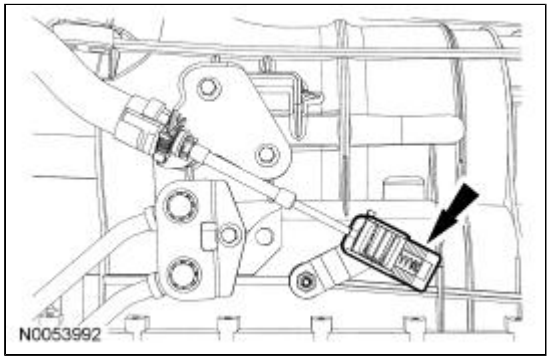
5. Install the fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 12 Nm (9 lb-ft).



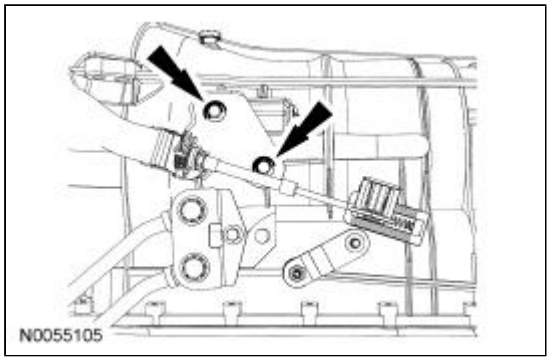
6. If equipped, remove the heat shield.



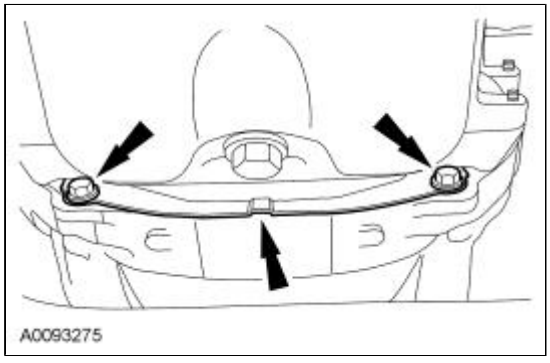
7. Move the locking tab up and disconnect the selector lever cable from the manual lever ball stud.



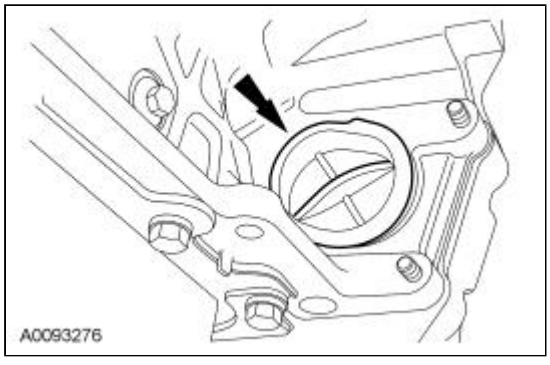
8. Remove the selector lever bracket bolts and remove the bracket.



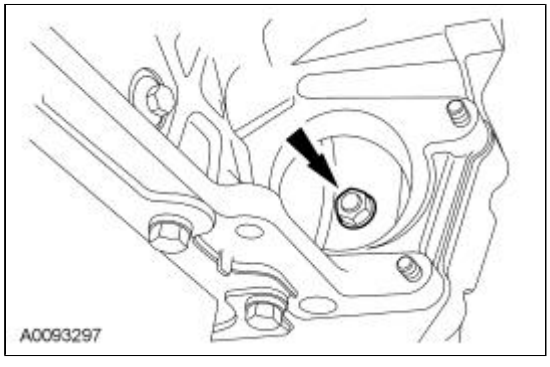
9. Remove the flexplate inspection cover bolts and the inspection cover.



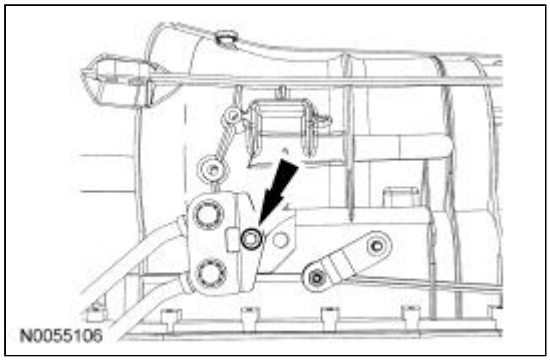
10. Remove the rubber torque converter nut access plug.



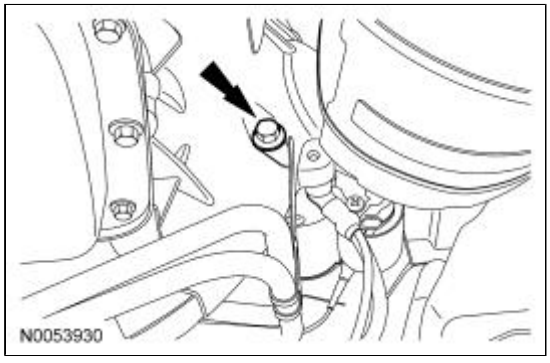
11. Remove and discard the 4 flexplate-to-torque converter nuts.



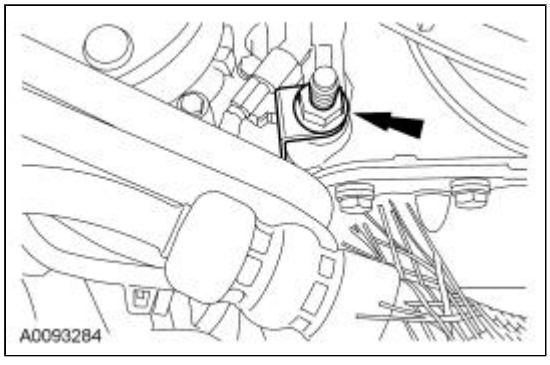
12. Remove the transmission cooler tube bracket bolt.



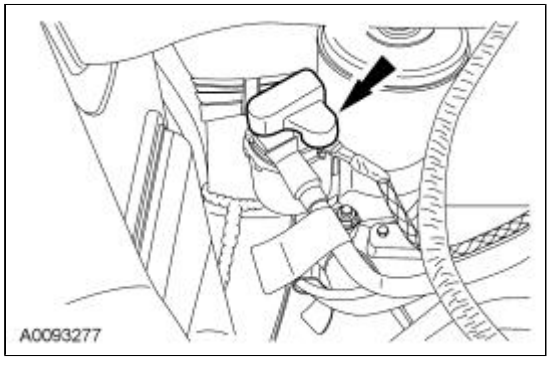
13. Remove the transmission case bolt.



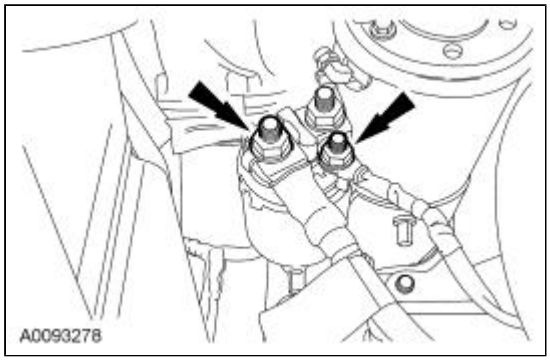
14. Remove the transmission fluid cooler tube bracket nut and position the bracket and tubes aside.



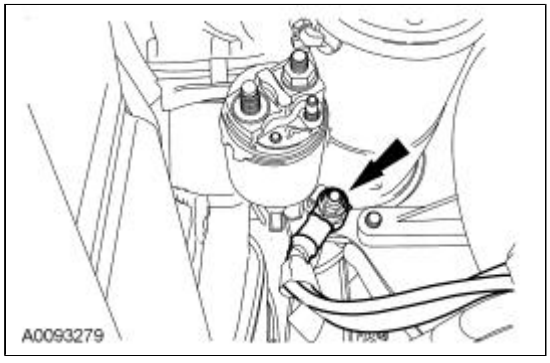
15. Remove the plastic starter motor electrical connector cap.



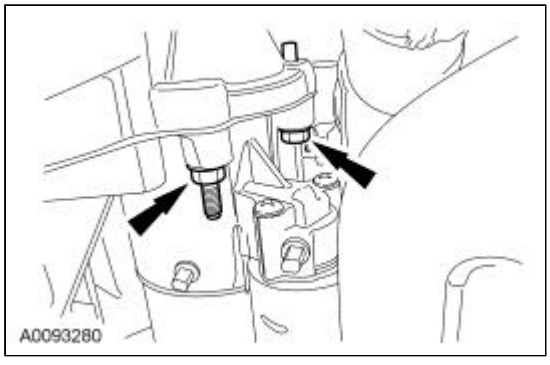
16. Remove the starter motor electrical connectors.



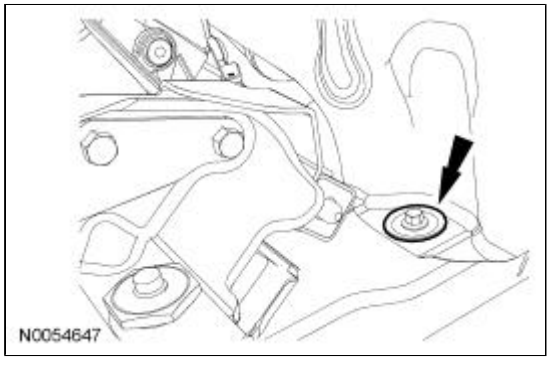
17. Remove the ground wire from the stud.



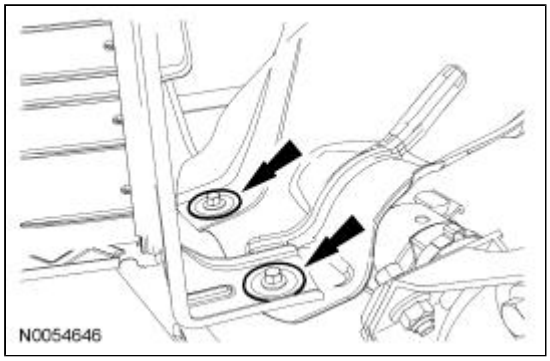
18. Remove the starter motor bolts and the starter motor.



19. Remove the RH exhaust heat shield bolt.

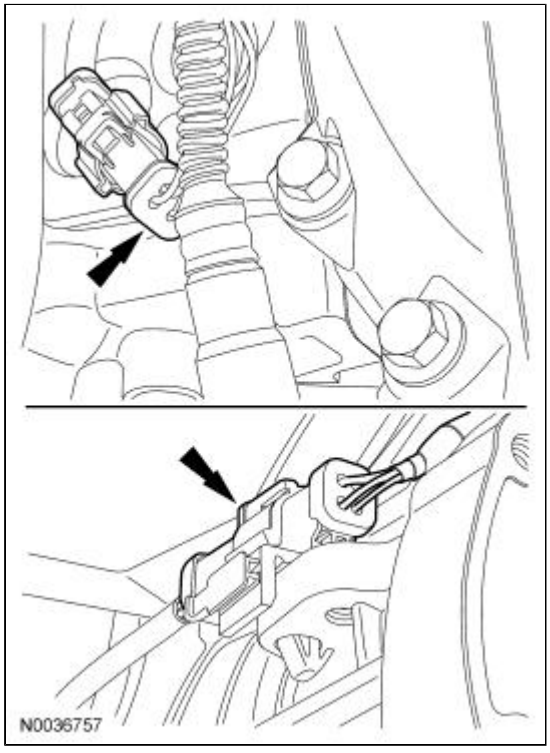


20. Remove the LH exhaust heat shield and evaporative emissions canister assembly bolts.

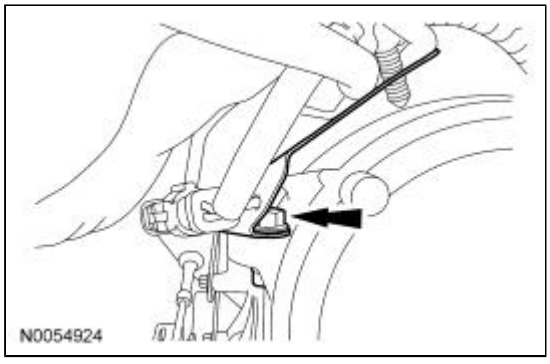


21. **NOTE:** LH shown, RH similar.

    Disconnect the RH and LH heated oxygen sensors (HO2S) and the catalyst monitor sensor (CMS) electrical connectors.



22. Remove the fuel line bracket bolt and position the bracket and lines aside.

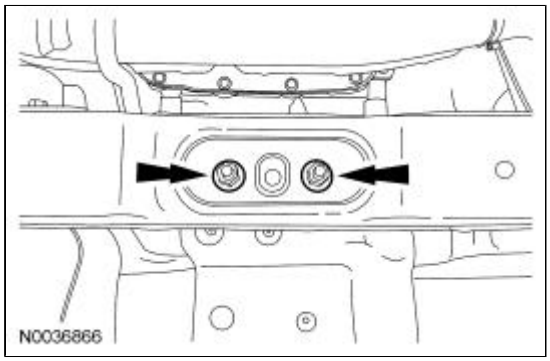


23. **NOTE:** Make sure that the transmission jack makes contact on the outer ribs of the fluid pan.

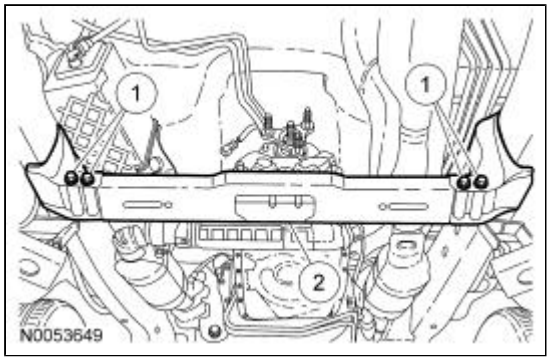
    NOTE: Make sure that the transmission is securely fastened to the transmission jack.

Position a suitable high-lift transmission jack under the transmission.

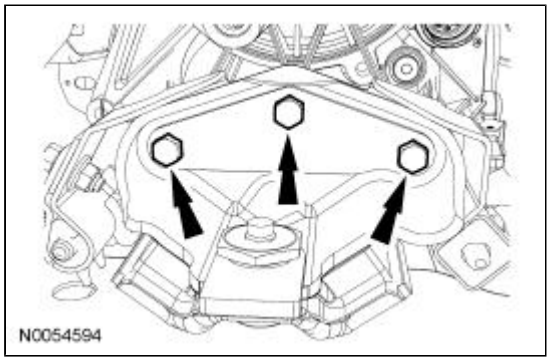
24. Remove the 2 rear crossmember nuts.



25. Remove the rear crossmember.
    1. Remove the 4 crossmember bolts and nuts.
    2. Remove the crossmember.

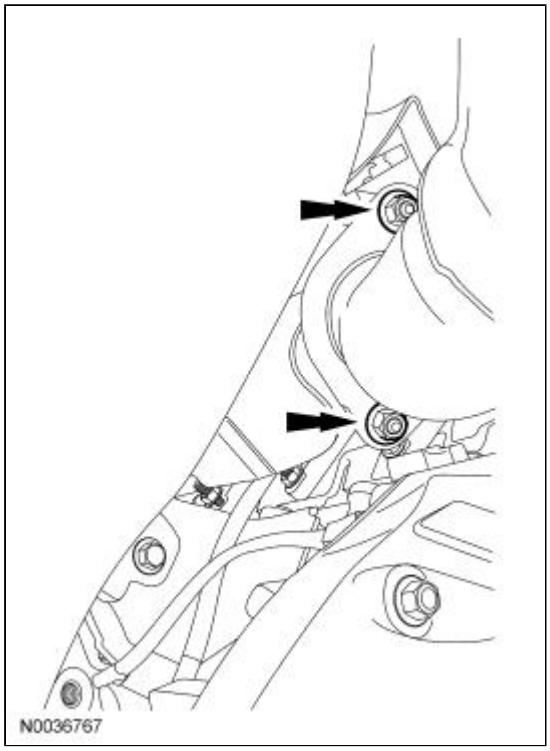


26. Remove the 3 bolts and remove the insulator.

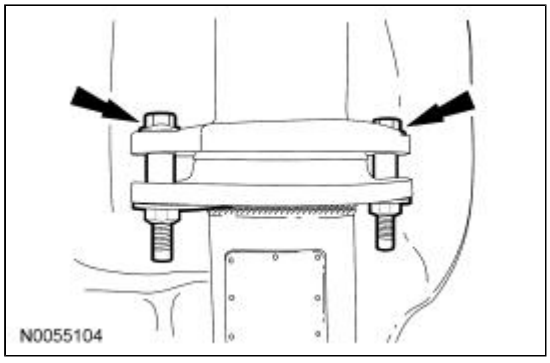


27. **NOTE:** LH shown, RH similar.

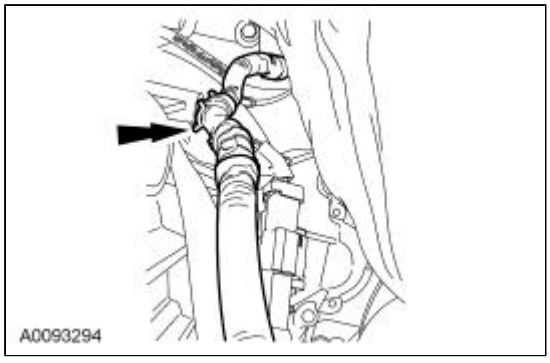
    Remove the RH and LH exhaust flange nuts.



28. Remove the 2 dual converter Y-pipe bolts and the dual converter Y-pipe.

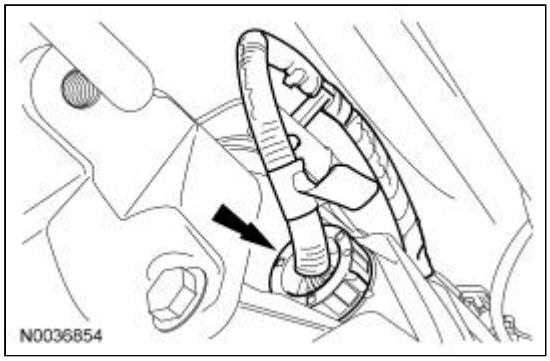


29. Disconnect the wire harness from the top of the transmission.



30. **CAUTION: Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

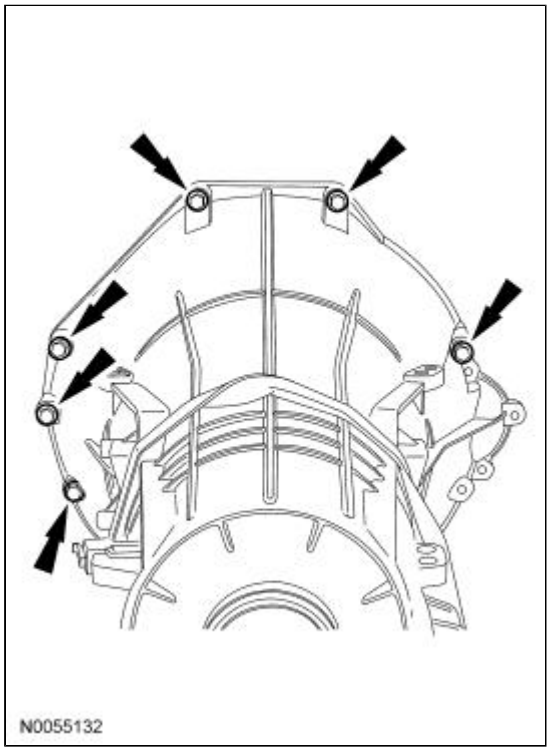
    Disconnect the main transmission electrical harness by twisting the outer shell and pulling back on the connector.



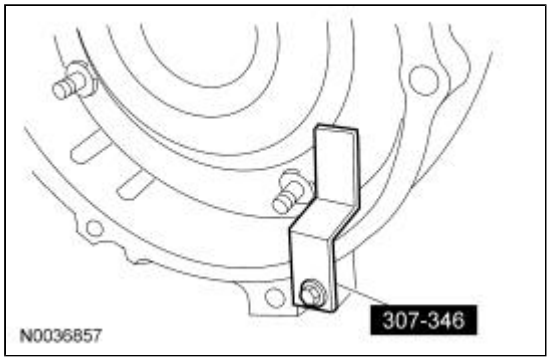
31. **NOTE:** The top 2 transmission-to-engine bolts need to be removed prior to removing the rest of the bolts.

    NOTE: The top left bolt secures the fuel line bracket to the transmission case.

    Remove the 6 remaining transmission case bolts.



32. Slide the transmission back far enough to install the special tool.



33. Remove the transmission from the vehicle.

34. If the transmission is to be overhauled or if installing a new transmission, carry out transmission fluid cooler backflushing and cleaning. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

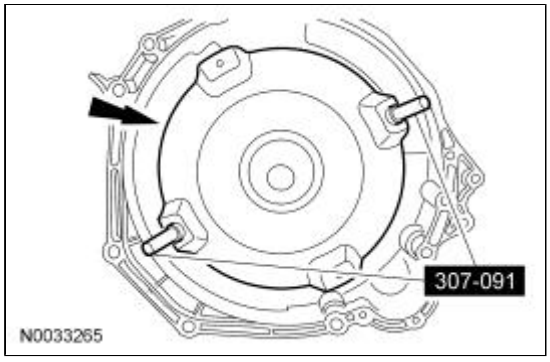
ST2891-A	Remover, Transmission Fluid Pump 307-553
	Remover, Bearing 307-562 (includes 307-562/1

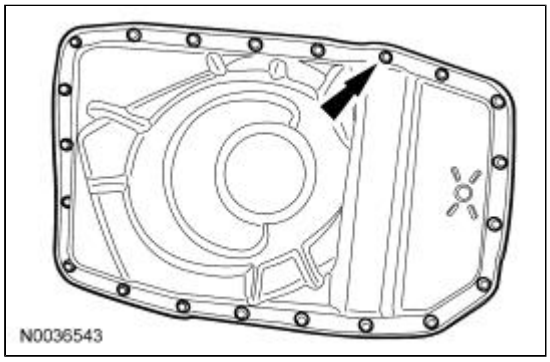
 ST2932-A	and 307-562/2)

All vehicles

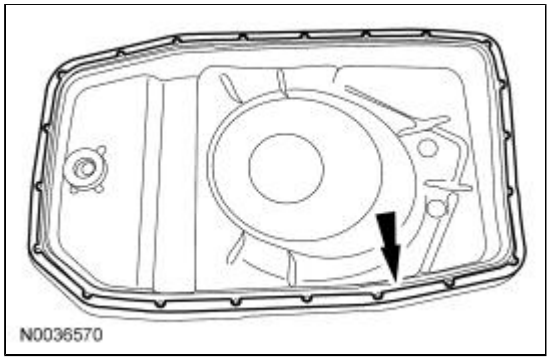
1. Using the special tools, remove the torque converter.



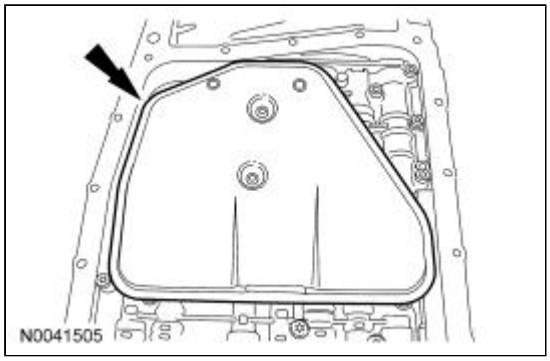
2. Remove the transmission fluid pan.



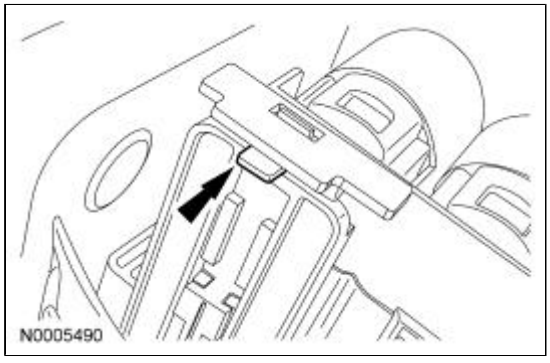
3. Remove the fluid pan gasket.



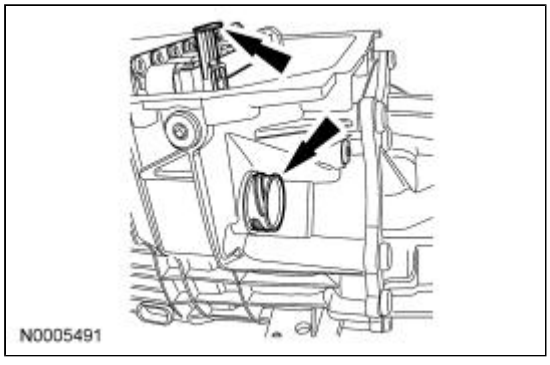
4. Remove and discard the transmission fluid filter.



5. Press the release tab and lift up on the bulkhead connector retainer.

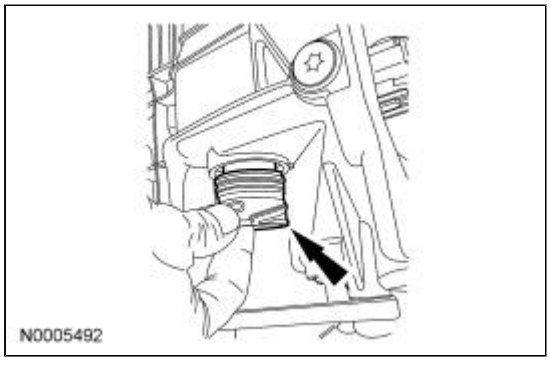


6. With the release tab up, pull the outer shell of the bulkhead electrical connector.

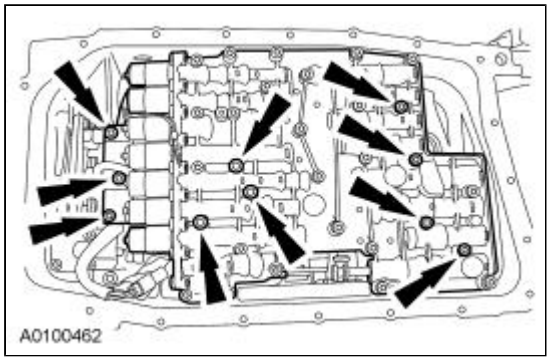


7. **CAUTION: Do not touch the electrical connector pins. Electrostatic charge may occur and will cause damage to the mechatronic unit.**

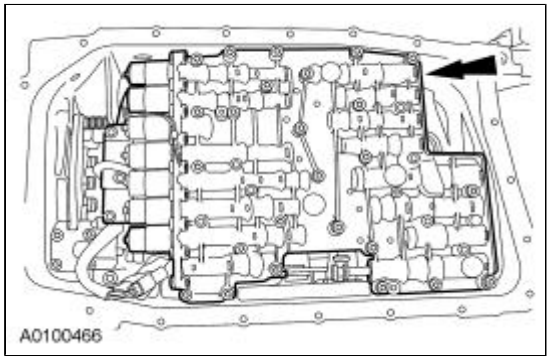
   Pull the outer shell of the bulkhead electrical connector out of the transmission.



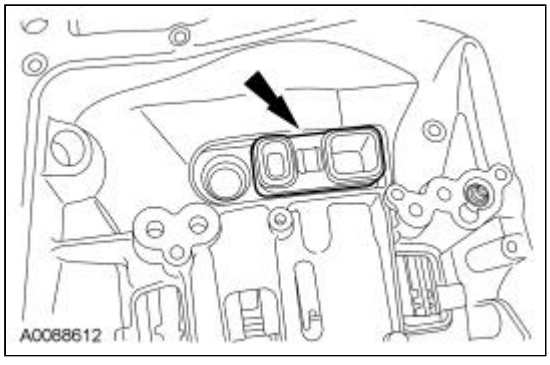
8. Remove the 10 bolts from the mechatronic assembly.



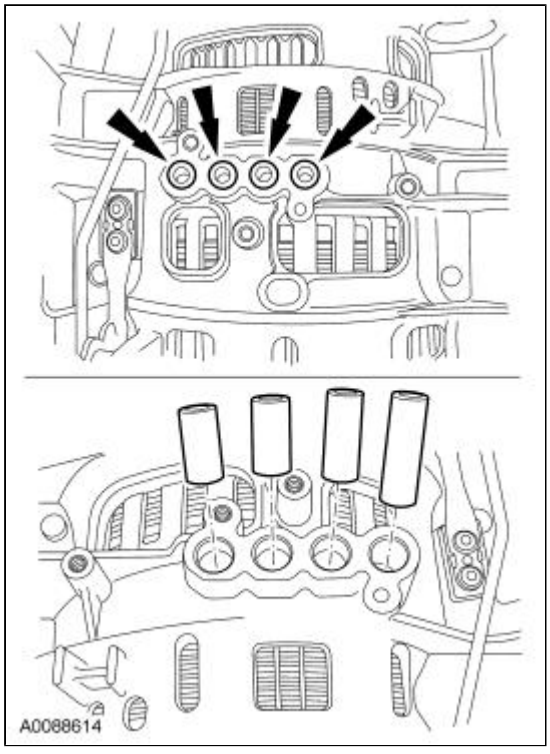
9. Remove the mechatronic assembly.



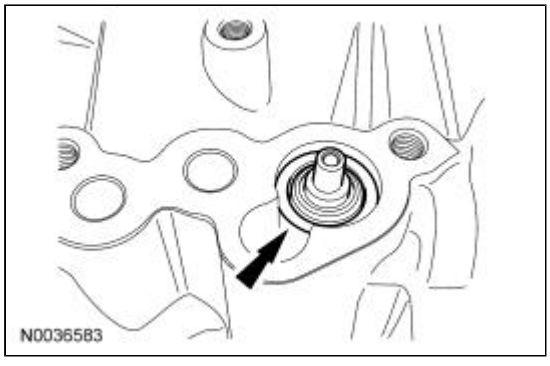
10. Remove the rubber adapter and the fluid filter seal.



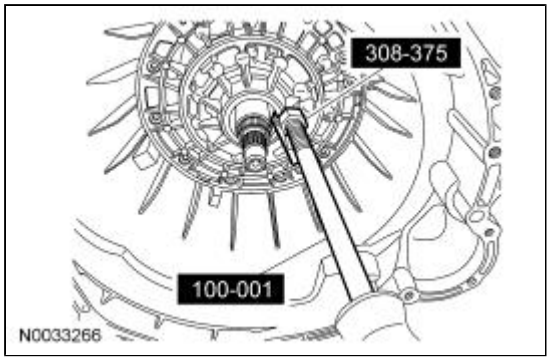
11. Remove and discard the 4 rubber feed tubes for the center support. Note the size and location while removing for correct installation.



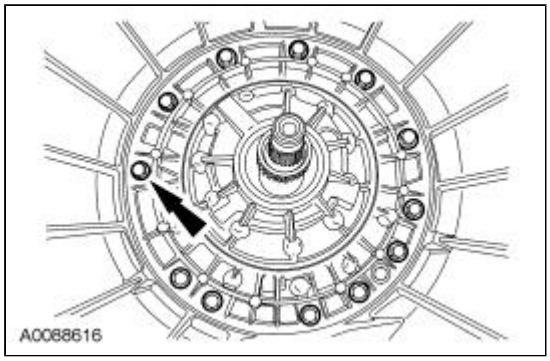
12. Remove the thermal bypass valve.



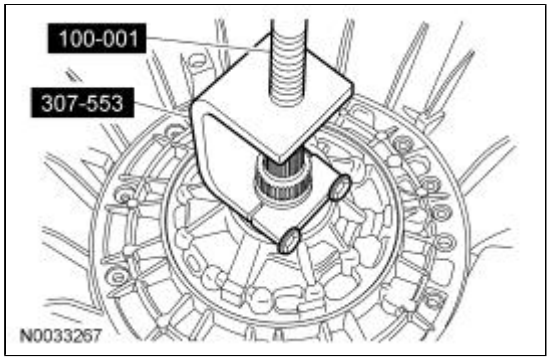
13. Using the special tools, remove and discard the front pump seal.



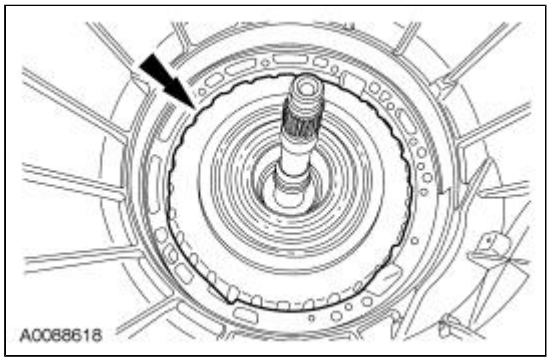
14. Remove and discard the front pump bolts.



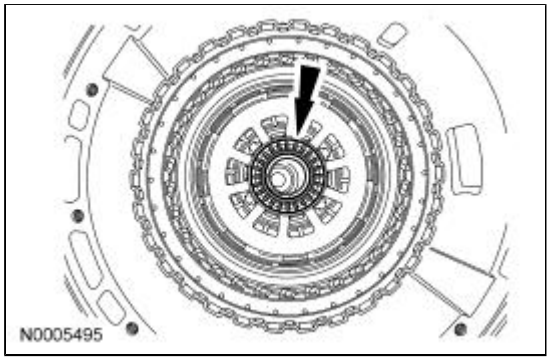
15. Using the special tools, remove the front pump support. Make sure that the selective shim is on the back side of the pump.



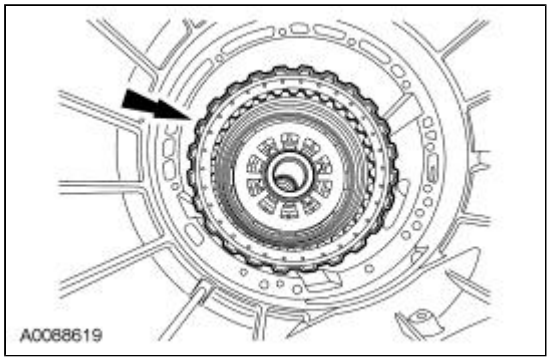
16. Remove the forward (clutch A)/overdrive (clutch E) clutch assembly.



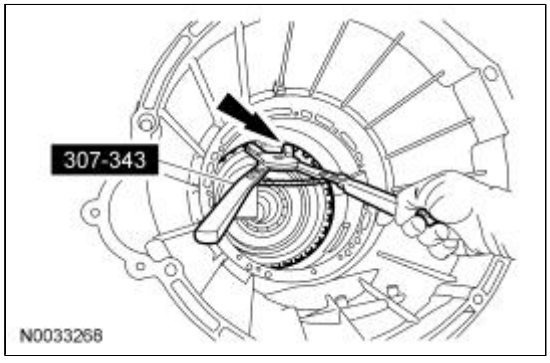
17. Remove the roller bearing.



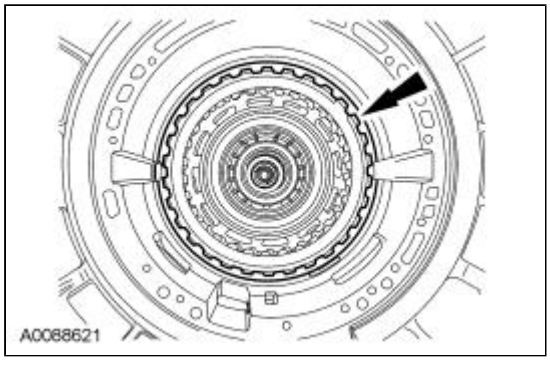
18. Remove the direct clutch assembly.



19. Using the special tool, remove the center support snap ring.

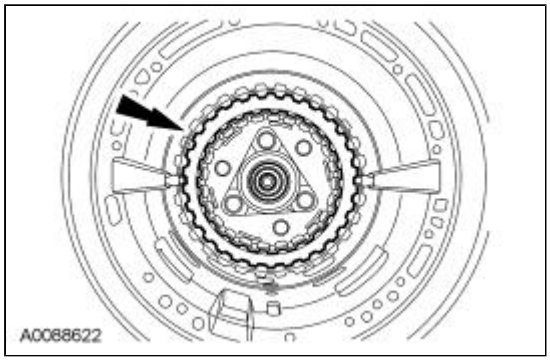


20. Remove the center support.

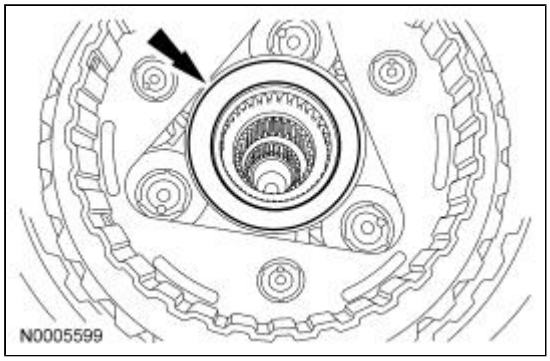


21. **NOTE:** When removing the planet carrier and the low/reverse clutch pack, some of the clutch plates may stay in the case. Try to keep all the clutches together.

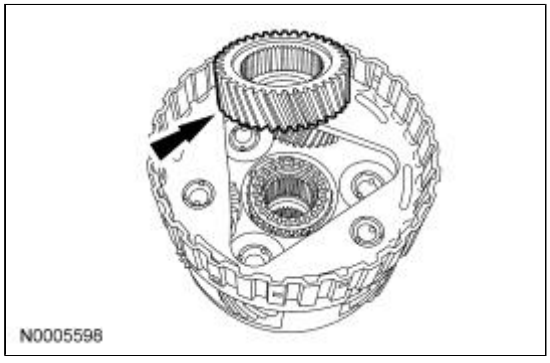
    Remove the planet carrier and the low/reverse clutch pack as an assembly.



22. Remove the low/reverse bearing race.

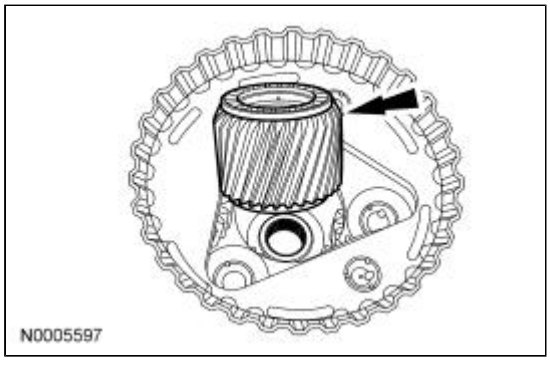


23. Remove the low/reverse sun gear.

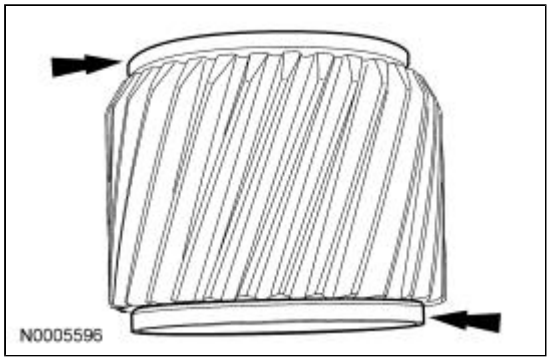


24. **NOTE:** When removing the sun gear, take note that the taper edge is facing up toward the torque converter housing.

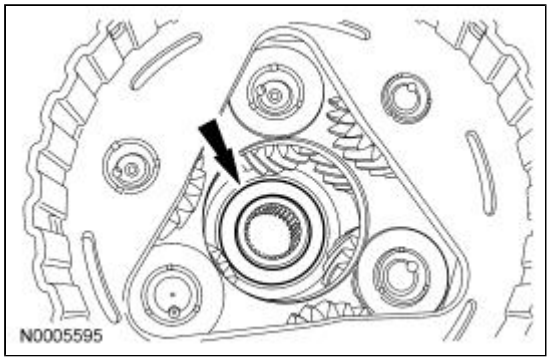
    Remove the sun gear into the planet assembly.



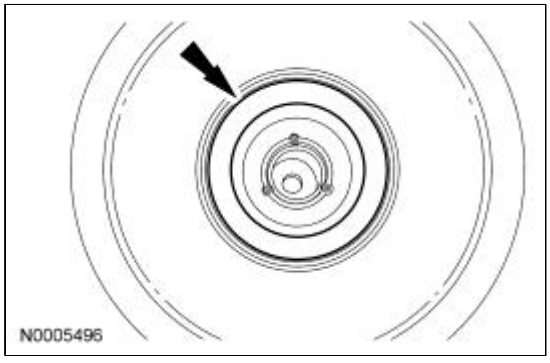
25. Remove the top and the bottom roller bearings from the sun gear.



26. Remove the roller bearing race in the bottom of the carrier.

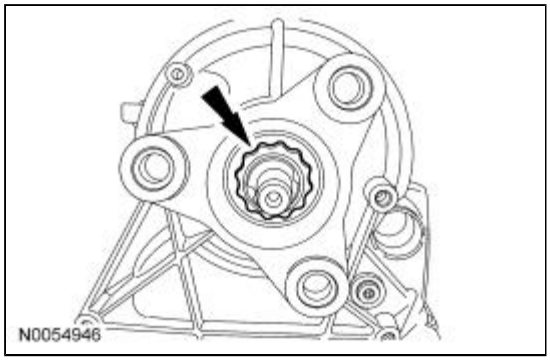


27. Remove the washer.

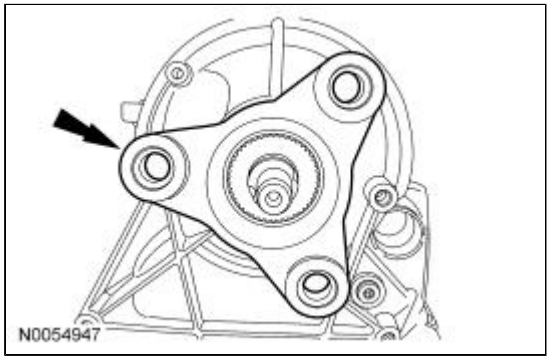


Rear wheel drive (RWD) vehicles

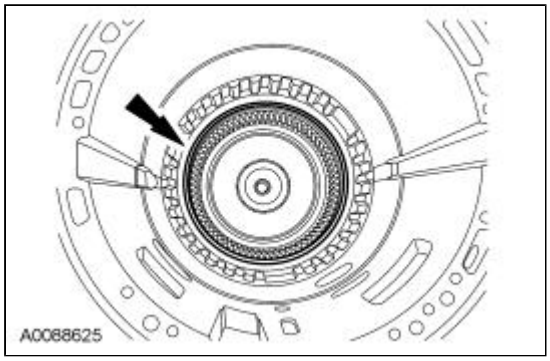
28. Remove and discard the output shaft flange nut.



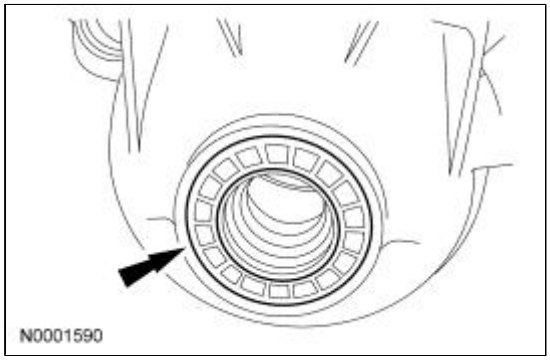
29. Remove the output shaft flange.



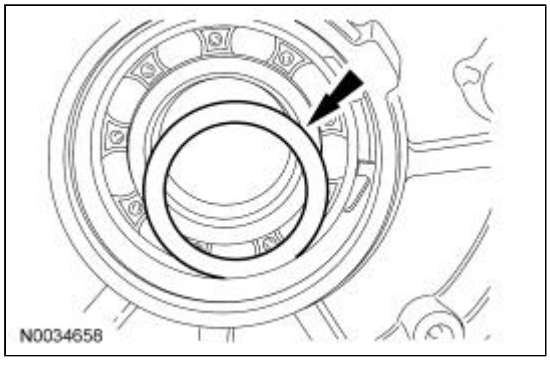
30. Remove the planet carrier hub and output shaft assembly.



31. Remove the output shaft seal.

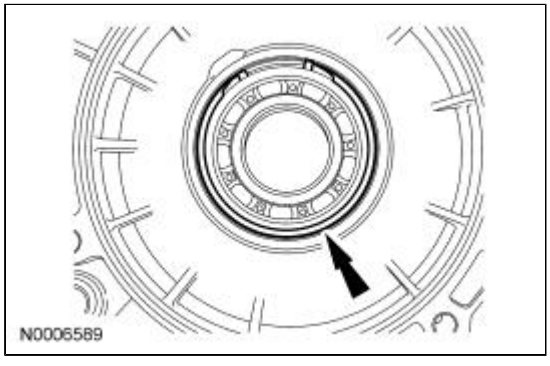


32. Remove the anti-click washer.



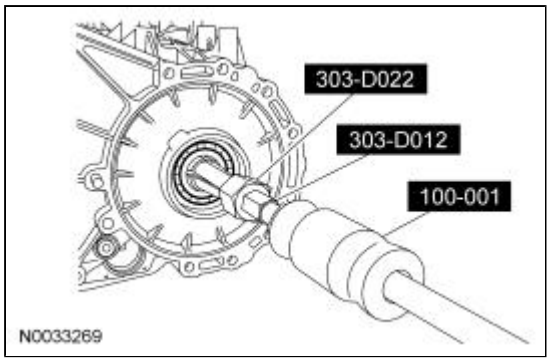
33. **NOTE:** Four wheel drive (4WD) case shown, RWD case similar.

    Remove the snap ring from the case.

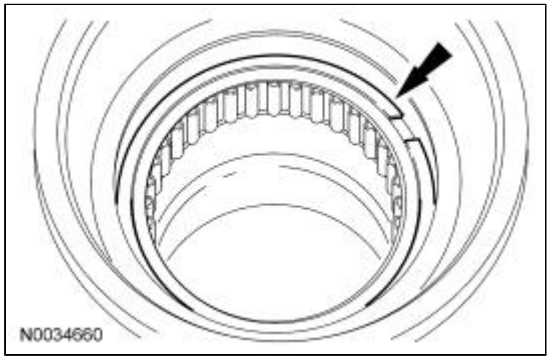


34. **NOTE:** 4WD case shown, RWD case similar.

Using the special tools, remove the roller bearing.

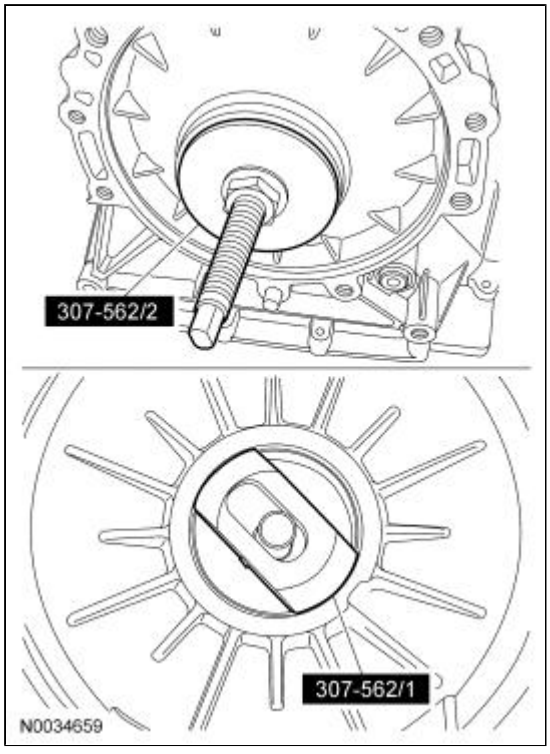


35. Using a small pick, remove the snap ring.



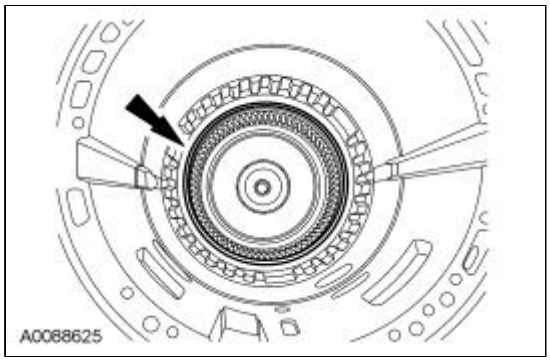
36. **CAUTION: Use care when installing the special tool. Look inside the transmission case to make sure that the tool contacts the bearing only and not the lip of the case, or damage to the case will result.**

Using the special tool, remove the bearing assembly.

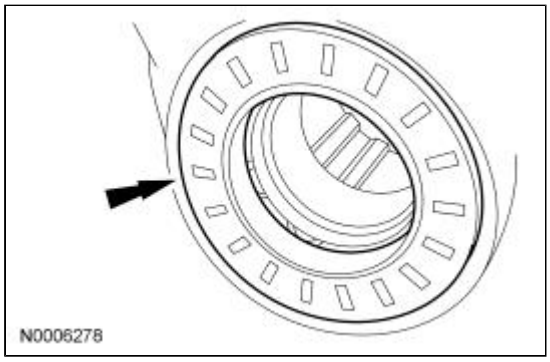


4WD vehicles

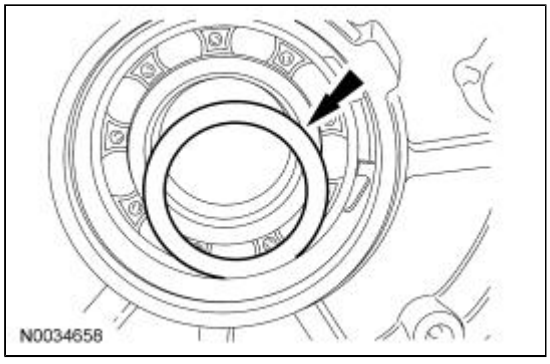
37. Remove the planet carrier hub and output shaft assembly.



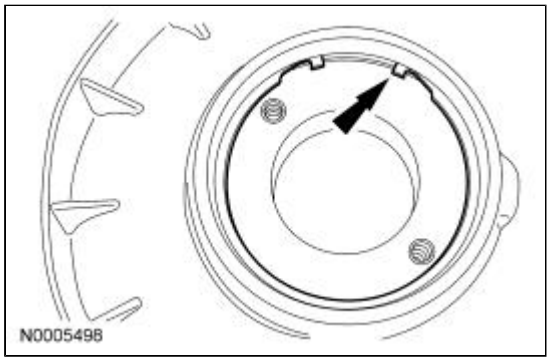
38. Remove and discard the output shaft seal.



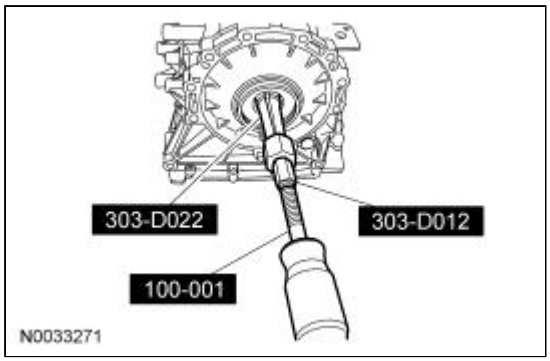
39. Remove the anti-click washer.



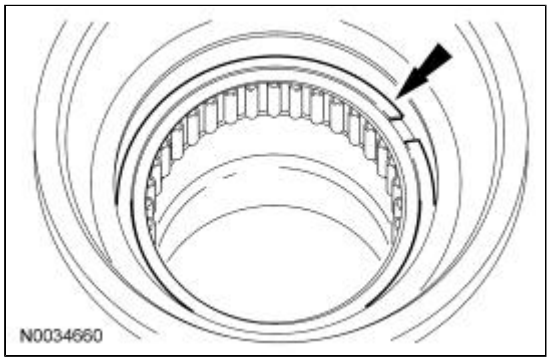
40. Remove the snap ring from the case.



41. Using the special tools, remove the bearing spacer.

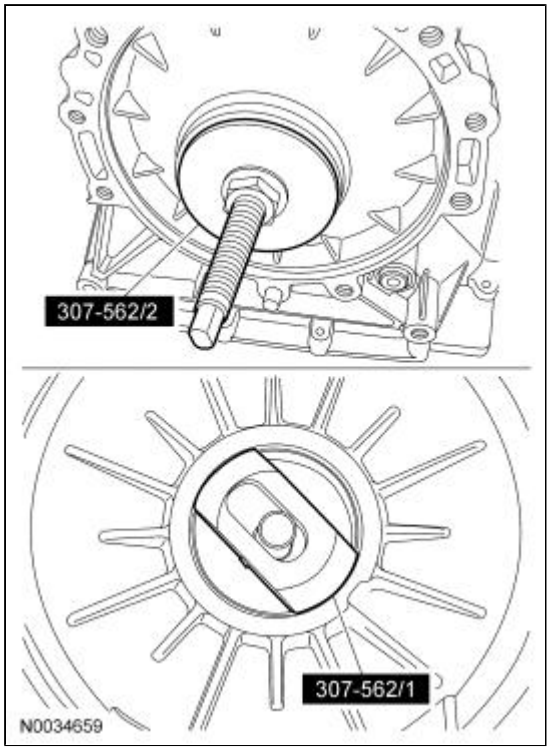


42. Using a small pick, remove the snap ring.



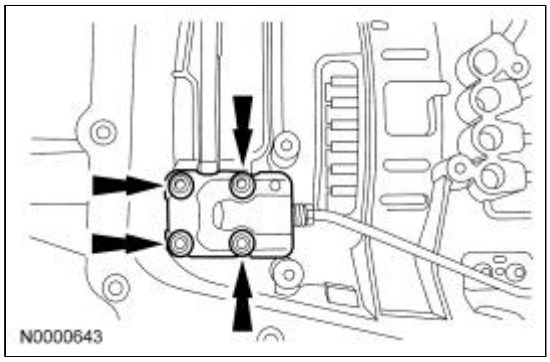
43. **CAUTION: Use care when installing the special tool. Look inside the transmission case to make sure that the tool contacts the bearing only and not the lip of the case, or damage to the case will result.**

Using the special tool, remove the bearing assembly.

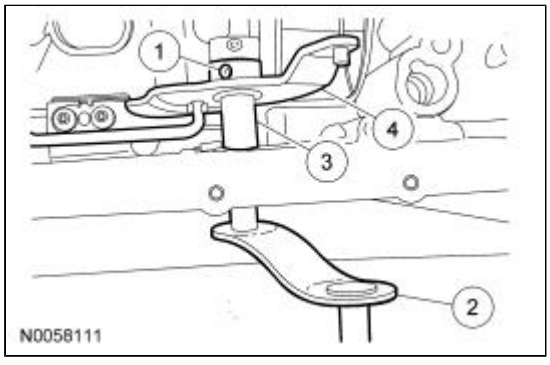


All vehicles

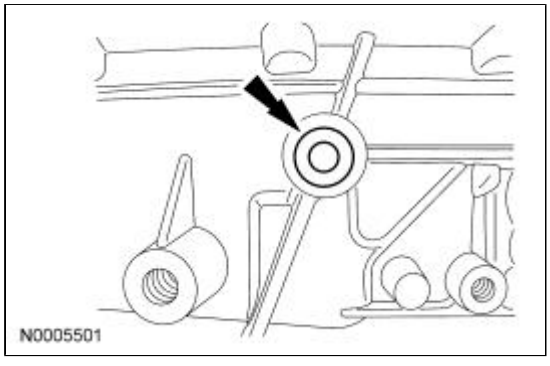
44. Remove the park rod actuating plate.



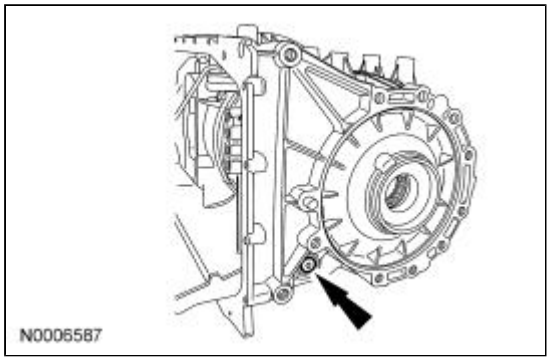
45. Remove the manual control lever.
    1. Remove the roll pin.
    2. Slide the manual control lever shaft out of the case.
    3. Hold the spacer to keep it from falling into the case.
    4. Remove the manual valve inner lever and the park rod as an assembly.



46. Remove and discard the manual control lever seal.



47. Remove the bolt from the back of the case to gain access to the park pawl pin.



48. From inside the case, push the park pawl pin out toward the back side of the case, while holding the spring and the park pawl. Remove the park pawl pin, then remove the park pawl and spring.

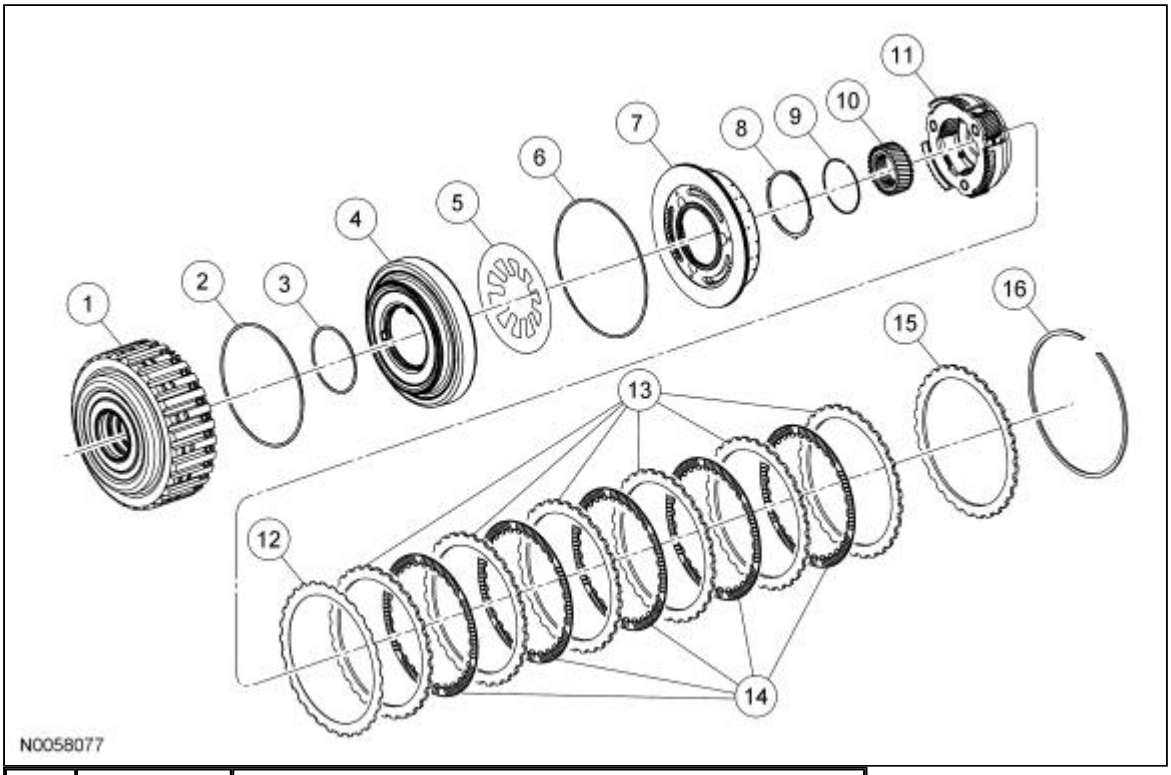
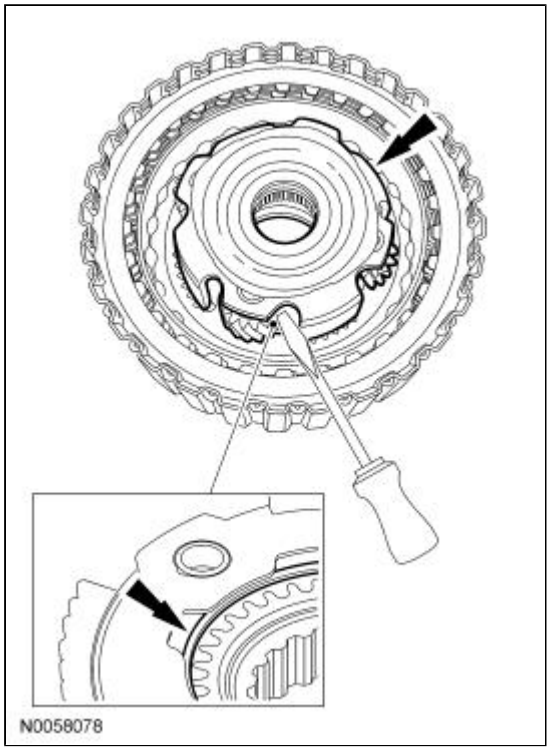
Forward Clutch Assembly (A clutch)



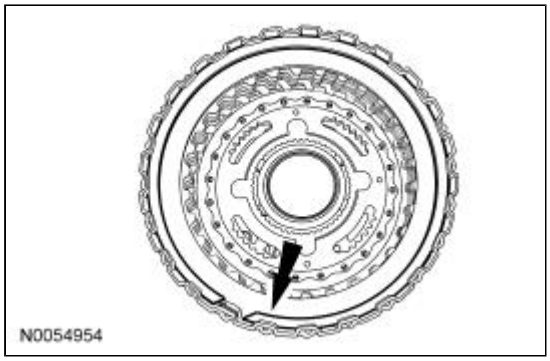
Item	Part Number	Description
1	7J011	Forward clutch drum
2	7F227	Forward clutch piston outer O-ring seal
3	7G242	Forward clutch piston inner O-ring seal
4	7L140	Forward clutch piston
5	7F230	Forward clutch piston return spring
6	7F227	Forward clutch balance dam O-ring seal
7	7J032	Forward clutch balance dam
8	—	Forward clutch balance dam retaining ring
9	7H356	Sun gear retaining ring
10	7G231	Sun gear
11	7G219	Planetary gear
12	7E457	Forward clutch wave spring
13	7E314	Forward clutch external splined steel plates (quantity model dependent)
14	7B164	Forward clutch internal splined friction plates (quantity model dependent)
15	—	Forward clutch pressure plate
16	7B421	Forward clutch plate retaining ring.

Disassembly

1. Remove the sun gear from the forward clutch assembly.
    - With a small screwdriver inserted into the sun gear push on the retaining ring in 3 places while lifting up on the sun gear to remove.

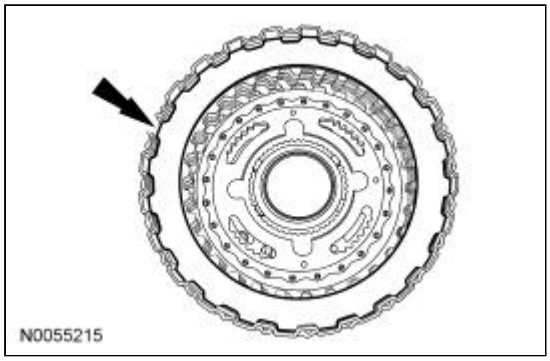


2. Remove the forward clutch pack snap ring.



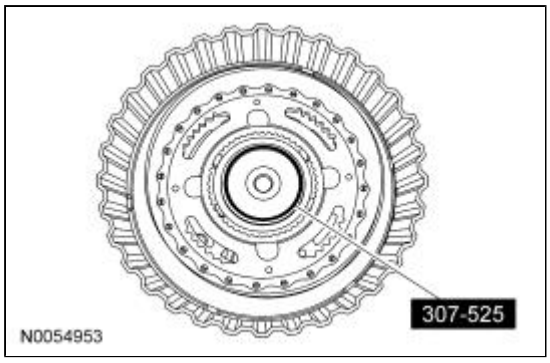
3. **NOTE:** Inspect the drum, friction plates and steel plates for damage.

   Remove the steel and friction forward clutch plates. Inspect the steel and friction plates for damage. If damage is indicated a new forward clutch assembly will be required.
   - If no damage is indicated the forward clutch can be re-assembled.



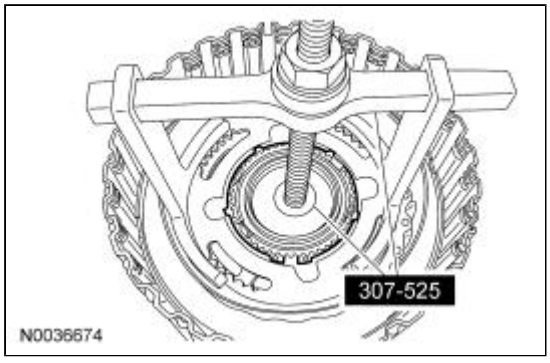
4. **NOTE:** The bottom of the special tool will need to be installed from the back side of the forward clutch assembly.

Install the special tool under the forward clutch drum.

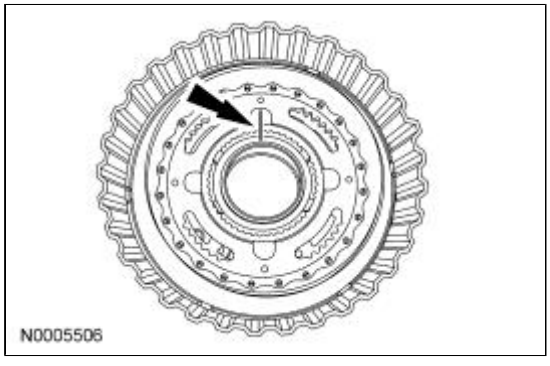


5. **NOTE:** The bottom of the special tool will need to be installed from the back side of the forward clutch assembly.

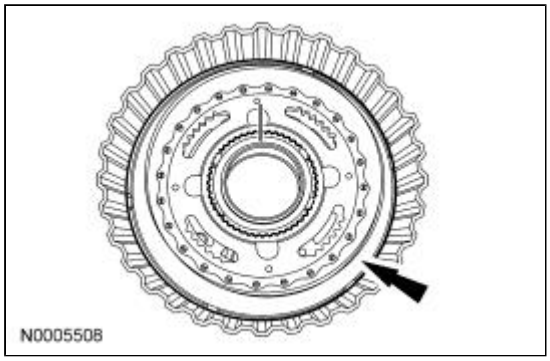
   Using the special tool, slightly collapse the balance dam to gain access to the retaining ring. Remove the retaining ring.



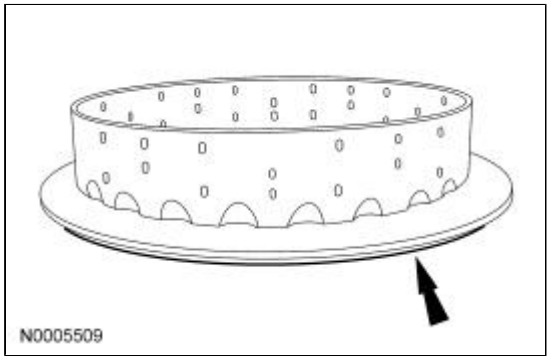
6. Prior to removing the balance dam, make an identifying mark on the balance dam and the center part of the housing. This is for correct alignment during the assembly.



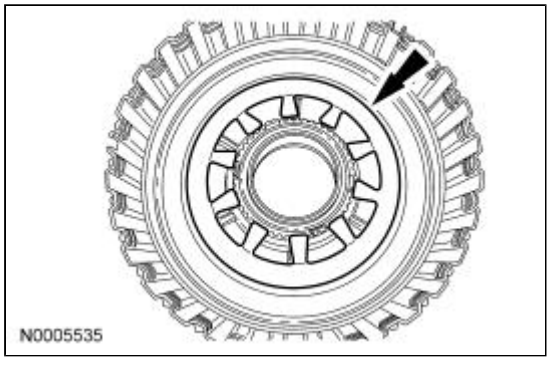
7. Remove the balance dam.



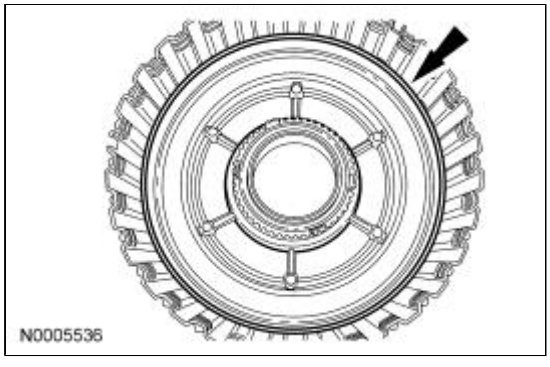
8. Remove and discard the O-ring seal from the balance dam.



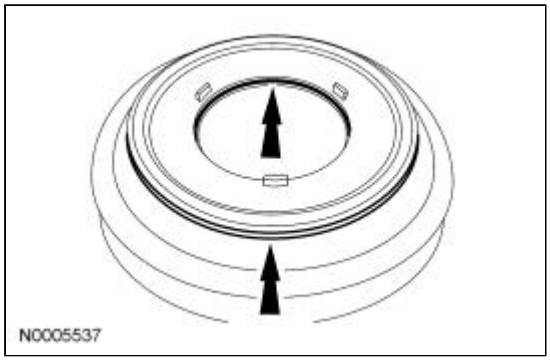
9. Remove the forward clutch return spring.



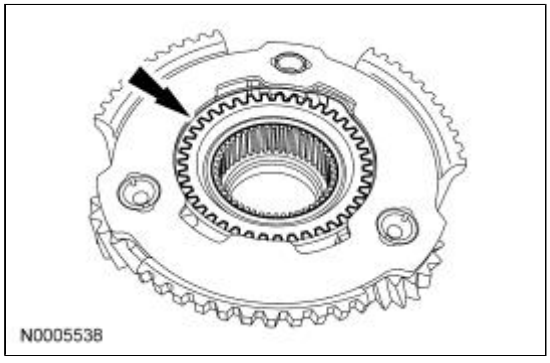
10. Remove the forward clutch piston.



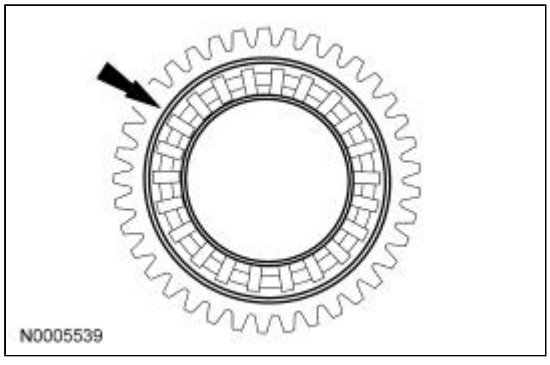
11. Remove and discard the inner and outer piston O-ring seals.



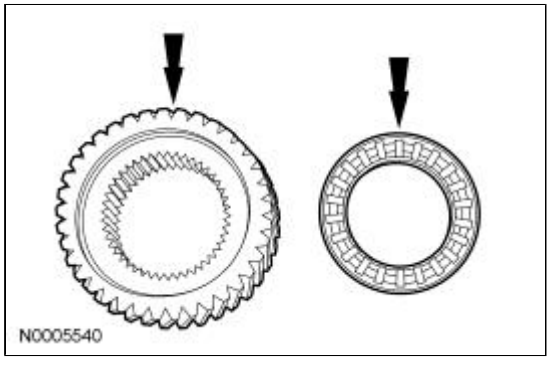
12. Remove the sun gear from the planet assembly.



13. Remove the bearing from the sun gear.

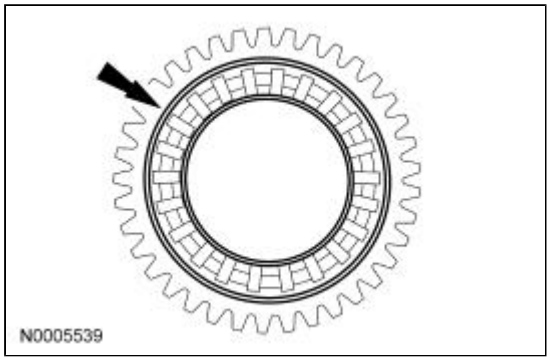


14. Inspect the sun gear and bearing for damage. Install new components if damage is indicated.

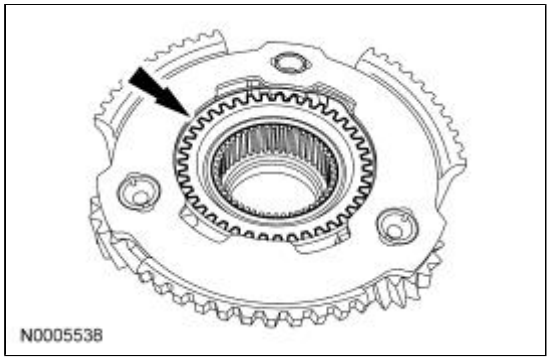


Assembly

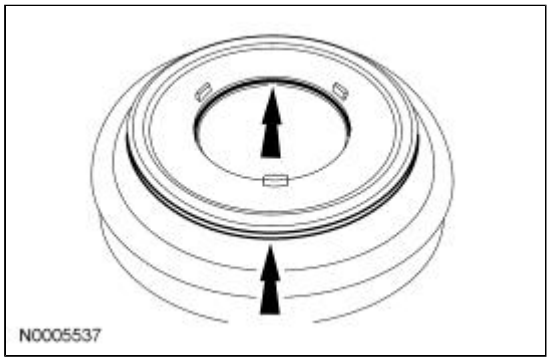
1. Install the bearing onto the sun gear.



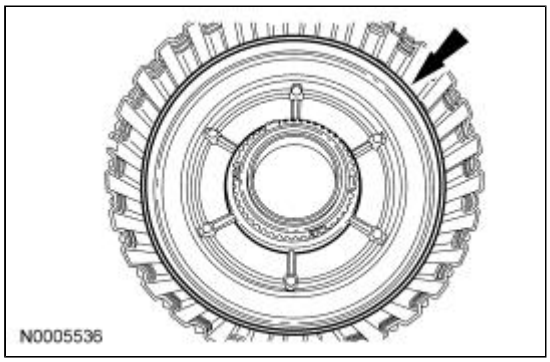
2. Install the sun gear into the planet assembly with the bearing facing down and the recess part of the gear up.



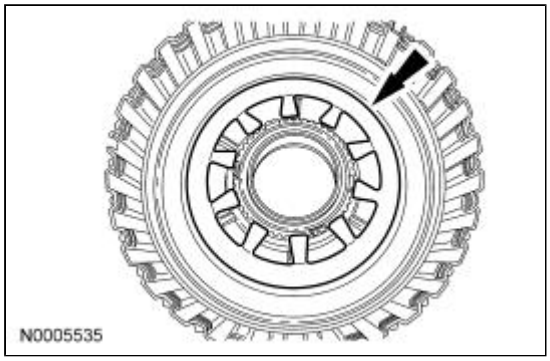
3. Install new O-ring seals onto the forward clutch piston.



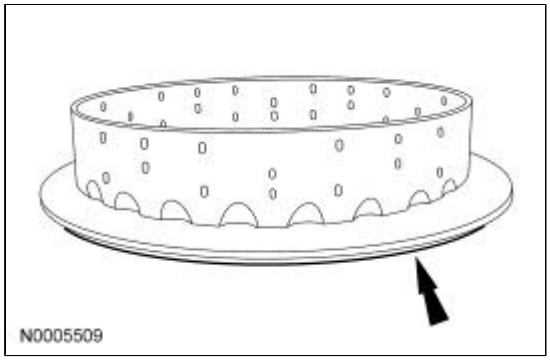
4. Lightly coat the O-ring seals with clean transmission fluid and install the forward clutch piston into the forward clutch drum.



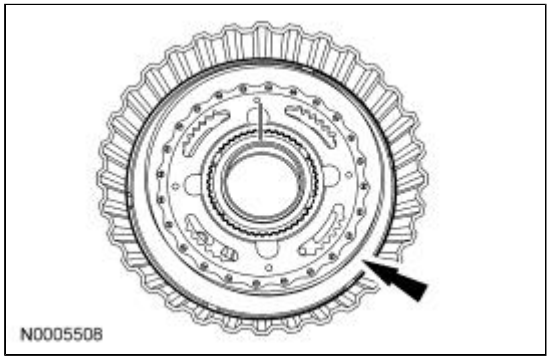
5. Install the forward clutch return spring.



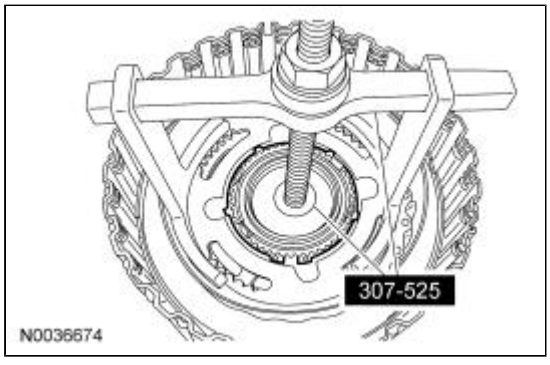
6. Install a new O-ring seal onto the forward clutch balance dam. Lightly coat the O-ring seal with clean transmission fluid.



7. Align the marks made during disassembly and install the balance dam into the forward clutch drum.

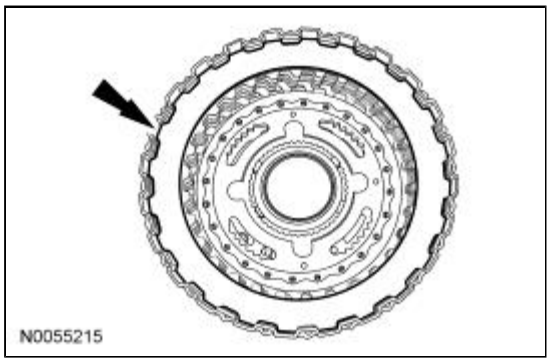


8. Using the special tool, slightly collapse the balance dam to install the retaining ring. Install the retaining ring.

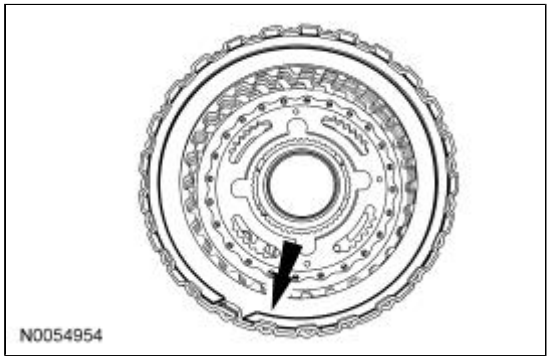


9. **NOTE:** Before assembly, soak the new clutch plates in clean automatic transmission fluid.

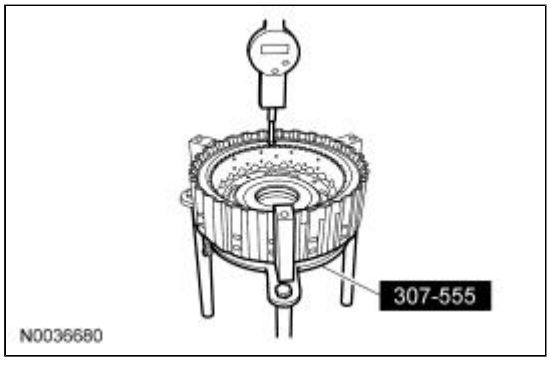
Install the new forward clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates, and ending up with the pressure plate.



10. Install the forward clutch plate snap ring.



11. Install the forward clutch assembly into the special tool.



12. With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

13. Rotate the forward clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

14. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.

- 5.4L engine — 0.71-1.10 mm (0.028-0.043 in).

If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

15. Install the sun gear into forward clutch drum. Make sure that it snaps and locks in place.

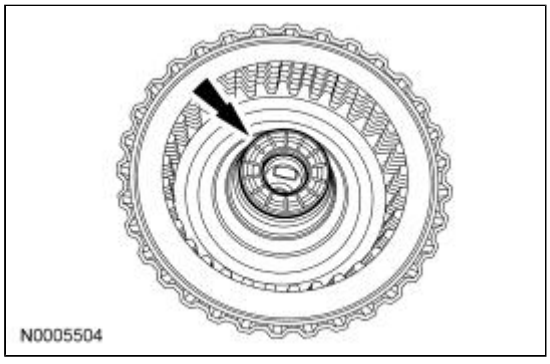
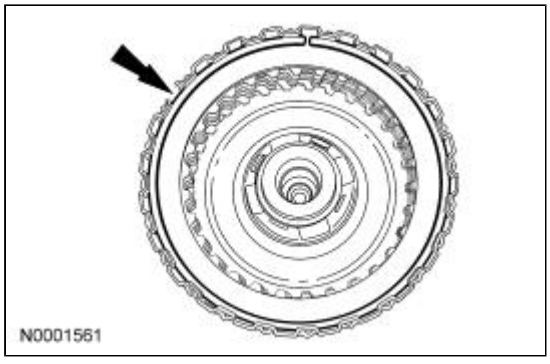
11	7B442	Overdrive clutch external splined clutch plates (steel)
12	7C576	Overdrive pressure plate
13	7M157	Overdrive clutch retaining ring
14	7A453	Bearing T3

Disassembly

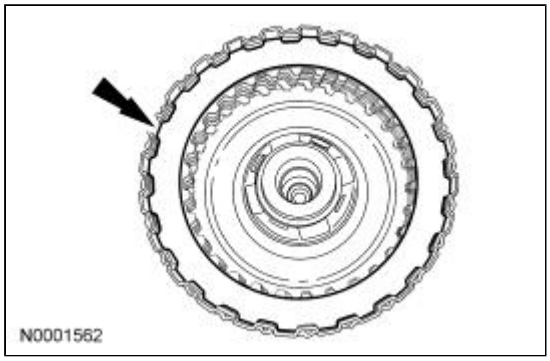
1. Remove the roller bearing.



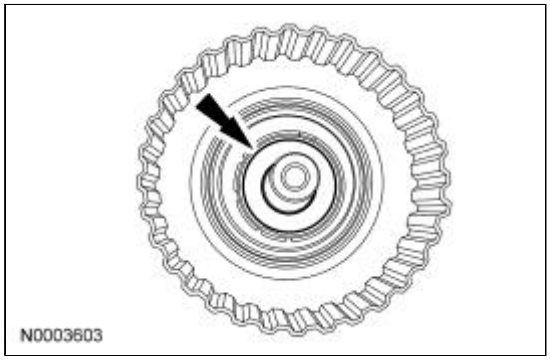
2. Remove the overdrive clutch pack snap ring.



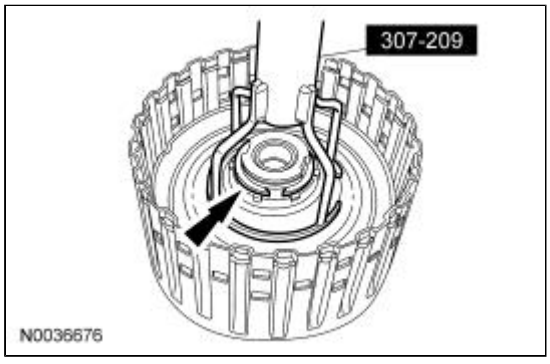
3. Remove the overdrive clutch pack.



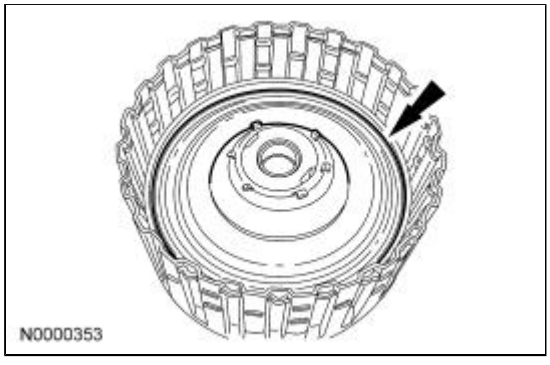
4. If equipped, remove the overdrive clutch thrust washer.



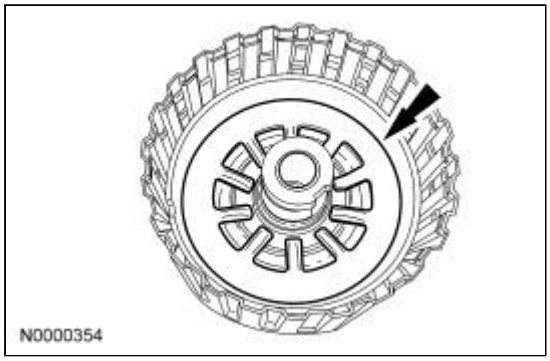
5. Using the special tool and a press, remove the overdrive clutch balance piston retaining ring and spacer.



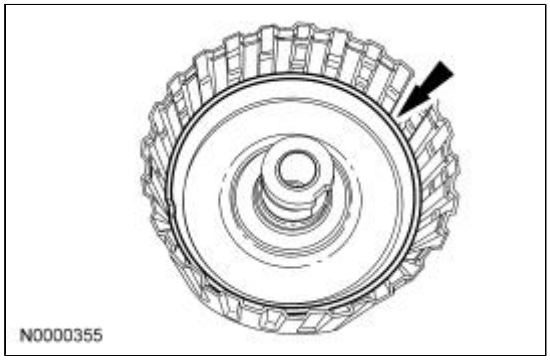
6. Remove the overdrive clutch balance piston.



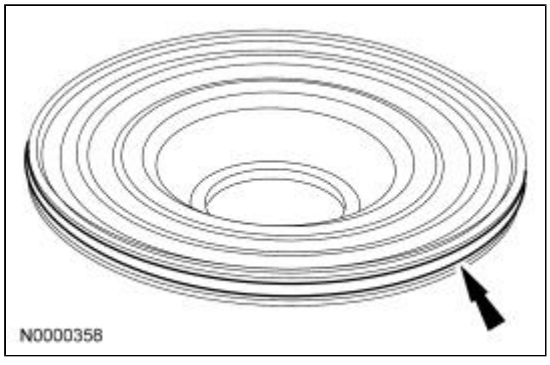
7. Remove the overdrive clutch return spring.



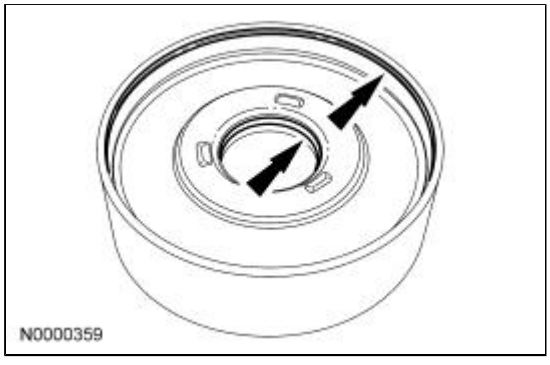
8. Remove the overdrive clutch apply piston.



9. Remove and discard the outer O-ring seal on the overdrive clutch balance piston.

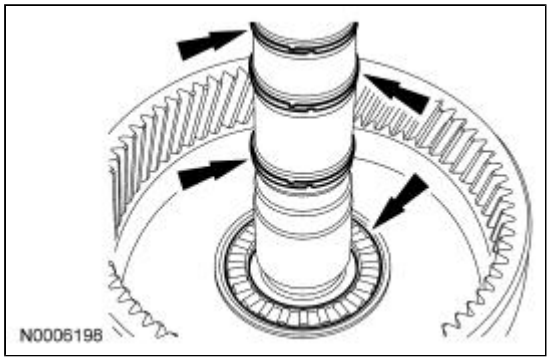


10. Remove and discard both the inner (one large and one small) O-ring seals on the overdrive clutch apply piston.



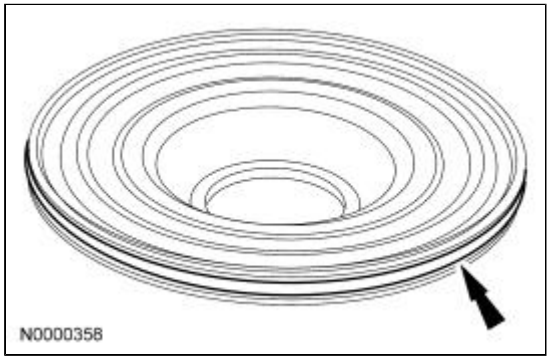
11. **NOTE:** The roller bearing may stick to the forward clutch assembly.

    Remove and discard the 3 square cut seals and the roller bearing.

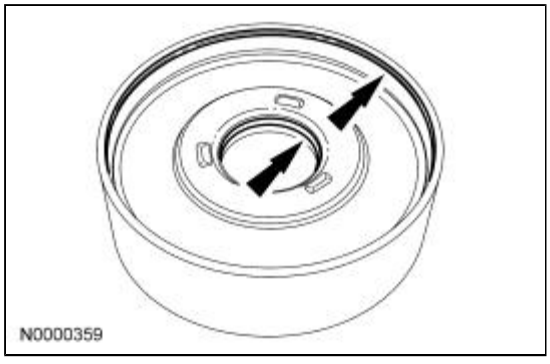


Assembly

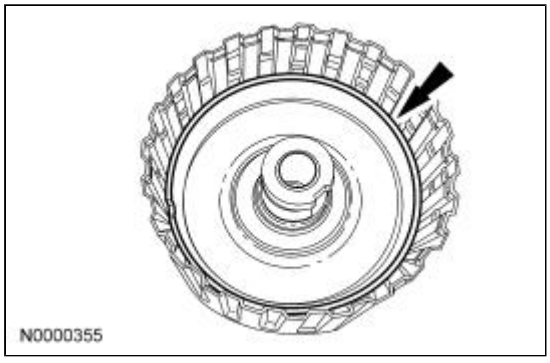
1. Install a new outer O-ring seal on the overdrive clutch balance piston.



2. Install 2 new inner O-ring seals on the overdrive clutch apply piston.

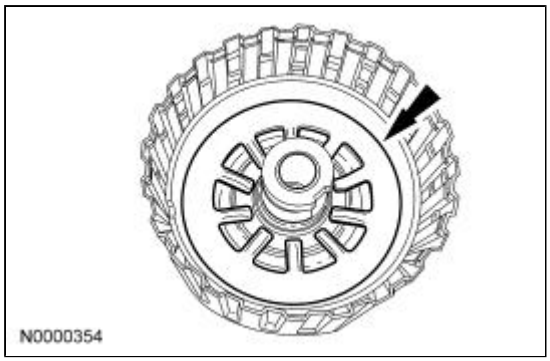


3. Install the overdrive clutch apply piston into the drum with the O-ring seals and the 3 pads facing down toward the drum.



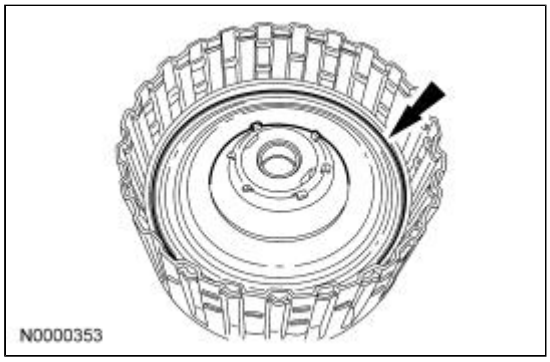
4. **NOTE:** The fingers on the return spring are facing down toward the piston.

Install the overdrive clutch return spring.

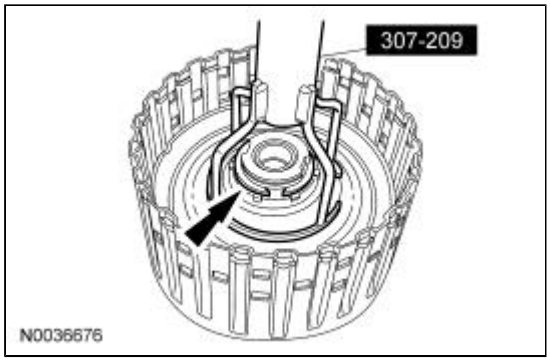


5. **NOTE:** The cone shape of the balance piston must face up when installed correctly.

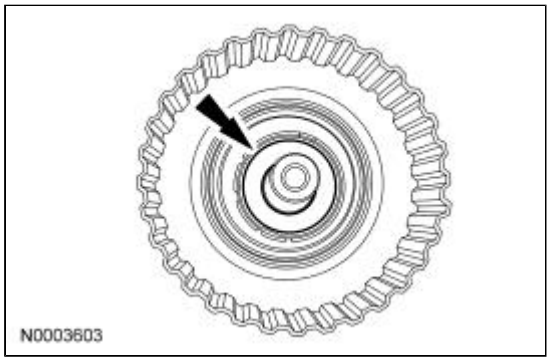
   Install the overdrive clutch balance piston.



6. Using the special tool, install the overdrive clutch balance piston retaining ring.



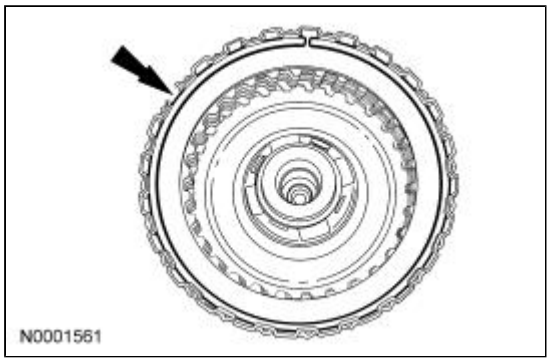
7. If removed, install the overdrive clutch thrust washer.



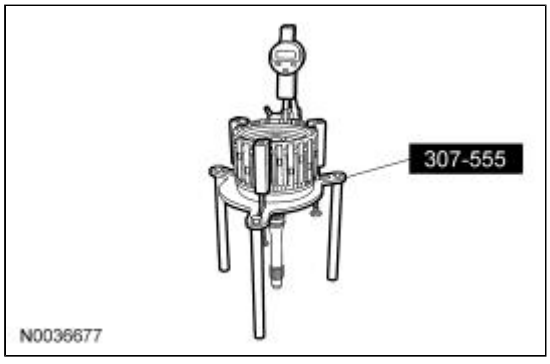
8. **NOTE:** Before assembly, soak the new clutch plates in clean automatic transmission fluid.

   Install the new overdrive clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates, and ending with the pressure plate on the top.

9. Install the overdrive clutch pack snap ring.



10. Install the overdrive clutch assembly into the special tool.



11. With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

12. Rotate the overdrive clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

13. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 5.4L engine — 0.50-0.90 mm (0.020-0.035 in).

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

14. Install a new roller bearing.

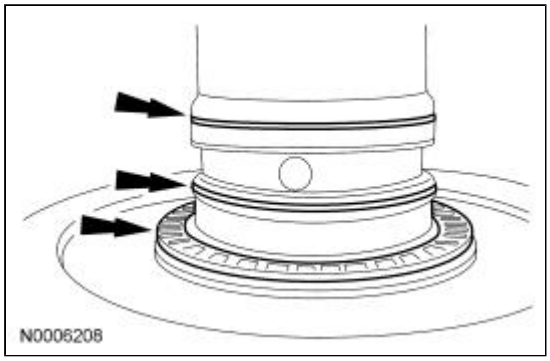
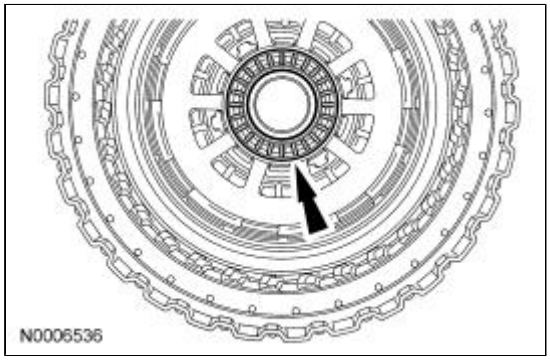
16	7B399	Seal rings
17	—	Roller bearing
18	—	Seal ring

Disassembly

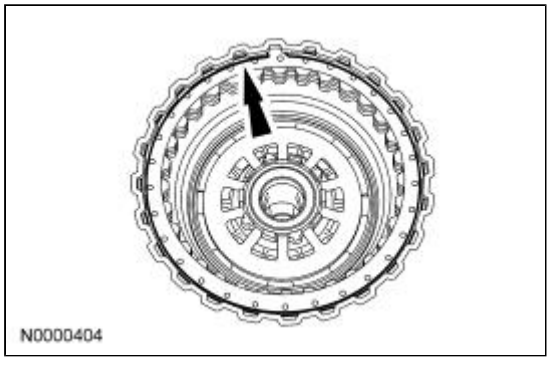
1. Remove and discard the 2 square cut seals and the roller bearing.



2. Remove the upper roller bearing.

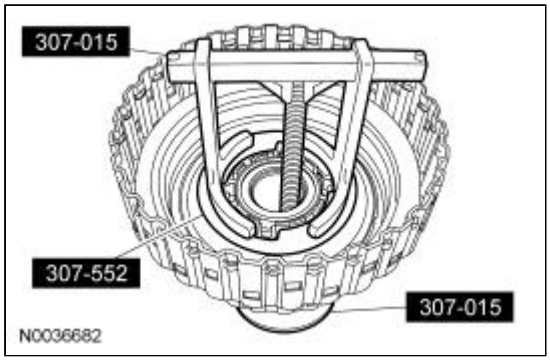


3. Remove the direct clutch snap ring.

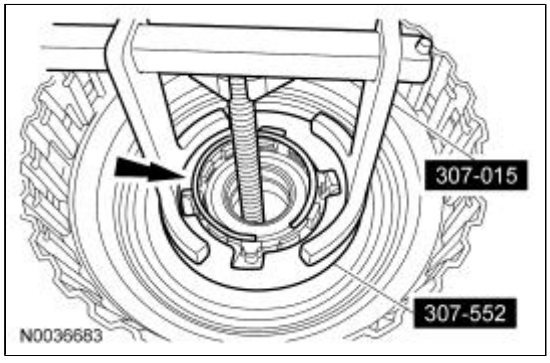


4. Remove the steel and friction direct clutch plates.

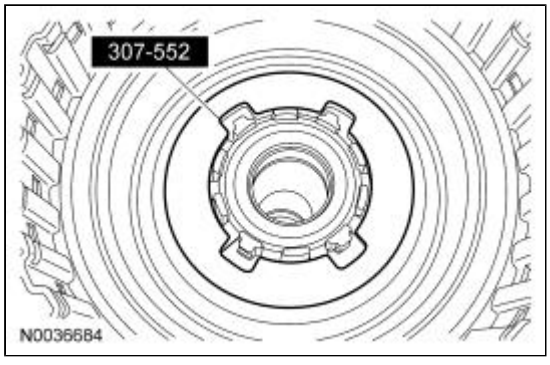
5. Install the special tools onto the direct clutch assembly.



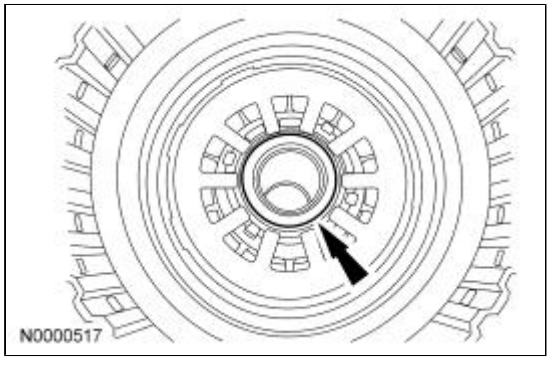
6. Using the special tool, remove the direct clutch return spring retainer.



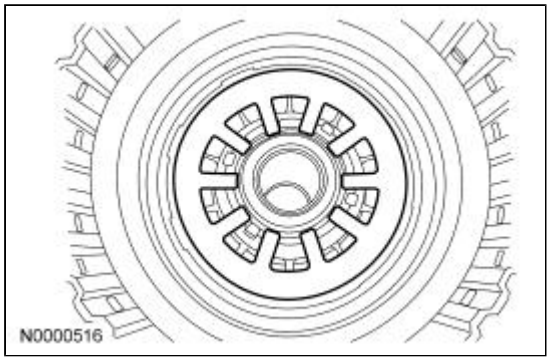
7. Remove the special tool.



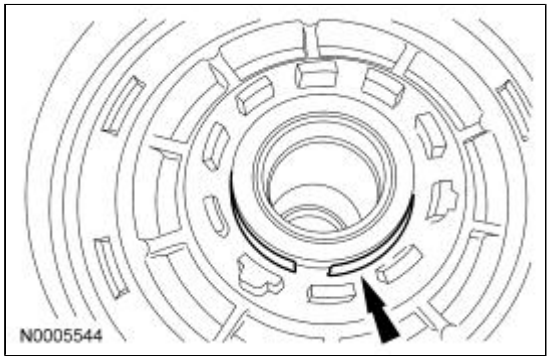
8. Remove the direct clutch return spring washer.



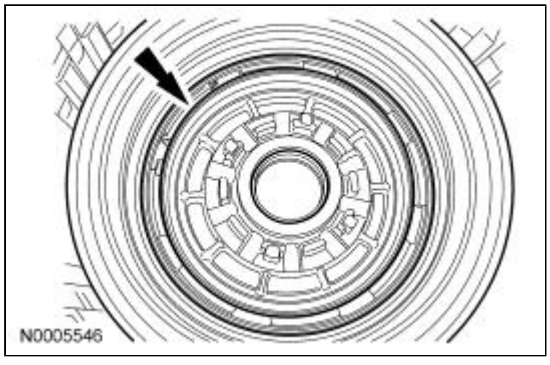
9. Remove the direct clutch return spring.



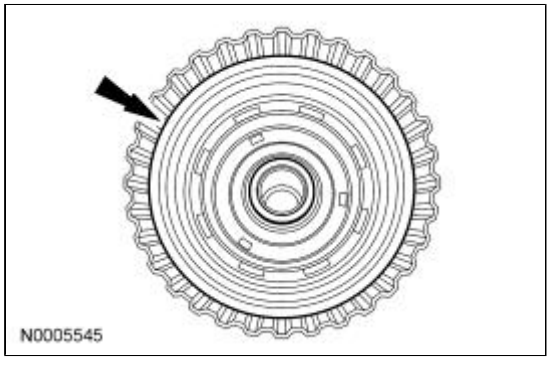
10. Slightly press down on the balance piston and remove the snap ring.



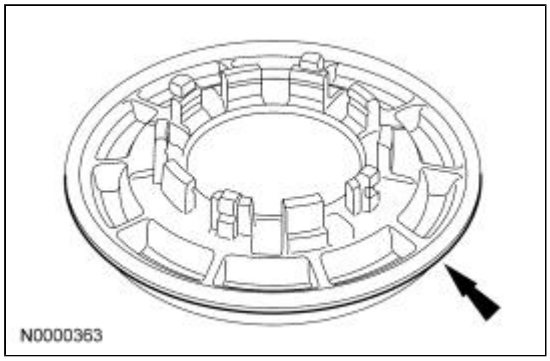
11. Remove the baffle plate from the direct clutch piston.



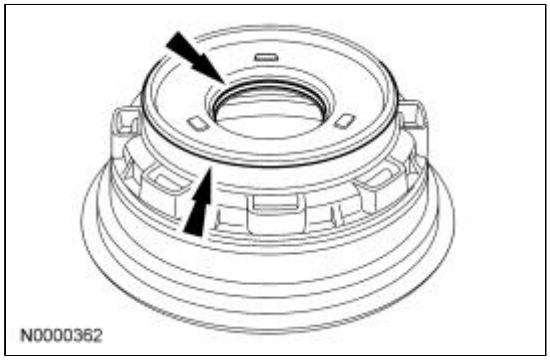
12. Remove the direct clutch piston.



13. Remove and discard the outer O-ring seal from the balance piston.



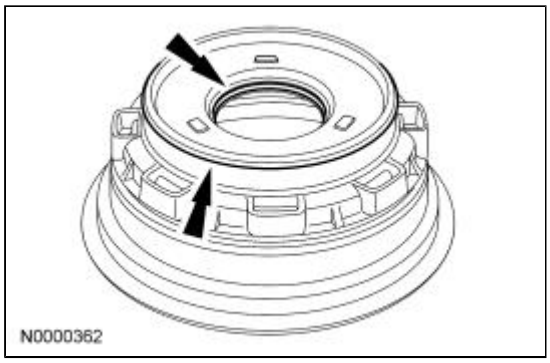
14. Remove and discard the outer and inner O-ring seal from the apply piston.



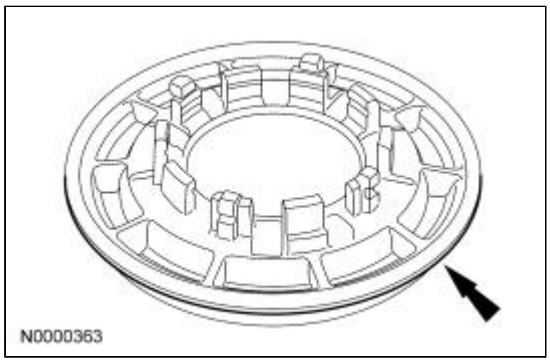
15. Inspect the direct clutch drum for damage. If damage is indicated, install a new direct clutch drum.

Assembly

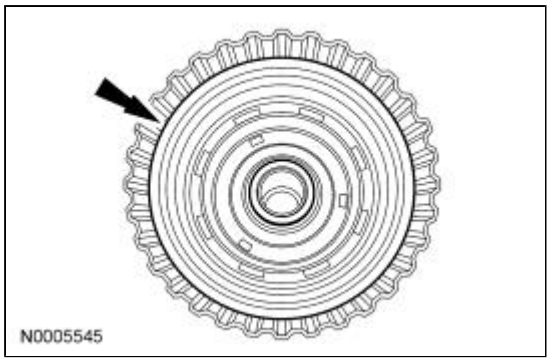
1. Install a new inner and outer O-ring seal on the apply piston.



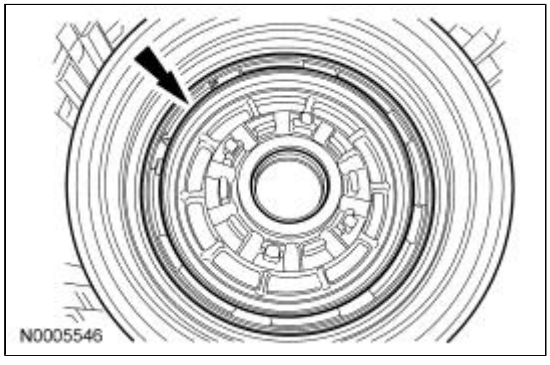
2. Install a new outer O-ring seal on the balance piston.



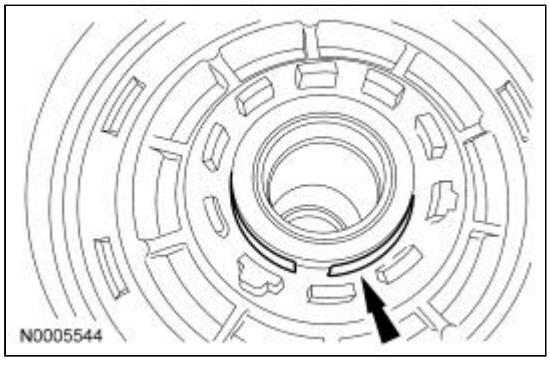
3. Lightly coat the O-ring seals in clean transmission fluid and install the direct clutch piston.



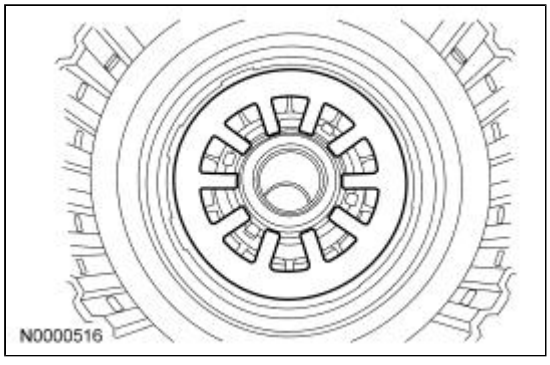
4. Lightly coat the O-ring seals in clean transmission fluid and install the apply piston into the direct clutch balance piston.



5. Slightly press down on the balance piston and install the snap ring.

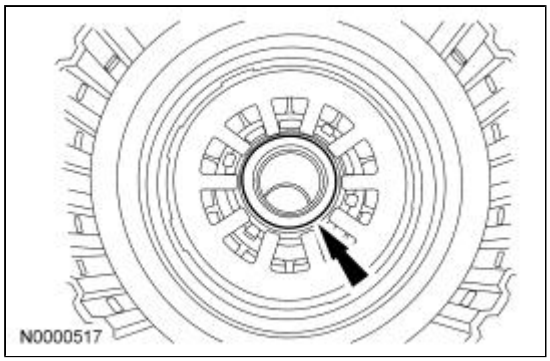


6. Install the direct clutch return spring.

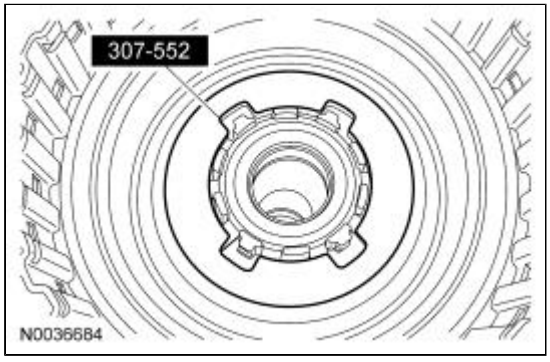


7. **NOTE:** When installing the washer, the stepped edge must face upward.

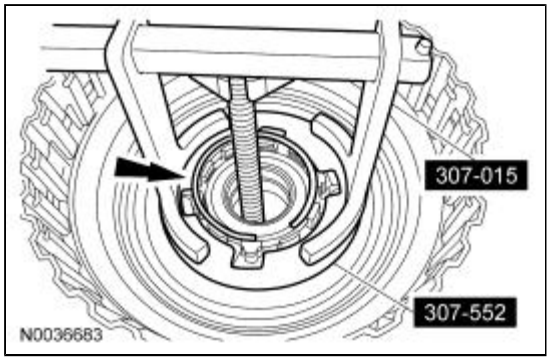
Install the direct clutch return spring washer.



8. Install the special tool.



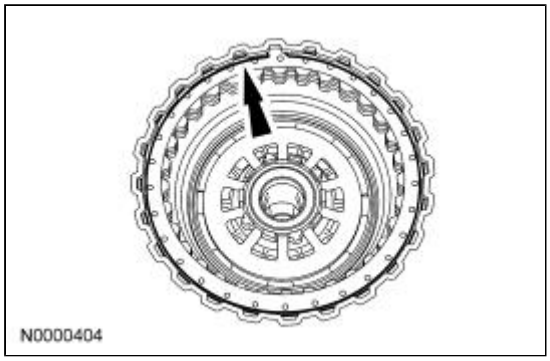
9. Using the special tool, install the direct clutch return spring retainer.



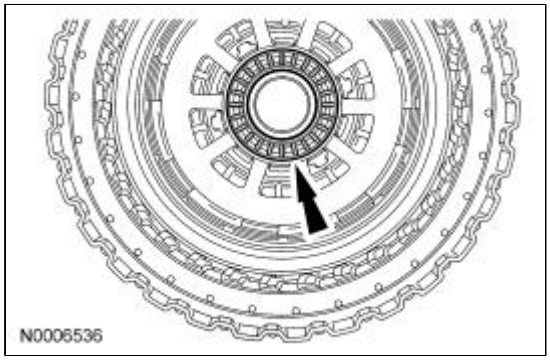
10. **NOTE:** Before assembly, soak the new clutch plates in clean automatic transmission fluid.

    Install the new direct clutch plates, starting with the wave spring then a steel plate and alternating between steel and friction plates, and ending with the pressure plate on the top.

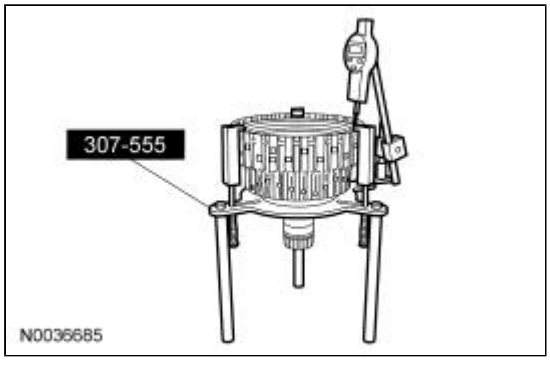
11. Install the direct clutch snap ring.



12. Install a new roller bearing.



13. Install the direct clutch assembly into the special tool.



14. With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

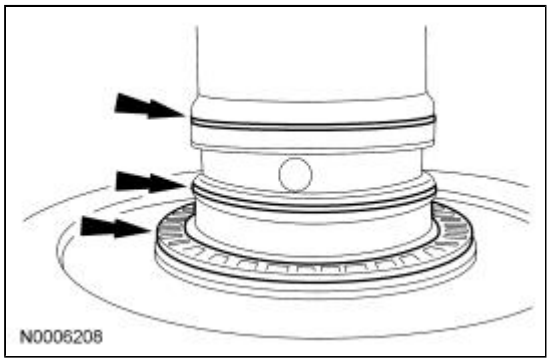
15. Rotate the direct clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

16. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 5.4L engine 0.50-1.30 mm (0.020-0.051 in).

If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

17. Install new square cut seals and roller bearing.



Intermediate Clutch Assembly

Printable View (504 KB)

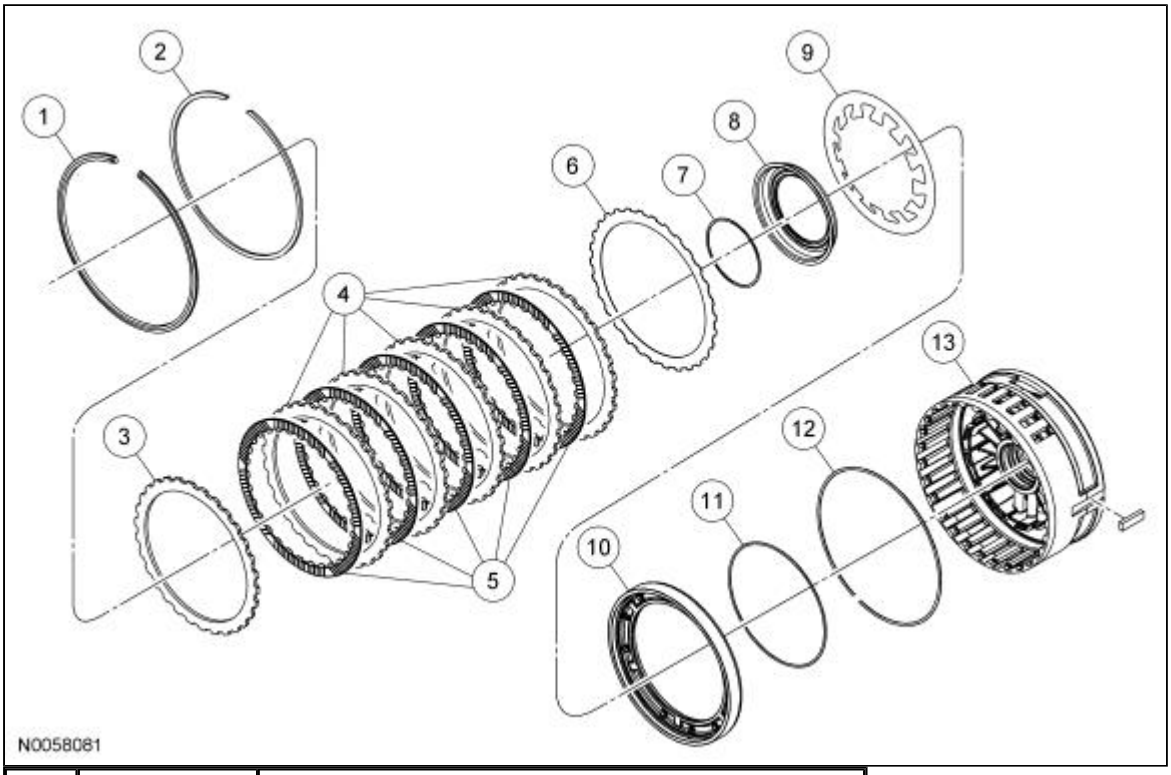
Special Tool(s)

ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
ST2881-A	Piston Spring Compressor 307-525
ST2892-A	Clutch Pack End Play Gauge 307-555

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

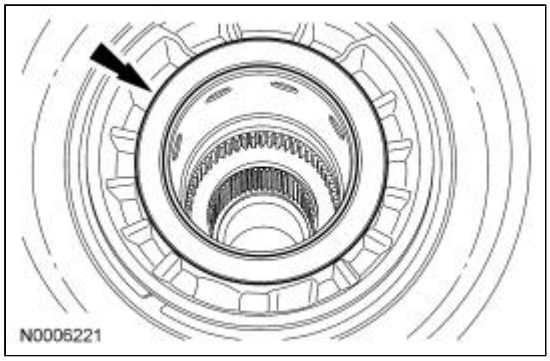
Intermediate Clutch Assembly



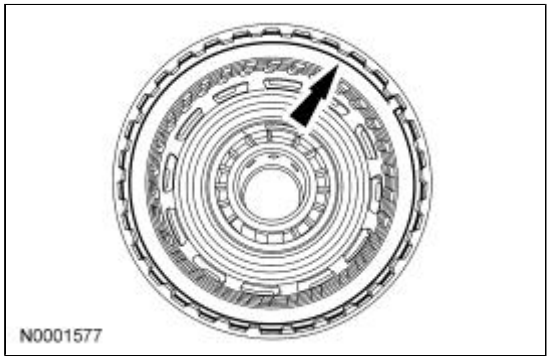
Item	Part Number	Description
1	7L327	Intermediate clutch assembly case retaining ring
2	7B421	Intermediate clutch pack retaining ring
3	7E314	Pressure plate
4	—	Intermediate clutch internal splined friction plates
5	7E314	Intermediate clutch external splined steel plates
6	7H136	Wave spring
7	7N169	Intermediate clutch snap ring
8	7B043	Intermediate clutch return spring retaining ring
9	7C151	Intermediate clutch return spring
10	7J015	Intermediate clutch piston
11	7F225	Intermediate clutch piston inner seal
12	7F224	Intermediate clutch piston outer seal
13	7G033	Intermediate/low/reverse clutch cylinder

Disassembly

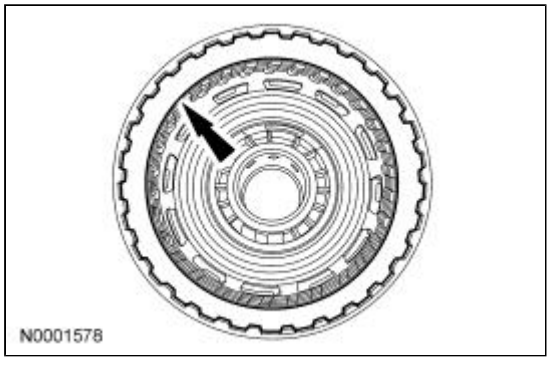
1. Remove the bearing race.



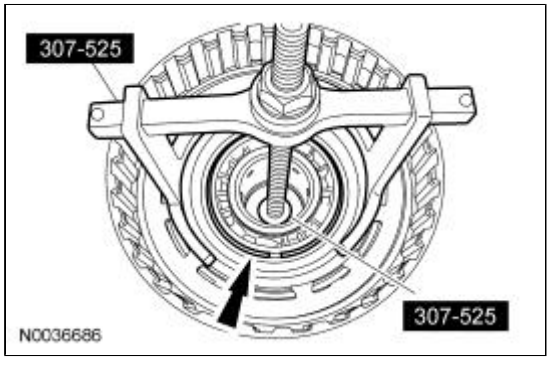
2. Remove the intermediate clutch plate snap ring.



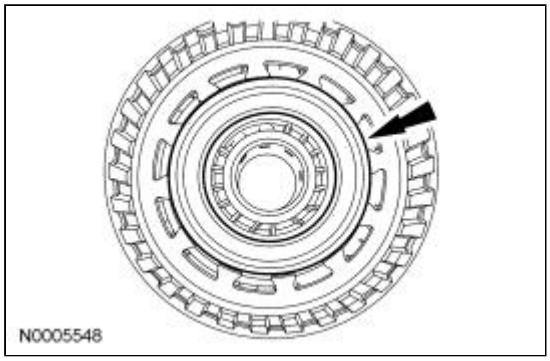
3. Remove the intermediate clutch plates, friction and steel, from the intermediate clutch cylinder.



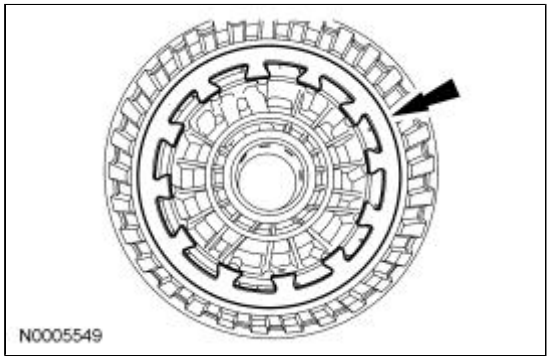
4. Using the special tool, remove the intermediate clutch return spring retainer.



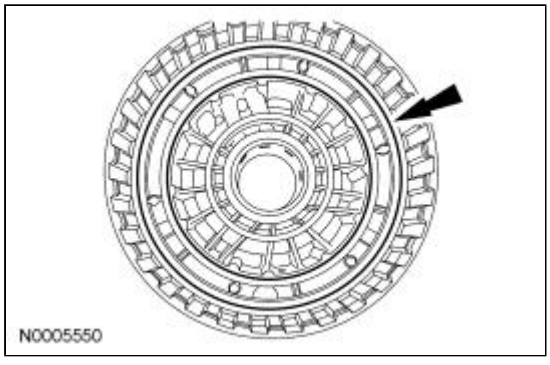
5. Remove the intermediate clutch return spring top plate.



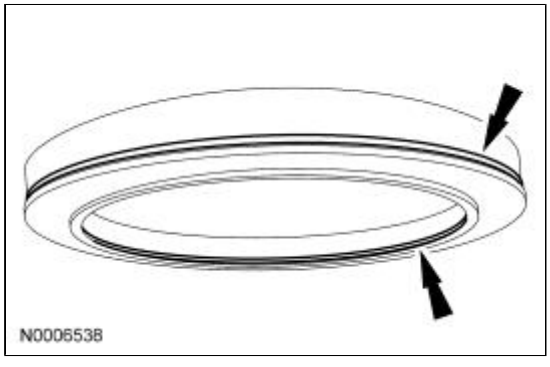
6. Remove the intermediate clutch return spring.



7. Remove the intermediate clutch piston.

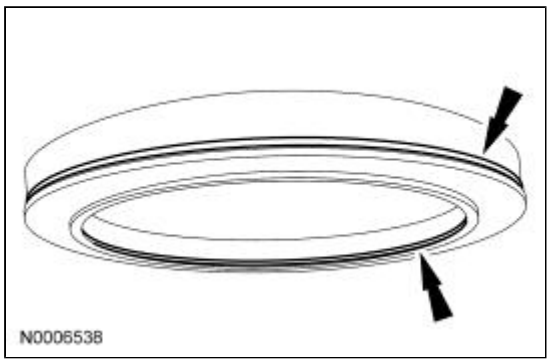


8. Remove and discard the inner and outer intermediate clutch piston O-ring seals.

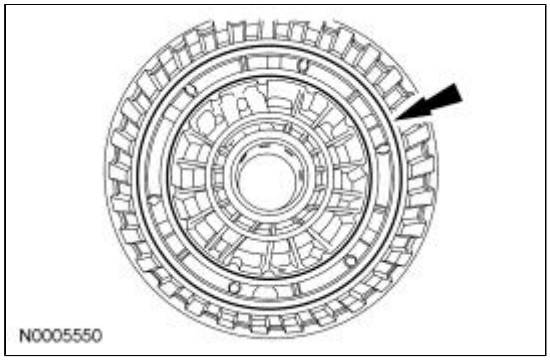


Assembly

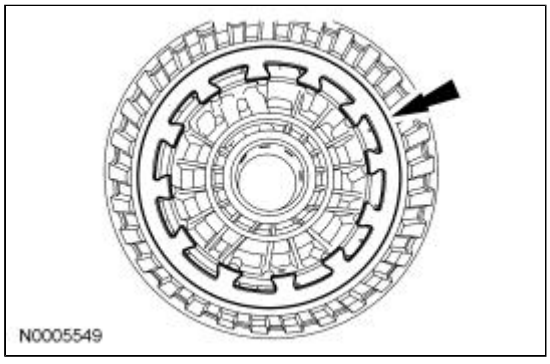
1. Install new inner and outer intermediate clutch piston O-ring seals.



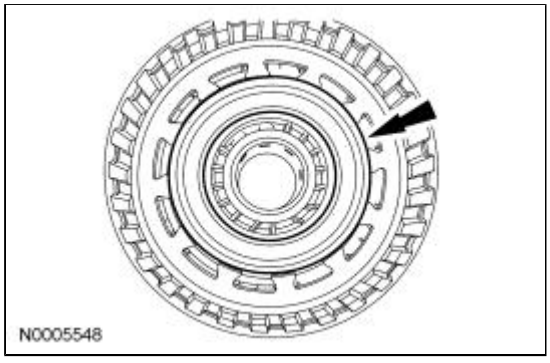
2. Lightly coat the O-ring seals in clean automatic transmission fluid and install the intermediate clutch piston.



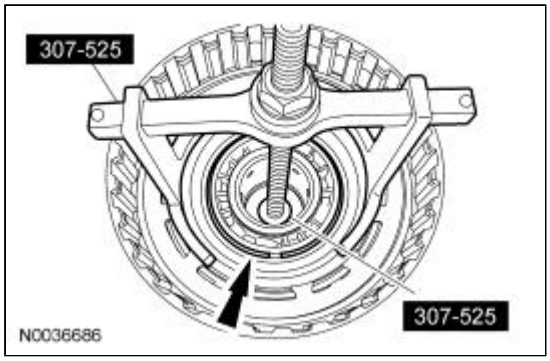
3. Install the intermediate clutch return spring.



4. Install the intermediate clutch return spring top plate.



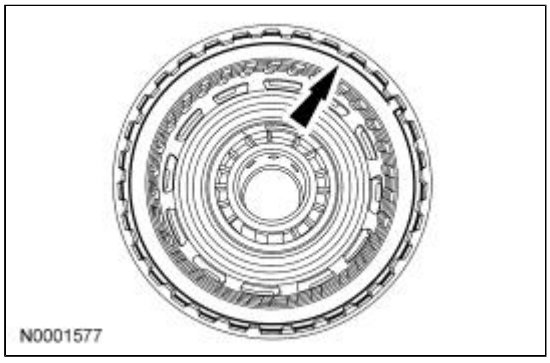
5. Using the special tool, install the intermediate clutch return spring retainer.



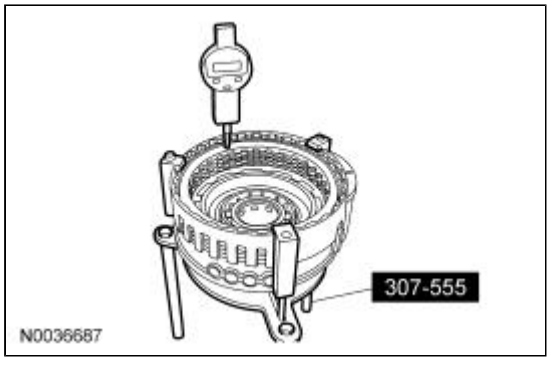
6. **NOTE:** Before assembly, soak the new clutch plates in clean automatic transmission fluid.

   Install the new intermediate clutch plates, starting with the wave spring then a steel plate and alternating between and fiber and steel plates, and ending with the pressure plate.

7. Install the intermediate clutch plate snap ring.



8. Install the intermediate clutch drum into the special tool.



9. With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

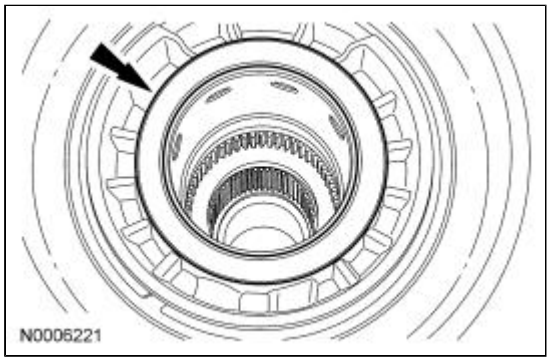
10. Rotate the direct clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

11. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 5.4L engine 0.71-1.10 mm (0.028-0.043 in).

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

12. Install the bearing race.



Low/Reverse Clutch Assembly

Printable View (632 KB)

Special Tool(s)

ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

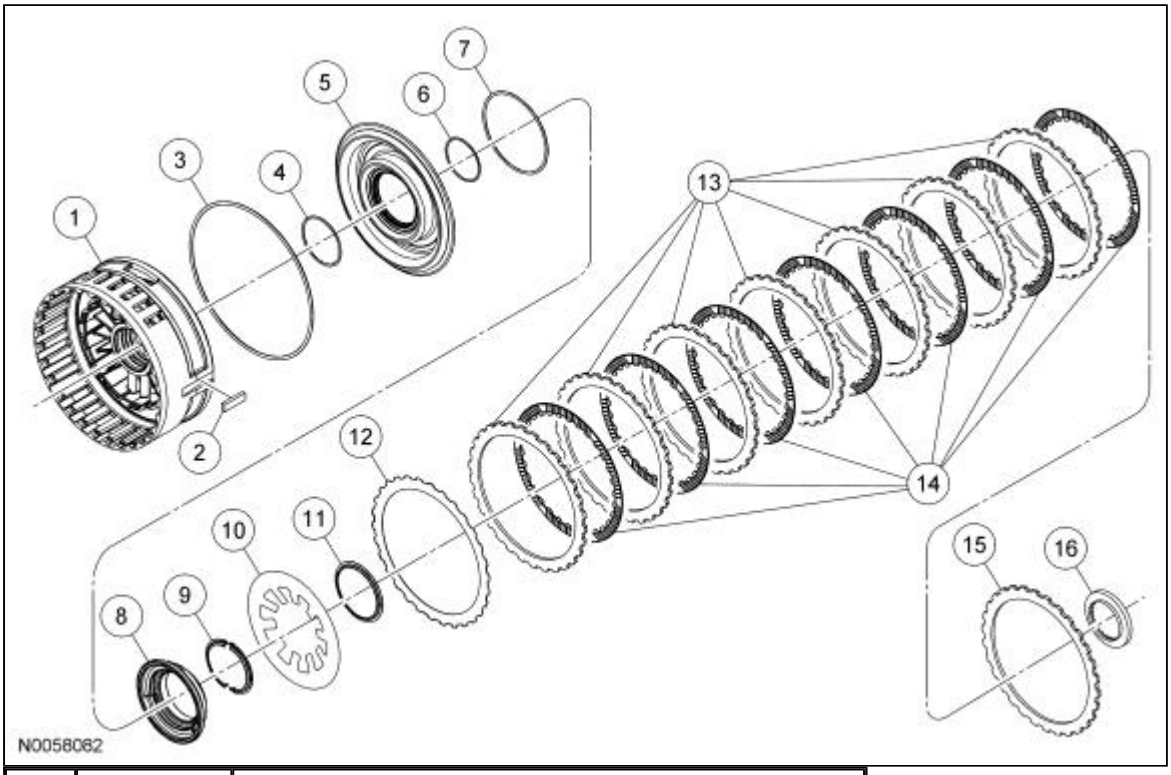
ST2881-A	Piston Spring Compressor 307-525
 ST2896-A	D-Clutch Stack-up Gauge 307-554

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Low/Reverse Clutch Assembly

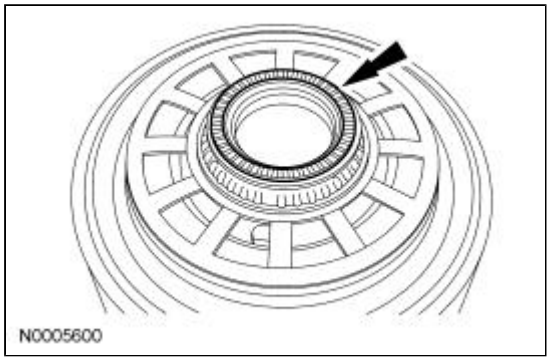


Item	Part Number	Description
1	7G033	Intermediate/low/reverse clutch cylinder
2	7J135	Center support keys (2 required)
3	7G446	Low/reverse clutch cylinder outer seal
4	7G444	Low/reverse clutch cylinder inner seal
5	7D343	Low/reverse clutch piston
6	—	Low/reverse clutch piston inner seal
7	—	Low/reverse clutch baffle plate outer seal
8	—	Low/reverse clutch baffle plate
9	—	Low/reverse clutch baffle plate retaining ring
10	7D404	Return spring
11	7G494	Return spring retainer
12	7N572	Pressure plate (internal to case)
13	7E314	Low/reverse clutch external splined steel plates (internal to case)
14	7B164	Low/reverse clutch internal splined friction plates (internal to case)
15	7E314	Wave spring (internal to case)
16	—	Roller bearing

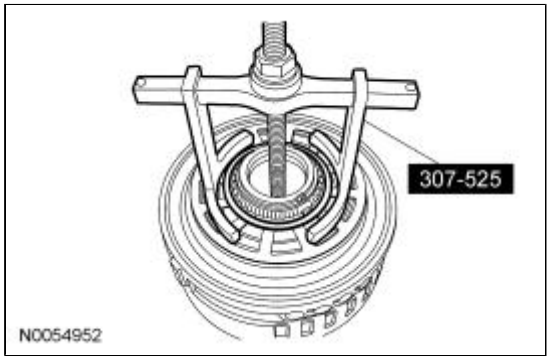
Disassembly

NOTE: The low/reverse clutch plates are installed in the case during the assembly procedure.

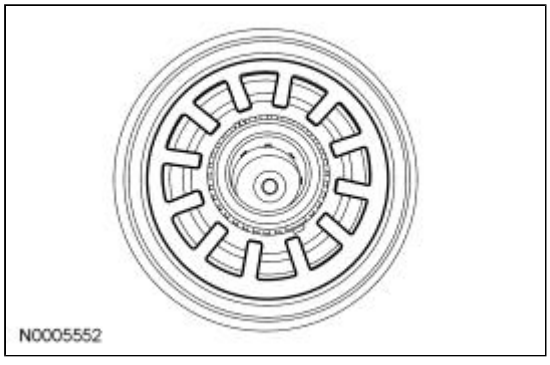
1. Remove the roller bearing on the center support.



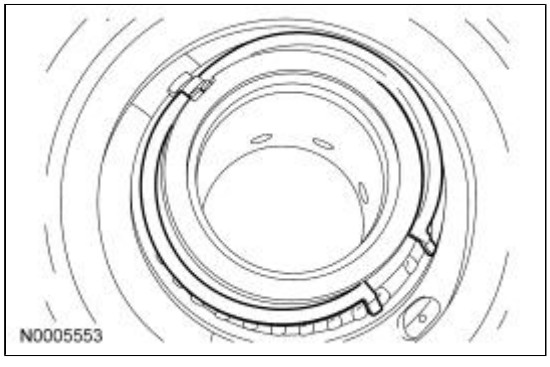
2. Using the special tool, remove the retaining ring.



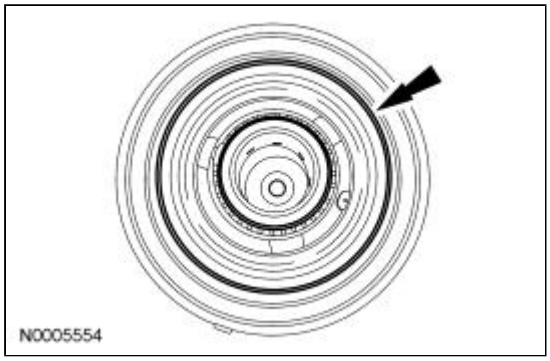
3. Remove the low/reverse clutch return spring.



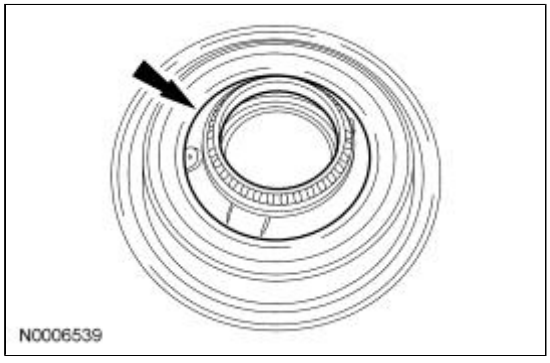
4. Remove the low/reverse clutch baffle plate retainers.



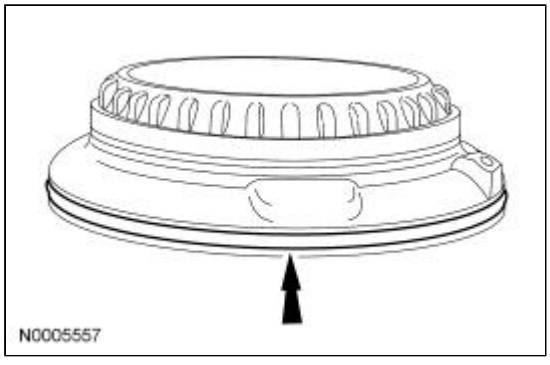
5. Remove the low/reverse clutch baffle plate and piston from the low/reverse clutch drum.



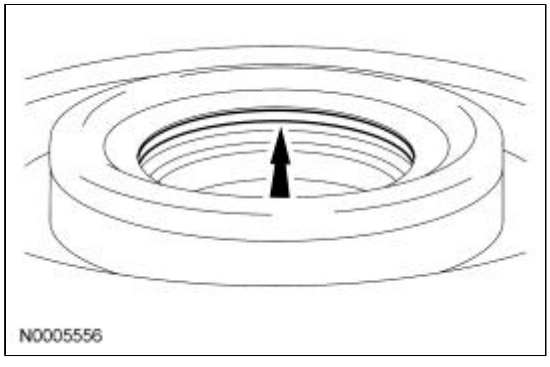
6. Separate the low/reverse clutch baffle plate from the piston.



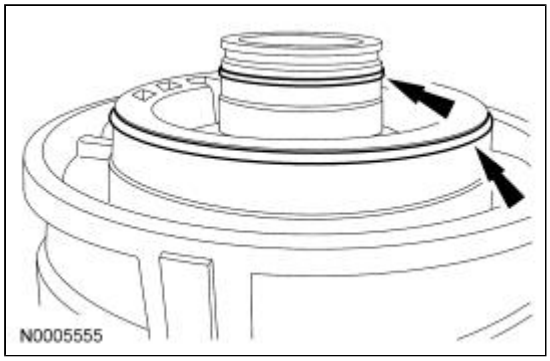
7. Remove and discard the low/reverse clutch baffle plate outer O-ring seal.



8. Remove and discard the low/reverse inner piston O-ring seals.



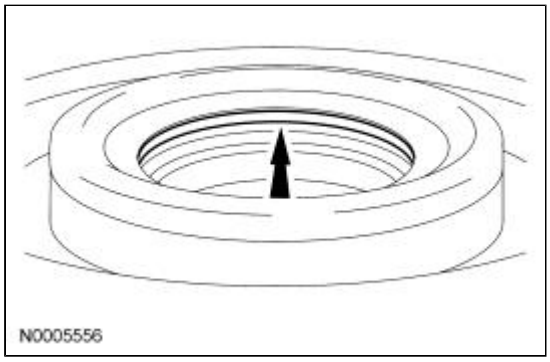
9. Remove and discard the low/reverse drum O-ring seal.



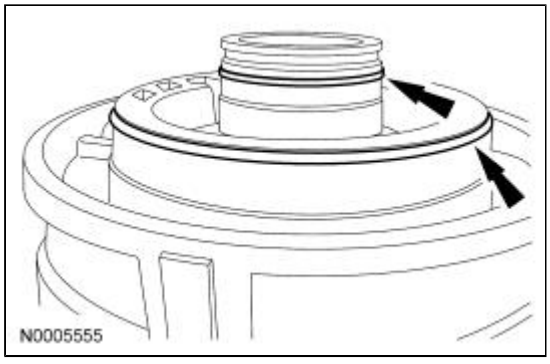
Assembly

Low/reverse piston

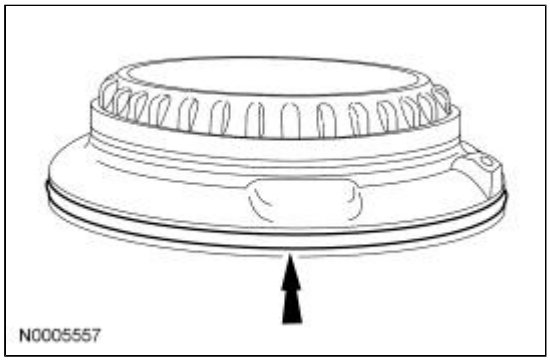
1. Install a new low/reverse inner piston O-ring seals.



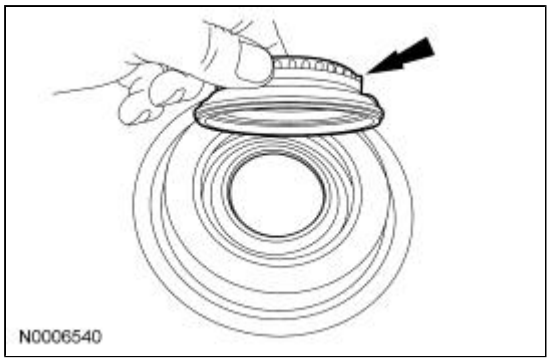
2. Install new low/reverse drum O-ring seal.



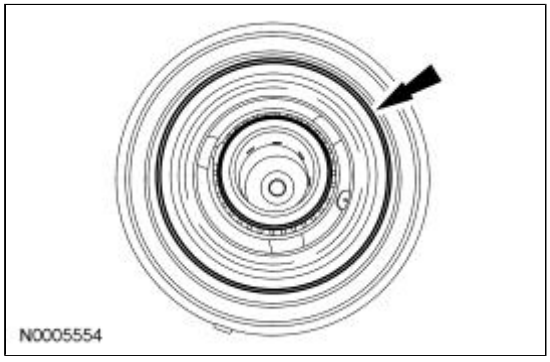
3. Install a new low/reverse clutch baffle plate outer O-ring seal.



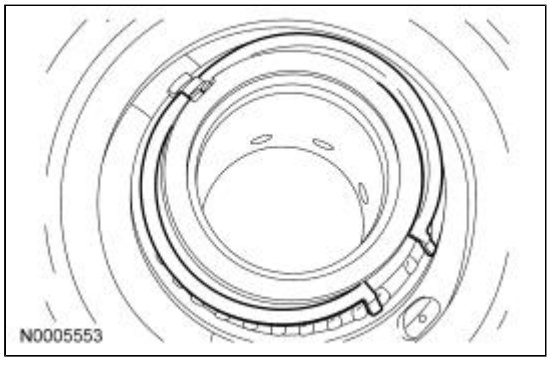
4. Install the low/reverse clutch baffle plate in the low/reverse piston.



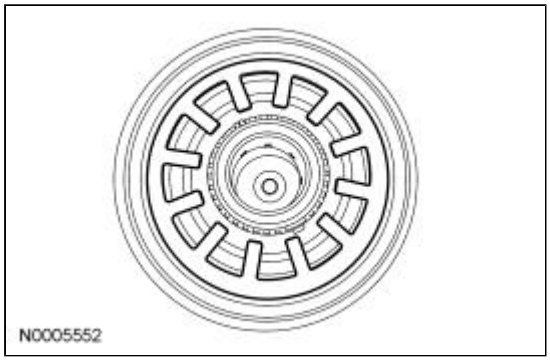
5. Lubricate the O-ring seal with clean automatic transmission fluid, and install the low/reverse piston.



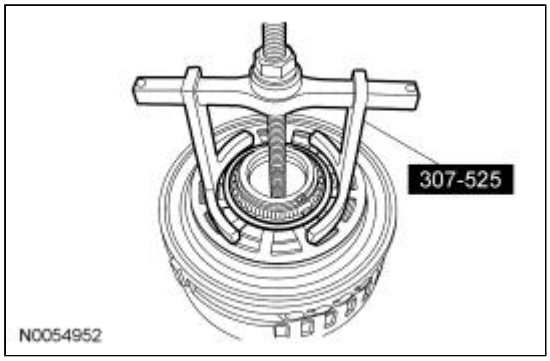
6. Install the low/reverse clutch baffle plate retainers.



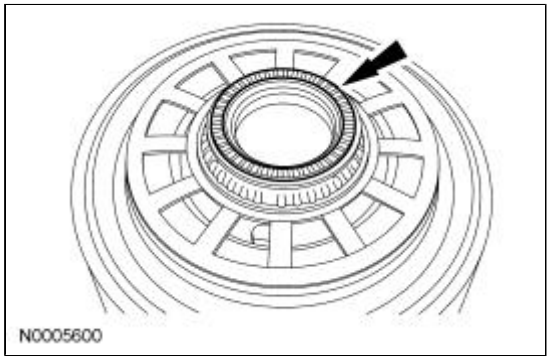
7. Install the low/reverse clutch return spring.



8. Using the special tool, install the retaining ring.



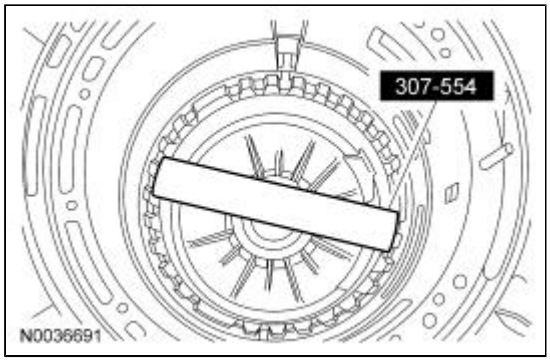
9. Install a new roller bearing on the center support.



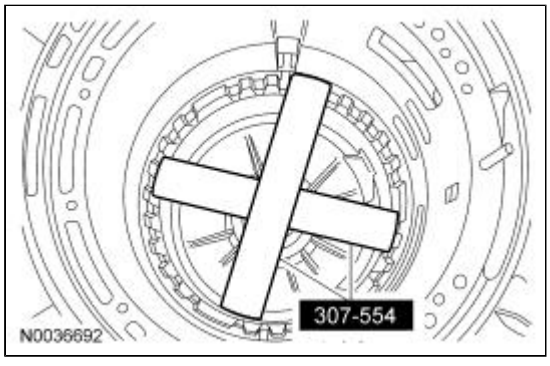
Low/reverse clutch stackup

10. **NOTE:** All intermediate clutch plates friction and steel are of a wave-type design.

    Install the special tool into the case.

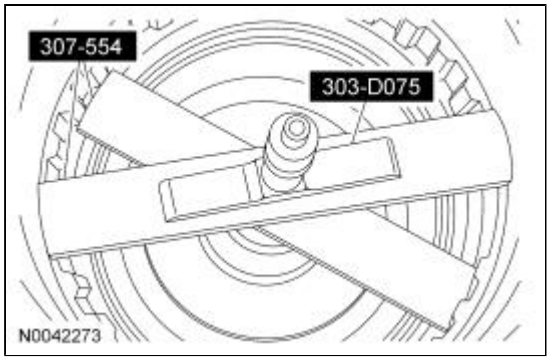


11. Install the special tool into the case as shown.



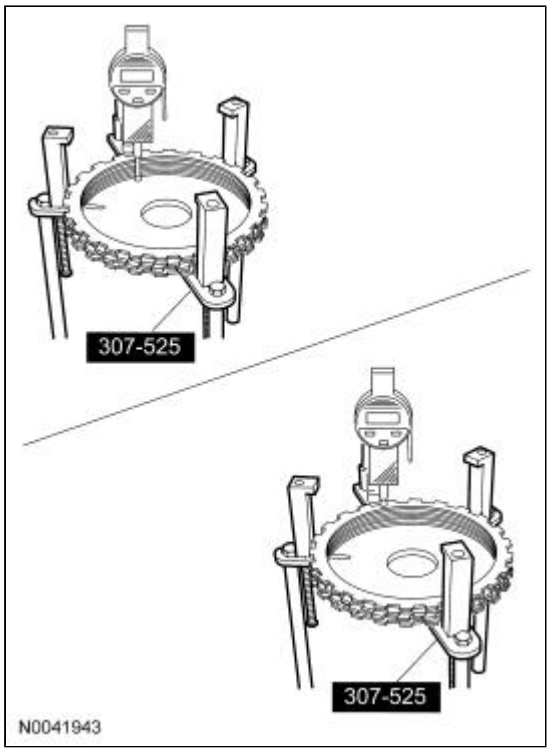
12. Measure case stop depth.

Description	Reading
Measure the distance from the top of the upper gauge bar to the top of the lower gauge bar. Record this reading as the case measurement. Record as reading A	



13. Measure the clutch pack height.

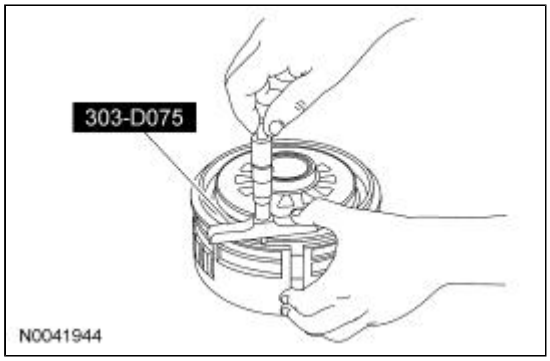
	Description	Reading
A.	Place the clutch pack with the pressure plate on to the special tool with the wave spring down. Slide the clutch off to the side so the probe of the dial indicator is touching the gauge plate of the special. Zero out the dial indicator.	
B.	Carefully lift the probe up enough to slide the clutch pack under the probe to take a reading. Record this reading. Rotate the clutch pack 180 degrees and take a second reading. Add the first and second readings together and divide the total by 2. Record this reading as B.	



14. Measure the piston to center support shoulder height.

Description	Reading

Measure the piston to center support shoulder height. Record this measurement. Rotate the center support 180 degrees and record this measurement. Add the first and the second measurements, then divide by 2. Record this as reading C.	



15. Calculate the end clearance.

Description	Reading
Total C measurement	
Subtract B and C from A to determine end clearance	
Minimum end clearance specification	5.08 mm (0.200 in)
Maximum end clearance specification	5.73 mm (0.226 in)

Compare the end clearance to the specification. If the end clearance is out of specification, select the next thinner or thicker plate as required and repeat Steps 10, 11 and 12.

Pump Assembly

Printable View (280 KB)

Special Tool(s)

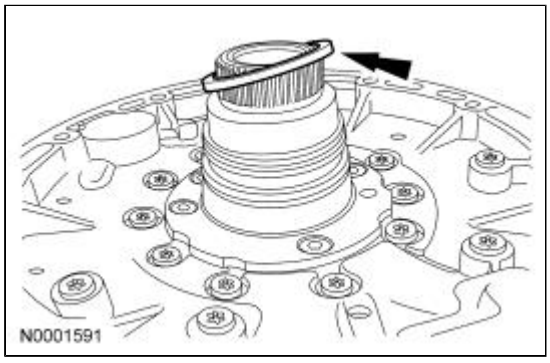
ST2887-A	Installer, Fluid Pump Seal 307-556

Material

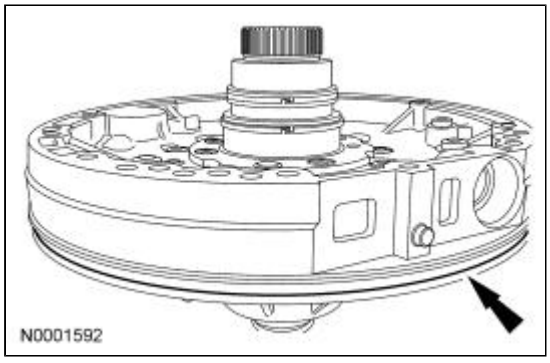
Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Disassembly

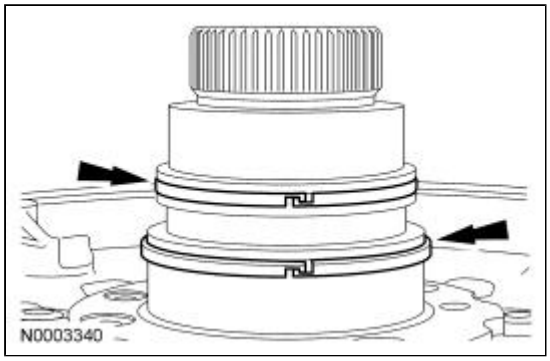
1. Remove the front pump washer.



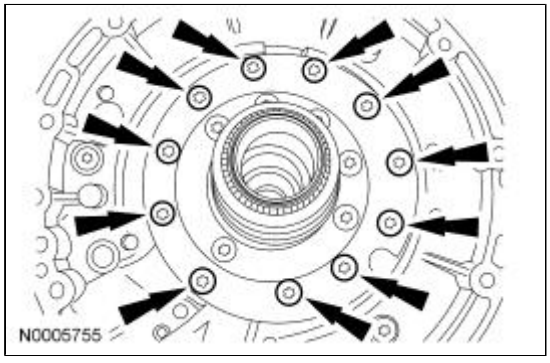
2. Remove and discard the front pump O-ring seal.



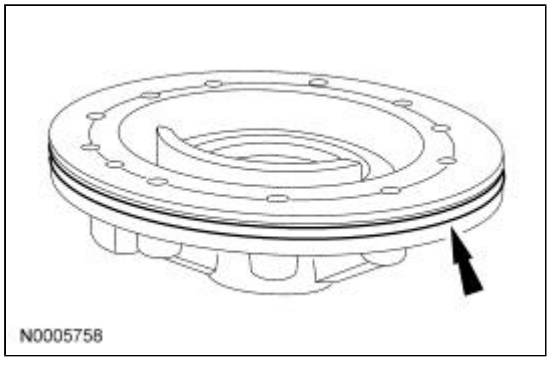
3. Remove and discard the front pump stator support seals.



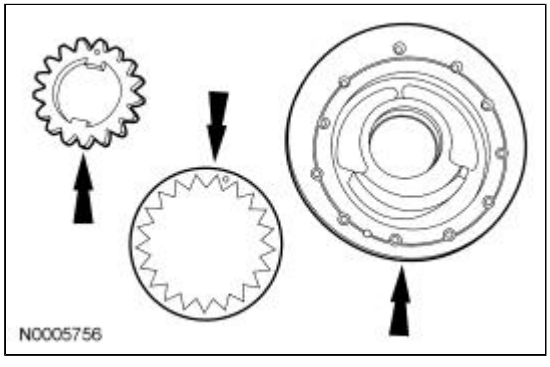
4. Remove the 11 bolts and separate the pump control body from the pump body.



5. Remove and discard the pump body outer seal.



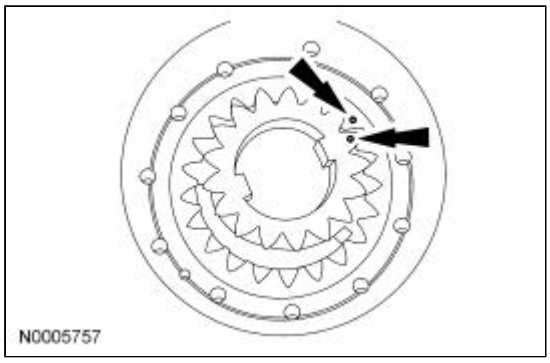
6. Remove and inspect the inner and the outer pump gears.
    - Clean all pump parts in solvent.
    - Dry the parts with compressed air.
    - Inspect the pump gears, faces, gear teeth, pump housing and mating surfaces for damage or scoring.
    - Install a new pump if any of the parts are damaged or worn.



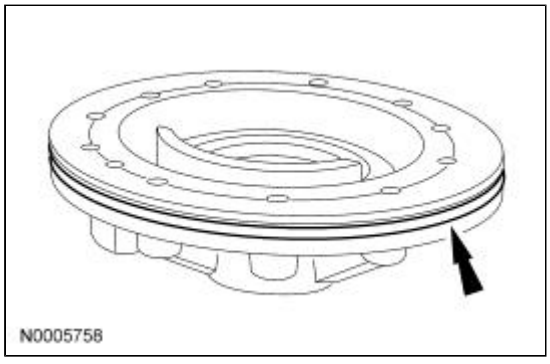
Assembly

1. **NOTE:** Prior to installation, lightly lubricate the pump gears with clean automatic transmission fluid.

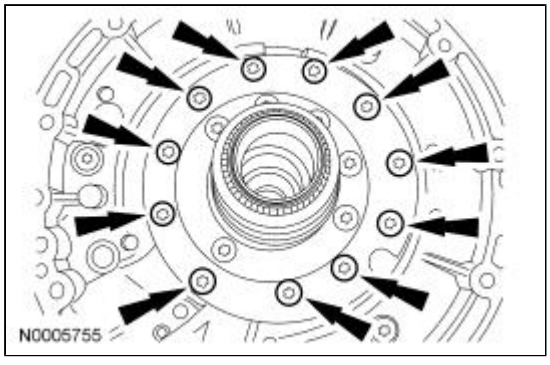
   Install the pump gears, with the dot facing the control body assembly.



2. Install a new pump body outer seal.

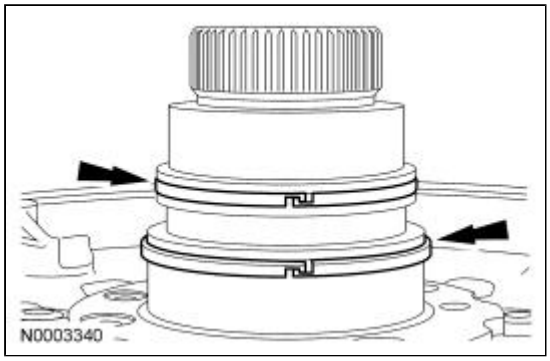


3. Assemble the control body and stator assembly onto the pump body and install the bolts.
   - Tighten to 15 Nm (11 lb-ft).

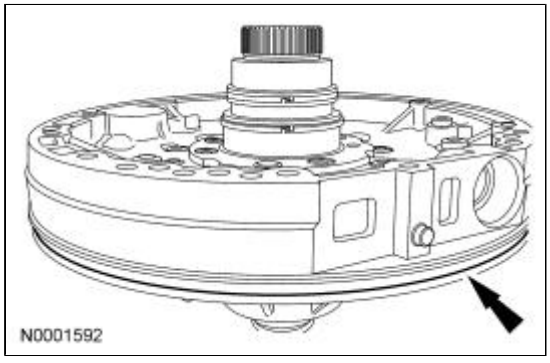


4. **CAUTION: Make sure the seal ends are correctly positioned together and not separated.**

   Install the 2 coast clutch Teflon® seals. Make sure the seals are fully seated in the stator support seal grooves and the seal ends are oriented 180 degrees apart.

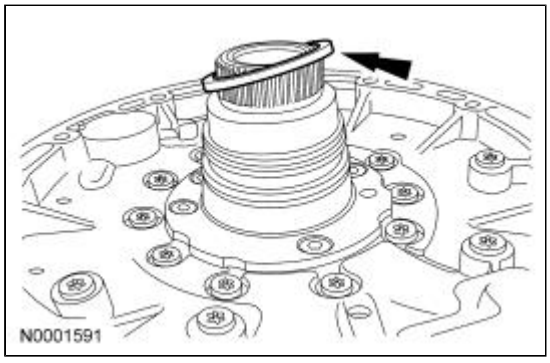


5. Install the pump outer diameter front pump O-ring seal.



6. **NOTE:** Lightly lubricate the thrust washer and the bearing with petroleum jelly to hold them in place during assembly.

   Install the pump thrust washer.



7. Using the special tool, install the front pump seal.

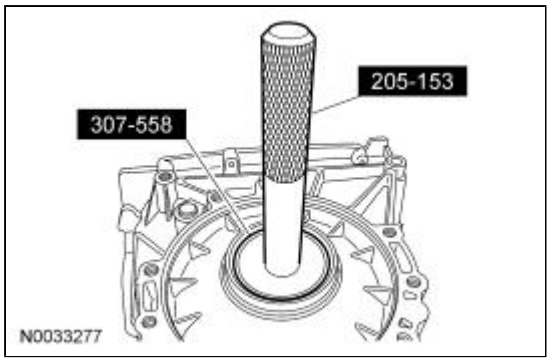
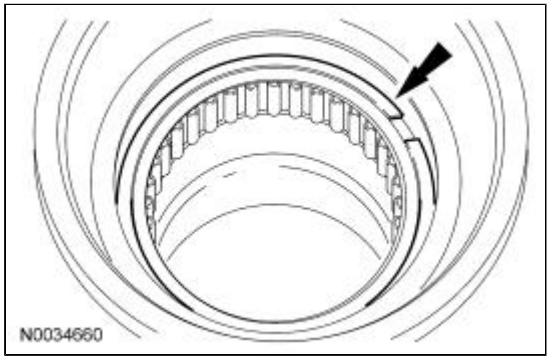
160	—	Transmission fluid pan drain plug
161	7A100	Mechatronic assembly
162	7N134	Mechatronic retaining bolts

Four wheel drive (4WD) vehicles

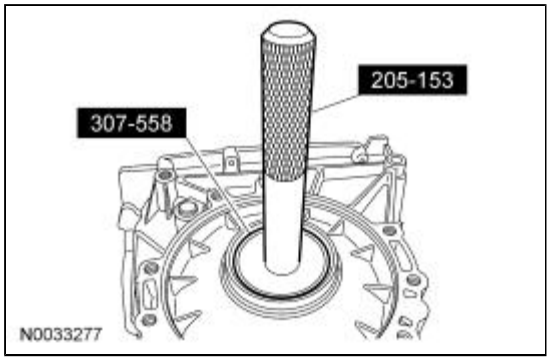
1. Using the special tool, install the rear bearing.



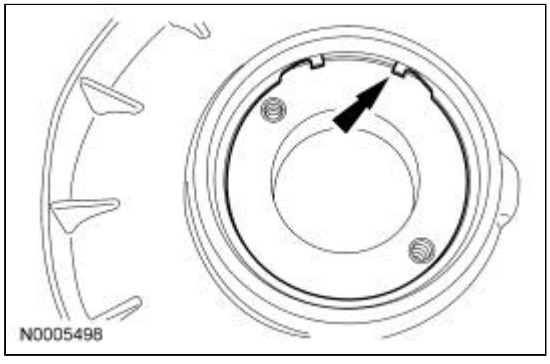
2. Install the snap ring.



3. Using the special tool, install the rear bearing spacer.

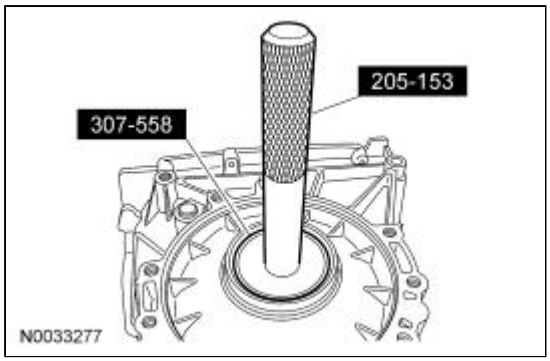


4. Install the rear bearing spacer snap ring.

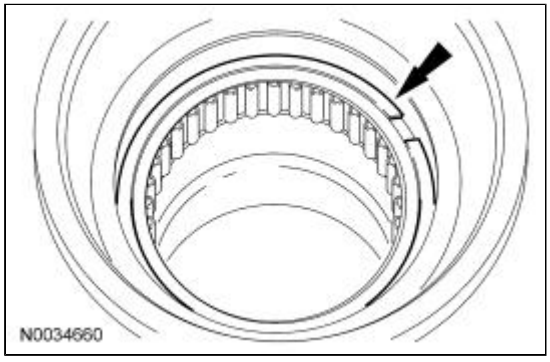


Rear wheel drive (RWD) vehicles

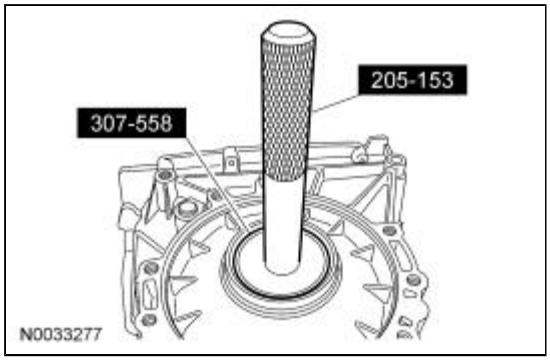
5. Using the special tool, install the rear bearing.



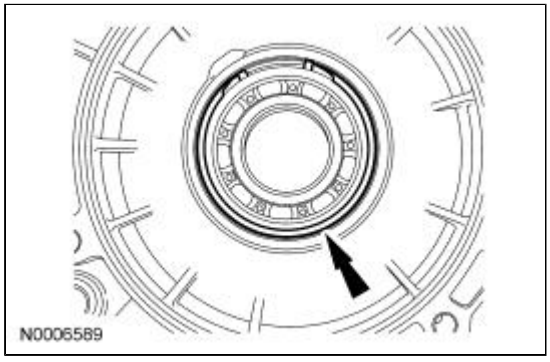
6. Install the snap ring.



7. Using the special tool, install the second rear bearing.



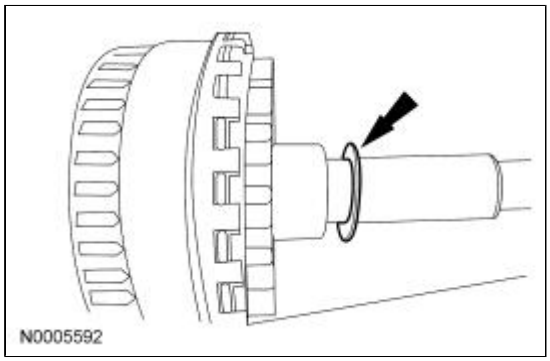
8. Install the rear bearing spacer snap ring.



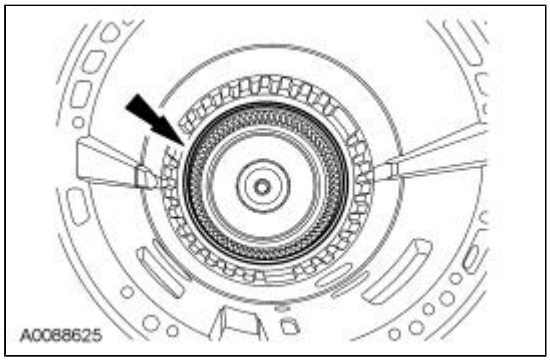
All vehicles

9. Place the transmission in the vertical position.

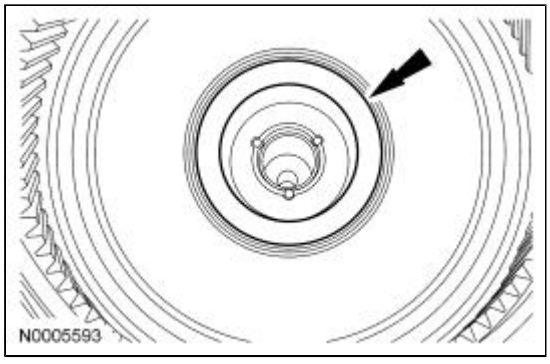
10. Install the shim on the end of the output shaft.



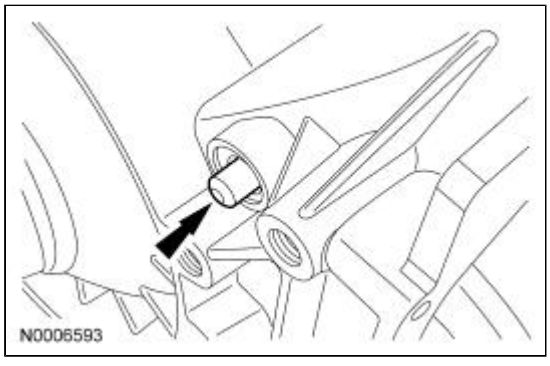
11. Install the planet carrier hub and output shaft assembly.



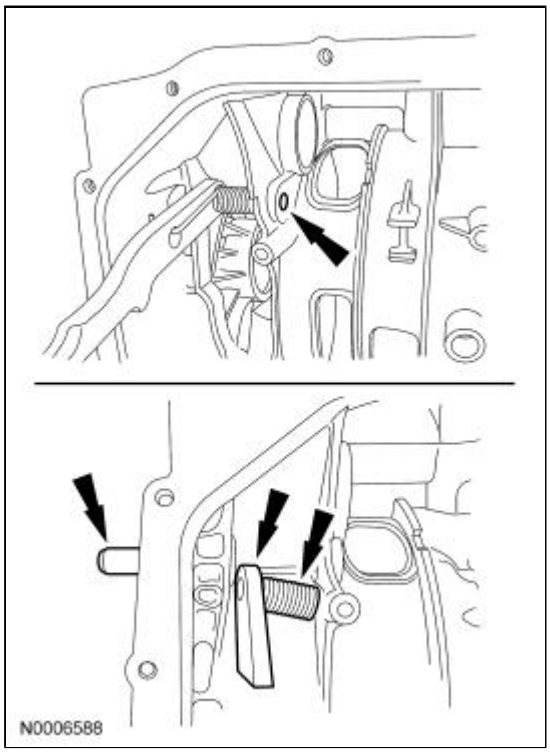
12. Install the silver shim on the planet carrier hub and output shaft assembly.



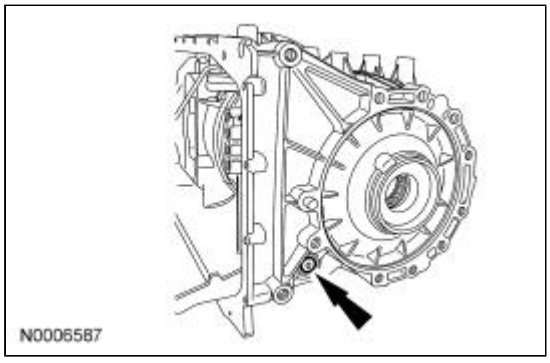
13. Position the park pawl pin into the case.



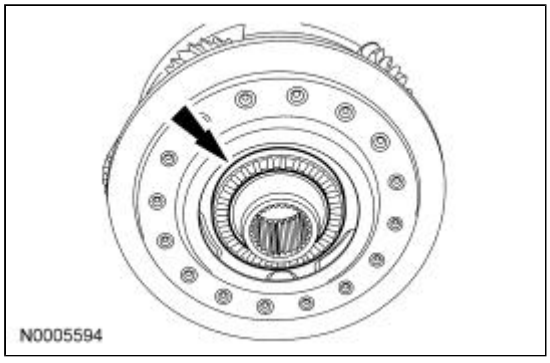
14. Position the park pawl into the case and push the park pawl pin in to hold the park pawl and spring in position.



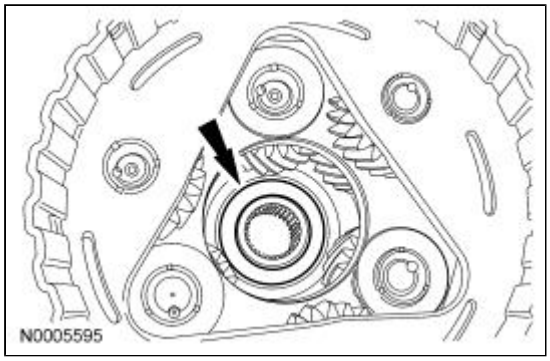
15. Install the park pawl pin bolt.
    - Tighten to 35 Nm (26 lb-ft).



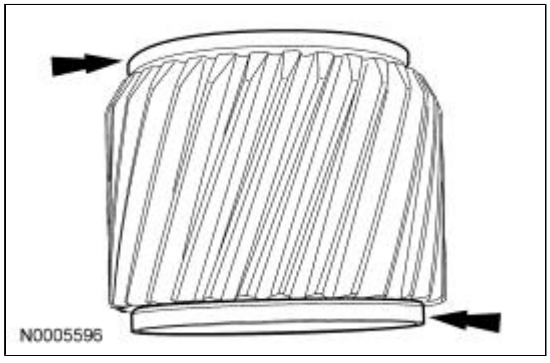
16. Install the roller bearing in the bottom of the carrier.



17. Install the roller bearing race in the bottom of the carrier.

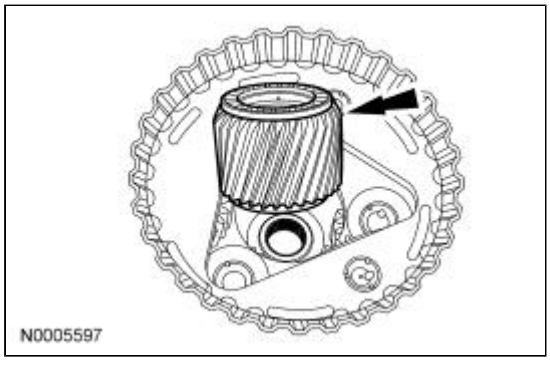


18. Snap the top and the bottom roller bearings onto the sun gear.

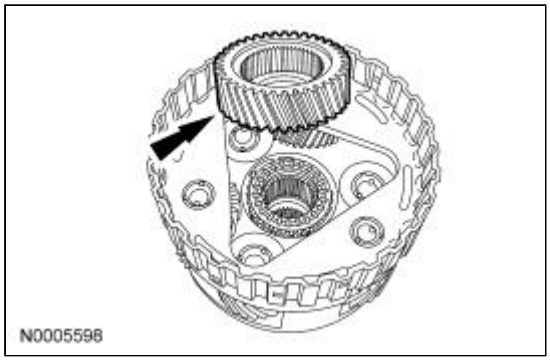


19. **NOTE:** When installing the sun gear, make sure that the taper edge is facing up toward the torque converter housing.

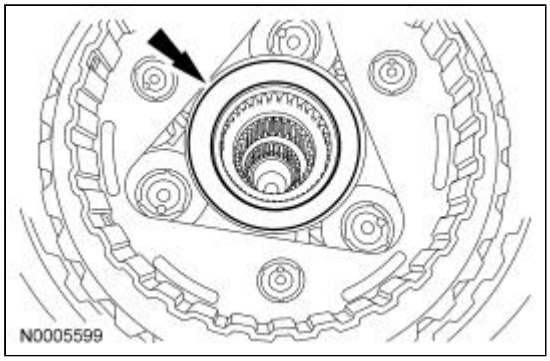
    Install the sun gear into the planet assembly.



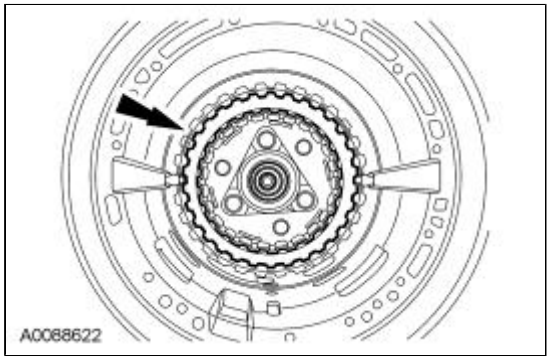
20. Install the low/reverse sun gear.



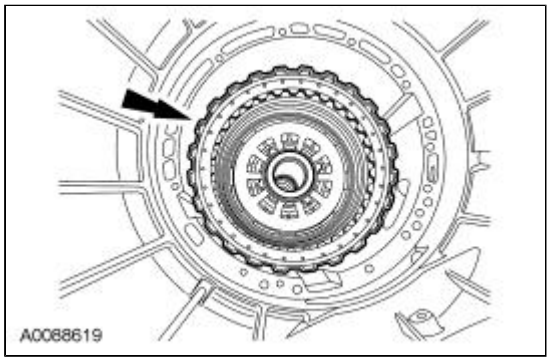
21. Install the low/reverse bearing race.



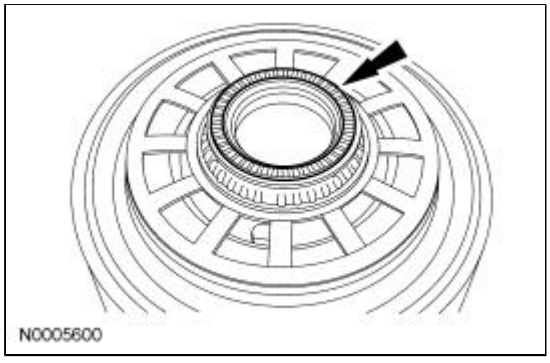
22. Install the planet carrier.



23. Install the low/reverse clutch plates, starting with the pressure plate and alternating between the friction and steel plates, and ending with the wave spring plate on the top.

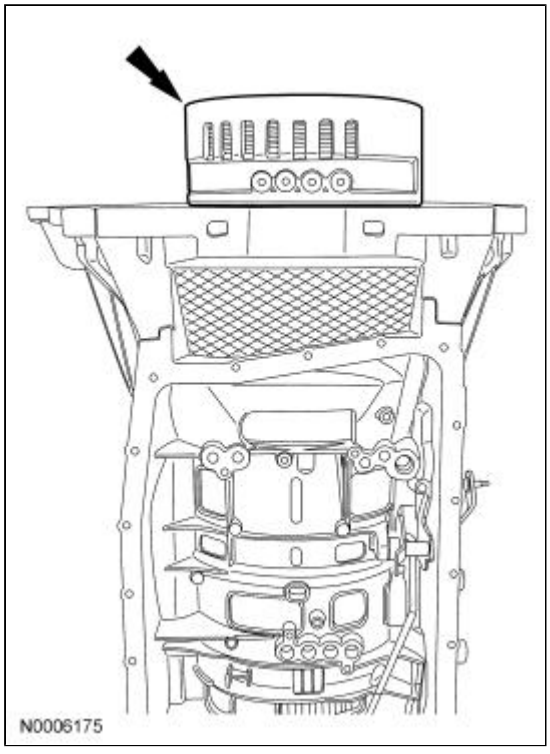


24. If not done previously, install the roller bearing onto the center support.

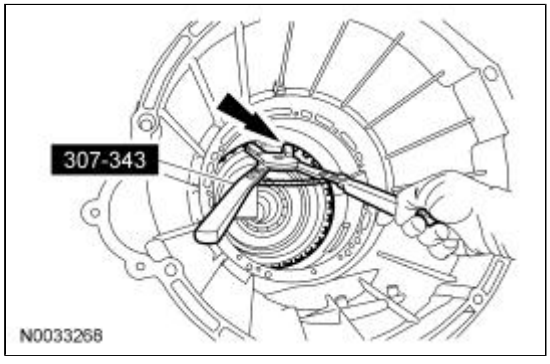


25. **NOTE:** Make sure that when installing the center support the feed holes on the center support are lined up with the feed holes in the case.

    Install the center support into the case.

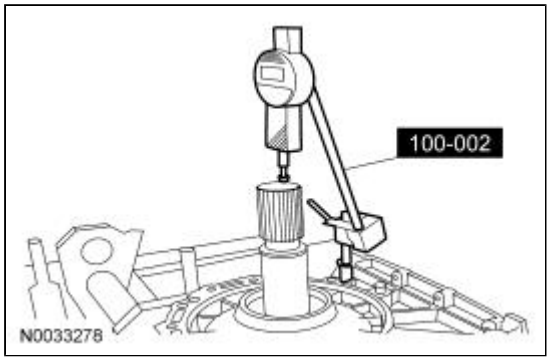


26. Using the special tool, install the center support snap ring. Tap the snap ring into the case to make sure that it is seated into the case.

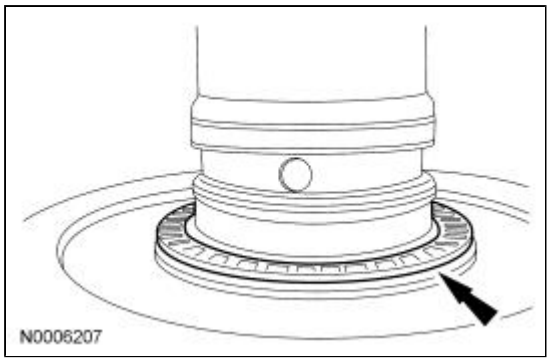


27. **NOTE:** Rotate the case 180 degrees.

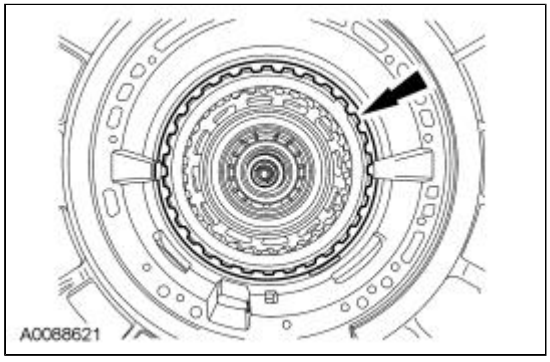
    Using the special tool, lift up on the output shaft and record the reading. The reading should be within the specification.
    - End play specification is 0.15-0.35 mm (0.006-0.013 in).
    - If the end play is not within specification, install a new transmission.



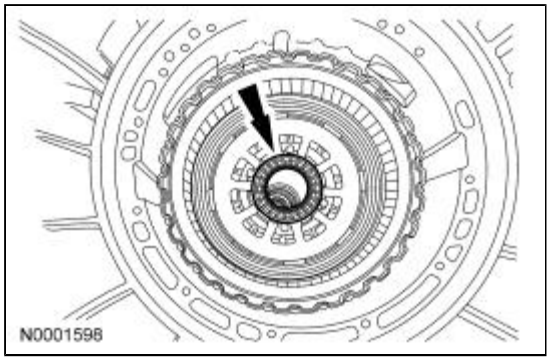
28. Install the roller bearing if not previously installed on the direct clutch drum.



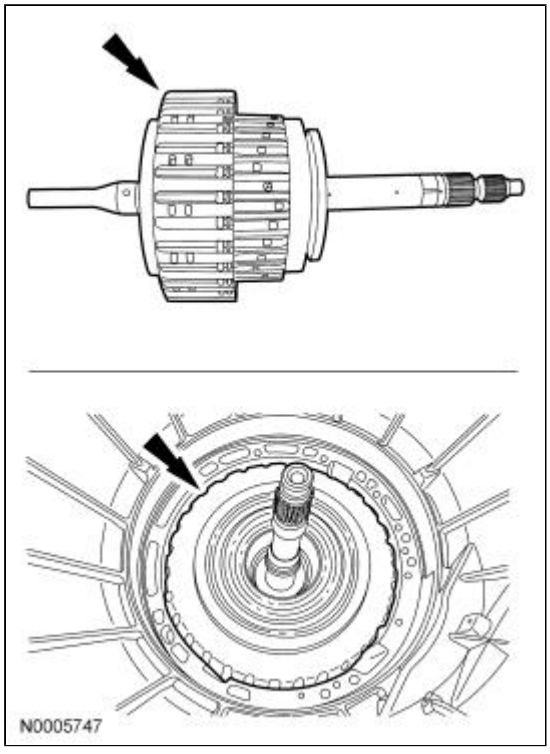
29. Install the direct clutch drum.



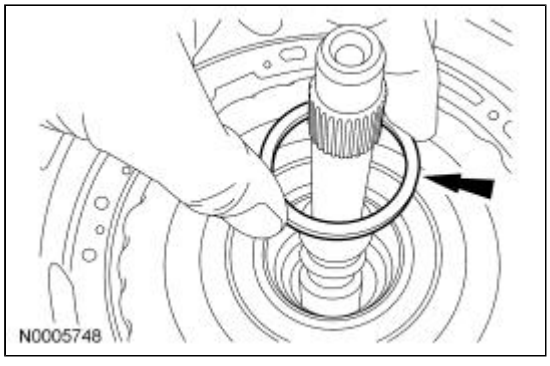
30. Install the roller bearing on the direct clutch assembly.



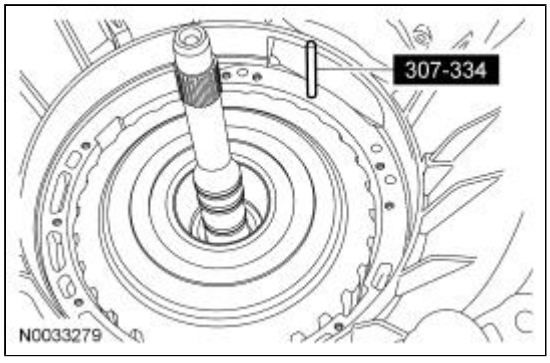
31. Install the forward and overdrive clutch assembly.



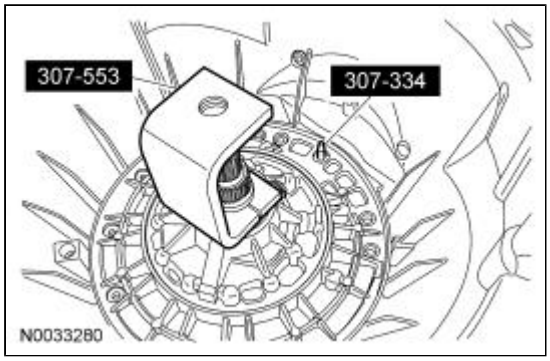
32. Install the pump washer.



33. Install the special tool into the case.

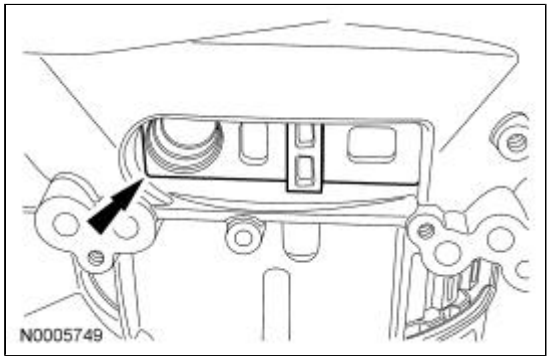


34. Using the special tools, install the front pump.

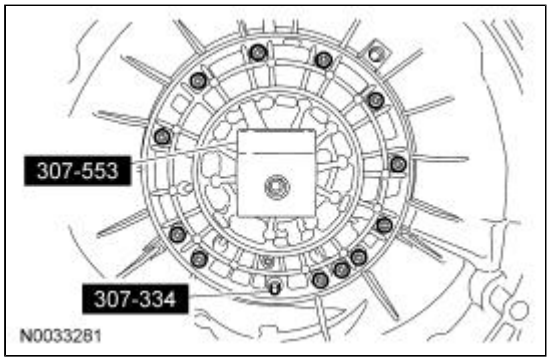


35. **NOTE:** Make sure that the fluid filter seal has been removed. If it has not been removed, use a suitable pick to remove the seal.

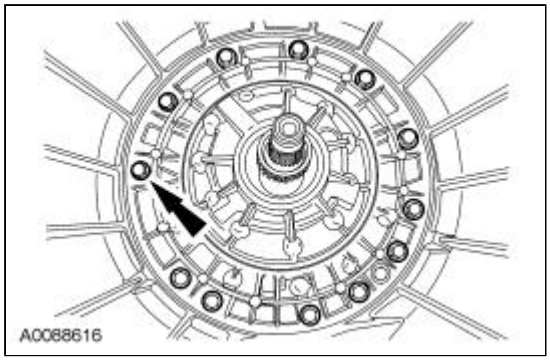
    Make sure that the pump is correctly aligned with the case.



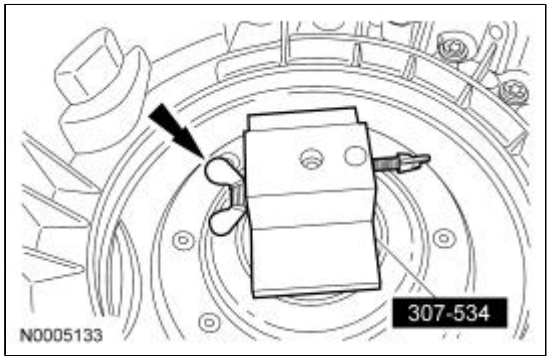
36. Loosely install the new front pump bolts with new washers.



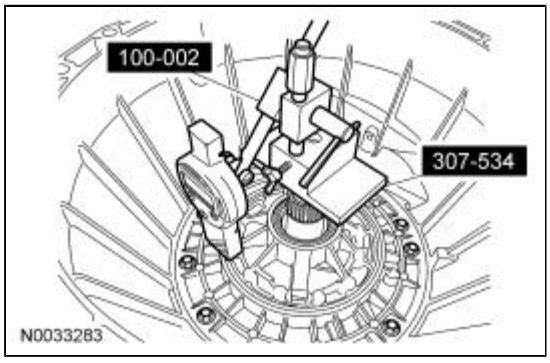
37. Install the remaining front pump bolt. Tighten the bolts in a crisscross pattern.
    - Tighten to 10 Nm (89 lb-in).



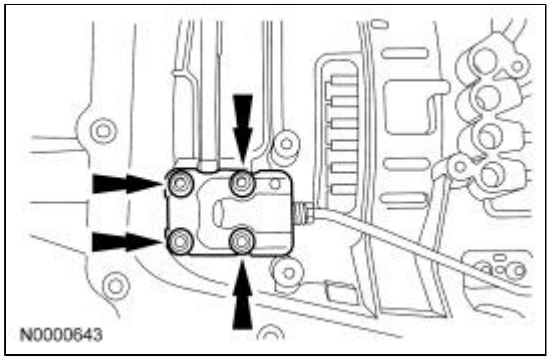
38. Install the special tool onto the input shaft to measure end play.
    - Tighten the wing nut.



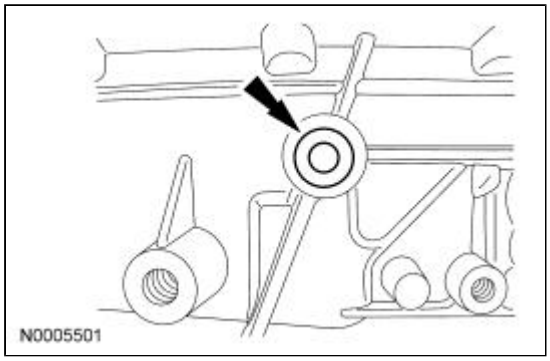
39. Install the remaining special tool.
    - Push down on the special tool and zero out the dial indicator.
    - Lift up on the special tool and record the measurement 0.2-0.4 mm (0.008-0.015 in). If the measurement is not within specification, install a new transmission.



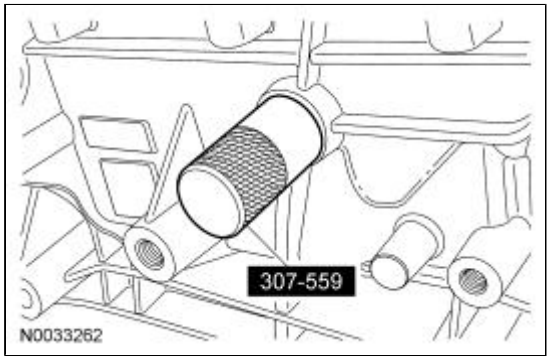
40. Install the park lever actuating plate.
    - Tighten to 10 Nm (89 lb-in).



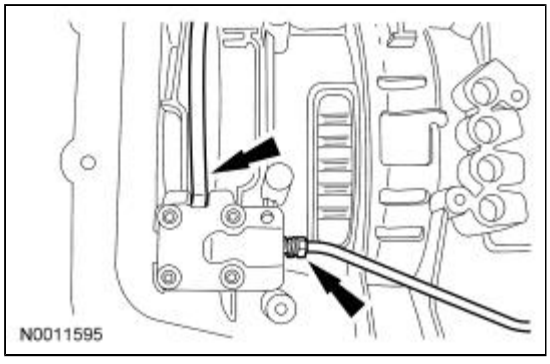
41. Position a new manual control lever seal in place.



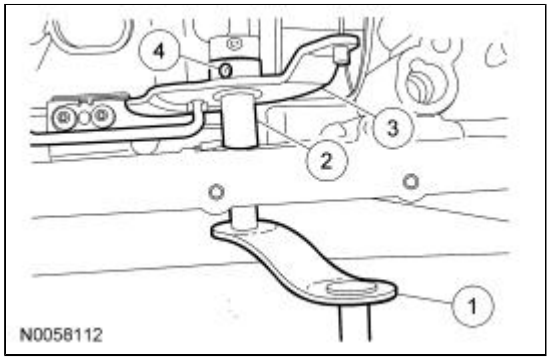
42. Using the special tool, install a new manual control lever shaft seal.



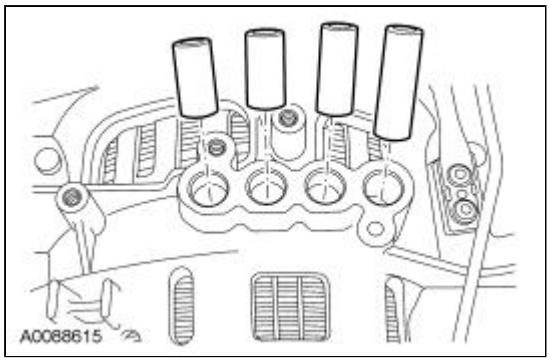
43. Position the manual lever and park rod in place.
    - Push down on the park pawl and slide the park rod in place.



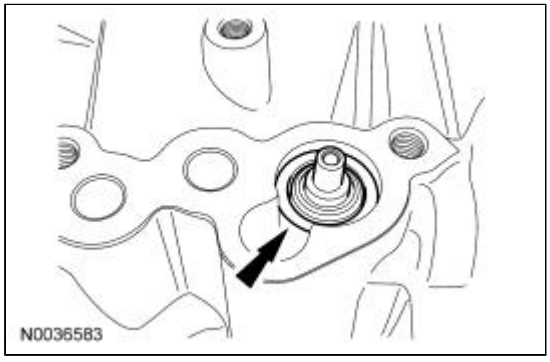
44. Install the manual lever in the case.
    1. Slide the manual lever in the case.
    2. Position the spacer in place while sliding the manual lever into the spacer.
    3. Position the manual valve inner lever while sliding the manual lever and line up the roll pin hole.
    4. Install the roll pin.



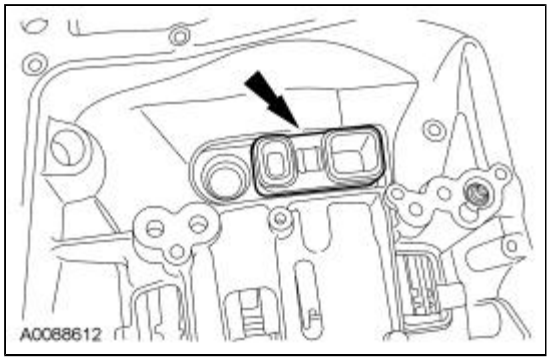
45. Install the 4 rubber feed tubes for the center support.



46. Install the thermal bypass valve into the case.



47. Install the rubber adapter.

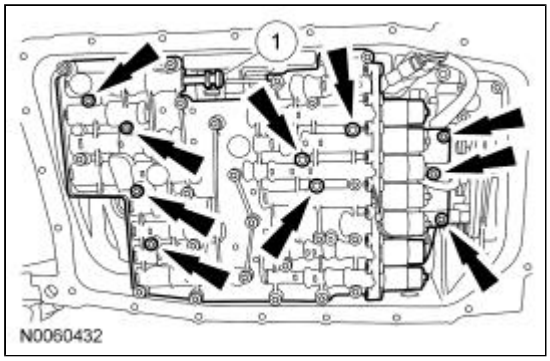


48. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the transmission control module (TCM). Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

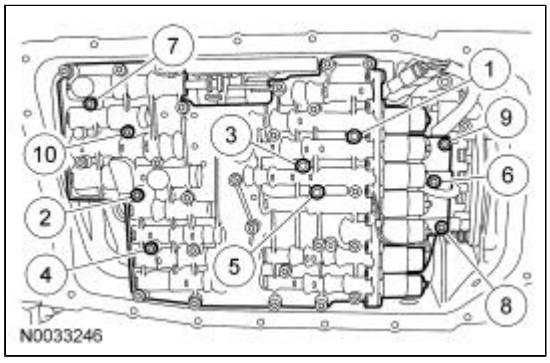
NOTE: The mechatronic assembly will not lay flush on the case, this is normal, the retaining bolts will pull the mechatronic assembly down.

Position the mechatronic assembly in place and loosely install the 10 bolts.

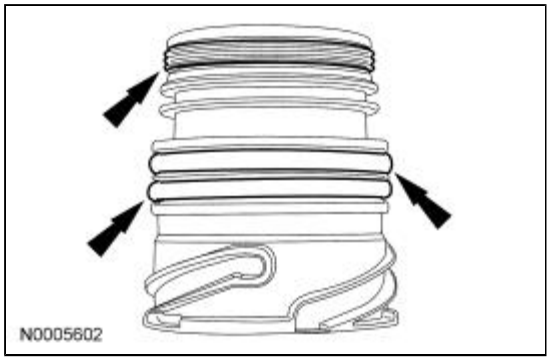
1. Align the manual valve and control lever linkage.



49. Tighten the bolts in the sequence shown.
    - Tighten to 8 Nm (71 lb-in).

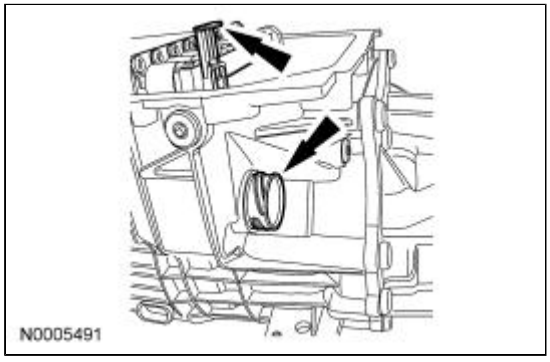


50. Install new O-rings on the outer shell of the bulkhead electrical connector.

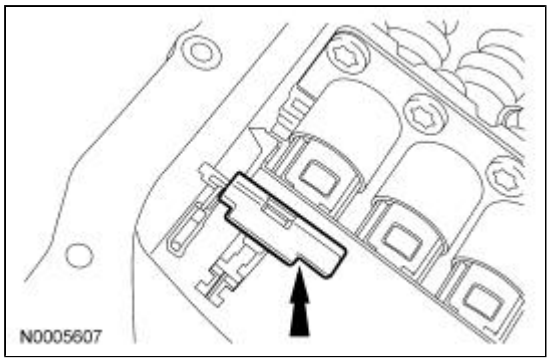


51. **CAUTION: Do not touch the electrical connector pins. Electrostatic charge may occur and will cause damage to the mechatronic unit.**

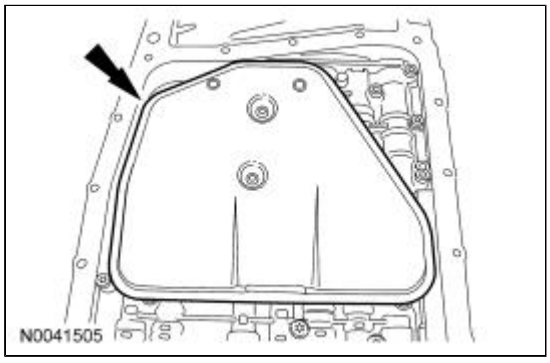
    With the release tab up, push the outer shell of the bulkhead electrical connector into the transmission.



52. Press down on the tab and lock the outer shell of the bulkhead electrical connector in place.

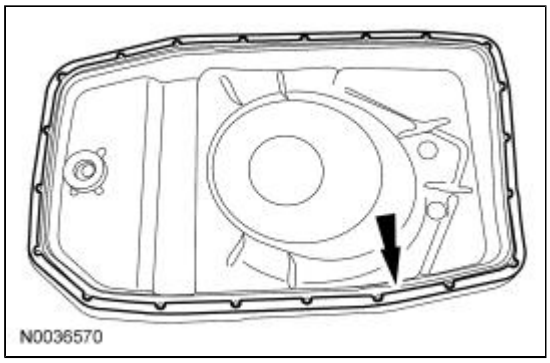


53. Install a new transmission fluid filter.

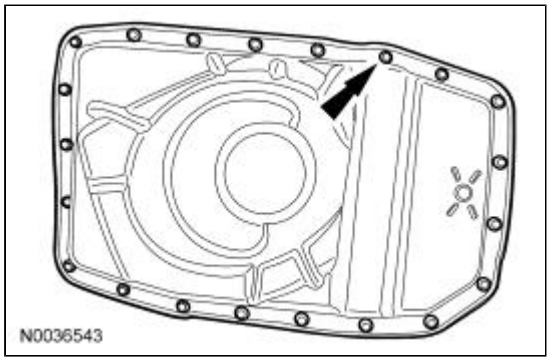


54. **NOTE:** The fluid pan gasket can be reused if not damaged.

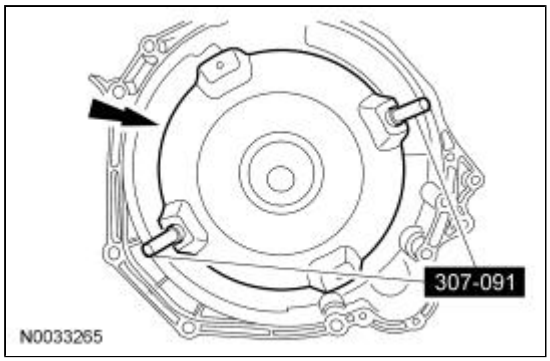
    Install a new transmission fluid pan gasket, if required.



55. Install the fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 12 Nm (9 lb-ft).

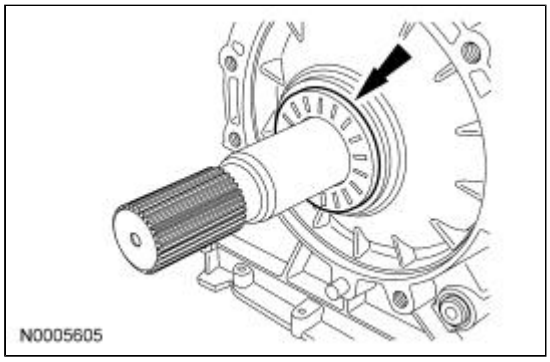


56. Install the torque converter.

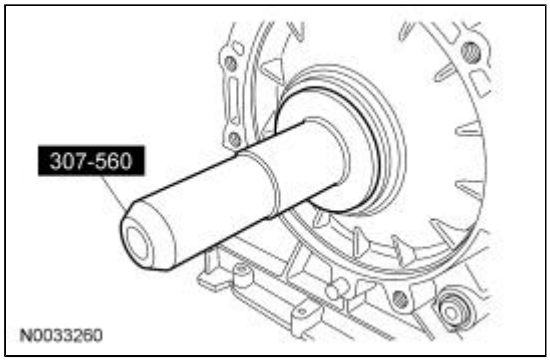


4WD vehicles

57. Position a new output shaft seal in place.

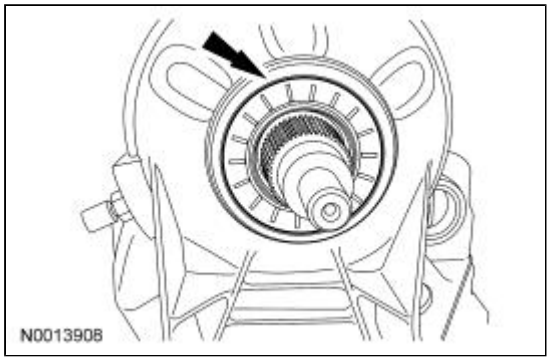


58. Using the special tool, install the output shaft seal.

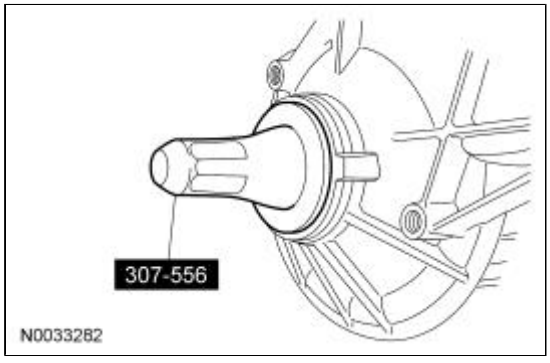


RWD vehicles

59. Position the output shaft seal in place.

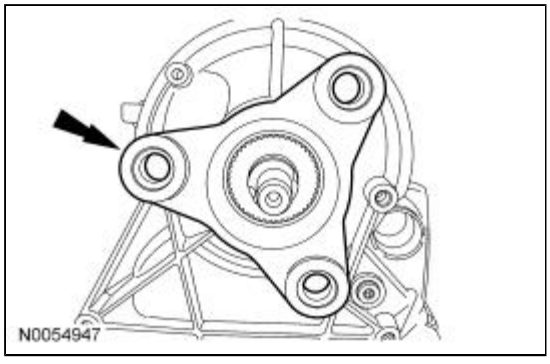


60. Using the special tool, install the output shaft seal.

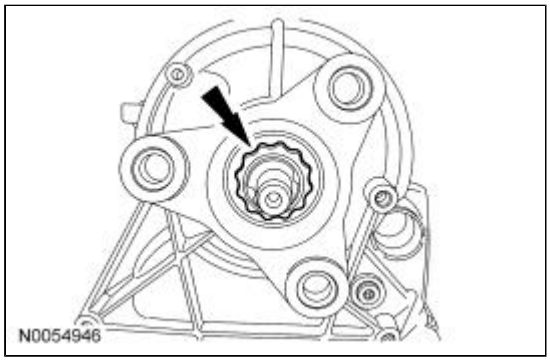


61. Install the anti-click washer over the output shaft.

62. Install the output shaft flange.



63. Install a new output shaft flange nut.
    - Tighten to 80 Nm (59 lb-ft).



Transmission — Four Wheel Drive (4WD)

Special Tool(s)

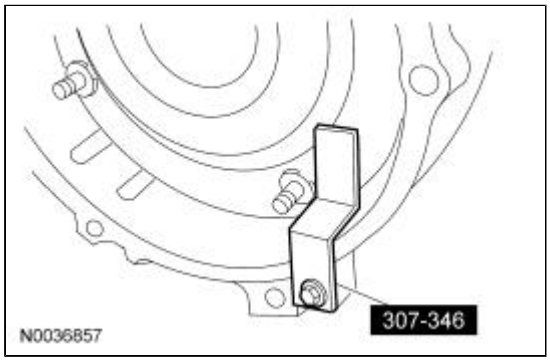
ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Installation

1. Install the special tool.



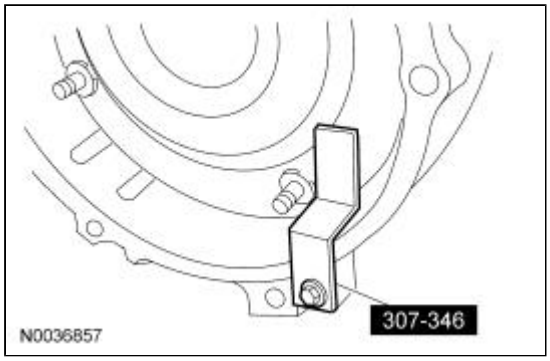
2. **CAUTION: The converter housing is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates that the converter pilot is not binding in the engine crankshaft.**

   NOTE: Make sure that the transmission jack makes contact on the outer ribs of the fluid pan.

   NOTE: Make sure that the transmission is securely fastened to the transmission jack.

   Position and secure the transmission on the high-lift transmission jack. Raise and position the transmission into the vehicle.

3. Remove the special tool.



4. **NOTE:** Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

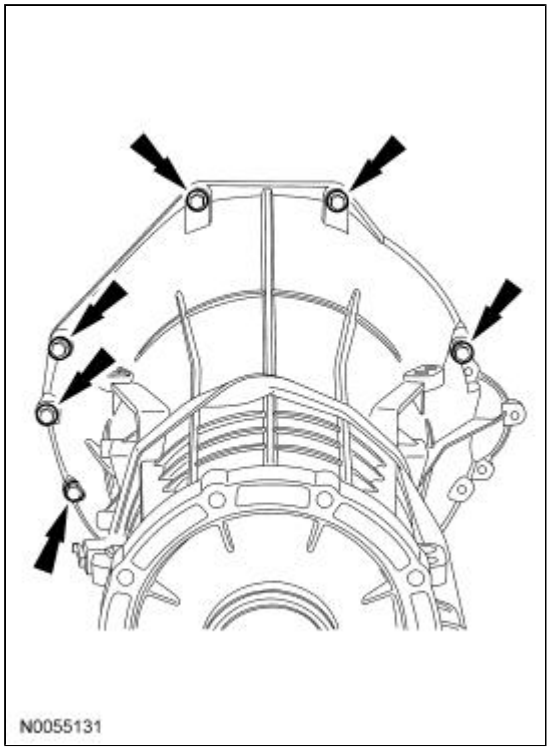
   With the transmission in a horizontal position, move it toward the engine. Align the orange balancing marks between the torque converter studs and the flexplate bolt holes.

5. **NOTE:** Install the transmission case bolts in their correct locations noted during removal.

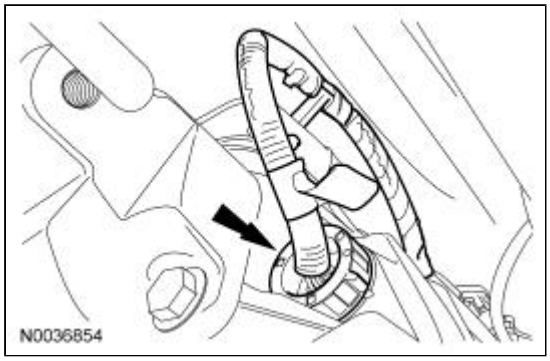
   NOTE: The top 2 transmission case bolts need to be installed prior to installing the rest of the bolts.

   NOTE: The top left bolt is inserted through the fuel line bracket first, then through the transmission case.

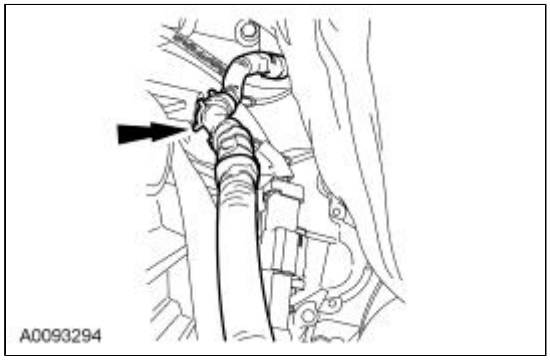
   Install 6 of the 7 transmission case bolts.
   - Tighten to 48 Nm (35 lb-ft).



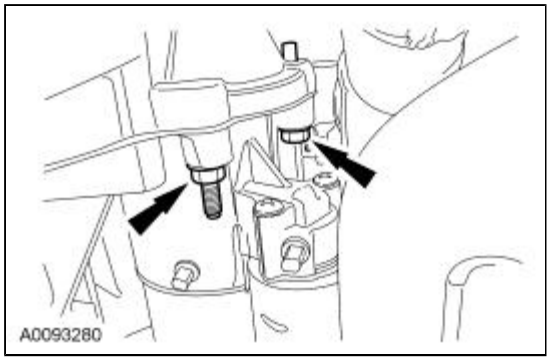
6. Connect the main transmission electrical harness by pushing it in and twisting the outer shell to lock it in place.



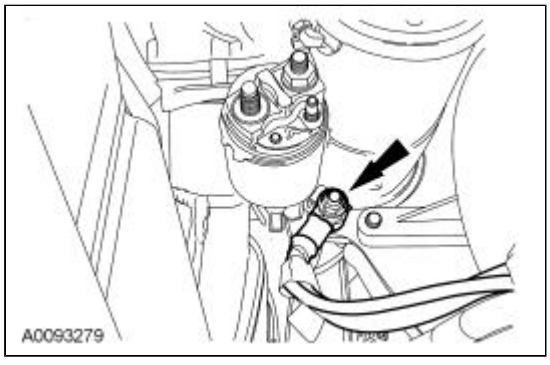
7. Connect the wire harness to the top of the transmission.



8. Install the starter motor and the 3 starter motor bolts.
    - Tighten to 26 Nm (19 lb-ft).

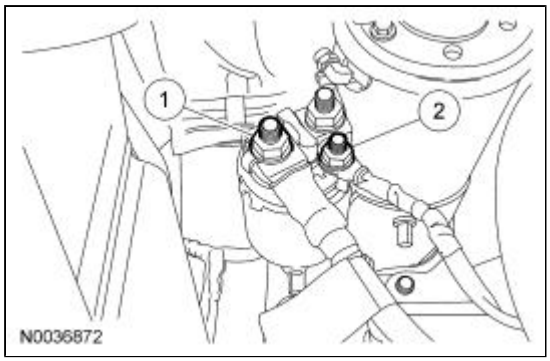


9. Install the ground wire on the stud and install the ground wire nut.
    - Tighten to 23 Nm (17 lb-ft).

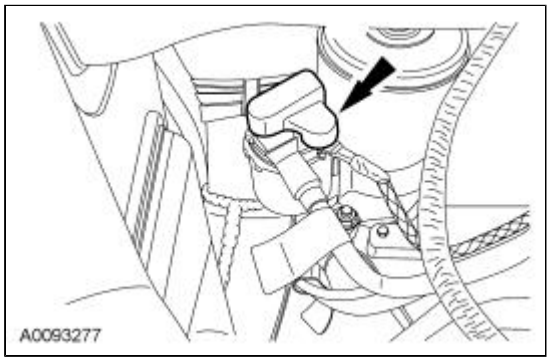


10. Install the starter motor electrical connectors.
    1. Tighten to 12 Nm (9 lb-ft).

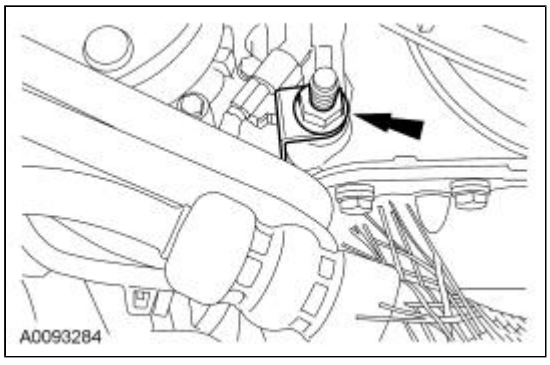
2. Tighten to 6 Nm (53 lb-in).



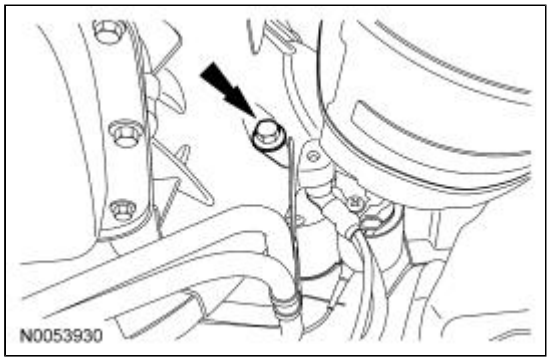
11. Install the plastic starter motor electrical connector cap.



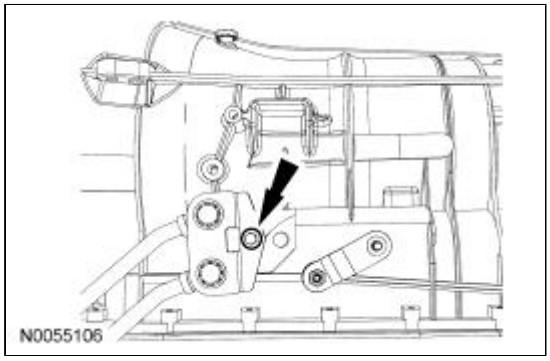
12. Position the transmission cooler tubes in place and install the cooler tube bracket nut.
    - Tighten to 27 Nm (20 lb-ft).



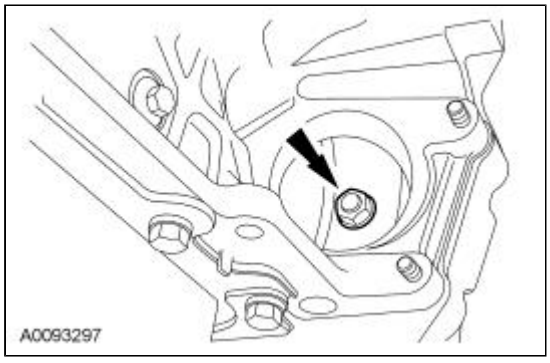
13. Align the bracket and install the remaining transmission case bolt.
    - Tighten to 48 Nm (35 lb-ft).



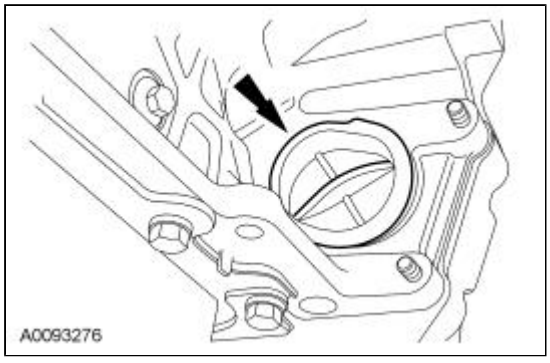
14. Install the transmission cooler tubes and the bracket bolt.
    - Tighten to 23 Nm (17 lb-ft).



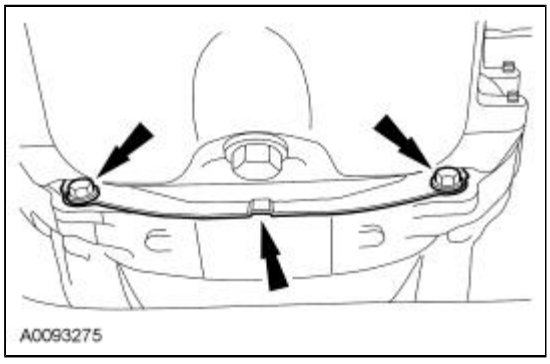
15. Install 4 new flexplate-to-torque converter nuts.
    - Tighten to 35 Nm (26 lb-ft).



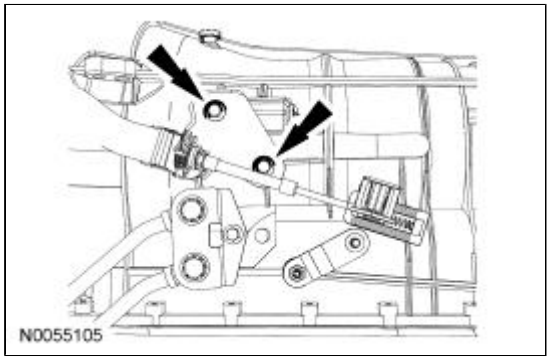
16. Install the rubber access plug.



17. Install the flexplate inspection cover and the inspection cover bolts.
    - Tighten to 35 Nm (26 lb-ft).

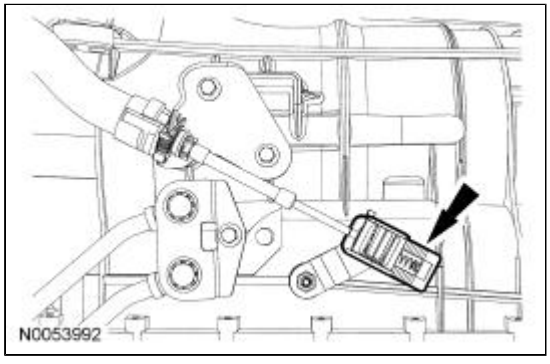


18. Install the selector lever bracket and bolts.
    - Tighten to 48 Nm (35 lb-ft).

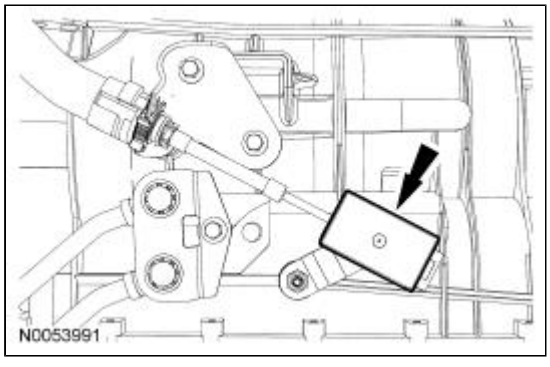


19. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

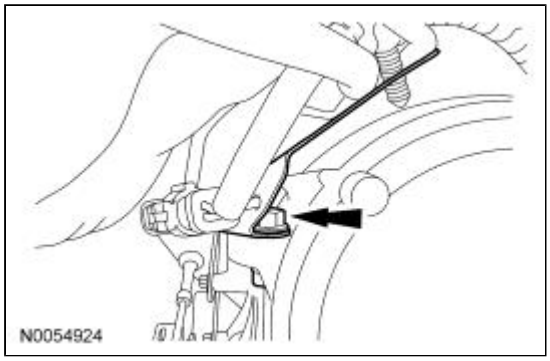
    With the manual lever in NEUTRAL, connect the selector lever cable onto the manual lever ball stud and move the locking tab up down.
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure it is correctly installed.



20. If equipped, install the heat shield.



21. Install the rear fuel line bracket and bolt.
    - Tighten to 25 Nm (18 lb-ft).



22. Install the transfer case. For additional information, refer to Section 308-07B .

23. Connect the battery ground cable. For additional information, refer to Section 414-01 .

24. Verify that the selector lever cable is correctly adjusted. For additional information, refer to Section 307-05 .

25. Reflash the transmission control module (TCM) to the latest level of software.

26. Fill the transmission with clean automatic transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

27. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

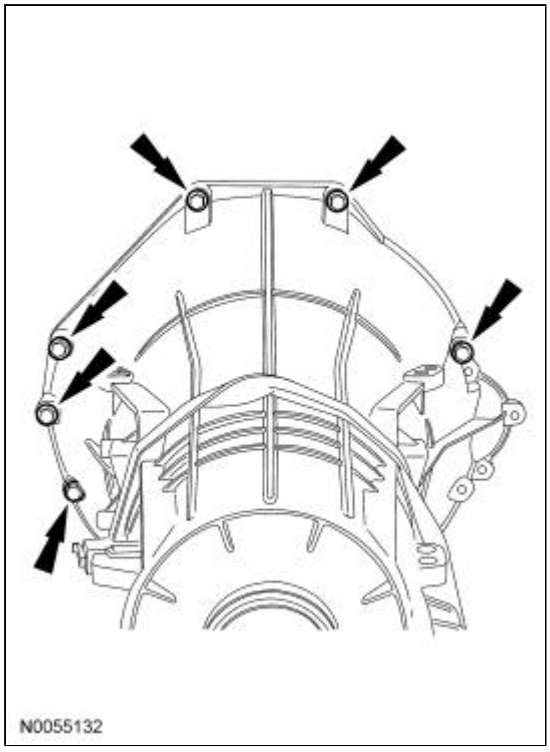
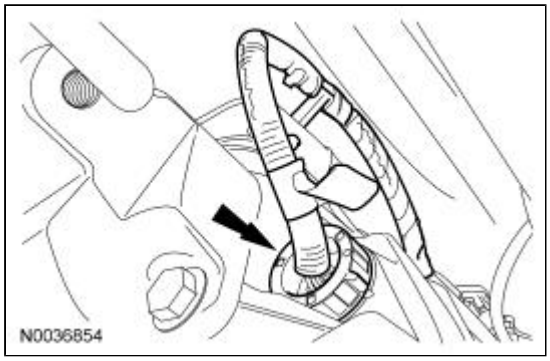
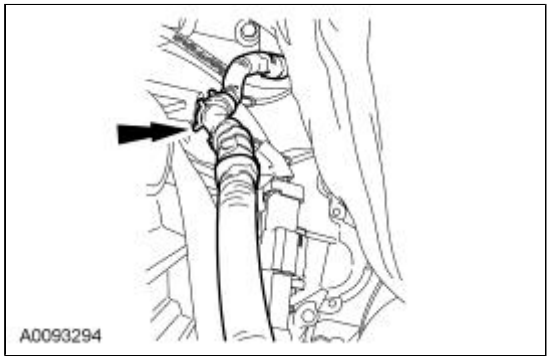
   Install 6 of the 7 transmission case bolts.
   - Tighten to 48 Nm (35 lb-ft).



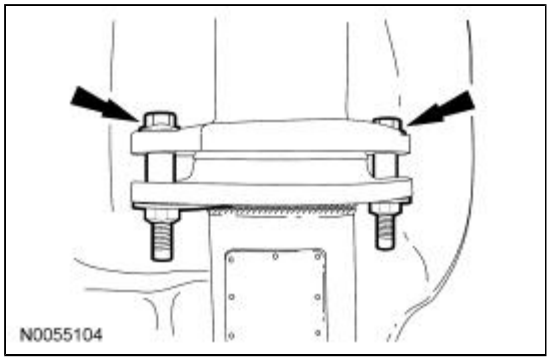
6. Connect the main transmission electrical harness by pushing it in and twisting the outer shell to lock it in place.



7. Connect the wire harness to the top of the transmission.

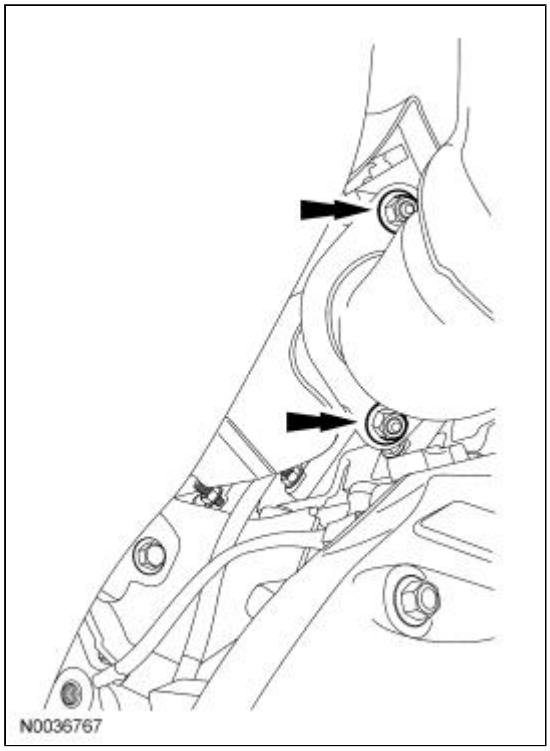


8. Position the dual converter Y-pipe in place and install the 2 dual converter Y-pipe bolts.
    - Tighten to 40 Nm (30 lb-ft).

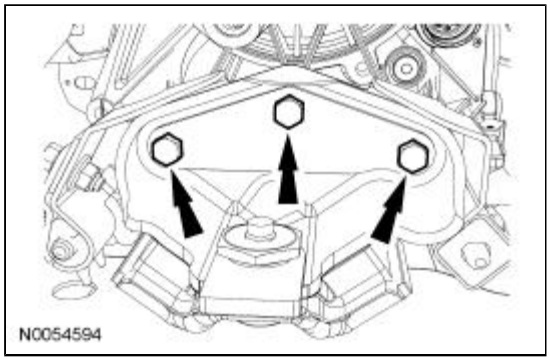


9. **NOTE:** LH shown, RH similar.

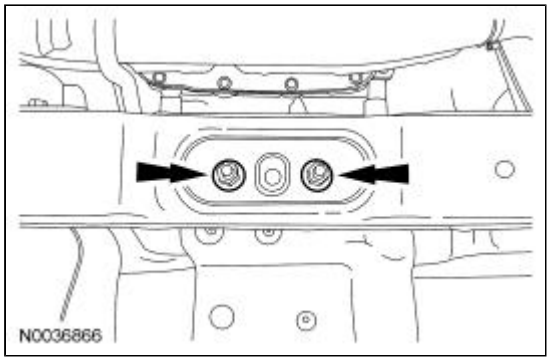
    Install the LH and RH exhaust flange nuts.
    - Tighten to 40 Nm (30 lb-ft).



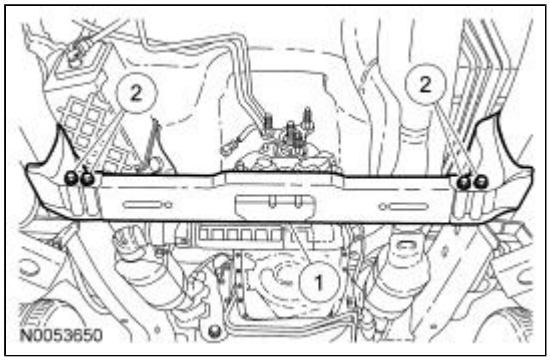
10. Install the transmission insulator and bolts.
    - Tighten to 90 Nm (66 lb-ft).



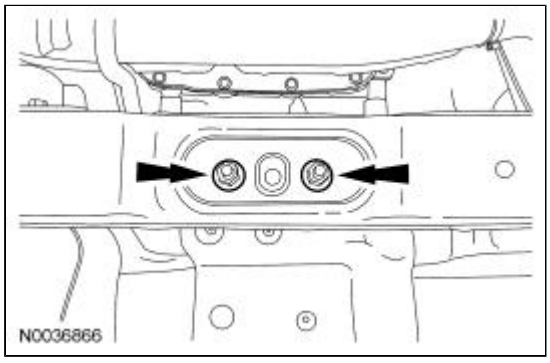
11. Position the rear transmission crossmember in place and loosely install the transmission insulator nuts.



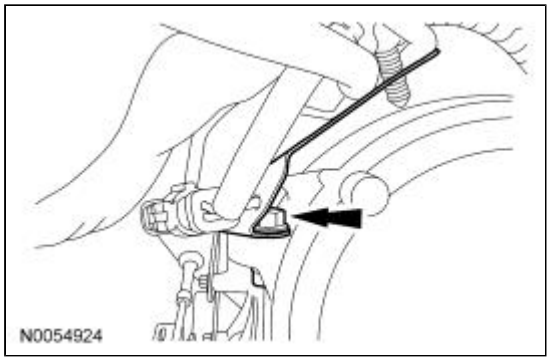
12. Install the rear transmission crossmember.
    1. Install the rear transmission crossmember.
    2. Install the 4 crossmember bolts and nuts.
        - Tighten to 90 Nm (66 lb-ft).



13. Tighten the transmission insulator nuts.
    - Tighten to 103 Nm (76 lb-ft).

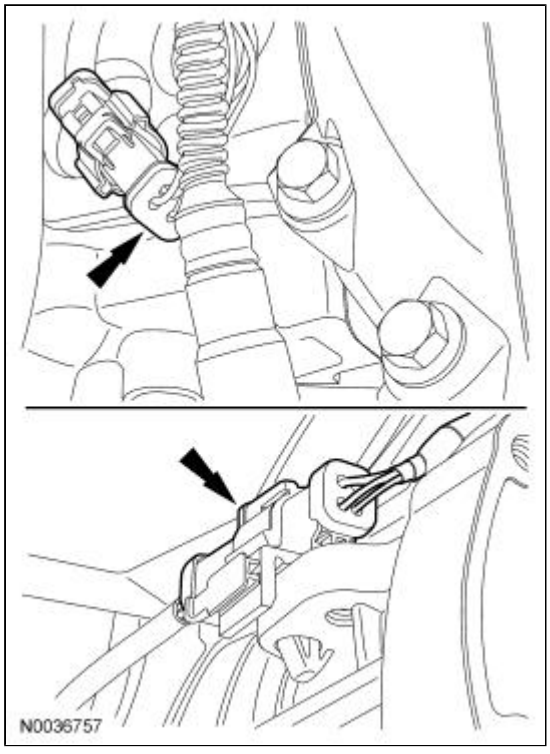


14. Install the rear fuel line bracket and bolt.
    - Tighten to 25 Nm (18 lb-ft).

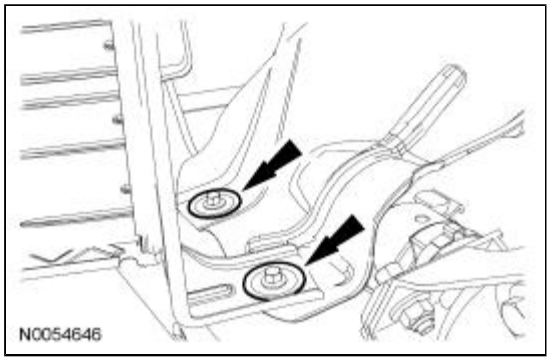


15. **NOTE:** LH shown, RH similar.

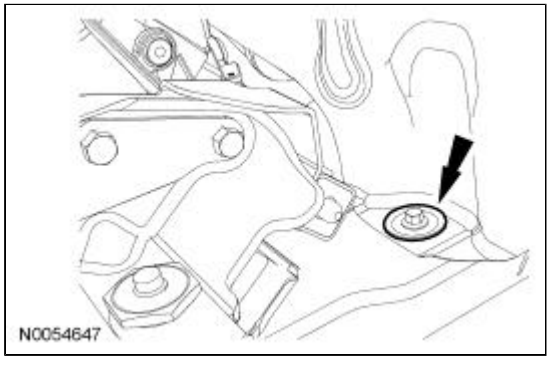
    Connect the RH and LH heated oxygen sensors (HO2S) electrical connectors and the CMS electrical connectors.



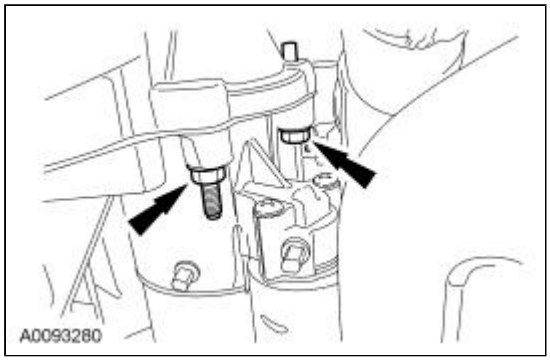
16. Install the LH exhaust heat shield and evaporative emissions canister assembly bolts.
    - Tighten to 15 Nm (11 lb-ft).



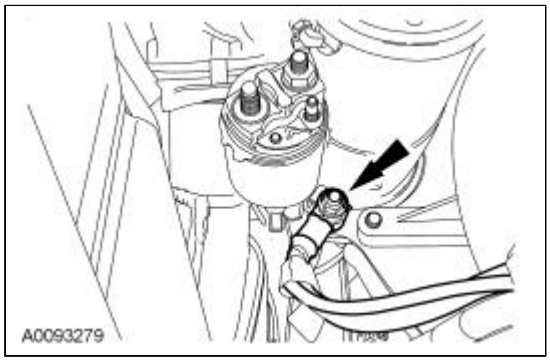
17. Install the RH exhaust heat shield bolt.
    - Tighten to 15 Nm (11 lb-ft).



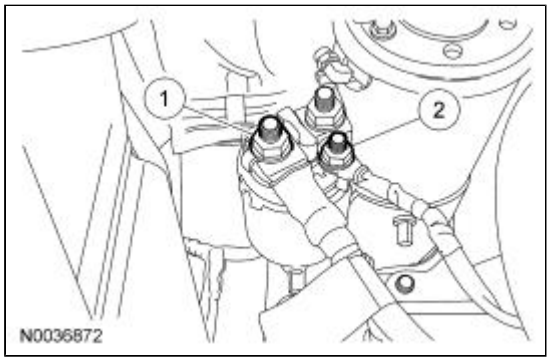
18. Position the starter motor in place and install the 3 starter motor bolts.
    - Tighten to 26 Nm (19 lb-ft).



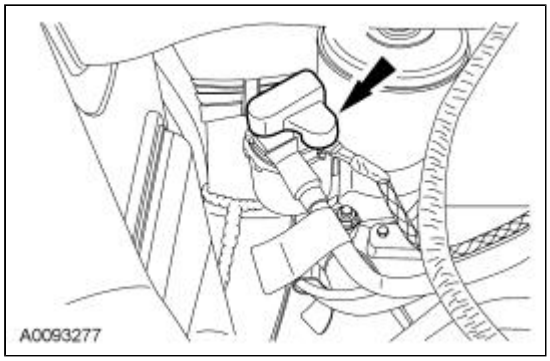
19. Install the ground wire on the stud and install the ground wire nut.
    - Tighten to 23 Nm (17 lb-ft).



20. Install the starter motor electrical connectors.
    1. Tighten to 12 Nm (9 lb-ft).
    2. Tighten to 6 Nm (53 lb-in).

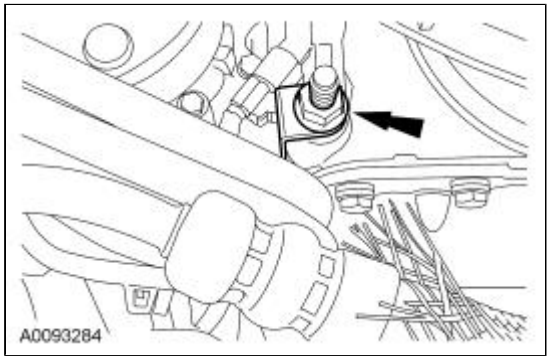


21. Install the plastic starter motor electrical connector cap.

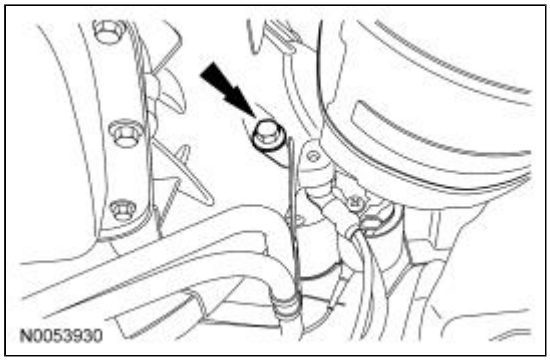


22. Position the transmission fluid cooler tubes in place and install the transmission fluid cooler tube bracket nut.

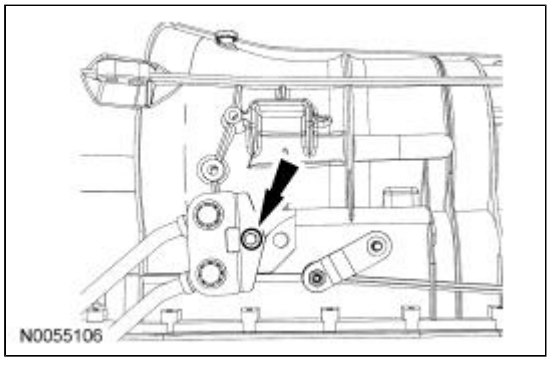
- Tighten to 27 Nm (20 lb-ft).



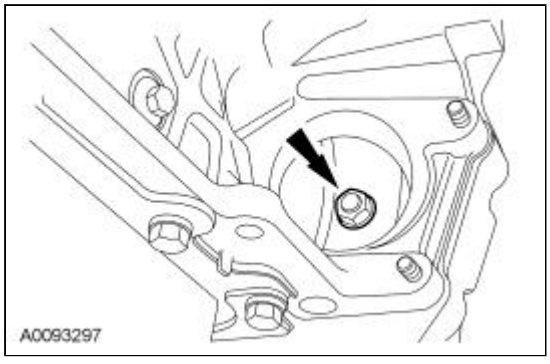
23. Align the transmission fluid cooler tube bracket and install the remaining transmission case bolt.
    - Tighten to 48 Nm (35 lb-ft).



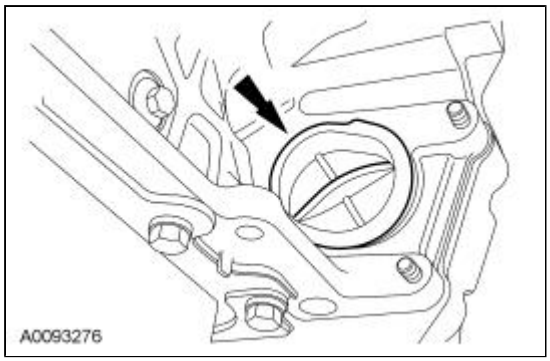
24. Install the transmission fluid cooler tubes and the bracket bolt.
    - Tighten to 23 Nm (17 lb-ft).



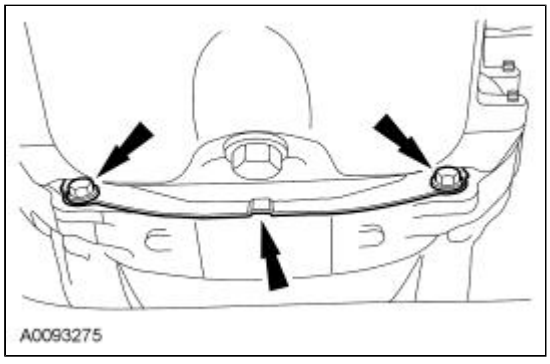
25. Install 4 new flexplate-to-torque converter nuts.
    - Tighten to 35 Nm (26 lb-ft).



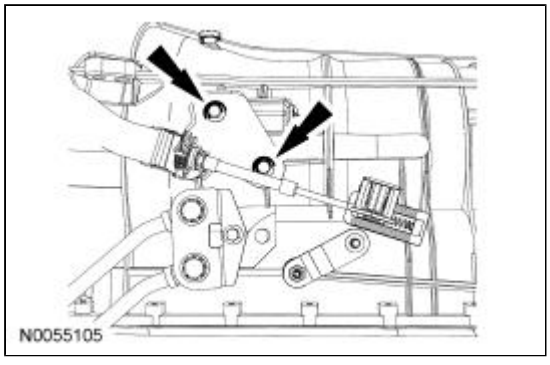
26. Install the rubber access plug.



27. Install the flexplate inspection cover and the flexplate inspection cover bolts.
    - Tighten to 35 Nm (26 lb-ft).

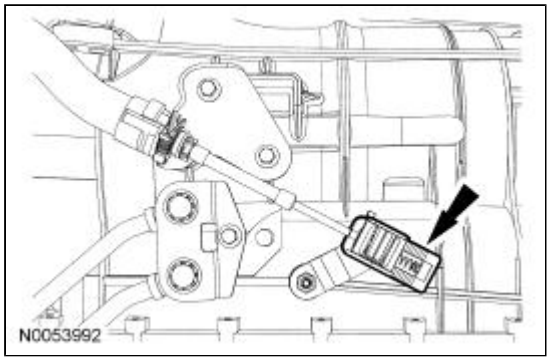


28. Install the selector lever bracket and bolts.
    - Tighten to 48 Nm (35 lb-ft).

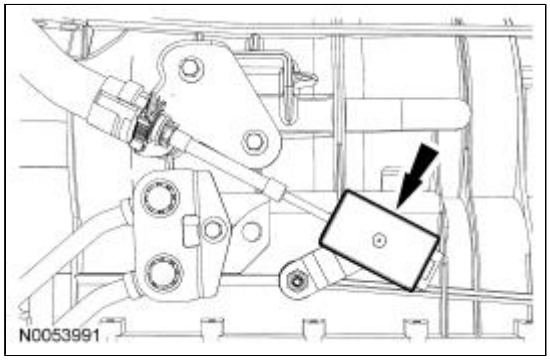


29. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

    With the manual lever in NEUTRAL, connect the selector lever cable onto the manual lever ball stud and move the locking tab up down.
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure it is correctly installed.



30. If equipped, install the heat shield.



31. Install the driveshaft. For additional information, refer to Section 205-01 .

32. Connect the battery ground cable. For additional information, refer to Section 414-01 .

33. Verify that the selector lever cable is correctly adjusted. For additional information, refer to Section 307-05 .

34. Reflash the transmission control module (TCM) to the latest level of software.

35. Fill the transmission with clean automatic transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

36. Start the engine. Move the transmission range selector lever through all the gear ranges, checking for engagements.

Transmission Description

Printable View (105 KB)

This transmission has an internal thermal bypass valve contained within the case. The thermal bypass valve will not allow the use of any type of transmission fluid exchange machine to be used on this transmission.

This transmission uses planetary gears with hydraulic electronic controls. The transmission control module (TCM) and the main control valve body units form a composite element that is installed as a single unit inside the automatic transmission.

This transmission has the following features:

- Six forward speeds
- Torque converter with an integral converter clutch
- Electronic shift and pressure controls
- Single planetary gear set
- Double planetary gear set
- Two fixed multi-disc clutches
- Three multi-plate clutches

All hydraulic functions are directed by electronic solenoids to control the following:

- Engagement feel
- Shift feel
- Shift scheduling
- Modulated torque converter clutch (TCC) applications

This transmission has a mechatronic unit also referred to as a TCM which contains:

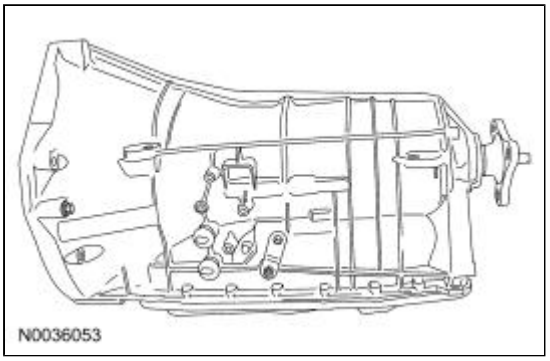
- Turbine shaft speed (TSS) sensor
- Output shaft speed (OSS) sensor
- An internal P, R, N, D selector shaft position sensor
- Transmission fluid temperature (TFT) sensor

Engine power reaches the transmission by a torque converter with an integral converter clutch. The 6 forward gears and one reverse gear are obtained from single planetary sets.

This automatic transmission is a 6-speed electronically controlled transmission comprising the basic elements of a TCM, main control valve body unit, torque converter, one solenoid valve and 6 pressure regulators. Gear selection is achieved by the control of automatic transmission fluid flow to operate various internal clutches. The TCM operates the electrical components and provides for the control of gear selection shift pressure, which increases refinement and torque converter slip.

In the event of a system fault, the TCM also provides for failure mode effect management (FMEM) to maintain maximum functional operation of the transmission with a minimum reduction in driver, passenger or vehicle safety. In the event of a total loss of control or electrical power, the basic transmission functions P, R, N and D are retained. Also 3rd or 5th gear is retained by the hydraulic system. The gear retained is dependent upon the gear selected at the time of the failure.

Automatic Transmission

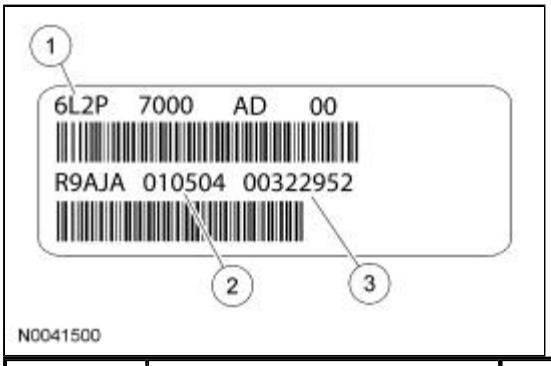


N0036053

Identification Tags

Printable View (74 KB)

The identification tag is located on the left side of the case just rearward of the manual control lever.

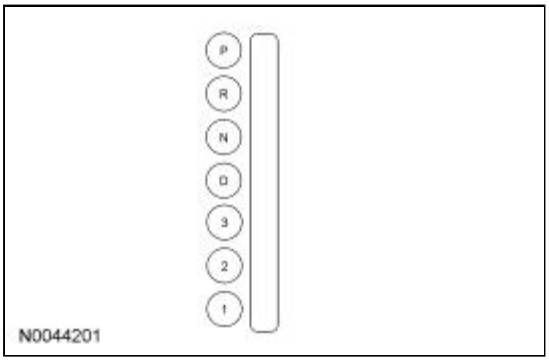


Item	Part Number	Description
1	—	Part number
2	—	Build date
3	—	Serial number

Range Selection

Printable View (70 KB)

The transmission has 7 range positions: P, R, N, D, 3, 2 and 1.



Park

In the PARK position:

- there is no power flow through the transmission.
- the parking pawl locks the output shaft to the case.
- the engine can be started.
- the ignition key can be removed.

Reverse

In the REVERSE position:

- the vehicle can be operated in a rearward direction, at a reduced gear ratio.
- backup lamps are illuminated.

Neutral

In the NEUTRAL position:

- there is no power flow through the transmission.
- the output shaft is not held and is free to turn.
- the engine can be started.

D Position

The D is the normal position for most forward driving.

The D position provides:

- automatic shifts 1-6 and 6-1.
- apply and release of the torque converter clutch.
- maximum fuel economy during normal operation.
- engine braking in all gears.

Position 3 — 3rd Gear

This position provides:

- manual 3rd gear.
- engine braking in 3rd gear.

Position 2 — 2nd Gear

This position provides:

- manual 2nd gear.
- engine braking in 2nd gear.

Position 1 — 1st Gear

This position provides:

- first gear operation only.
- engine braking for descending steep grades.

Shift Patterns

Printable View (64 KB)

Downshifts

Under certain conditions, the transmission will downshift automatically to a lower gear range (without moving the range selector lever). There are 3 categories of automatic downshifts:

- Coastdown
- Torque demand
- Forced or kickdown shifts

Coastdown

The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size, engine and transmission calibration requirements.

Torque Converter

Printable View (63 KB)

The torque converter is a 3-element unit containing a 3-plate clutch. The clutch can be controlled and engaged in any gear 2 to 6. Calibration parameters may be set to allow lockup in a higher gear only. The clutch is applied by removing fluid pressure from one side of the plate. The torque converter transmits and multiplies torque. The torque converter includes the following 3 elements:

- Impeller assembly
- Turbine assembly
- Reactor assembly

The standard torque converter components operate as follows:

- Rotation of the converter housing and impeller set the fluid in motion.
- The turbine reacts to the fluid motion from the impeller, transferring rotation to the geartrain through the input shaft.
- The reactor redirects fluid going back into the impeller, allowing for torque multiplication.
- Power is transmitted from the torque converter to the planetary gearsets and other components through the input shaft.

Torque Converter Clutch

The torque converter clutch is a device that reduces slip in the torque converter and, therefore, helps to keep fuel consumption to a minimum.

The torque converter clutch is engaged and released by the control system.

Pressure at the torque converter clutch piston is determined by an electronic pressure control valve.

Geartrain

Printable View (64 KB)

Power is transmitted from the torque converter to the planetary gearsets through the input shaft. Clutches are used to hold and drive certain combinations of gearsets. This results in 6 forward ratios and one reverse ratio which are transmitted to the output shaft and differential. The ratios are as follows:

Gear Ratio	
1st	4.17 to 1
2nd	2.34 to 1
3rd	1.52 to 1
4th	1.14 to 1
5th	0.87 to 1
6th	0.69 to 1
Reverse	3.40 to 1

Single Planetary Gearset

The single planetary gear overdrive carrier is driven by the input shaft. The single planetary gear set consists of the following components:

- One sun gear
- Four planetary gears meshing with the sun gear
- One planetary carrier
- One ring gear

Ravigenaux Planetary Gearset

The ravigenaux planetary gearset is splined to the output shaft and consists of the following components:

- Two sun gears of different sizes
- Three short planetary gear pinions meshing with the sun gears
- Three long planetary gear pinions meshing with the sun gears
- One planetary carrier
- One ring gear

Output Shaft

The output shaft provides torque to the driveshaft and rear axle assembly. It is driven by the ring gear of the planetary gearset.

Apply Components

Printable View (80 KB)

Shift Elements

NOTE: All friction and steel clutch plates use a wave designed plate.

In addition to the torque converter, the other shift elements are:

- three rotating multi-plate clutches: forward, direct and overdrive.
- two fixed multi-disc brakes: intermediate and low/reverse.

All gear shifts from 1st to 6th or from 6th to 1st are power-on overlapping shifts. That is, during the shift, one of the clutches must continue to transmit the drive at lower main pressure until the other clutch is able to accept the input torque.

The shift elements, clutches or brakes are engaged hydraulically. The transmission fluid pressure builds up between the cylinder and the piston, pressing the clutches together.

The purpose of these shift elements is to carry out in-load shifts with no interruption to traction.

Multi-plate clutches; forward, direct and overdrive, supply power from the engine to the planetary geartrain. Multi-disc brakes, intermediate and low/reverse, press against the transmission housing in order to achieve a torque reaction effect.

Multi-Plate Clutch

Clutches; overdrive, forward and direct are balanced in terms of dynamic pressure. That is, their pistons are exposed to the transmission fluid flow on both sides, in order to prevent pressure buildup in the clutch as speed increases. This equalization process is achieved by a baffle plate and pressure-free transmission fluid supply by a lubricating passage, through which the space between piston and baffle plate is filled with transmission fluid.

The advantages of this dynamic pressure equalization are:

- reliable clutch engagement and release in all speed ranges.
- improved shift refinement.

Shift Overlap Control

The electro-hydraulic shift action is obtained by means of various valves in the transmission control module (TCM) and main control valve body, actuated by pressure regulators. They engage or disengage the relevant clutches or brakes at the correct moments.

Hydraulic Systems

Fluid Pump

The torque converter is supported in the fluid pump by a needle roller bearing. The fluid pump is driven directly from the engine by the torque converter shell and supplies transmission fluid to the transmission and the hydraulic control unit.

The fluid pump draws in transmission fluid through a filter and delivers it at high pressure to the main pressure valve in the main control valve body unit. The valve adjusts the pressure and returns excess

transmission fluid to the fluid pan.

Fluid Filter

All transmission fluid that is picked up from the pan passes through the fluid filter. The filter and its accompanying seal are part of the fluid path from the pan to the fluid pump.

Transmission Electronic Control System

Printable View (74 KB)

Transmission Electronic System

The transmission control module (TCM) and its input/output network control the following operations:

- Shift timing
- Clutch pressure (shift feel)
- Line pressure (shift feel)
- Torque converter clutch

In addition, the TCM receives input signals from certain transmission-related sensors. The TCM also uses these signals when determining transmission operating strategy.

Using all of these input signals, the TCM can determine when the time and conditions are right for a shift or when to apply or release the torque converter clutch. It will also determine the pressure needed to optimize shift feel. To accomplish this, the TCM uses 6 pressure control solenoids and one shift solenoid to control transmission operation.

The following provides a brief description of each of the sensors and actuators used to control transmission operation.

Transmission Control Module (TCM) and Main Control Valve Body

The TCM and main control valve body are a combination of hydraulic and electronic control units. Both of these modules are installed in the transmission inside the transmission fluid pan.

Transmission Control Module (TCM)

The TCM for the transmission is mounted on top of the main control valve body. The control module for the transmission has been designed to operate correctly in the environment in which the TCM is located.

The TCM is activated and deactivated by the ignition supply and is connected to the transmission link harness by a 16-pin connector.

The TCM controls the operation of the transmission. The TCM processes information in both analog and digital forms, such as:

- transmission input speed.
- transmission output speed.
- throttle position.
- gear selection.
- engine torque.
- engine speed.
- transmission fluid temperature.
- brake pedal position.
- engine oil temperature.
- engine coolant temperature.
- ABS wheel speed.

The information is then used by the TCM to decide which shift pattern to select and for shift energy management. Electro-hydraulic solenoid valves and pressure regulators control the transmission gear

changes.

Five pressure regulators and one solenoid valve are used to control direct transmission fluid flow to select internal clutches and control the fluid pressure at the clutch. A separate pressure regulator is used exclusively for torque converter clutch control.

The TCM monitors all transmission inputs and outputs to confirm correct system operation. If a fault occurs, the TCM is able to carry out default action. It informs the driver of the problem through the instrument cluster diagnostic MIL light.

The TCM will shut down if the TCM hardware temperature rises above a predetermined temperature. Prior to shutting down, the TCM will log a fault code and enter a mechanical limp-home mode.

Solenoids

The hydraulic module contains one solenoid valve. The solenoid valve is activated by the TCM and is either open or closed. It is used to switch the position valve.

There are 6 electronic pressure control valves which convert an electronic current into a proportional hydraulic pressure. They are energized by the TCM and actuate the valves belonging to the relevant switching elements.

Solenoids VFS1, VFS3 and VFS6 are proportional in operation, meaning that hydraulic pressure increases with an increase in current. Solenoids VFS2, VFS4 and VFS5 are inversely proportional in operation, meaning that hydraulic pressure decreases with an increase in current. Solenoid SS1 is a shift solenoid having a ON/OFF operation.

Controller Area Network (CAN) Interface

For the TCM to carry out shift point and shift quality management, a number of external signals are required. For shift point management alone, the TCM requires output speed sensor, throttle pedal position, brake pedal status, gear selection position, transmission fluid temperature, 4WD position, traction control, engine speed and engine torque. The controller area network (CAN) bus is used to share information between control modules.

Brake Pedal Position (BPP) Switch

The brake pedal position (BPP) switch tells the TCM when the brakes are applied. The torque converter clutch disengages when the brakes are applied. The BPP switch closes when the brakes are applied and opens when they are released.

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor detects the temperature of the engine coolant and supplies the information to the TCM. The ECT is installed in the heater outlet fitting or cooling passage on the engine. For engine control applications, the ECT signal is used to modify ignition timing, exhaust gas recirculation (EGR) valve flow and air-to-fuel ratio as a function of engine coolant temperature.

Accelerator Pedal Position (APP) Sensor

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal. The APP sensor detects the position of the accelerator pedal and inputs this information as a voltage to the powertrain control module (PCM). The PCM broadcasts the APP on the CAN bus. The TCM reads APP off the CAN message. The PCM uses the APP sensor information to aid in determining shift scheduling and torque converter control.

Turbine Shaft Speed (TSS) Sensor

The turbine shaft speed (TSS) sensor is a Hall-effect type sensor.

The sensor is mounted internally and is located on the transmission control module.

Output Shaft Speed (OSS) Sensor

The output shaft speed (OSS) sensor is a Hall-effect type sensor.

The sensor is mounted internally and is located on the transmission control module.

Transmission Fluid Temperature (TFT) Sensor

The transmission fluid temperature (TFT) sensor is located on the TCM. The TCM uses the sensor input to activate various shift strategies. The sensor is in the form of a temperature-dependent resistor.

The resistance value of the TFT sensor varies with temperature change. The TCM monitors the voltage across the TFT to determine the temperature of the transmission fluid.

The TCM uses this initial signal to determine whether a cold start shift schedule is necessary. The TCM also inhibits torque converter clutch operation at low transmission fluid temperatures.

Transmission Range (TR) Sensor

The TCM uses the position of the transmission range (TR) sensor, housed in the TCM, to determine the selected gear range from the range selector lever.

The sensor completes the start circuit in P and N, and the back-up lamp circuit in R. The sensor also opens/closes a set of switches that are monitored by the TCM to determine the position of the manual lever (P, R, N, D, 3, 2 and 1).

Transmission Operational Strategies

Adaptive Shift Strategy

Adaptive shift strategy is comprised of the following:

- Shift Energy Management — this function involves reducing or increasing engine output torque during shifting.
    - Reduces excessive energy of the friction packs
    - Increases transmission service life
    - Improves shift quality
    - Unique shift schedules are selected based on vehicle operation conditions and environmental conditions
    - Trailer towing mode
- Pressure Modulation — this function monitors the hydraulic pressure in a shift. This pressure must be matched accurately to the transmission input torque to better provide shift comfort.
- Shift Quality Adapts — is used to provide a higher quality and consistent shift feel. Monitoring and adapting shift pressures and shift energy, to overcome hardware variability over time, will achieve this.
- The TCM has the ability to control the engine output torque during the shift, synchronized with the operation of the transmission clutches.
- Trailer towing mode uses a different shift and converter map. This new map reduces the number of gearshifts when towing, climbing steep hills and while driving at higher altitudes.

TCM Monitoring Functions

The TCM monitors all transmission input and output to identify possible transmission failures. If a fault is detected, the TCM takes the appropriate action to make sure that the transmission enters a safe mode of operation.

- Voltage Supply — this function monitors the vehicle battery voltage.
- Watchdog Monitoring — the watchdog monitoring has 2 functions:
    - Checks for faults in the driver circuits by activating each driver.
    - Checks to see if the safety circuit is functioning correctly.
- TCM Temperature — If the TCM temperature rises above a predetermined temperature, the TCM will shut down. Prior to shutting down, the TCM will log a fault code during shutdown. The transmission will enter a mechanical limp-home mode.
- Pressure Regulator/Solenoid — Each pressure regulator and solenoid is monitored for open and short circuits. The TCM also checks that the current being delivered to each solenoid valve or pressure regulator is within limits.
- Torque Converter Control — The TCM checks and verifies that the torque converter has been engaged correctly. If the torque converter has not engaged correctly, the TCM will carry out the fail-safe action of opening the converter clutch.

Diagnostic Strategy

Printable View (80 KB)

Troubleshooting an electronically controlled automatic transmission is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

NOTE: Do not take short cuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To correctly diagnose a concern, have the following publications available:

- Powertrain Control/Emissions Diagnosis (PC/ED) manual
- OASIS Messages
- Technical Service Bulletins (TSBs)
- Wiring Diagram

These publications provide the information required when diagnosing transmission concerns.

Use the Diagnostic Flow Chart as a guide and follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer's concern.
- Verify the concern by operating the vehicle.
- Check the fluid levels and condition.
- Check for non-factory add-on items.
- Check shift linkages for correct adjustment.
- Check TSBs and OASIS messages regarding the concern.

Diagnostics

- Carry out on-board diagnostic procedures Key On/Engine Off (KOEO) and Key On/Engine Running (KOER).
- Record all diagnostic trouble codes (DTCs).
- Repair all non-transmission codes first.
- Repair all transmission codes second.
- Erase all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only pass codes are obtained, go to Diagnosis By Symptom in this section for additional information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

Diagnostic Flow Chart

Printable View (66 KB)

Prior to carrying out the flow test, the following items should be checked:

- Know and understand the customer concerns.
- Verify the concern by operating the vehicle.
- Check the fluid level and condition.
- Check for non-factory-installed items and verify correct installation.
- Check the shift linkage adjustments.
- Check TSBs and OASIS messages for vehicle concerns.
- Carry out quick test both KOER and KOEO.
- Record all codes.
- Verify that the vehicle transmission control module (TCM) is at the latest calibration release level.

Diagnostic Flow Chart		
1) Did you record any diagnostic trouble codes (DTCs)?	Yes	· REPAIR all hard DTCs. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first, then this workshop manual, then GO to Step 2.
	No	· REFER to Diagnosis By Symptom in this section, then GO to Step 5.
2) Are any continuous test memory codes present?	Yes	· CLEAR codes and CARRY OUT drive cycle test, then GO to Step 3.
	No	· GO to Step 4.
3) Did the continuous test memory codes reappear?	Yes	· REPAIR all continuous test memory codes. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, then this workshop manual, then GO to Step 4.
	No	· GO to Step 4.
4) Is the concern repaired?	Yes	· CARRY OUT the final quick test to verify that no DTCs are present. CLEAR memory codes.
	No	· REFER to Diagnosis By Symptom in this section to diagnose and repair the concern, then GO to Step 5.
5) Is the concern repaired?	Yes	· CARRY OUT the final quick test to verify that no DTCs are present. CLEAR memory codes.
	No	· GET assistance from Technical Hotline.

Preliminary Inspection

Printable View (92 KB)

The following items must be checked prior to beginning the diagnostic procedures:

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer concern or condition. Customer contact may be required in order to begin to verify the concern. Understand the conditions, including when the concern occurs. For example:

- Hot or cold vehicle temperature
- Hot or cold ambient temperature
- Vehicle driving conditions
- Vehicle loaded/unloaded

After understanding when and how the concern occurs, proceed to Verification of Condition.

Verification of Condition

This section provides information that must be used in both determining the actual cause of customer concerns and carrying out the appropriate procedures.

The following procedures must be used when verifying customer concerns for the transmission.

Determine Customer Concern

NOTE: Some transmission conditions can cause engine concerns. An electronic pressure control short circuit can cause engine misfiring. The torque converter clutch not disengaging will stall the engine.

Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperature
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshifting
- Downshifting
- Coasting
- Engagement
- Noise/vibration — check for dependencies, either rpm dependent, vehicle speed dependent, shift dependent, gear dependent, range dependent or temperature dependent.

Check Fluid Level and Condition

Fluid Level Check

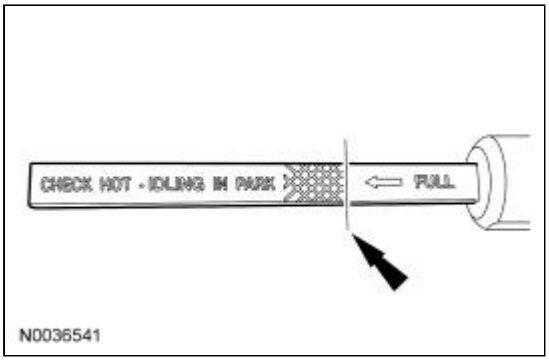
CAUTION: The vehicle should not be driven if the fluid level is low as internal failure could result.

CAUTION: The fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.

NOTE: If the vehicle has been operated for an extended period at high highway speeds, in city traffic, during hot weather or while pulling a trailer, the fluid must cool down to obtain an accurate reading.

NOTE: If the transmission starts to slip, shifts slowly or shows signs of fluid leaking, the fluid level should be checked.

This transmission is equipped with an internal thermal bypass located in the case. This internal thermal bypass valve will shut off fluid flowing to the fluid cooler if the fluid temperature falls below normal operating temperature. Refer to Transmission Fluid Level Check in this section.



High Fluid Level

CAUTION: A fluid level that is too high can cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission failure.

If an overfill reading is indicated, remove any excessive fluid. Refer to Transmission Fluid Level Check in this section.

Low Fluid Level

A low fluid level can result in poor transmission engagement, slipping or failure. This may also indicate a leak in one of the transmission seals or gaskets.

Adding Fluid

CAUTION: The use of any other type of transmission fluid than specified can result in transmission failure.

CAUTION: The fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.

CAUTION: The vehicle should not be driven if the fluid level is low as internal failure could result.

NOTE: If the vehicle has been operated for an extended period at high highway speeds, in city traffic, during hot weather or while pulling a trailer, the fluid must cool down to obtain an accurate reading.

Add fluid using the refill procedure. Refer to Transmission Fluid Drain and Refill in this section.

Fluid Condition Check

1. Check the fluid level.

2. Remove the fluid fill plug and fluid level indicator and allow the fluid to drip onto a facial tissue and examine the stain.

3. Observe the color and the odor. The color under normal circumstances should be dark reddish, not black or have a burnt odor.

4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.

5. If the stain is a foamy pink color, this may indicate coolant in the transmission. The engine cooling system should also be inspected at this time.

6. If fluid contamination or transmission failure is confirmed by the sediment in the bottom of the fluid pan, the transmission must be disassembled and completely cleaned. This includes the torque converter and fluid cooler tubes. A new oil-to-air (OTA) cooler must be installed.

Shift Point Road Test

Printable View (89 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

This test verifies that the shift control system is operating correctly.

1. Bring engine and transmission up to normal operating temperature.
2. Operate vehicle with transmission range selector lever in D position.
3. Apply minimum throttle and observe speeds at which upshift occurs and the torque converter engages. Refer to the Shift Speeds chart in this section.
4. With the transmission in D, move the range selector lever into the manual 3 position. The transmission should downshift to 4th gear. Release the accelerator pedal; engine braking should occur.
5. Press the accelerator pedal to floor, wide open throttle (WOT). Transmission should shift from 4th to 3rd, depending on vehicle speed. The torque converter clutch (TCC) should disengage and then reapply.
6. With the transmission in D position and speed above 80 km/h (50 mph) and less than half throttle, move the transmission range selector lever from D position to manual 2 position and remove pressure from the accelerator pedal. The transmission should downshift into 2nd gear. With the vehicle remaining in manual 2 position, move the transmission range selector lever into manual 1 position and release the accelerator pedal. The transmission should downshift into 1st gear at speeds below approximately 45-56 km/h (28-35 mph).
7. If the transmission fails to upshift/downshift or the TCC does not apply and release, refer to Diagnosis By Symptom in this section.

Shift Speeds

NOTE: Shift speed ranges are approximate for all applications. For specific applications (engine, axle ratio, tire size and application), refer to the Automatic Transmission Specification booklet.
Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

Throttle Position	Shift	MPH	Km/H
Light Throttle	1-2	8-13	13-21
TP Voltage	2-3	16-21	26-34

1.25 Volts	3-4	22-27	35-43
	4-5	35-40	56-64
	5-6	44-49	71-79
Closed Throttle	6-5	35-40	56-64
	5-4	25-30	40-48
	4-3	8-13	13-21
	3-2	2-7	3-11
	2-1	1-4	2-6
Wide Open	1-2	28-33	45-53
Throttle (WOT)	2-3	54-59	87-95
	3-4	87-92	140-148

Road Test — Adaptive Drive Cycle

NOTE: Using the scan tool, clear the adaptive table before conducting an adaptive drive cycle test.

NOTE: All adaptive drive cycle tests are carried out with the transmission fluid temperature at normal operating temperature 80°C-82°C (175°F-180°F).

NOTE: All adaptive drive cycle test are carried out with the range selector lever in the D position.

NOTE: Do not clear the powertrain control module (PCM) keep alive memory (KAM).

This test will begin the adaptive learning schedule to provide a better shift quality and shift feel.

1. Verify that the transmission fluid temperature (TFT) PID is above 80°C (175°F).
2. Clear TCM KAM and adaptive tables using the scan tool.
3. Accelerate from rest with light throttle. The 1-2, 2-3 and 3-4 shifts must occur at engine speeds between 1300-1800 RPM.
4. Continue to accelerate gently to 80 Km/h (50 mph) so that the transmission shifts into 5th gear.
5. Brake gently to a complete stop and hold foot on brake for at least 15 seconds.
6. Repeat Steps 3-6 a total of 5 times.

Torque Converter Diagnosis

Printable View (89 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Prior to torque converter installation, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of good torque converters. Only after a complete diagnostic evaluation can the decision be made to install a new torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary inspection.
2. Know and understand the customer's concern.
3. Verify the condition — carry out the torque converter operation test.
4. Carry out diagnostic procedures.

- Carry out On-Board Diagnostics. Refer to Diagnostics in this section.
  - Repair all non-transmission related DTCs first.
  - Repair all transmission-related DTCs.
  - Rerun on-board diagnostics to verify repair.
- Carry out Stall Speed Test. Refer to Special Testing Procedures in this section.
- Carry out Diagnostic Routines. Refer to Diagnosis By Symptom in this section.
  - Use the Diagnosis by Symptom to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed; diagnose and repair as required before changing the torque converter.

Torque Converter Operation Test

The Torque Converter Operation Test verifies that the torque converter clutch (TCC) control system and the torque converter are operating correctly.

1. Carry out Quick Test with the scan tool. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. Check for DTCs.
2. Connect a scan tool to the vehicle.
3. Bring the engine to normal operating temperature by driving the vehicle at highway speeds for approximately 15 minutes in D position.
4. After normal operating temperature is reached, maintain a constant speed of about 56 km/h (35 mph) in 5th gear for 10 seconds.

5. Release the accelerator pedal and monitor the scan tool TP voltage to approximately 1.25 volts or 25 percent throttle.

6. Monitor the TCC and engine speed PID. The TCC should release and engine rpms should increase before the 5-4 shift occurs.

NOTE: The following is a list of common vehicle concerns that have been misdiagnosed as TCC shudder. For diagnosis of the following items, refer to the appropriate sections of the workshop manual and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

- Spark plugs — check for cracks, high resistance or broken insulators
- Plug wires
- Fuel injector — filter may be plugged
- Fuel contamination — engine driveability concerns
- Exhaust gas recirculation (EGR) valve — valve may let in too much exhaust gas and cause engine to run lean
- Vacuum leak — engine will not get correct air/fuel mixture
- Manifold absolute pressure (MAP)/mass air flow (MAF) sensor — incorrect air/fuel mixture
- Heated oxygen sensor (HO2S) — too rich/lean air/fuel mixture
- Fuel pressure — may be too low
- Engine mounts — loose/damaged mounts can cause vibration concerns
- Axle joints — check for vibration

Visual Inspection

Printable View (65 KB)

A visual inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- Electronic add-on items:
  - air conditioning
  - generator (alternator)
  - engine turbo
  - cellular telephone
  - cruise control
  - CB radio
  - linear booster
  - backup alarm signal
  - computer
- Vehicle modification:

These items, if not installed correctly, will affect the powertrain control module (PCM), transmission control module (TCM) or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size or axle ratio changes.

- Leaks; refer to Leakage Inspection in this section.
- Correct linkage adjustments; refer to Section 307-05 .

Shift Linkage Check

Check for a misadjustment in shift linkage by matching the detents in the transmission range selector lever with those of the manual lever in the transmission. If they match, the misadjustment is in the indicator. Do not adjust the shift linkage.

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted. Refer to Section 307-05 for shift linkage adjustment.

Check TSBs and OASIS

Refer to all technical service bulletins (TSBs) and OASIS messages that pertain to the transmission concern and follow the procedure as described.

Carry Out On-Board Diagnostics (KOEO, KOER)

After a road test, with the vehicle warm and before disconnecting any connectors, carry out the Quick Test using the diagnostic tool. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Diagnostics

Printable View (89 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST1137-A	73 III Automotive Meter 105-R0057 or equivalent

Diagnosing an electronically controlled automatic transmission is simplified by using the following procedures. One of the most important things to remember is that there is a definite procedure to follow. Do not take shortcuts or assume that critical checks or adjustments have already been made. Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostics With Scan Tool

NOTE: For detailed instruction and other diagnostic methods using the scan tool, refer to the scan tool tester manual and the Powertrain Control/Emissions Diagnosis (PC/ED) manual. These quick tests should be used to diagnose the powertrain control module (PCM) and should be carried out in order.

- Quick Test 1.0 — Visual Inspection
- Quick Test 2.0 — Set Up
- Quick Test 3.0 — Key On, Engine Off (KOEO)
- Quick Test 4.0 — Continuous Memory
- Quick Test 5.0 — Key On, Engine Running (KOER)
- Special Test Mode
  - Wiggle Test
  - Output Test Mode
- PCM Reset Mode
- Clearing DTCs
- OBD II Drive Cycle

Other Scan Tool Features

For information on other diagnostic testing features using the scan tool, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Output State Control (OSC) Mode

Printable View (85 KB)

On-Board Diagnostics

Output State Control (OSC) Mode

Output state control (OSC) allows the technician to take control of certain parameters to function the transmission.

For example, OSC allows the technician to shift the transmission only when commanding a gear change. If the technician commands 1st gear in OSC, the transmission will remain in 1st gear until the technician commands the next gear.

Another example of the OSC features is that a technician can command the torque converter to turn ON or OFF to check operation.

This transmission OSC has one mode of operation; DRIVE. This mode has a unique set of operating requirements that the technician must meet before allowed to operate the torque converter or select gears.

NOTE: To operate OSC, the digital transmission range (TR) sensor and the output shaft speed (OSS) sensor must be operational. No diagnostic trouble codes (DTCs) related to the digital TR sensor or the OSS can be present.

- The vehicle requirements MUST BE MET when SENDING the OSC value. Refer to the vehicle requirements for each test.
- If the vehicle requirements are NOT MET when SENDING the OSC value, an ERROR MESSAGE will appear. OSC is aborted and must be restarted.
- If, after the sent value is substituted, the vehicle requirements are no longer met, the powertrain control module (PCM) will cancel the OSC value and resume normal operations. No error message will be sent.
- The OSC value XXX may be sent anytime to cancel OSC.

Output State Control (OSC) Procedures

- Carry out a visual inspection and prepare the vehicle as necessary.
- Select the "Vehicle and Engine Selection" menu.
- Select the appropriate vehicle and engine.
- Select "Diagnostic Data Link."
- Select "Powertrain Control Module."
- Select "Diagnostic Test Mode."
- Select "KOEO On-Demand Self Test and KOER On-Demand Self Test."
- Carry out the tests and record the DTCs.
- Repair all non-transmission DTCs.
- Repair all VSS and digital TR sensor DTCs.
- Make sure that the OSS and digital TR sensors are functional.
- Select "Active Command Mode."
- Select "Output State Control."
- Select "Trans-Drive Mode."

OSC — Transmission in Drive Mode

The OSC provides the following DRIVE Mode functions:

- GEAR — Allows upshifts and downshifts.
- TCC — Engages or disengages the torque converter clutch (TCC).

GEAR in Drive Mode

The DRIVE Mode allows the technician to choose the following options:

- 1 - TCM selects 1st gear.
- 2 - TCM selects 2nd gear.
- 3 - TCM selects 3rd gear.
- 4 - TCM selects 4th gear.
- 5 - TCM selects 5th gear.
- 6 - TCM selects 6th gear.

The DRIVE Mode for GEAR operates ONLY when:

- The OSS and digital TR sensor are operational.
- No OSS and digital TR sensor DTCs are set.
- The Key is ON, engine running.
- The transmission shifter is in the D position.
- Vehicle speed is above 3 km/h (2 mph).

OSC Command Values:

- 1 - TCM selects 1st gear.
- 2 - TCM selects 2nd gear.
- 3 - TCM selects 3rd gear.
- 4 - TCM selects 4th gear.
- 5 - TCM selects 5th gear.
- 6 - TCM selects 6th gear.
- XXX - Cancels a value sent to the TCM.
- SEND - Sends a value to the TCM.

Drive Mode Procedure for GEAR

Follow operating instructions from scan tool menu screen.

- Select "Output State Control."
- Select "Trans - Drive Mode."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during tests.
- Select "Parameters - GEAR."
- Select value "1-6."
- Press "SEND" to send the command.
- Select "XXX" to cancel at any time.
- Press "SEND."

TCC in Drive Mode

The DRIVE Mode allows the technician to choose the following options:

- TCC - Activates TCC OFF and ON.

- ON - Turns TCC solenoid ON.
- OFF - Turns TCC solenoid OFF.

DRIVE Mode for "TCC OFF" operates only when:

- The OSS and digital TR sensor are set.
- NO OSS and digital TR sensor DTCs are set.
- The key is ON, engine running.
- The transmission shifter is in the D position.
- Vehicle speed is above 16 km/h (10 mph).

DRIVE Mode for "TCC ON" operates only when:

- The OSS and digital TR sensor are operational.
- No OSS and digital TR sensor DTCs are set.
- The key is ON, engine running.
- The transmission shifter is in the D position.
- Vehicle speed is above 16 km/h (10 mph).
- TFT is above 38°C (100°F).
- The brake is not applied below 32 km/h (20 mph).
- Steady vehicle speed is maintained.

OSC Command Values:

- OFF - Turns TCC OFF.
- ON - Turns TCC ON.
- XXX - Cancels OSC value sent to the TCM.
- SEND - Sends the values to the TCM.

Drive Mode Procedures for TCC

Follow operating instructions from the scan tool menu screen.

- Select "Output State Control."
- Select "Trans - Drive Mode."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during tests.
- Select "Parameters - TCC."
- Select "ON" to turn the TCC solenoid ON.
- Press "SEND" to send the ON command.
- Select "OFF" to turn the TCC solenoid OFF.
- Press "SEND" to send the OFF command.
- Select "XXX" to cancel at any time.
- Press "SEND."

Diagnostic Parameters Identification (PID) Chart

Printable View (73 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Diagnostic PID Chart

PID No.	PID Name	Units
ECT	Engine coolant temperature	Degrees
VSS	Vehicle speed sensor— low resolution	MPH
TP	Absolute throttle position sensor	Percent full throttle
VBAT	VPWR: Control module voltage	Volts
APP_A	APP_D: Accelerator pedal position D	Percent
SSA_AMP	Commanded current for shift solenoid A	Amperes
SSB_AMP	Commanded current for shift solenoid B	Amperes
SSC_AMP	Commanded current for shift solenoid C	Amperes
SSD_AMP	Commanded current for shift solenoid D	Amperes
PCA_AMP	Commanded current for pressure control A	Amperes
TCC_AMP	Commanded current for torque converter clutch pressure control	Amperes
SSE_DC	Shift solenoid E duty cycle	Percent
RPM	Engine speed	RPM
VBAT	Battery voltage	Volts
GEAR	Gear commanded (1, 2, 3, 4, 5 and 6)	1, 2, 3, 4, 5 and 6
TCCMACT	Absolute value of slip across torque converter	RPM
RAT_CMD	Current transmission gear ratio commanded	1, 2, 3, 4, 5 and 6
RAT_MES	Current transmission gear ratio measured (input speed/output speed)	1, 2, 3, 4, 5 and 6
TFT	Transmission fluid temperature	Degrees
DSS_SRC	Output shaft speed (OSS) — raw signal	RPM
TSS	Turbine shaft speed (TSS) — raw signal	RPM
TR	PRNDL position	—
BPP	Brake pedal position (BPP) switch	ON or OFF
PCA	Commanded pressure for pressure control solenoid A (VFS5)	PSI
PM	Engine speed (revolutions per minute)	RPM
SLIPABS	Torque converter speed ratio (engine speed compared with turbine	

	shaft speed)	
OSS	Output shaft speed (OSS) sensor	MPH

Transmission Drive Cycle Test

Printable View (82 KB)

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The Transmission Drive Cycle Test must be followed exactly. Malfunctions must occur 4 times consecutively for shift error diagnostic trouble code (DTC) code to be set, and 5 times consecutively for continuous torque converter clutch (TCC) code to set.

NOTE: When carrying out the Transmission Drive Cycle Test, refer to the Solenoid Application Chart for correct solenoid operation.

After carrying out the Quick Test, use the Transmission Drive Cycle Test for checking continuous codes.

1. Record and then erase Quick Test codes.
2. Warm engine to normal operating temperature.
3. Make sure transmission fluid level is correct.
4. With transmission in DRIVE, moderately accelerate from stop to 80 km/h (50 mph). This allows the transmission to shift into 6th gear. Hold speed and throttle open steady for a minimum of 15 seconds.
5. With transmission in 6th gear and maintaining steady speed and throttle opening, lightly apply and release brake to operate stop lamps. Then, hold speed and throttle steady for a minimum of 5 seconds.
6. Brake to a stop and remain stopped for a minimum of 20 seconds.
7. Repeat Steps 4 through 6 at least 5 times.
8. Carry out the Quick Test and record continuous DTCs.
    - If the DTCs are still present, refer to the Diagnostic Trouble Code Chart. Repair all non-transmission DTCs first as they can directly affect the operation of the transmission. Repeat the Quick Test and the Road Test to verify the correction. Erase the DTCs, carry out the Drive Cycle Test and repeat the Quick Test after completing the repair on the DTC.
    - If the continuous test passes and a concern is still present, refer to Diagnosis By Symptom in this section, OASIS messages and TSBs for concerns.

After On-Board Diagnostic

NOTE: The vehicle wiring harness, powertrain control module (PCM) and non-transmission sensors may affect transmission operations. Repair these concerns first.

After the on-board diagnostic procedures are completed, repair all DTCs.

Begin with non-transmission related DTCs, then repair any transmission-related DTCs. Use the diagnostic trouble code chart for information on condition and symptoms. This chart will be helpful in referring to the correct manual(s) and aids in diagnosing internal transmission concerns and external non-transmission inputs. The pinpoint tests are used in diagnosing transmission electrical concerns. Make sure that the vehicle wiring harness and the PCM are diagnosed as well. The Powertrain Control/Emissions Diagnosis (PC/ED) manual will aid in diagnosing non-transmission electronic components.

Diagnostic Trouble Code (DTC) Charts

Printable View (140 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Using a scan tool to retrieve diagnostic trouble codes (DTCs), begin with and correct all non-transmission related DTCs. Start with the U-DTC codes (communication link codes) then repair any transmission-related DTCs.

Limp-home mode is a default condition to protect the engine and transmission when a fault occurs. Limp-home mode depends on the actual gear the vehicle was in when the fault has occurred.

- For gears 1-3, the limp-home default will be 3rd gear.
- For gears 4-6, the limp-home default will be 5th gear.

The limp-home gear will be held until the vehicle is placed in R, P or the vehicle has been restarted. After these action(s) the vehicle will default to the limp-home mode of 3rd gear.

Diagnostic Trouble Code Chart

Five Digit DTC	Component	Description	Condition	Symptom	Action
P0218	TFT	Transmission fluid over temperature condition.	TCM has detected a TFT that has exceeded a set temperature.	• Aggressive lockup schedule	CARRY OUT normal diagnostic for an overheating condition. REFER to Diagnosis By Symptom in this section.
P0562	Battery	System voltage low.	TCM has detected a voltage level below minimum voltage to operate solenoids. Maintains current solenoid state.	• No adaptive strategy • No self learning strategy • May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear • Battery voltage below 9 volts • Will turn on TCIL	MONITOR the appropriate Parameter Identification (PID) to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

P0563	Battery	System voltage high.	TCM has detected a voltage level above maximum voltage.	• No adaptive strategy • No self learning strategy • May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear • Battery voltage above 16 volts • Will turn on TCIL	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0605	TCM	The TCM ROM has been corrupted.	TCM has detected an internal software concern with ROM.	• May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear • Will turn on TCIL	REFLASH the original mechatronic to the latest level calibration. CLEAR all DTCs. TEST the system for normal operation. If DTCs return, INSTALL a new mechatronic assembly. After installing the new mechatronic assembly, it must be reflashed to the latest level calibration. CARRY OUT the Road Test — Adaptive Drive Cycle. REFER to Shift Point Road Test in this section.
P0613	TCM	TCM processor.	TCM has detected an internal software issue.	• May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear • Will turn on TCIL	INSTALL a new mechatronic assembly. After installing the new mechatronic assembly, it must be reflashed to the latest level calibration.
P0634	TCM	TCM module temperature.	Internal temperature within TCM too high. Possible restriction in cooling circuit.	• May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear	MONITOR the TFT PID to validate that an error is present. INSPECT the transmission cooler lines for possible restrictions (kinked or bent cooler lines). VERIFY correct operation/orientation of the thermal bypass valve. INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest

					level calibration.
P0641	TCM	TCM module sensor voltage failed.	Sensor reference voltage A circuit open, voltage too high or too low.	• May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear • Will turn on TCIL • Low battery voltage under 9 volts. May also cause P0562	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0657	TCM	Actuator supply voltage A circuit open.	Power supply actuators open circuit.	• May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0658	TCM	Actuator supply voltage A circuit low.	Power supply actuators short circuit to ground.	• May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0659	TCM	Actuator supply voltage A circuit high.	Actuator power supply short circuit to power before key ON.	• May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0667	TCM-TFT	PCM, ECM, TCM internal temperature sensor range operation.	Substrate temperature sensor.	—	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.

P0701	Transmission control system	Transmission control system. Range operation.	TCM has detected a concern with the operational strategy.	• Dual DTC code causing transmission default to a hydraulic limp-home mode • May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear • Will turn on TCIL	Multiple DTC failure with conflicting failure mode actions. If other DTCs are present, REPAIR them first. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. REFLASH the TCM first. If the DTC returns, INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0705	TR sensor	TR sensor circuit error.	TCM has detected a TR signal (P, R, N, D, 3, 2 or 1) is out of normal range.	• May turn on MIL • Mechanical limp-home mode — default to 3rd or 5th gear • Will turn on TCIL	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0711	TFT sensor	No change in TFT during operation.	PCM has detected no TFT change during operation. TFT stuck at some normal reading.	—	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0712	TFT sensor	TFT sensor circuit grounded.	TCM has detected a voltage drop across TFT sensor exceeds scale set for temperature (grounded circuit).	—	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.

P0713	TFT sensor	TFT sensor circuit short to power.	TCM has detected a voltage drop across TFT sensor; exceeds scale set for temperature.	—	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0714	TFT sensor	TFT intermittent error.	TCM has detected no TFT intermittent operation.	—	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0715	TSS sensor	TSS sensor circuit error.	TSS has detected a short circuit to power.	• No TCC engagements • May turn on MIL • Max line pressure • No adaptive learning strategy • Hold in 3rd gear • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0716	TSS sensor	TSS range or operation insufficient input from TSS.	TCM has detected a loss or noisy TSS signal during operation.	• No TCC engagements • May turn on MIL • Max line pressure • No adaptive learning strategy • Hold in 3rd gear • Will turn on TCIL	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0717	TSS sensor	No TSS signal.	TCM has not detected a TSS signal. No TSS signal when OSS signal is present.	• No TCC engagements • May turn on MIL • Max line pressure • No adaptive learning strategy • Hold in 3rd gear • Will turn on TCIL	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronics unit.

					After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0720	OSS sensor	No OSS signal.	TCM has detected an OSS short circuit to power.	May turn on MIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0721	OSS sensor	OSS range or operation insufficient input from OSS.	TCM has detected a loss or noisy OSS signal during operation.	May turn on MIL	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0722	OSS sensor	No OSS signal.	TCM has not detected a OSS signal. No OSS signal when OSS signal is present.	May turn on MIL	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0723	OSS sensor	No OSS signal intermittent.	TCM has detected an intermittent signal.	• No TCC engagements • Hold in gear currently selected • Max line pressure • No adaptive learning strategy • Will turn on	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If

				TCIL	the DTC returns, INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0729	Transmission	Sixth gear ratio error.	No 6th gear ratio detected by the TCM.	• No 6th gear • No TCC engagements • May turn on MIL • No adaptive learning strategy • Max line pressure • Held in 5th gear • Will turn on TCIL	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 272. REFER to Diagnosis By Symptom in this section.
P0731	Transmission	First gear ratio error.	No 1st gear ratio detected by the TCM.	• No 1st gear • No TCC engagements • May turn on MIL • No adaptive learning strategy • Held in 3rd gear • Max line pressure • Will turn on TCIL	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 215. REFER to Diagnosis By Symptom in this section.
P0781	Transmission	1-2 or 2-1 shift error.	Incorrect ratio calculated during shift 1-2 or 2-1.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material)	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 220 or 225. REFER to

				• No TCC engagements • No adaptive learning strategy • Hold in 3rd, 2nd or 4th gear • Will turn on TCIL	Diagnosis By Symptom in this section.
P0782	Transmission	2-3 or 3-2 shift error.	Incorrect ratio calculated during shift 2-3.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • No TCC engagements • No adaptive learning strategy • Hold in 4th, 3rd or 2nd gear • May turn on MIL • Will turn on TCIL	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 221 or 224. REFER to Diagnosis By Symptom in this section.
P0783	Transmission	3-4 or 4-3 shift error.	Incorrect ratio calculated during shift 3-4 or 4-3.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • No TCC engagements • No adaptive learning strategy • Hold in 4th or 3rd gear • May turn on MIL • Will turn on	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 222 or 223. REFER to Diagnosis By Symptom in this section.

				TCIL	
P0784	Transmission	4-5 or 5-4 shift error.	Incorrect ratio calculated during shift 4-5 or 5-4.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material) • No TCC engagements • No adaptive learning strategy • Hold in 5th or 4th gear • May turn on MIL • Will turn on TCIL	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 270 or 271. REFER to Diagnosis By Symptom in this section.
P0732	Transmission	Second gear ratio error.	No 2nd gear ratio detected by the TCM.	• No TCC engagements • No adaptive learning strategy • Max line pressure • May turn on MIL • Hold in 3rd gear • Will turn on TCIL	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 220, 224 and 217. REFER to Diagnosis By Symptom in this section.
P0733	Transmission	Third gear ratio error.	No 3rd gear ratio detected by the TCM.	• No TCC engagements • No adaptive learning strategy • Max line pressure • May turn on MIL • Hold in 4th gear • Will turn on TCIL	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 221

					or 223. REFER to Diagnosis By Symptom in this section.
P0734	Transmission	Fourth gear ratio error.	No 4th gear ratio detected by the TCM.	• No TCC engagements • No adaptive learning strategy • Max line pressure • May turn on MIL • Hold in 3rd gear • Will turn on TCIL	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 222 or 271. REFER to Diagnosis By Symptom in this section.
P0735	Transmission	Fifth gear ratio error.	No 5th gear ratio detected by the TCM.	• No TCC engagements • No adaptive learning strategy • Max line pressure • May turn on MIL • Hold in 3rd gear • Will turn on TCIL	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 270 or 273. REFER to Diagnosis By Symptom in this section.
P0736	Transmission	Reverse gear ratio error.	No reverse gear ratio detected by the TCM.	• No TCC engagements • No adaptive learning strategy • Max line pressure • May turn on MIL • Hold in 4th gear	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 202 or 205. REFER to Diagnosis By Symptom in this section.

P0829	Transmission	5-6 or 6-5 shift error.	Incorrect ratio calculated during shift 5-6 or 6-5.	• Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material). • No TCC engagements • Held in 3rd or 2nd gear • May turn on MIL • Will turn on TCIL	FOLLOW preliminary diagnostics. MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, see diagnostic routine 272 or 273. REFER to Diagnosis By Symptom in this section.
P0960	PC A	PC A circuit or solenoid failure or open circuit.	PC A circuit or solenoid (VFS-5) failed during operation.	• No adaptive strategy • Max line pressure • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0962	PC A	PC A solenoid signal or ground circuits either short or open solenoid circuit failure.	Voltage through PC A solenoid (VFS-5) is checked. An error will be noted if tolerance is exceeded.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0963	PC A	PC A solenoid short to power circuit failure.	Voltage through PC A solenoid (VFS-5) is checked. An error will be noted if tolerance is exceeded.	• Max line pressure • No adaptive strategies • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0972	SS A	SS A circuit or solenoid failure.	SS A (VFS-1) circuit or solenoid failure.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new

					mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0973	SS A	SS A solenoid or circuit shorted to ground or open.	Voltage through SS A solenoid (VFS-1) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0974	SS A	SS A solenoid or circuit shorted to power or open.	Voltage through SS A solenoid (VFS-1) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0975	SS B	SS B circuit shorted to ground or open.	SS B (VFS-2) circuit or solenoid failure.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0976	SS B	SS B solenoid or circuit shorted to ground or open.	Voltage through SS B solenoid (VFS-2) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0977	SS B	SS B solenoid or circuit shorted to power or open.	Voltage through SS B solenoid (VFS-2) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0978	SS C	SS C circuit	SS C (VFS-3)	• Mechanical	INSTALL a new

		shorted to ground or open.	circuit or solenoid failure.	limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0979	SS C	SS C solenoid or circuit shorted to ground or open.	Voltage through SS C solenoid (VFS-3) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0980	SS C	SS C solenoid or circuit shorted to power or open.	Voltage through SS C solenoid (VFS-3) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0981	SS D	SS D circuit shorted to ground or open.	SS D (VFS-4) circuit or solenoid failure.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0982	SS D	SS D solenoid or circuit shorted to ground or open.	Voltage through SS D solenoid (VFS-4) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0983	SS D	SS D solenoid or circuit shorted to power or open.	Voltage through SS D solenoid (VFS-4) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.

P0770	SS E	SS E circuit or solenoid failure.	SS E (SS1) circuit or solenoid failure.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new SS E (SS1) solenoid.
P0985	SS E	SS E solenoid signal circuit shorted to ground or open.	Voltage through SS E solenoid (SS1) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new SS E (SS1) solenoid.
P0986	SS E	SS E solenoid or circuit shorted to power or open.	Voltage through SS E solenoid (SS1) is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	• Mechanical limp-home mode — default to 3rd or 5th gear • May turn on MIL • Will turn on TCIL	INSTALL a new SS E (SS1) solenoid.
P1707	Transmission	P/N switch circuit failure.	Circuit or sensor failure high. Circuit or sensor failure low.	• Engine will not crank in P or N or engine will crank in all gears • Will turn on TCIL	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. CHECK the shift linkage. If the DTC returns, INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P1910	Reverse lamp circuit	Reverse solenoid circuit failure.	Circuit or sensor failure.	• Park lock or interlock switched OFF • Reverse lamps may be on at all times • Reverse may not come on	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all the DTCs. TEST system for

					normal operation. If DTC returns, REFER to Section 417-01 .
P1911	Reverse lamps	Reverse solenoid signal circuit shorted to ground. Circuit low.	Circuit or sensor failure.	—	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all the DTCs. TEST system for normal operation. If DTC returns, REFER to Section 417-01 .
P1912	Reverse lamps	Reverse solenoid circuit shorted to power. Circuit high.	Circuit or sensor failure.	Park lock or interlock switched OFF.	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all the DTCs. TEST system for normal operation. If DTC returns, REFER to Section 417-01 .
P0740	TCC solenoid	TCC solenoid circuit failure.	TCC solenoid (VFS-6) circuit fails. Circuit open.	• May turn on MIL • No adaptive learning strategy • Mechanical limp-home mode — default to 3rd or 5th gear • TCC engagements • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P2763	TCC	TCC solenoid signal circuit shorted to power. Circuit high (ON).	TCC solenoid (VFS-6) circuit fails to provide voltage drop across solenoid. Circuit shorted to power.	• No TCC engagements • May turn on MIL • No adaptive learning strategy • Mechanical limp-home mode — default to 3rd or 5th gear • Will turn on TCIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P2764	TCC	TCC solenoid circuit shorted to ground. Circuit low.	TCC solenoid (VFS-6) circuit fails to provide voltage drop	• No TCC engagements • May turn on MIL	INSTALL a new mechatronics unit. After installing the new mechatronic unit,

			across solenoid.	• No adaptive learning strategy • Will turn on TCIL	it must be reflashed to the latest level calibration.
U0073	CAN	CAN communication link error.	CAN communication bus off, short circuit CAN high to CAN low.	• No adaptive learning strategy • Hold in 3rd gear • Max line pressure • Will turn on TCIL • No TCC engagements	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual [a] .
U0155	CAN	TCM communication link error.	CAN link error detected by TCM and IP.	• No communication with instrument panel cluster (IPC)	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual [a] .
U0100	CAN	TCM communication link error.	CAN link error detected by TCM, between TCM and ECM.	• No adaptive learning strategy • Hold in 3rd gear • Max line pressure • Will turn on TCIL • No TCC engagements	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual [a] .
U0121	CAN	TCM communication link error.	PCM/TCM have detected an error in the CAN wheel RPM information from the ABS system.	—	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual [a] .
P062F	TCM	Transmission control module EEPROM error.	TCM has detected an internal software concern with KAM.	• May turn on MIL • No adaptive strategy • Will turn on TCIL	MONITOR the appropriate PID to validate that an error is present. REFER to Diagnostic Parameters Identification (PID) Chart in this section. CLEAR all DTCs. TEST the system for normal operation. If the DTC returns, INSTALL a new mechatronics unit. After installing the new mechatronic unit, it must be reflashed to the latest level calibration.
P0741	TCC	TCC solenoid	TCC solenoid	• No TCC	CARRY OUT normal

		circuit stuck open.	(VFS-6), clutch or circuit open.	engagements • May turn on MIL • Will turn on TCIL	diagnostics for TCC. FOLLOW diagnostic routines 240, 241 and 242. REFER to Diagnosis By Symptom in this section.

14	—	Term 30 (Battery voltage)
15	—	NOT USED
16	—	Terminal 31 (Ground)

Special Testing Procedures

Printable View (135 KB)

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portions of the transmission.

Engine Idle Speed Check

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the engine idle speed.

Stall Speed Test

WARNING: Apply the service and parking brakes firmly while carrying out each stall test.

CAUTION: Carry out the Line Pressure Test prior to carrying out the Stall Speed Test. If line pressure is low at stall, do not carry out the Stall Speed Test or further transmission damage will occur.

NOTE: The stall test should only be carried out with the engine and transmission at normal operating temperatures.

The stall test checks the operation of the following items:

- Torque converter one-way clutch
- Forward clutch
- Reverse clutch
- Direct clutch
- Engine driveability concerns

1. Connect a tachometer to the engine.
2. After testing each of the following ranges, D, 3, 2, 1 and R, move the transmission range selector lever to N (NEUTRAL) and run the engine for about 15 seconds to allow the torque converter to cool before testing the next range.
3. **CAUTION: If the engine rpm recorded by the tachometer exceeds the maximum specified rpm, release the accelerator pedal immediately. Clutch slippage is indicated.**

   CAUTION: Do not maintain wide-open throttle (WOT) in any gear range for more than 5 seconds or damage to the transmission may occur.

   Press the accelerator pedal to the floor (WOT) in each range. Record the rpm reached in each range. Stall speeds should be in the appropriate range.

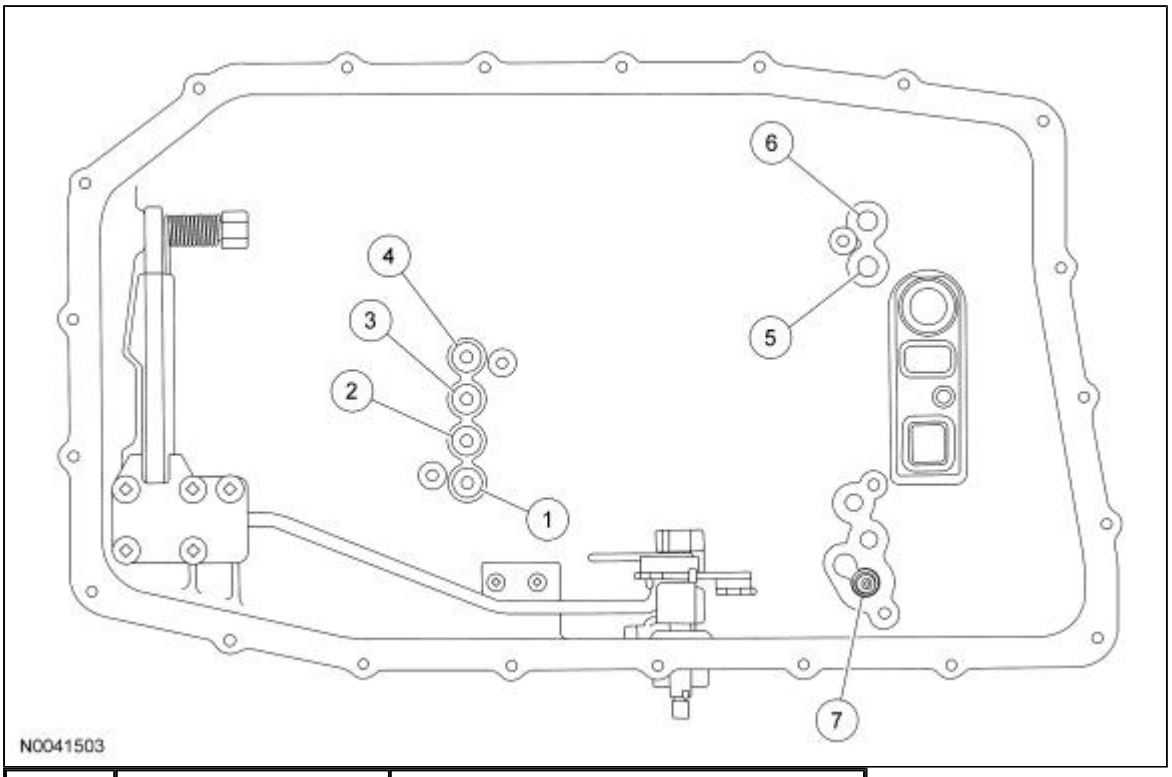
Stall Speed

Engine	Min	Max

5.4L	2,159	2,531

If the stall speeds were too high, refer to the following Stall Speed Diagnosis Chart. If the stall speeds were too low, check engine tune-up. If the engine is OK, remove the torque converter and check the torque converter reactor one-way clutch for slippage.

Air Pressure Test



Item	Part Number	Description
1	—	Clutch (C) port
2	—	Clutch (D1) port
3	—	Clutch (D2) port
4	—	Direct clutch (B) port
5	—	Overdrive clutch (E) port
6	—	Forward clutch (A) port
7	—	Cooler bypass valve

A no-drive condition can exist, even with correct transmission fluid pressure, because of inoperative clutches or bands. Refer to the Clutch Application Chart to determine the appropriate elements. A clutch concern can be located through a series of checks by substituting air pressure for fluid pressure to determine the location of the concern.

Example: When the transmission range selector lever is in a forward gear range (D, 3, 2, 1), a no-drive condition may be caused by an inoperative forward clutch.

1. Drain the transmission fluid. Remove the transmission fluid pan.

2. Remove the filter and seal assembly and the mechatronics unit.

3. The inoperative clutches can be located by applying air pressure into the appropriate clutch port.

4. Apply air pressure to the appropriate clutch port. A dull thud may be heard or movement felt when a clutch piston is applied. If the clutch seals or check ball are leaking, a hissing may be heard.

5. If the clutches fail to operate during the air check:
    - the piston seals are not seated, damaged or not installed correctly.
    - plugged feed holes for clutch apply in the case and/or clutch cylinder.
    - damaged piston and/or clutch cylinder.

6. Service as required and recheck.

Leakage Inspection

Printable View (110 KB)

Special Tool(s)

ST1300-A	100W/12 Volt DC UV Lamp 164-R0751 or equivalent

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP
Automatic Transmission/Power Steering Dye 164-R3701 or equivalent	—

The transmission has the following parts to prevent external fluid leakage:

- Gaskets
- Lip-type seals
- O-ring seals
- Seal rings
- Seal grommets
- Seal washers
- Thread sealant

Leakage at the transmission pan-to-case gasket often can be stopped by tightening the bolts to specification. Refer to Torque Specifications in this section.

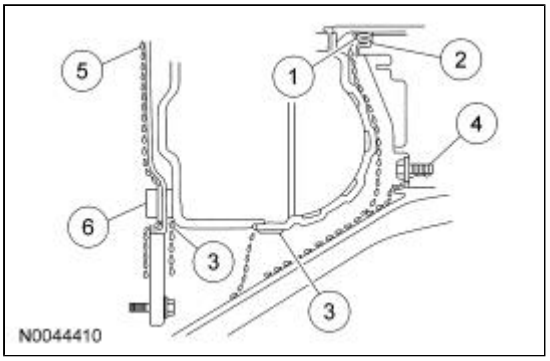
When fluid is found to be leaking between the case and the cooler tube fitting, tighten the fitting to maximum specification.

If leakage is found at the manual control lever shaft, install a new seal.

Check for fluid leaking from the end of the extension housing. Leakage can result from a damaged seal, missing garter spring or worn extension bushing. Install a new seal assembly, bushing or both, as necessary.

Fluid Leakage in Torque Converter Area

Leakage at the front of the transmission, as evidenced by fluid around the torque converter housing part of the case, may have several sources. By careful observation it is possible, in many instances, to pinpoint the source of the leak before removing the transmission from the vehicle. The paths which the fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The 6 numbers in the illustration correspond with the 6 flow path steps.



Leak Path	Symptom	Possible Source
1, 2 and 4	Leak at front of transmission	Pump lip seal
1, 2 and 4	Leak at front of transmission	Vent
1, 2 and 4	Leak at front of transmission	Converter hub weld
1, 2 and 4	Leak at front of transmission	External pump seal (large)
1, 2 and 4	Leak at front of transmission	Pump to case fasteners
1, 2 and 4	Leak at front of transmission	Pump gasket
3	Leak at front of transmission	Torque converter seal weld
5	Leak at front of transmission	Engine oil leak; rear main seal
5	Leak at front of transmission	Engine valve cover
5	Leak at front of transmission	Oil galley
5	Leak at front of transmission	Pump lip seal
5	Leak at front of transmission	Engine oil pressure sensor
6	Leak at front of transmission	Torque converter rivet

Leak Check Test with A Black Light

NOTE: Automatic Transmission/Power Steering Dye (164-R3701 or equivalent specifically formulated for ATF) is used to detect a transmission fluid leak.

Add Automatic Transmission/Power Steering Dye to the transmission fluid. Use one 30.0 mL (1 oz) of dye solution for every 3.8L (4 qt) of transmission fluid. Add any additional transmission fluid to bring it to the correct level. Such dyes can be used to determine whether an engine fluid or transmission fluid leak is present, or if the fluid in the transmission fluid cooler hose leaks into the engine coolant system. An ultraviolet light must be used to detect the fluorescent dye solution.

1. Remove the fluid level fill plug and note the color of the fluid that drips out. Original factory fill fluid is clear and red if the fluid has been exchanged.

2. Clean off any fluid from the top and bottom of the torque converter housing, front of the case and rear face of the engine and oil pan. Clean the torque converter area by washing with a suitable non-flammable solvent and blow-dry with compressed air.

3. Wash out the torque converter housing and the front of the flexplate. The torque converter housing may be washed out using clean solvent and a squirt-type oil can. Blow-dry all washed areas with compressed air.

4. Start and run the engine until the transmission reaches its normal operating temperature. Shift the transmission through all the gear ranges to make sure that the dye has circulated through the

transmission. Observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Observe the front of the flexplate, back of the cylinder block (in as far as possible) and inside the torque converter housing and front of the case. Run the engine until fluid leakage is evident and the probable source of leakage can be determined. Repair as required.

External Fluid Leaks

Leak Path	Possible Source
Leaks at the fluid pan to case	• Pan bolts not tightened to specification • Pan gasket damaged • Case pan rail damaged
Fluid cooler tubes or O-rings leaking	• Cooler tube(s), cooler tube O-rings damaged • Cooler tube hold-down plate damaged
Leaks at the fluid cooler	• Fluid cooler damaged • Cooler tube O-rings damaged
Leaks at the manual control lever	• Manual control lever seal missing or damaged
Mechatronic harness connector	• O-ring on connector missing or damaged

Transmission Fluid Cooler Tube Replacement

For installation of new transmission fluid cooler tube, refer to Section 307-02.

Transmission Fluid Cooler

Printable View (79 KB)

CAUTION: Whenever a transmission has been disassembled to install new parts, the transmission fluid cooler and transmission fluid cooler tubes must be cleaned and backflushed. Use a torque converter/oil cooler cleaner.

NOTE: Cleaning and backflushing the transmission fluid cooling system, along with following all the normal cleaning and inspection procedures during disassembly and reassembly, will keep contaminants from entering the transmission, causing a repeat repair.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material or band material may have been carried into the torque converter and transmission fluid cooler. These contaminants are a major cause of recurring transmission troubles and must be removed from the system before the transmission is put back into use.

Diagnosis By Symptom

Printable View (163 KB)

The Diagnosis By Symptom gives the technician diagnostic information and direction, and suggests possible components using a symptom as a starting point. All routines start out with any potential electrical components that can cause or contribute to the symptom described. The routines then list all possible hydraulic or mechanical components that can cause or contribute the symptom described.

Diagnosis by Symptom Chart Directions

1. Using the Diagnosis by Symptom, select the condition that best describes the condition.

2. Refer to the routine indicated in the Diagnosis by Symptom Index.

3. Always begin diagnosis of a symptom with:
    1. preliminary inspections.
    2. verifications of condition.
    3. checking the fluid levels.
    4. carrying out other test procedures as directed.

4. **NOTE:** Not all concerns and conditions with electrical components will set a diagnostic trouble code (DTC). Be aware that the components listed may still be the cause. Verify correct function of these components prior to proceeding to the Hydraulic/Mechanical Routine listed.

   NOTE: When the battery is disconnected or a new battery is installed, certain transmission operating parameters can be lost. The transmission control module (TCM) must relearn these parameters. During this learning process, you may experience slightly firm shifts, delayed or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the TCM.

   Begin with the ROUTINES, if indicated. Follow the reference or action required statements. Always carry out the on-board diagnostic tests as required. Never skip steps. Repair as required. If the concern is still present after electrical diagnosis, then proceed to the Hydraulic/Mechanical Routine listed.

5. The list contains only possible hydraulic or mechanical components that may cause or contribute to the concern. These components are listed in the removal sequence and by most probable cause. All components listed must be inspected to make sure that repairs are complete.

Diagnosis by Symptom Index

Title	Routines
Engagement Concerns	
No Forward In D	201
No Reverse	202
Harsh Reverse	203
Harsh Forward	204
Delayed/Soft Reverse	205
Delayed/Soft Forward	206
No Forward and No Reverse	207

Harsh Forward and Harsh Reverse	208
Delayed Forward and Delayed Reverse	209
Shift Concerns	
Some/All Shifts Missing	210
Timing — Early/Late	211
Timing — Erratic/Hunting	212
Feel Concerns	
Soft/Slipping (some or all)	213
Harsh (some or all)	214
No 1st Gear, Engages in Higher Gear	215
No Manual 1st Gear	216
No Manual 2nd Gear	217
No Manual 3rd Gear	218
No 1-2 Shift (Automatic)	220
No 2-3 Shift (Automatic)	221
No 3-4 Shift (Automatic)	222
No 4-5 Shift (Automatic)	270
No 5-6 Shift (Automatic)	272
No 6-5 Shift (Automatic)	273
No 5-4 Shift (Automatic)	271
No 4-3 Shift (Automatic)	223
No 3-2 Shift (Automatic)	224
No 2-1 Shift (Automatic)	225
Torque Converter Operation Concerns	
No Apply	240
Cycling/Chatter	241
Always Applied/Stalls Vehicle	242
Other Concerns	
External Leaks	252
Noise/Vibration in Forward or Reverse	254
Engine Will Not Crank	255
No Park (P) Range	256
Transmission Overheating	257
Fluid Venting/Foaming	261

Diagnostic Routines

Engagement Concerns: No Forward in D

Possible Component	Reference/Action
201 — ROUTINE	
Fluid	
・Incorrect fluid level	・Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Shift Linkage	

· Shift linkage — damage or incorrectly adjusted	· Inspect and repair as required. Verify transmission selector lever cable adjustment. Refer to Section 307-05 . Adjust transmission selector lever cable as necessary.
Mechatronics	
· Defective manual valve	· Inspect connection to shift linkage.
· Defective forward clutch (A) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Clutch Plates	
· Forward clutch (A) friction and steel plate — failure	· Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure	· Inspect the low/reverse clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.
Pump	
· Pump gear — failure	· Install a new pump assembly. Refer to Pump Assembly in this section.

Engagement Concerns: No Reverse

Possible Component	Reference/Action
202 — ROUTINE	
Fluid Level	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Shift Linkage	
· Shift linkage — damage or incorrectly adjusted	· Inspect and repair as required. Verify transmission selector lever cable adjustment. Refer to Section 307-05 . Adjust transmission selector lever cable as necessary.
Mechatronics	
· Defective direct clutch (B) or low/reverse clutch (D) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
Pump	
· Pump gear — failure	· Install a new pump assembly. Refer to Pump Assembly in this section.

Engagement Concerns: Harsh Reverse

Possible Component	Reference/Action
203 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Driveline	
· Engine driveline looseness in the driveshaft, U-joints or the engine mounts	· Repair as required.

Engagement Concerns: Harsh Forward Only

Possible Component	Reference/Action
204 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Mechatronics	
· Defective forward clutch (A) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective forward clutch (A) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Driveline	
· Engine driveline looseness in the driveshaft, U-joints or the engine mounts	· Repair as required.

Engagement Concerns: Delayed/Soft Reverse Only

Possible Component	Reference/Action
205 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.

Engagement Concerns: Delayed/Soft Forward Only

Possible Component	Reference/Action
206 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Mechatronics	
· Defective forward clutch (A) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.

Engagement Concerns: No Forward and No Reverse

Possible Component	Reference/Action
207 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.

Mechatronics	
· Defective manual valve	· Inspect connection to shift linkage.
Pump	
· Pump gear — failure	· Install a new pump assembly. Refer to Pump Assembly in this section.

Engagement Concerns: Harsh Forward and Harsh Reverse

Possible Component	Reference/Action
208 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses, solenoids, transmission range (TR) sensor, SSA solenoid, PCA solenoid	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
· Multiple shift missing (more than one gear)	· If some shifts are missing, determine which shifts do not occur. Refer to clutch and solenoid application charts in this section. Monitor appropriate PIDs as listed in diagnostics. Refer to routine 210.
Mechatronics	
· Gears 4-6 default to 5th gear and gears 1-3 default to 3rd gear	· Retrieve DTC codes.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.

Engagement Concerns: Delayed Forward and Delayed Reverse

Possible Component	Reference/Action
209 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Mechatronics	
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.

Shift Concerns: Some/All Shifts Missing

Possible Component	Reference/Action
210 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Shift Linkage Damaged or Incorrectly Adjusted	
· External shift cable	· Inspect and repair as required. Verify transmission selector lever cable adjustment. Refer to Section 307-05 . Adjust transmission selector lever cable as necessary.
Forward Clutch (A) Assembly (No Shifts)	
· Seals, piston — damaged	· Inspect for damage. Repair as required.
· Friction elements — damaged or worn	· Inspect for damage. Repair as required.
· Return springs — damaged	· Inspect for damage. Repair as required.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses, solenoids, transmission range (TR) sensor, SSA solenoid, PCA solenoid	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
· Multiple shift missing (more than one gear)	· If some shifts are missing, determine which shifts do not occur. Refer to clutch and solenoid application charts in this section. Monitor appropriate PIDs as listed in diagnostics.

Shift Concerns: Timing — Early/Late

Possible Component	Reference/Action
211 — ROUTINE	
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
· Engine driveability concerns	· Refer to Section 303-00 .
Mechatronics	
· Bolts not tightened to specification	· Tighten to specification.
· Mechatronic unit contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	· Inspect for damage. If damaged, install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Incorrect Pressures	
· Application pressures are incorrect	· Incorrect application pressures may be due to non-transmission components, mechatronic assembly or internal transmission damage. Repair all non-transmission components then continue with this routine.
Other	

· Tire size change, axle ratio change	· Verify that the vehicle has the original equipment. Refer to the certification label. Changes in tire size and axle ratio will affect shift timing.

Shift Concerns: Timing — Erratic/Hunting (Some/All)

Possible Component	Reference/Action
212 — ROUTINE	
Fluid	
· Incorrect level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out the fluid level check in Transmission Fluid Level Check in this section.
· Fluid over temperature condition	· Refer to transmission overheating.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
Torque Converter Concerns	
· Torque converter clutch	· Refer to torque converter clutch operation concern: cycling shutter chatter.

Shift Concerns: Feel — Soft or Slipping (Some or All)

Possible Component	Reference/Action
213 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
Transmission Fluid Temperature (TFT) Sensor Damaged	
· Mechatronic assembly	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Bolts not tightened to specification	· Tighten to specification.
· Mechatronic unit contaminated, solenoid(s) damaged, stuck or bore damaged. Manual valve damaged, stick or bore damaged	· Inspect for damage. If damaged, install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.

Shift Concerns: Feel — Harsh (Some/All)

Possible Component	Reference/Action
214 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Re-flash mechatronic assembly to the latest level calibration. Carry out road test — adaptive drive cycle, refer to Shift Point Road Test in this section. Road test and carry out on-board diagnostic test again.
Mechatronics	
· Bolts not tightened to specification	· Tighten bolts to specification.
· Mechatronic assembly contaminated, solenoid(s) damaged, solenoids stuck or bore damaged.	· Inspect for damage. If damaged install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Manual valve damaged, stuck or bore damaged.	· Inspect for damage. If damaged install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.

Shift Concerns: No 1st Gear in Drive, Engages in a Higher Gear

Possible Component	Reference/Action
215 — ROUTINE	
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
Incorrect Gear	
· Mechatronic failure	· Determine which gear the transmission is in. Refer to the Clutch and Solenoid Application Charts in this section.

Shift Concerns: No 1st Gear Manual

Possible Component	Reference/Action
216 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Shift Linkage	
· External selector lever cable system — damaged, misaligned	· Inspect and repair as necessary.

Mechatronics	
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
Clutch Plates	
· Forward clutch (A) friction and steel plate — failure	· Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure	· Inspect the low/reverse clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.
Pump	
· Pump gear — failure	· Install a new pump assembly. Refer to Pump Assembly in this section.

Shift Concerns: No 2nd Gear Manual

Possible Component	Reference/Action
217 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Shift Linkage	
· External selector lever cable system — damaged, misaligned	· Inspect and repair as necessary.
Mechatronics	
· Defective SSA (VFS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Powertrain Control System	
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
Clutch Plates	
· Forward clutch (A) friction and steel plate — failure	· Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure	· Inspect the low/reverse clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.
Pump	
· Pump gear — failure	· Install a new pump assembly. Refer to Pump Assembly in

	this section.

Shift Concerns: No 3rd Gear Manual

Possible Component	Reference/Action
218 — ROUTINE	
Shift Linkage	· Inspect and repair as necessary.
· External selector lever cable system — damaged, misaligned	
Mechatronics	
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Powertrain Control System	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs. Road test and carry out on-board diagnostic test again.
· PCM electrical inputs/outputs, TCM, external vehicle wiring harnesses	
Clutch Plates	
· Forward clutch (A) friction and steel plate — failure	· Inspect the forward clutch assembly for damage. Repair as required. Refer to Forward Clutch Assembly in this section.
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure.	· Inspect the low/reverse clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.
Pump	· Install a new pump assembly. Refer to Pump Assembly in this section.
· Pump gear — failure	

Shift Concerns: No 1-2 Shift

Possible Component	Reference/Action
220 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective direct clutch (B) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective intermediate clutch (C) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.

· Defective SSC (VFS-3) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Defective SSD (VFS-4) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Clutch Plates	
· Intermediate clutch (C) friction and steel plate — failure	· Inspect the intermediate clutch assembly for damage. Repair as required. Refer to Intermediate Clutch Assembly in this section.
· Low/reverse clutch (D) friction and steel plate — failure	· Inspect the low/reverse clutch assembly for damage. Repair as required. Refer to Low/Reverse Clutch Assembly in this section.

Shift Concerns: No 2-3 Shift

Possible Component	Reference/Action
221 — ROUTINE	
Fluid	
· Incorrect fluid level	· Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid filter and seal assembly — plugged, damaged	· Install a new filter assembly.
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective direct clutch (B) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective intermediate clutch (C) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Defective SSC (VFS-3) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Intermediate clutch (C) friction and steel plate — failure	· Inspect the intermediate clutch assembly for damage. Repair as required. Refer to Intermediate Clutch Assembly in this section.

Shift Concerns: No 3-4 Shift

Possible Component	Reference/Action

222 — ROUTINE	
Mechatronics	
· Defective direct clutch (B) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective direct clutch (B) latch valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective intermediate clutch (E) regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective solenoid multiplex valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective SSB (VFS-2) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Defective SSD (VFS-4) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Defective SSE (SS-1) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· TCM mechatronic unit — failed	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Electronic component — failure	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Clutch Plates	
· Direct clutch (B) friction and steel plate — failure	· Inspect the direct clutch assembly for damage. Repair as required. Refer to Direct Clutch Assembly in this section.
· Overdrive clutch (E) friction and steel plate — failure	· Inspect the overdrive clutch assembly for damage. Repair as required. Refer to Overdrive Clutch Assembly in this section.

Shift Concerns: No 4-5 Shift

Torque Converter Clutch Operation Concerns : Does Not Apply

Possible Component	Reference/Action
240 — ROUTINE	
Torque Converter	
· Torque converter components	· Remove the transmission. Inspect for damage. Install a new or remanufactured torque converter. Refer to Transmission — Four Wheel Drive (4WD) or Transmission — Rear Wheel Drive (RWD) in this section.
Fluid	
· Fluid condition	· Carry out the fluid level check in Preliminary Inspection in this section.
Mechatronics	
· Defective torque converter apply regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective torque converter release regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective TCC (VFS-6) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Mechatronic assembly bolts — not tightened to specification	· Tighten to specification.
· Mechatronic unit contaminated, solenoid (s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	· Inspect for damage. If damaged, install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Powertrain Control Module	
· Powertrain control system electrical inputs/outputs, TCM, vehicle wiring harnesses, torque converter clutch (TCC) solenoid, transmission fluid temperature (TFT) sensor	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again.

Torque Converter Clutch Operation Concerns : Cycling/Chatter

Possible Component	Reference/Action
241 — ROUTINE	

Fluid	
· Fluid condition	· Carry out the fluid level check in Preliminary Inspection in this section.
Mechatronics	
· Defective torque converter apply regulator valve	· Inspect mechatronic assembly for stuck valves or contamination. Refer to Mechatronic Assembly in this section.
· Defective TCC (VFS-6) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Mechatronic assembly bolts — not tightened to specification	· Tighten to specification.
· Mechatronic unit contaminated, solenoid (s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	· Inspect for damage. If damaged, install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Powertrain Control Module	
· Powertrain control system electrical inputs/outputs, TCM, vehicle wiring harnesses, torque converter clutch (TCC) solenoid, transmission fluid temperature (TFT) sensor	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again.
Torque Converter	
· Torque converter components	· Remove the transmission. Inspect for damage. Install a new or remanufactured torque converter. Refer to Transmission — Four Wheel Drive (4WD) or Transmission — Rear Wheel Drive (RWD) in this section.

Torque Converter Clutch Operation Concerns : Always Applied/Stalls Vehicle

Possible Component	Reference/Action
242 — ROUTINE	
Fluid	
· Fluid condition	· Carry out the fluid level check in Preliminary Inspection in this section.
Mechatronics	
· Defective TCC (VFS-6) shift solenoid	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· Mechatronic assembly bolts — not tightened to specification	· Tighten to specification.
· Mechatronic unit contaminated, solenoid (s) damaged, stuck or bore damaged. Manual valve damaged, stuck or bore damaged	· Inspect for damage. If damaged, install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
Powertrain Control Module	
· Powertrain control system electrical inputs/outputs, TCM, vehicle wiring harnesses, torque converter clutch (TCC) solenoid, transmission fluid temperature (TFT) sensor	· Carry out on-board diagnostic tests. Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again.
Torque Converter	

· Torque converter components	· Remove the transmission. Inspect for damage. install a new or remanufactured torque converter. Refer to Transmission — Four Wheel Drive (4WD) or Transmission — Rear Wheel Drive (RWD) in this section.

Other Concerns: External Leaks

Possible Component	Reference/Action
252 — ROUTINE	
Fluid	
· Incorrect level	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
· Transmission case vent — damaged, case porosity	· Inspect for damage. If damaged, repair as necessary.
· Leakage at gaskets, seals, bulkhead connector	· Refer to Leakage Inspection , Fluid Leakage in the Torque Converter Area and Transmission Leak Check Test Procedures in this section for potential leak locations. Remove all traces of lubricant on exposed surface of the transmission. Repair as necessary.
Fluid Cooler Tubes	
· Cooler tube fittings	· Locate leak source. Repair as required. Refer to Section 307-02 .
· Cooler tube O-rings, cooler tubes	· Locate leak source. Repair as required. Refer to Section 307-02 .
Torque Converter	
· Torque converter studs	· Install a new torque converter.
· Torque converter hub seal	· Install a new torque converter hub seal.
· Torque converter weld	· Install a new torque converter.
Transmission Case	
· Case — leaking	· Install a new transmission case. Refer to Transmission in this section.
· Transmission electrical bulkhead connector	· Install a new transmission electrical bulkhead connector O-ring.
· Fluid fill plug	· Install a new fill plug.
· Output shaft seal	· Install a new seal. Refer to Output Shaft Seal in this section.
· Manual control lever seal	· Install a new seal.
· Transmission fluid pan seal (gasket)	· Install a new seal.
Fluid Pump	
· Fluid pump O-ring	· Install a new O-ring. Refer to Pump Assembly in this section.
· Fluid pump seal ring	· Install a new seal ring. Refer to Pump Assembly in this section.

Noise/Vibration — Forward or Reverse

Possible Component	Reference/Action
254 — ROUTINE	
Fluid	
· Fluid level (low) pump cavitation	· Check the fluid level. Adjust fluid to correct level. Refer to Preliminary Inspection in this section.
Fluid Cooler Tubes	
· Cooler line grounding out	· Adjust or reposition cooler tubes.
Torque Converter	
· Check the torque converter components/balance weight	· Locate source of disturbance. Repair as required.
Engine Driveline	
· Engine drive accessories	· Refer to Section 303-00 .

Engine Will Not Crank

Possible Component	Reference/Action
255 — ROUTINE	
External Selector Lever Cable System	
· Cable system — damaged, misaligned	· Inspect and repair as necessary. Refer to Section 307-05 .
Powertrain Control System	
· Electrical inputs/outputs, TCM, vehicle wiring harnesses, engine starting system, TR sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of engine components. Check PIDs for TR park and neutral positions. Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again
Torque Converter	
· Flexplate — damaged	· Inspect for damage. Repair as necessary.
Vehicle Starter	
· Starter system concerns	· Inspect and repair as necessary. Refer to Section 303-06 .
TR Sensor Assembly	
· TR assembly — damaged	· Inspect and repair as necessary.
Fluid Pump Assembly	
· Internal parts seized	· Inspect for damage. Repair as necessary.

No Park Range

Possible Component	Reference/Action
256 — ROUTINE	
Selector Lever Cable	
· Cable system — damaged, misaligned	· Inspect and repair as necessary.

· Manual control lever assembly damaged, manual valve inner lever pin bent, manual valve inner lever damaged, spring rod damaged, park pawl pin loose or damaged, park rod actuating plate loose, damaged or missing	· Inspect for damage. If damaged, repair as necessary.
· Transmission case assembly	· Inspect for damage. If damaged, repair as necessary.
· Park gear, parking pawl, parking pawl return spring, part or guide, parking actuating rod, parking pawl shaft, manual lever	· Inspect for damage. If damaged, repair as necessary.
· External linkages/brackets — damaged	· Inspect for damage. If damaged, repair as necessary.
TR Assembly Damaged	
· Manual Lever Detent Spring	· Install a new mechatronic assembly. Refer to Mechatronic Assembly in this section.
· TR assembly	

Transmission Overheating

Possible Component	Reference/Action
257 — ROUTINE	
Fluid	
· Incorrect level	· Check fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Fluid condition	· Carry out the fluid level check. Refer to Preliminary Inspection in this section.
Powertrain Control System	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of engine components. Check PIDs for TR park and neutral positions. Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again.
· Electrical inputs/outputs, TCM, vehicle wiring harnesses, TCC solenoid	
Torque Converter Not Engaging	· Install a new torque converter.
· Torque converter	
Case Vent Damaged	· Inspect for damage. If damaged, repair as necessary.
· Transmission case assembly	
Other	
· Restriction in transmission cooling system	· Check transmission cooling system efficiency. Refer to Section 307-02 for automatic transmission cooling system diagnostic procedures.
· Excessive trailer tow load	· Refer to the Owner Guide for specifications on trailer towing.
· Vehicle heat shield — missing or damaged	· Inspect for damage. If damaged, repair as necessary.
· Vehicle airflow is restricted	· Inspect for damage. If damaged, repair as necessary.

Fluid Venting/Foaming

Possible Component	Reference/Action
261 — ROUTINE	
Incorrect Level	
・Fluid	・Check the fluid level. Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Case Vent Damaged	
・Transmission case assembly	・Inspect for damage. If damaged, repair as necessary.

Transmission Fluid Cooler — Backflushing and Cleaning

Printable View (80 KB)

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

CAUTION: When internal damage occurs in the transmission, metal particles and clutch plate material can travel into the torque converter and the transmission fluid cooler. These contaminates are a major cause of recurring transmission concerns. To prevent further concerns, remove these contaminates from the cooler lines and install a new cooler before placing the transmission in use.

1. Install a new transmission fluid cooler if any fluid leaks are indicated or a major metallic failure is indicated.

2. Using a suitable torque converter/fluid cooler cleaner, flush the fluid cooler and lines.

3. **NOTE:** Rubber hoses must be attached to the ends of the fluid cooler tubes, to aid in connecting them to the cleaner.

   Connect the cleaner pressure and return lines appropriately.
   1. Connect the pressure line to the fluid cooler inlet tube.
   2. Connect the return line to the fluid cooler outlet tube.
   3. Place the outlet end of the return line in the fluid tank reservoir.

4. **NOTE:** Cycling the fluid pump ON and OFF will help dislodge contaminants in the cooler system.

   Switch the fluid pumps ON. Allow the fluid to circulate a minimum of 5 minutes.

5. Switch the fluid pump OFF.

6. Disconnect the cleaner pressure line at the fluid cooler tube.

7. Using compressed air, blow through the fluid cooler inlet tube until all fluid is removed.

8. Remove the rubber hoses from the fluid cooler tubes.

Transmission Fluid Drain and Refill

Printable View (304 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

ST2467-A	Rubber Tip Air Nozzle 100-D009 (D93L-7000-A)

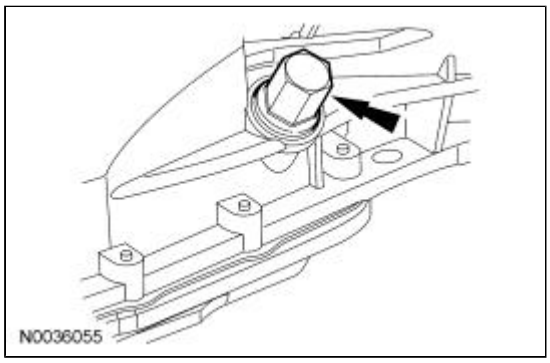
Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

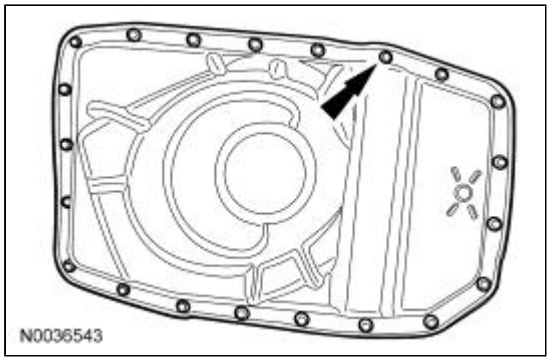
Drain

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. **NOTE:** Some fluid leakage may occur when removing the fluid fill plug.

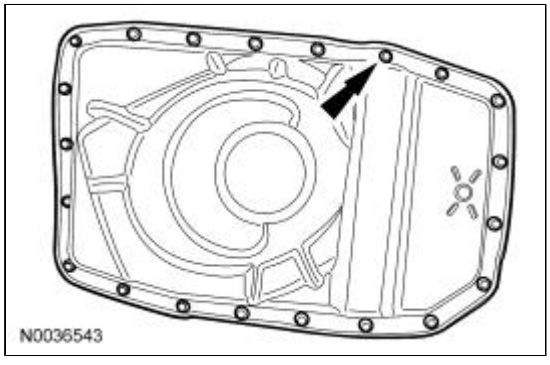
Remove the fluid fill plug fluid level indicator assembly located on the passenger side front portion of the transmission case. Removal of the plug will relieve any vacuum that might have built up in the transmission. This will aid in allowing the fluid pan to be easily removed when the bolts are removed.



3. Remove the transmission fluid pan and allow the fluid to drain.



4. Install the transmission fluid pan.
    - Tighten to 14 Nm (10 lb-ft).



Transmission Fluid Refill

CAUTION: This procedure contains the air purge steps required to purge air from the cooling system. This procedure is NOT intended for use with the Transmission Fluid Level Check.

CAUTION: The vehicle should not be driven if the fluid level is low as internal failure could result.

CAUTION: The fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.

CAUTION: The use of any other transmission fluid than specified, can result in the transmission failing to operate in a normal manner or transmission failure.

NOTE: If the transmission starts to slip, shifts slowly or shows signs of fluid leaking, the fluid level should be checked.

NOTE: Here is an overview of the Transmission Fluid Drain and Refill procedure.

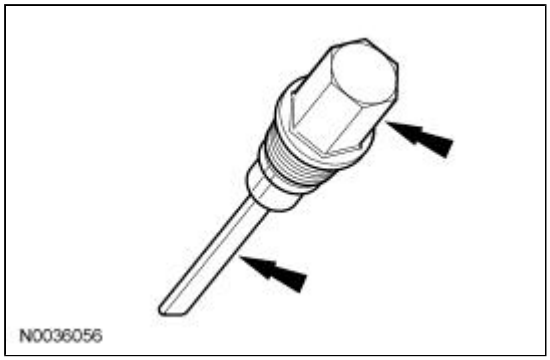
- Adding 3.3L (3.5 qt) of clean automatic transmission fluid to the transmission is an initial fill enabling you to start the engine.
- The cold level range shown in the procedure allows the vehicle to be driven.
- The vehicle should be driven to allow the transmission fluid temperature to reach 85ºC-88ºC (185ºF-190ºF) in order to purge the air from the transmission cooling system.
- Fill the transmission fluid to the fill range on the fluid level indicator at the normal operating range 80ºC-85ºC (175ºF-185ºF).

1. **NOTE:** The transmission will need 3.3L (3.5 qt) of clean automatic transmission fluid added to the transmission as an initial fill if:
   - the transmission has been overhauled.
   - a new mechatronic assembly has been installed.
   - the transmission fluid pan or fluid filter have been removed.

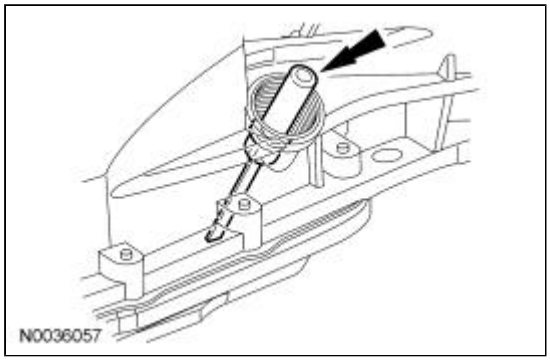
   Using the special tool, add 3.3L (3.5 qt) of clean automatic transmission fluid to the transmission through the fluid fill hole. For additional information, refer to Adding Additional Transmission Fluid in this procedure.

2. Check the transmission fluid level cold.
   1. The vehicle is safe to drive if the transmission fluid is in the cold level range 32°C-43°C (90°F-110°F).
   - Using the scan tool and the engine running, place the transmission selector lever in each gear position and hold approximately 5 seconds. Place the transmission selector lever in PARK, with the engine at idle (600-750 rpm).

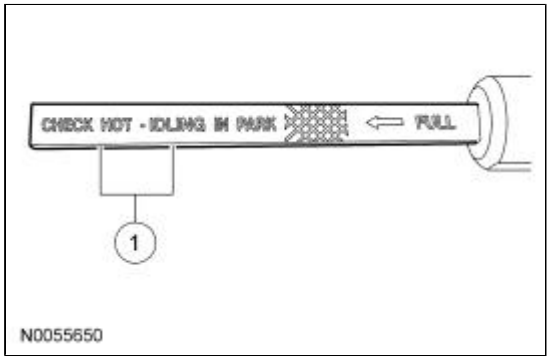
3. Separate the fluid level indicator from the fill plug.



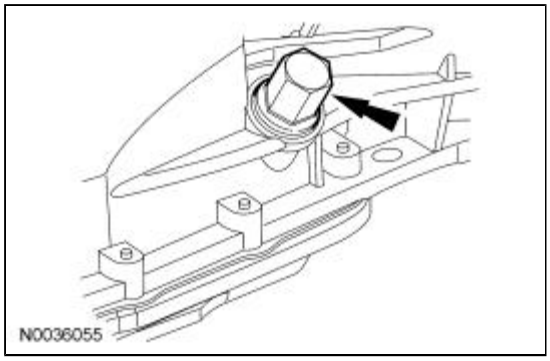
4. Wipe the fluid level indicator clean. Reinstall the fluid level indicator only back into the fill plug hole to check the fluid level. Repeat this until a consistent reading is established.



5. Add clean transmission fluid to the cold level location as shown in the illustration.

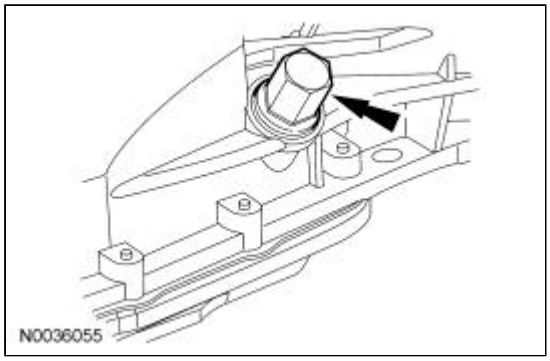


6. Install the fluid fill plug.
    - Tighten to 35 Nm (26 lb-ft).

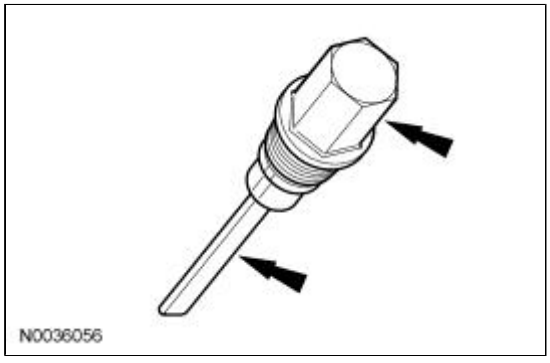


7. While driving the vehicle, use the scan tool to verify that the transmission fluid temperature has reached a temperature of 88°C (190°F). This will circulate the transmission fluid through the torque converter and the cooling system, eliminating any trapped air in the cooling system.
    - With the engine idling (600-750 rpm) in PARK, verify that the transmission fluid temperature is between 80ºC-85ºC (175ºF-185ºF).

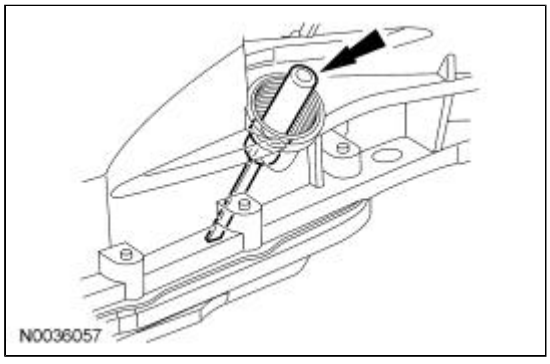
8. Remove the fluid fill plug fluid level indicator assembly located on the passenger side front portion of the transmission case.



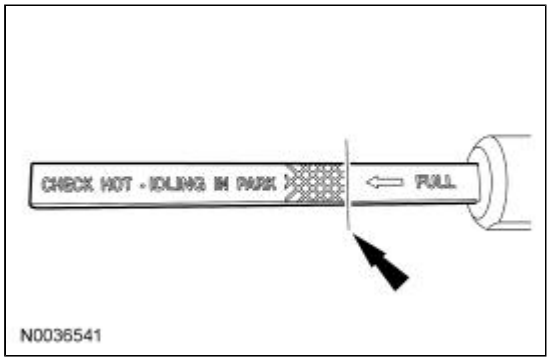
9. Separate the fluid level indicator from the fill plug.



10. Wipe the fluid level indicator clean. Reinstall the fluid level indicator only back into the fill plug hole to check the fluid level. Repeat this until a consistent reading is established.



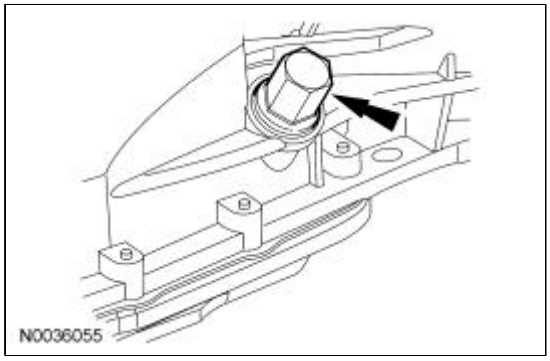
11. Using the scan tool verify that the transmission fluid temperature is between 80ºC-85ºC (175ºF-185ºF). The fluid level must be at the upper level of the crosshatch mark.



12. **NOTE:** If the transmission fluid is not at the correct level, follow the steps for Adding Additional Transmission Fluid or Removing Transmission Fluid in this procedure.

Install the fluid fill plug.

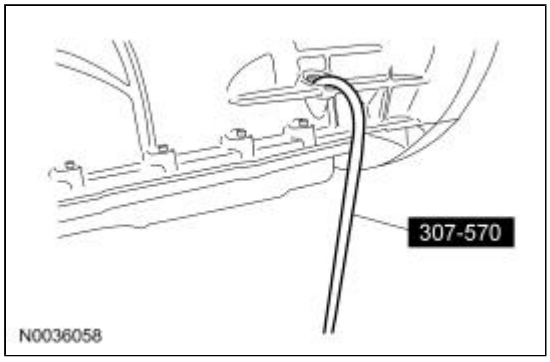
- Tighten to 35 Nm (26 lb-ft).



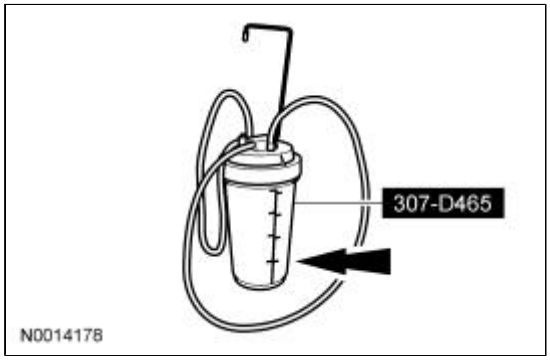
Adding Additional Transmission Fluid

NOTE: To get an accurate fluid level reading the engine should be idling (600-750 rpm) in PARK.

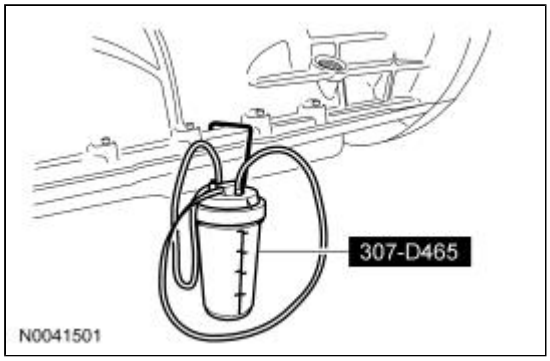
1. Install the special tool into the fluid fill hole.



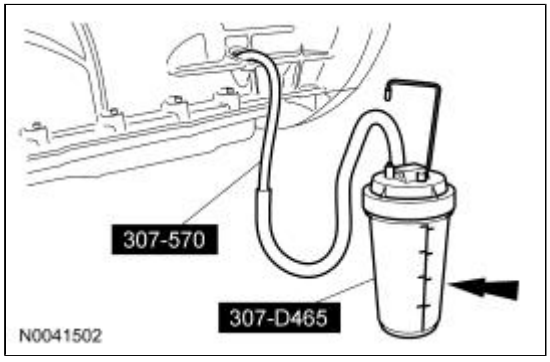
2. Fill the special tool with approximately 0.47L (1 pt) of clean automatic transmission fluid.



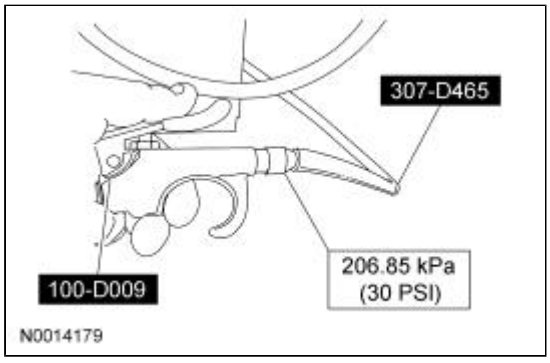
3. Hang the special tool under the vehicle, upright and close to the transmission.



4. Connect the special tools.
    - Connect the open end of the fluid hose from the special tool onto the special tool from the transmission case.

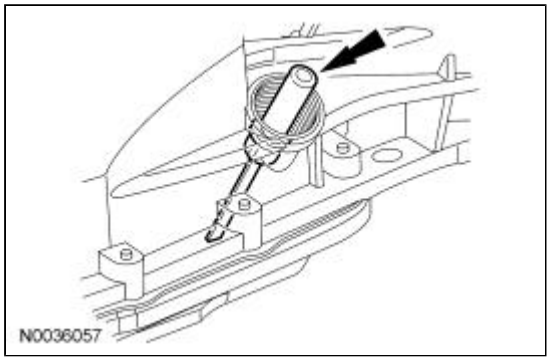


5. Apply a maximum of 206.85 kPa (30 psi) to the open end of the vacuum/pressure hose from the special tool. Fluid will immediately start flowing out of the special tool into the transmission.

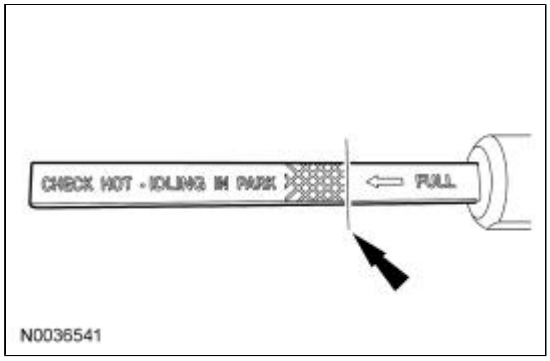


6. **NOTE:** Do not overfill the transmission. The fluid level must be at the upper level of the crosshatch mark.

    Reinstall the fluid level indicator only back into the fill plug hole to check the fluid level. Repeat this until a consistent reading is established.

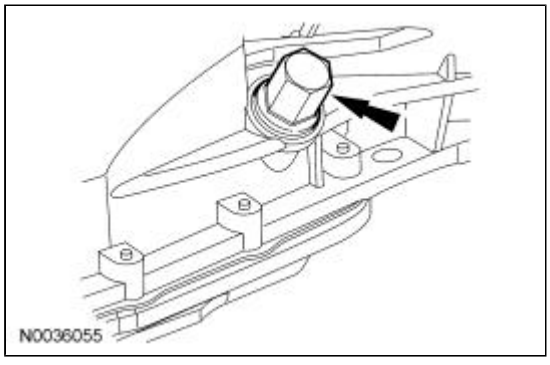


7. Using the scan tool verify that the transmission fluid temperature is between 80ºC-85ºC (175ºF-185ºF). The fluid level must be at the upper level of the crosshatch mark.



8. **NOTE:** If the transmission fluid is over full, follow the steps for Removing Transmission Fluid in this procedure.

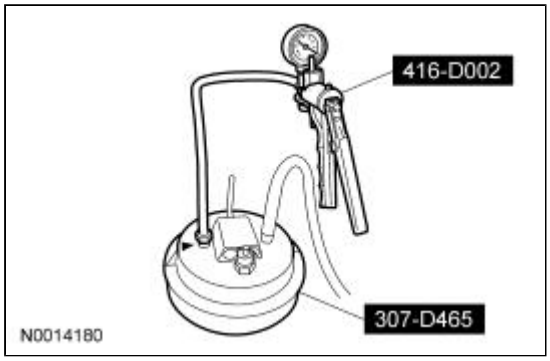
   Install the fluid fill plug.
   - Tighten to 35 Nm (26 lb-ft).



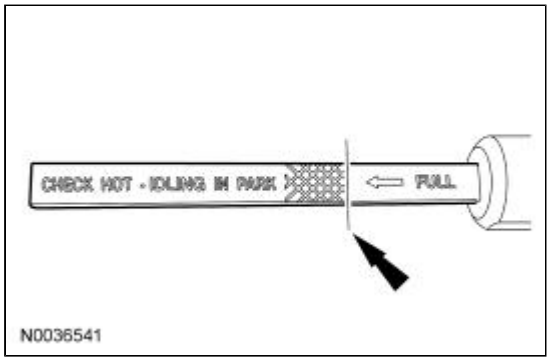
Removing Transmission Fluid

NOTE: To get an accurate fluid level reading the engine should be idling (600-750 rpm) in PARK.

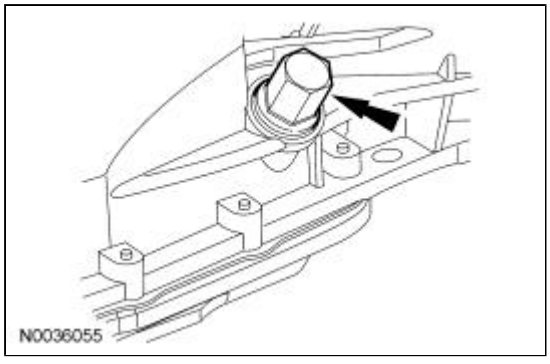
1. If the transmission is overfilled, fluid must be removed to the correct level. Use the special tools to extract any excessive fluid.



2. Using the scan tool, verify that the transmission fluid temperature is between 80ºC-85ºC (175ºF-185ºF). The fluid level must be at the upper level of the crosshatch mark. Reinstall the fluid level indicator only back into the fill plug hole to check the fluid level. Repeat this until a consistent reading is established.



3. Install the fluid fill plug.
    - Tighten to 35 Nm (26 lb-ft).



Transmission Fluid Level Check

Printable View (145 KB)

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

CAUTION: The vehicle should not be driven if the fluid level is low as internal failure could result.

CAUTION: The fluid fill plug is located near the exhaust system. The exhaust will be extremely hot during this procedure.

NOTE: If the vehicle has been operated for an extended period at high highway speeds, in city traffic, during hot weather or while pulling a trailer, the fluid must cool down to obtain an accurate reading.

NOTE: If the transmission starts to slip, shifts slowly or shows signs of fluid leaking, the fluid level should be checked.

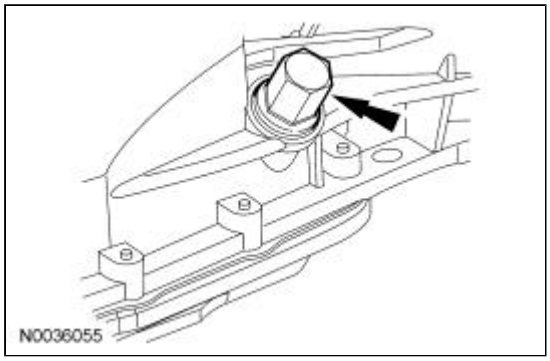
NOTE: Do not overfill the transmission. The fluid level must be at the upper level of the crosshatch mark.

NOTE: If the installation of a new transmission fluid cooler, cooler lines have been carried out the vehicle must be driven to get the transmission fluid to a temperature of 88ºC (190ºF) in order to purge the air from the cooling system.

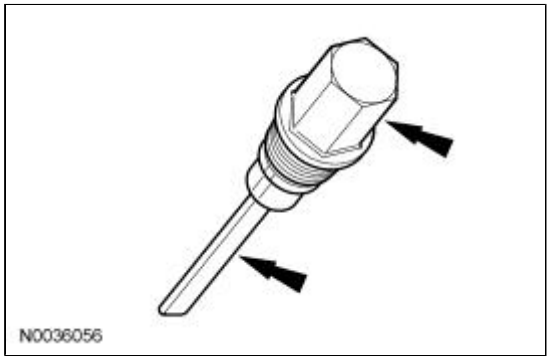
1. With the engine running, place the transmission selector lever in each gear position and hold approximately 5 seconds. Place the transmission selector lever in PARK.

2. With the engine idling (600-750 rpm) in PARK, position it on a hoist. For additional information, refer to Section 100-02 .

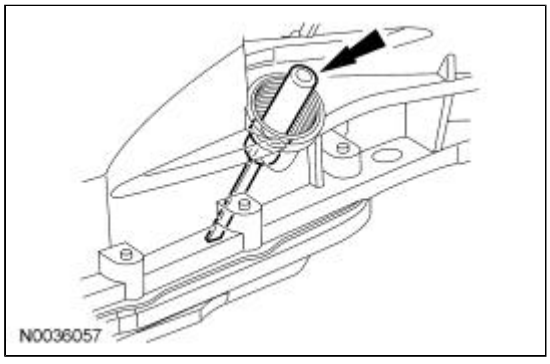
3. Remove the fluid fill plug fluid level indicator assembly, located on the passenger side front portion of the transmission case.



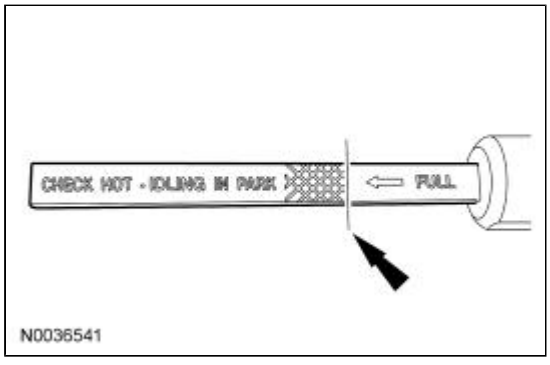
4. Separate the fluid level indicator from the fill plug.



5. Wipe the fluid level indicator clean. Reinstall the fluid level indicator only back into the fill plug hole to check the fluid level.



6. Using the scan tool, verify that the transmission fluid temperature is between 80ºC-85ºC (175ºF-185ºF). Do not overfill the transmission. The fluid level must be at the upper level of the crosshatch mark.

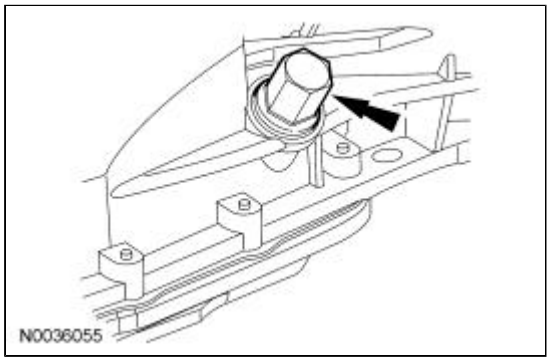


7. **NOTE:** If the transmission fluid is not at the correct level, follow the steps for Adding Additional Transmission Fluid or Removing Transmission Fluid. For additional information, refer to

Transmission Fluid Drain and Refill in this section.

Install the fluid fill plug.

- Tighten to 35 Nm (26 lb-ft).



Torque Converter

Printable View (63 KB)

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:
    - A torque converter malfunction has been determined based on complete diagnostic procedures.
    - Converter rivets, impeller hub or bushing are damaged.
    - Discoloration (due to overheating).
    - Evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes:
        - Major metallic failure.
        - Multiple clutches or clutch plate failures.
        - Sufficient component wear which results in metallic contamination.
        - Internal torque converter contamination present. For additional information, refer to Torque Converter Contamination Inspection in this section.

Torque Converter Contamination Inspection

Printable View (80 KB)

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

CAUTION: Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission, damage will occur. Use only clean automatic transmission fluid designated for the transmission and converter being serviced.

1. If a new or remanufactured torque converter is not being installed, the following steps must be completed.
2. With the torque converter on a bench, pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or through a paper filter and examine the fluid.
3. Observe the color and odor of the fluid. The fluid should be red, not brown or black. Odor may indicate an overheating condition such as clutch disc or band failure.
4. Examine the stain on the tissue for evidence of particles (specks of any kind). Examine the fluid level indicator for signs of antifreeze (gum or varnish). If particles are present in the fluid, a new torque converter must be installed.
5. If there are no particles or contamination present, drain the remainder of the transmission fluid from the torque converter.
6. Add 1.9L (2 qt) of clean automatic transmission fluid into the converter and agitate by hand.
7. Thoroughly drain the fluid.

Fluid Pan, Gasket and Filter

Printable View (251 KB)

Material

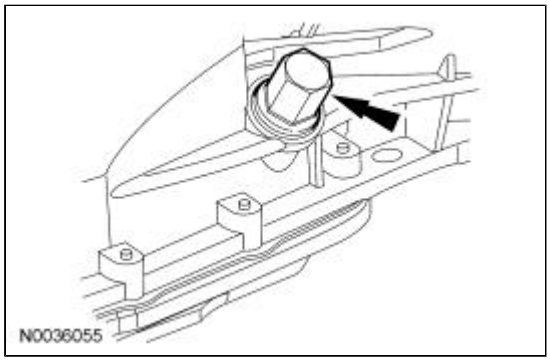
Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Removal

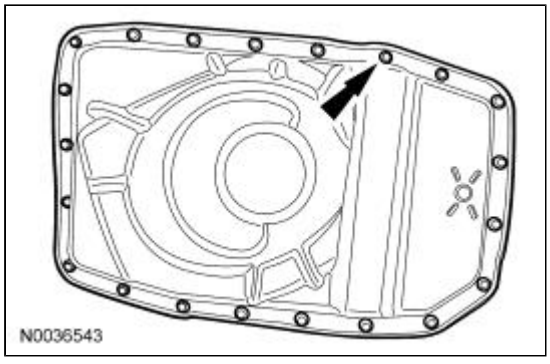
CAUTION: The use of any other transmission fluid than specified, can result in the transmission failing to operate in a normal manner or transmission failure.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

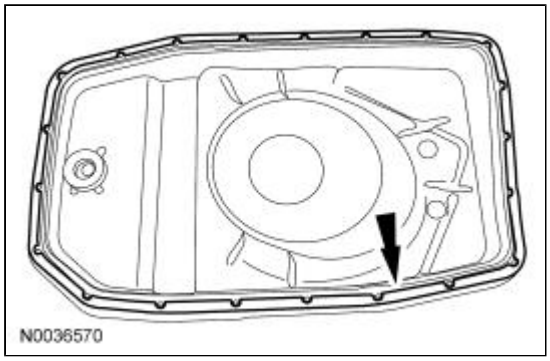
2. Remove the fluid fill plug fluid level indicator assembly located on the passenger side front portion of the transmission case. Removal of the plug will relieve any vacuum that might have built up in the transmission. This will aid in allowing the fluid pan to be easily removed when the bolts are removed.



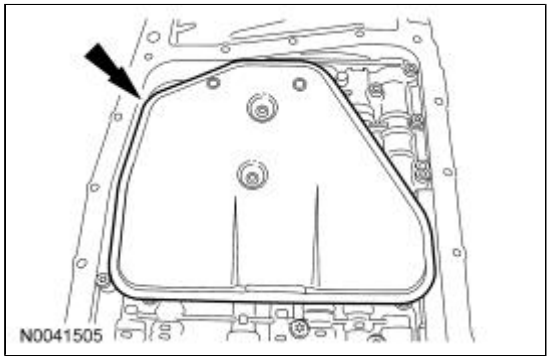
3. Remove the transmission fluid pan and allow the fluid to drain.



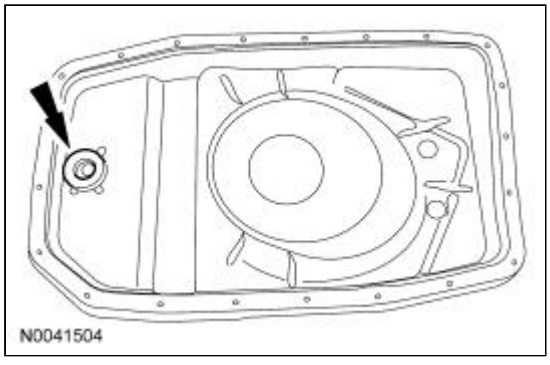
4. Remove the fluid pan gasket.



5. Remove and discard the transmission fluid filter.



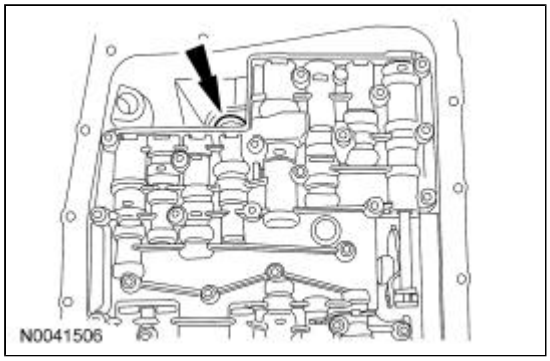
6. Clean and inspect the transmission fluid pan and magnet.



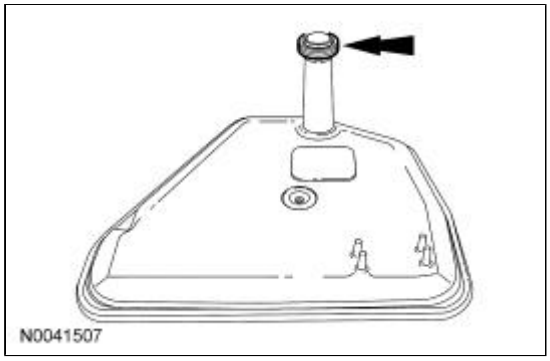
Installation

NOTE: If the transmission is being repaired for a contamination-related failure, install a new transmission fluid filter and seal assembly. The fluid filter may be reused if no excessive contamination is indicated.

1. Inspect the transmission case for the transmission fluid filter seal. If the seal is in the case, carefully remove the seal without scratching the case.

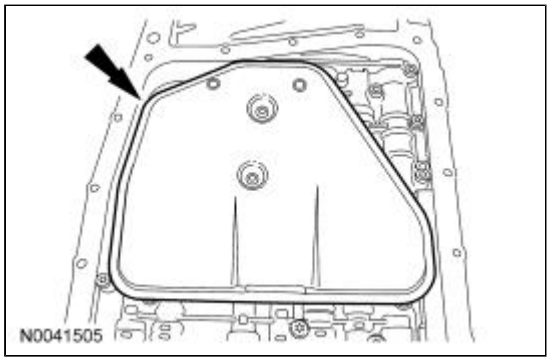


2. Make sure that the seal is on the transmission fluid filter and lubricate the seal with clean automatic transmission fluid.

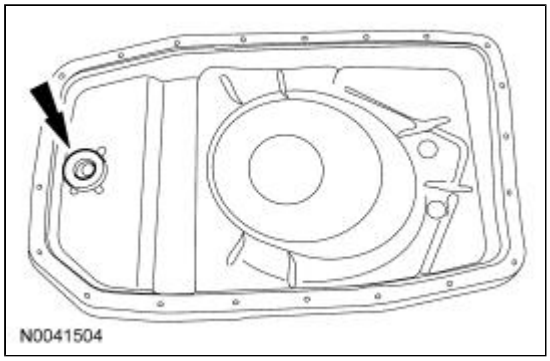


3. **NOTE:** The fluid filter may be reused if no excessive contamination is indicated.

   Install a new transmission fluid filter.

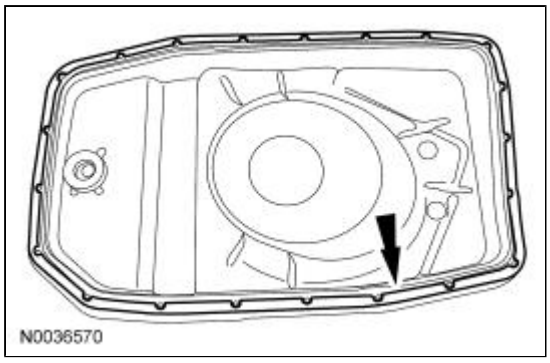


4. Position the magnet in the transmission fluid pan.

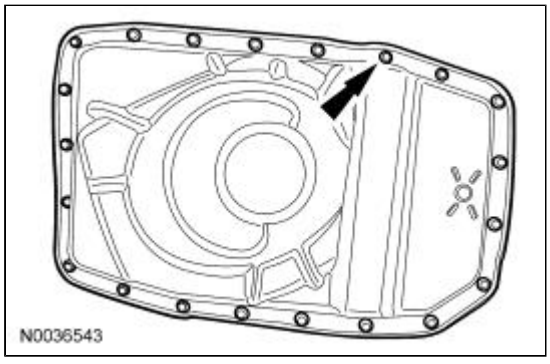


5. **NOTE:** The fluid pan gasket can be reused if not damaged.

Install a new transmission fluid pan gasket if required.



6. Install the fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 14 Nm (10 lb-ft).



7. Using the refill procedure, fill and check the transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

Mechatronic Assembly

Printable View (586 KB)

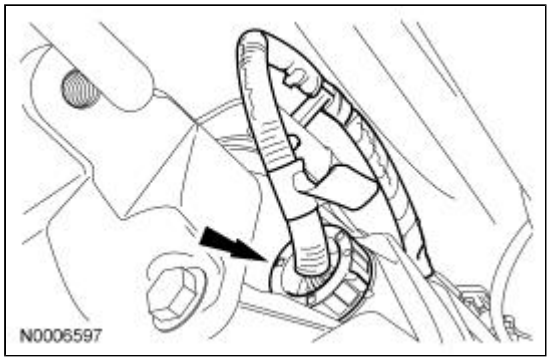
Removal

NOTE: If a new or the existing mechatronic assembly is installed, the transmission control module (TCM) will need to be reflashed to the latest level calibration available.

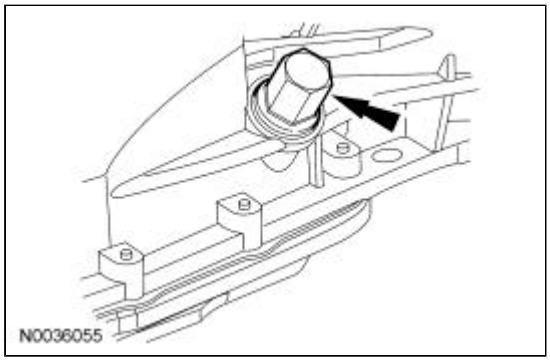
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **CAUTION: Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

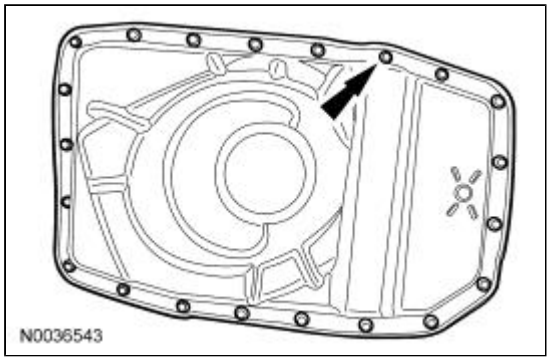
   Disconnect the main transmission electrical harness by twisting the outer shell and pulling back on the connector.



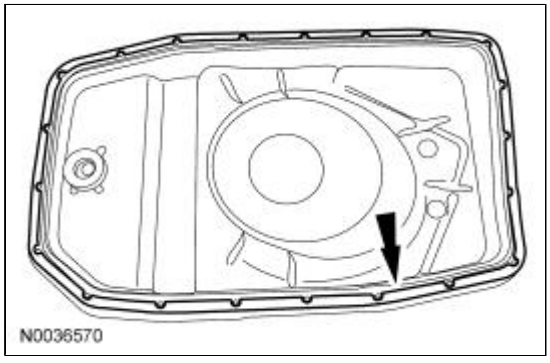
3. Remove the fluid fill plug fluid level indicator assembly located on the passenger side front portion of the transmission case. Removal of the plug will relieve any vacuum that might have built up in the transmission. This will aid in allowing the fluid pan to be easily removed when the bolts are removed.



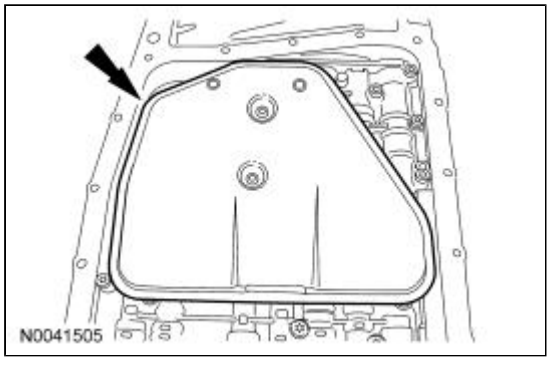
4. Remove the transmission fluid pan and allow the fluid to drain.



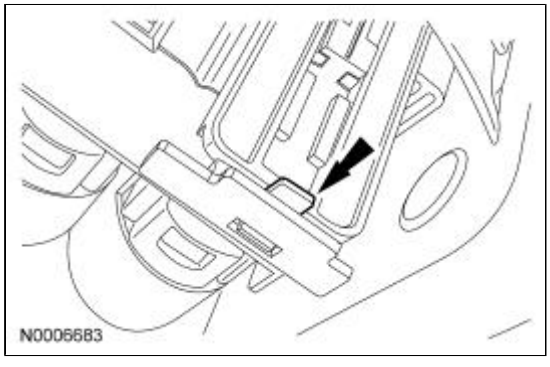
5. Remove the fluid pan gasket.



6. Remove and discard the transmission fluid filter.

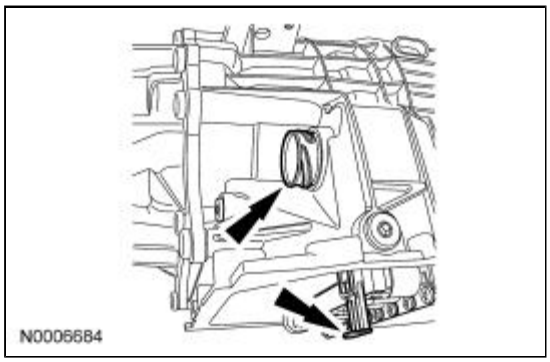


7. Pull the release tab and pull down on the bulkhead connector retainer.



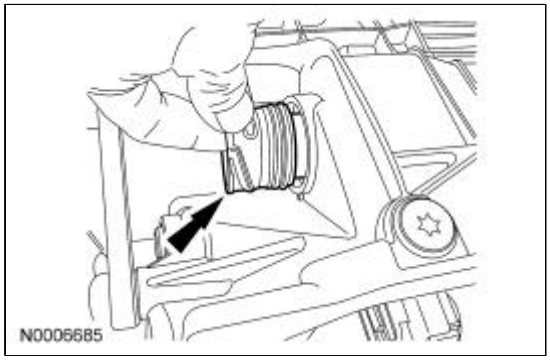
8. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

With the release tab down, pull the outer shell of the bulkhead electrical connector out of the TCM.

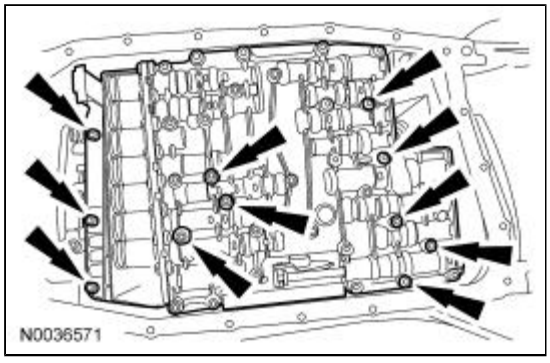


9. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

   Pull the bulkhead electrical connector out of the transmission.



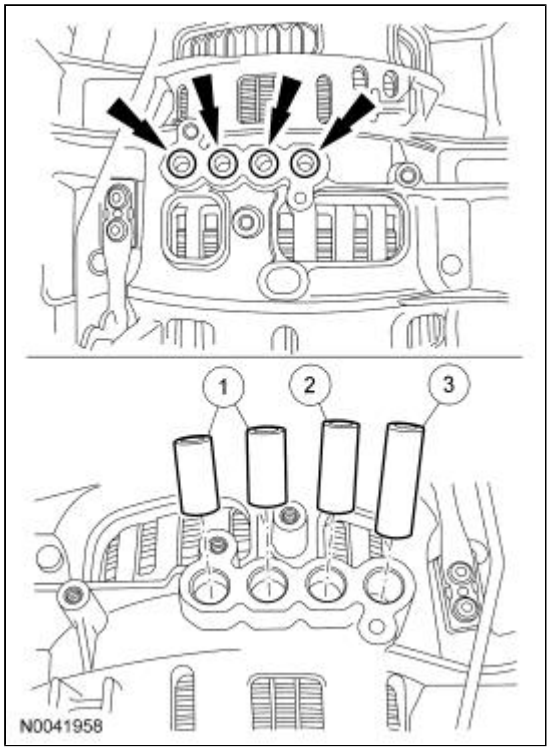
10. Remove the 11 bolts from the mechatronic assembly and remove the mechatronic assembly.



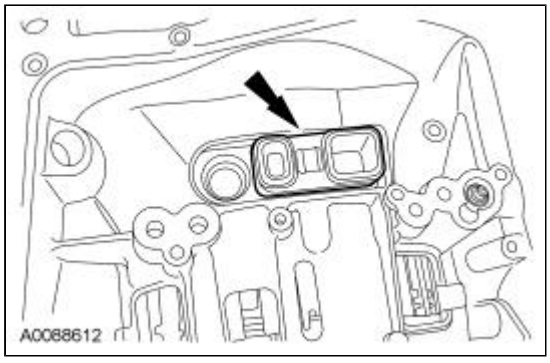
Installation

1. **NOTE:** Before installing the mechatronic assembly into the transmission case, verify presence and correct orientation of the thermal bypass valve, pump adapter seal and center support seals. Also note that one or more of the center support seals may have remained in the mechatronic assembly during removal and should be installed into the transmission case at this time.

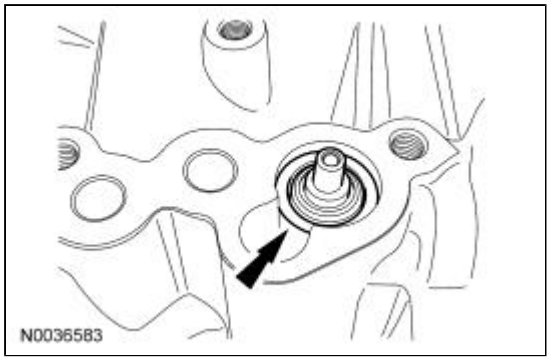
   Verify the 4 rubber feed tubes for the center support are in place.
   1. Black feed tube.
   2. Green feed tube.
   3. Blue feed tube.



2. Verify the rubber adapter is in place.



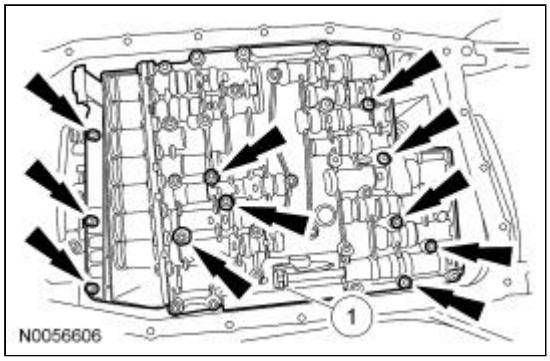
3. Verify the thermal bypass valve is in the case.



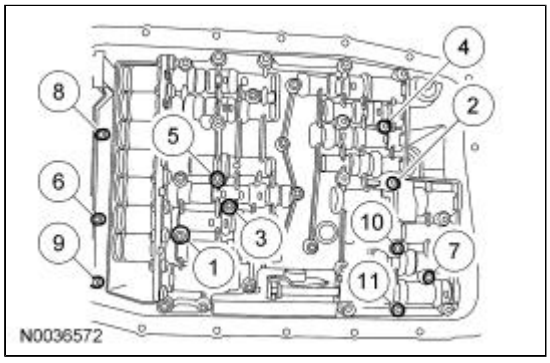
4. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

Position the mechatronic assembly in place and loosely install the 11 bolts.

1. Align the manual valve and control lever linkage.

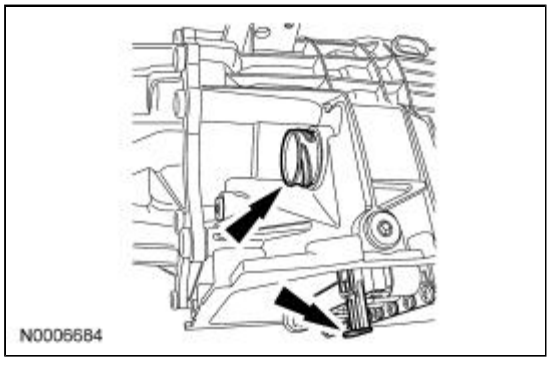


5. Tighten the mechatronic bolts in the sequence shown.
    - Tighten to 6 Nm (53 lb-in).

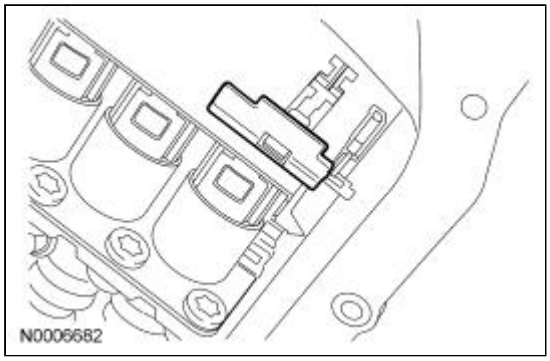


6. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

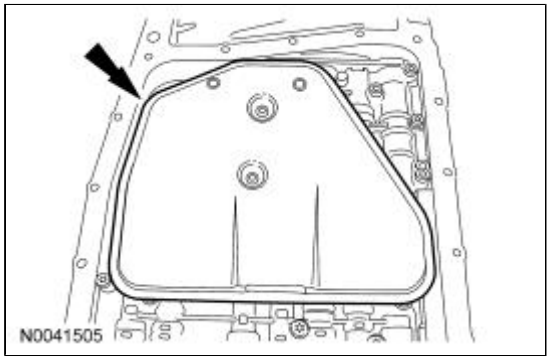
    With the release tab down and unlocked, push the outer shell of the bulkhead electrical connector into the transmission. Make sure that the bulkhead connector is fully seated into the TCM.



7. Press up on the tab and lock the outer shell of the bulkhead electrical connector in place. Make sure that the locking tab is securely locked.

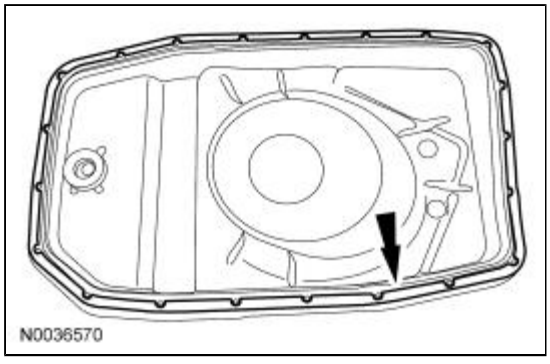


8. Install a new transmission fluid filter.

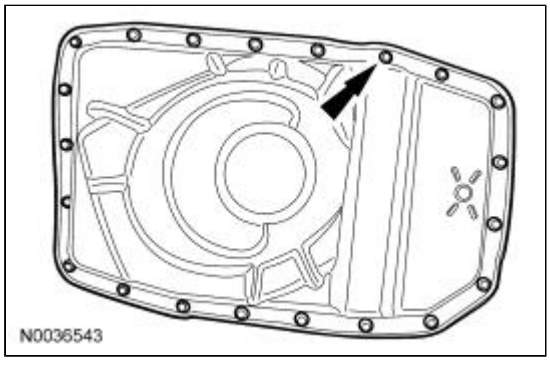


9. **NOTE:** The fluid pan gasket can be reused if not damaged.

   Install the transmission fluid pan gasket if required.

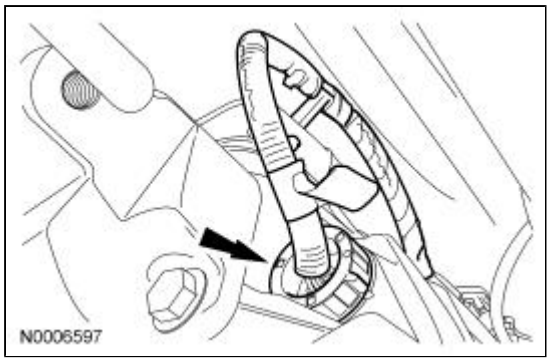


10. Install the fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 14 Nm (10 lb-ft).



11. Connect the main transmission electrical harness by pushing it in and twisting the outer shell to

lock it in place.



12. Using the refill procedure, fill and check the transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

13. If a new or the existing mechatronic assembly is installed, the TCM will need to be reflashed to the latest level calibration available.

Output Shaft Seal

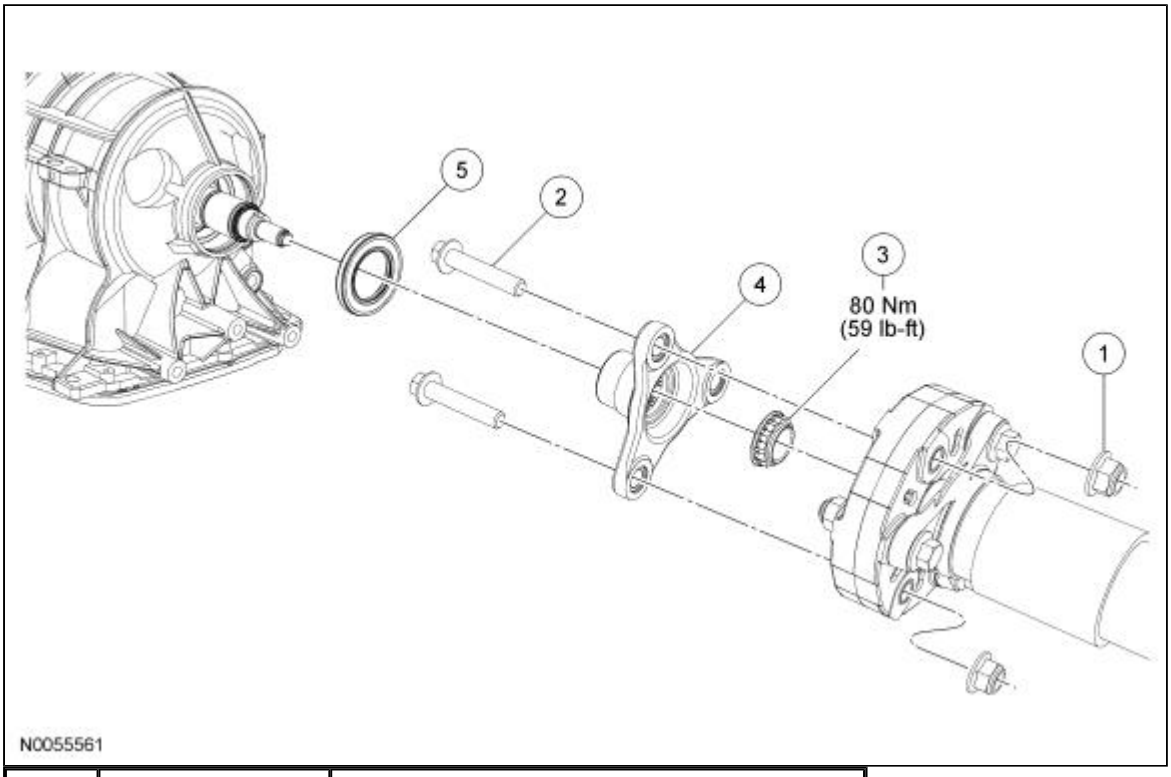
Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

NOTE: Rear wheel drive (RWD) shown, four wheel drive (4WD) similar.



Item	Part Number	Description
1	—	Rear driveshaft nuts (3 required)
2	—	Rear driveshaft bolts (3 required)
3	7K440	Output shaft flange nut
4	7A021	Output shaft flange
5	7052	Output shaft seal

Removal

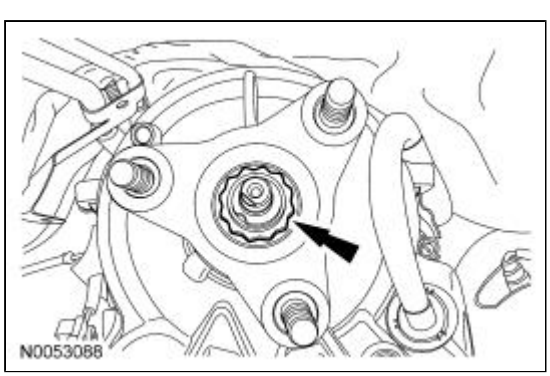
All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

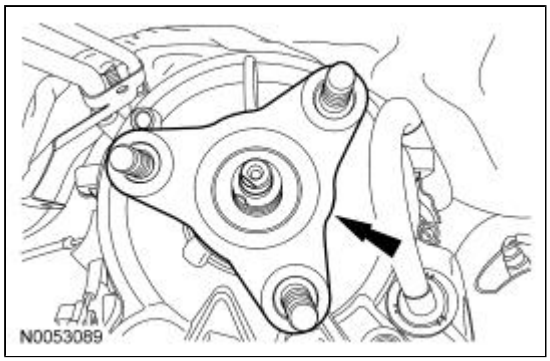
Rear wheel drive (RWD) vehicles

2. Remove the rear driveshaft. For additional information, refer to Section 205-01 .

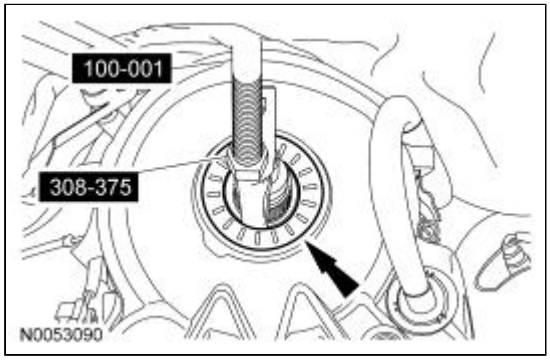
3. Remove and discard the output shaft flange nut.



4. Remove the output shaft flange.



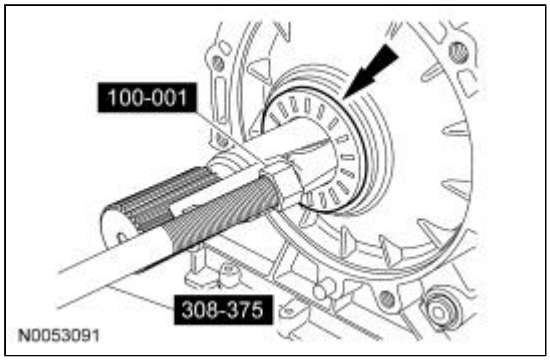
5. Using the special tools, remove the output shaft seal.



Four wheel drive (4WD) vehicles

6. Remove the transfer case. For additional information, refer to Section 308-07B .

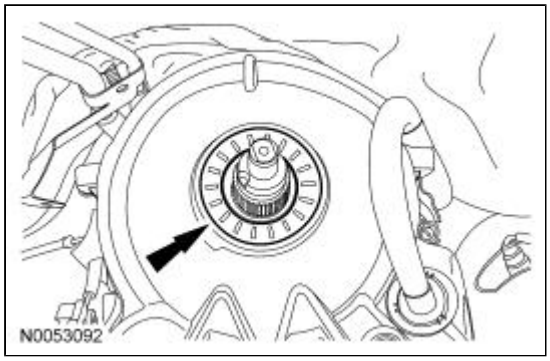
7. Using the special tools, remove the output shaft seal.



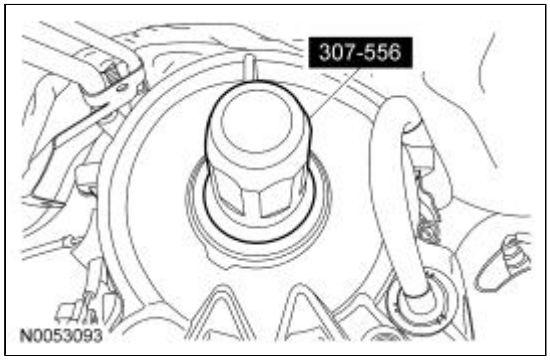
Installation

RWD vehicles

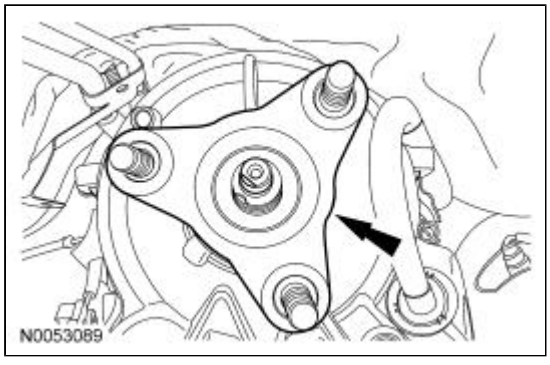
1. Position a new output shaft seal.



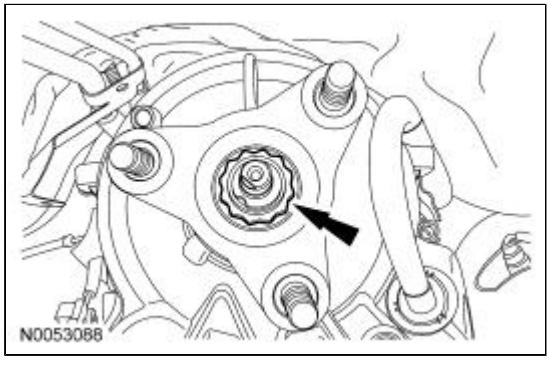
2. Using the special tool, install the output shaft seal.



3. Install the output shaft flange.



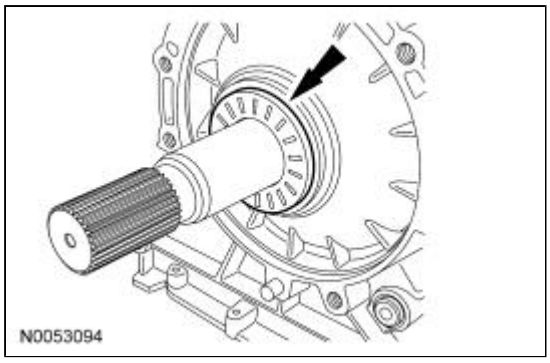
4. Install a new output shaft flange nut.
    - Tighten to 80 Nm (59 lb-ft).



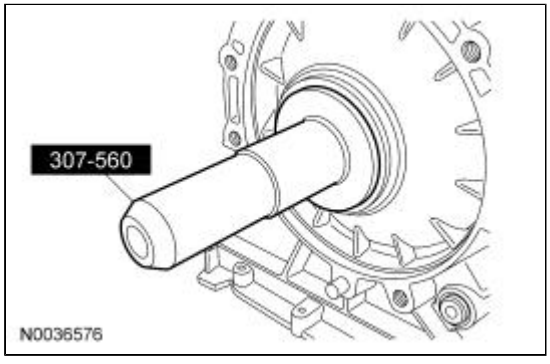
5. Install the rear driveshaft. For additional information, refer to Section 205-01 .

4WD vehicles

6. Position the output shaft seal.



7. Using the special tool, install a new output shaft seal.



8. Install the transfer case. For additional information, refer to Section 308-07B .

All vehicles

9. Fill and check the transmission fluid. For additional information, refer to Transmission Fluid Level Check in this section.

Manual Control Lever Shaft and Seal

Special Tool(s)

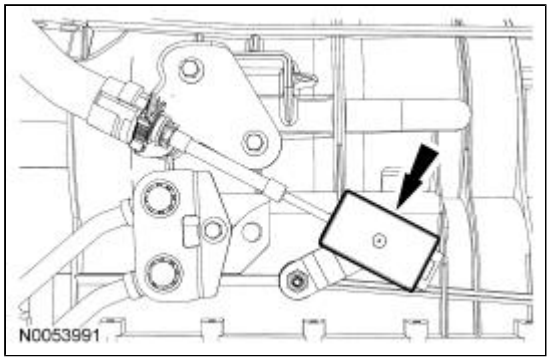
ST2890-A	Installer, Shift Shaft Fluid Seal 307-559

Material

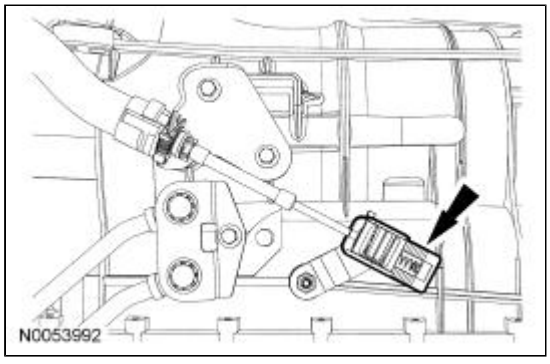
Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Removal

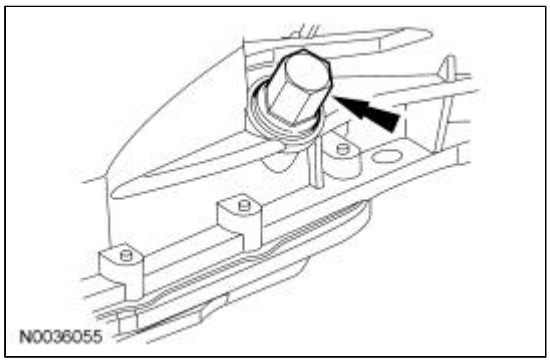
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. If equipped, remove the heat shield.



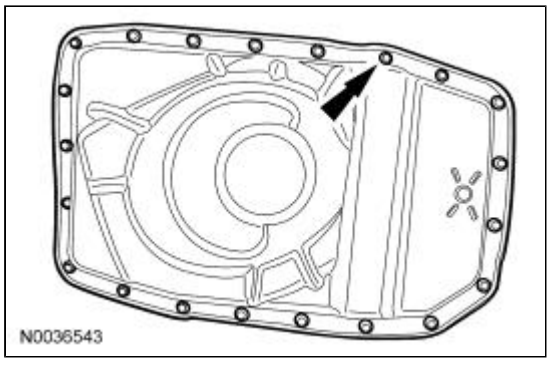
3. Move the locking tab up and disconnect the selector lever cable from the manual lever ball stud.



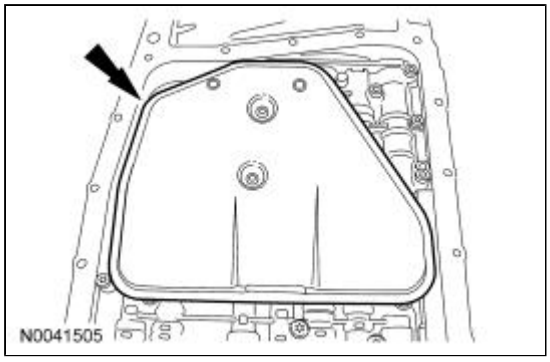
4. Remove the fluid fill plug fluid level indicator assembly located on the passenger side front portion of the transmission case. Removal of the plug will relieve any vacuum that might have built up in the transmission. This will aid in allowing the fluid pan to be easily removed when the bolts are removed.



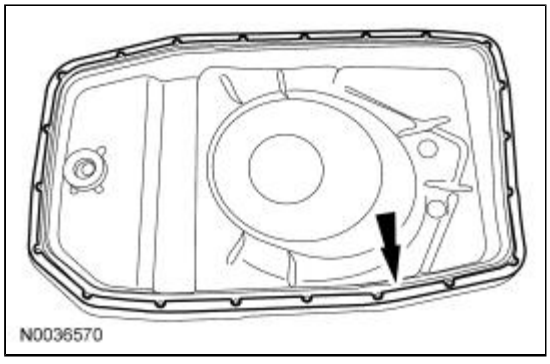
5. Remove the transmission fluid pan and allow the fluid to drain.



6. Remove and discard the transmission fluid filter.

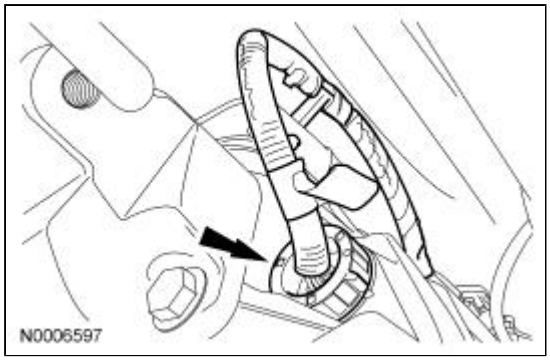


7. Remove the fluid pan gasket.

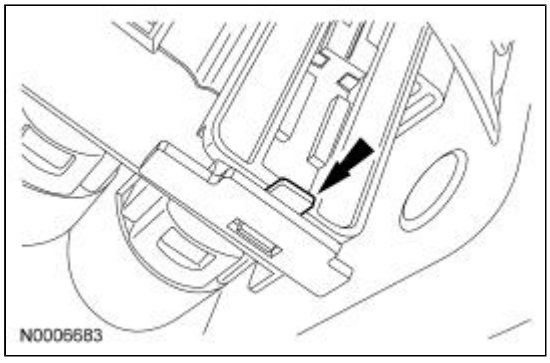


8. **CAUTION: Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

   Disconnect the main transmission electrical harness by twisting the outer shell and pulling back on the connector.

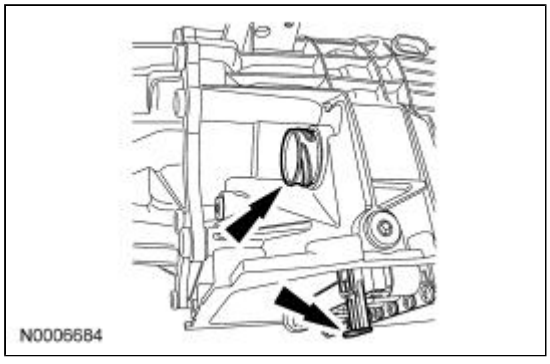


9. Pull the release tab and pull down on the bulkhead connector retainer.



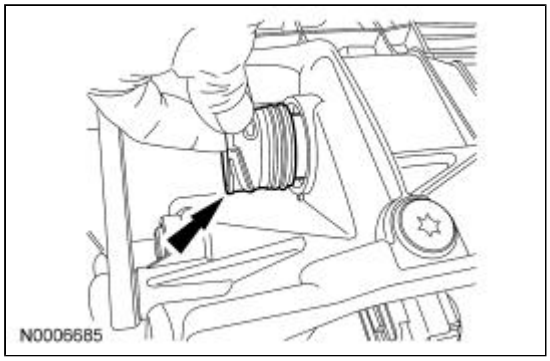
10. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

    With the release tab down, pull the outer shell of the bulkhead electrical connector out of the transmission control module (TCM).

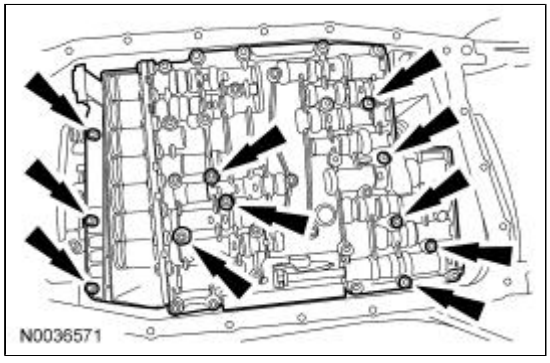


11. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

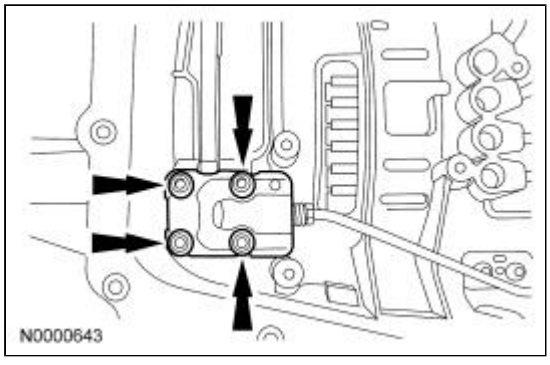
    Pull the bulkhead electrical connector out of the transmission.



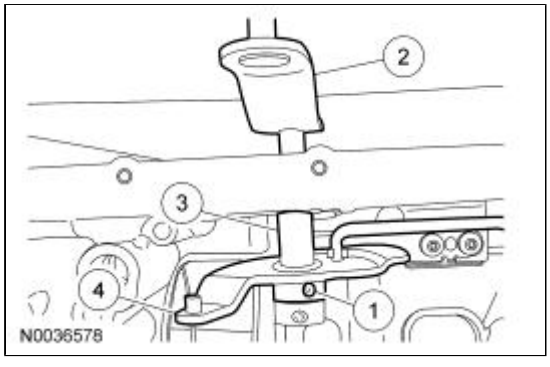
12. Remove the 11 bolts from the mechatronic assembly and remove the mechatronic assembly.



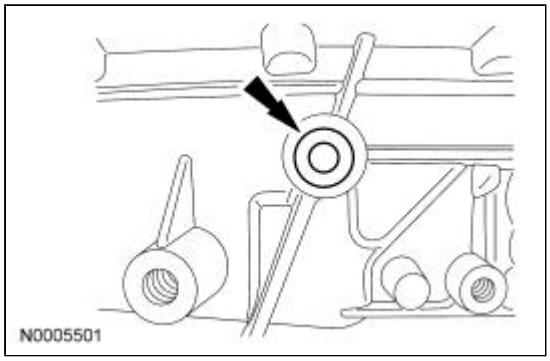
13. Remove the park rod actuating plate.



14. Remove the manual control lever.
    1. Remove the roll pin.
    2. Slide the manual control lever shaft out of the case.
    3. Hold the spacer to keep it from falling out of the case.
    4. Remove the manual valve inner lever and the park rod as an assembly.

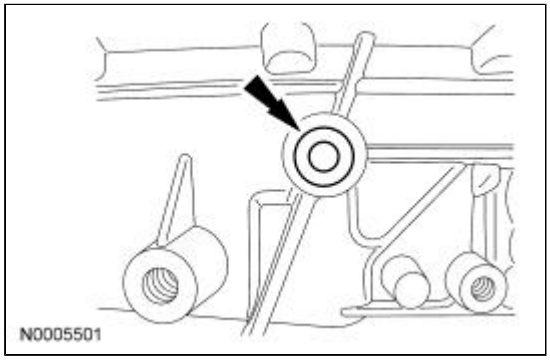


15. Remove and discard the manual control lever seal.

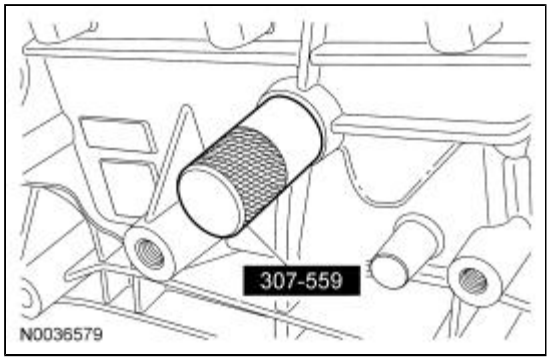


Installation

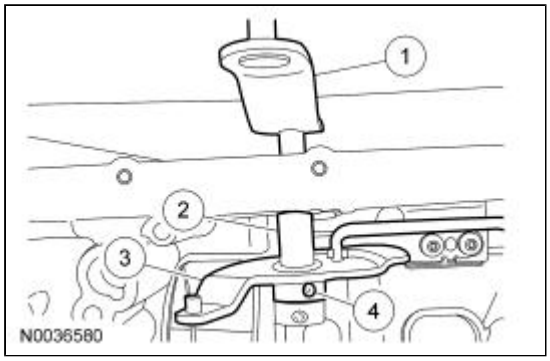
1. Position a new manual control lever seal in place.



2. Using the special tool, install a new manual control lever shaft seal.

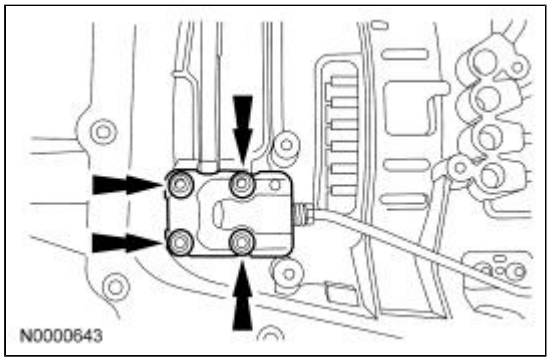


3. Install the manual lever in the case.
    1. Slide the manual lever in the case.
    2. Position the spacer in place while sliding the manual lever into the spacer.
    3. Position the manual valve inner lever while sliding the manual lever and lining up the roll pin hole.
    4. Install the roll pin.



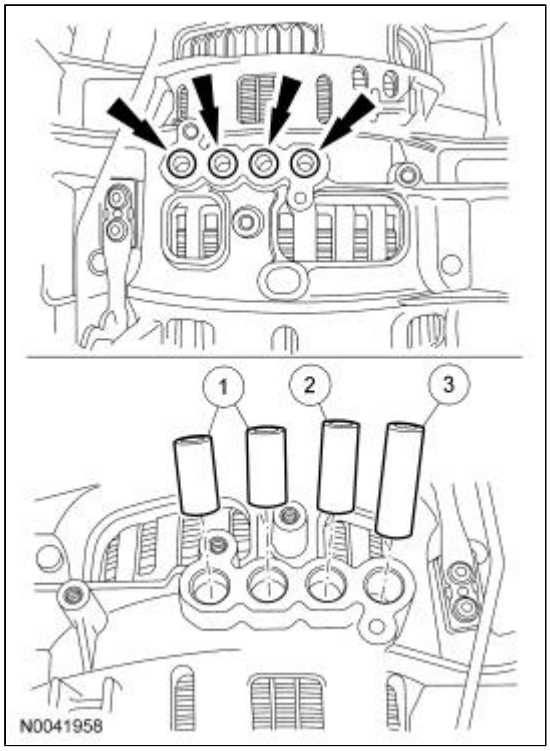
4. Position the park rod in place. Push down on the park pawl and position the park rod in place.

5. While holding the park rod down, install the park rod actuating plate.
   - Tighten to 10 Nm (89 lb-in).

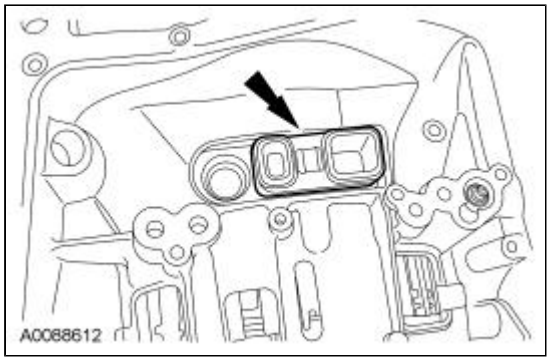


6. **NOTE:** Before installing the mechatronic assembly into the transmission case, verify presence and correct orientation of the thermal bypass valve, pump adapter seal and center support seals. Also note that one or more of the center support seals may have remained in the mechatronic assembly during removal and should be installed into the transmission case at this time.

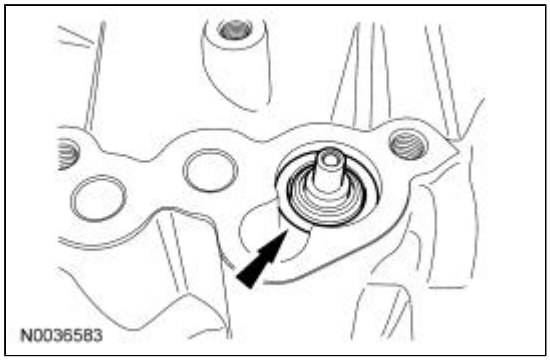
   Verify the 4 rubber feed tubes for the center support are in place.
   1. Black feed tube.
   2. Green feed tube.
   3. Blue feed tube.



7. Verify the rubber adapter is in place.



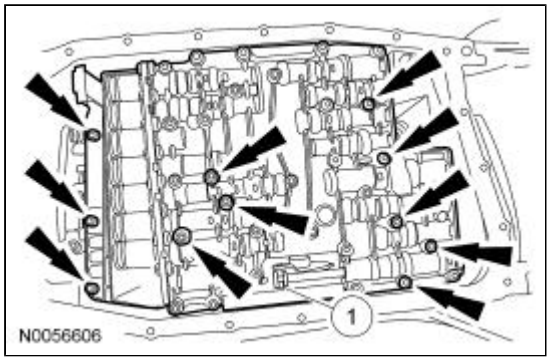
8. Verify the thermal bypass valve is in the case.



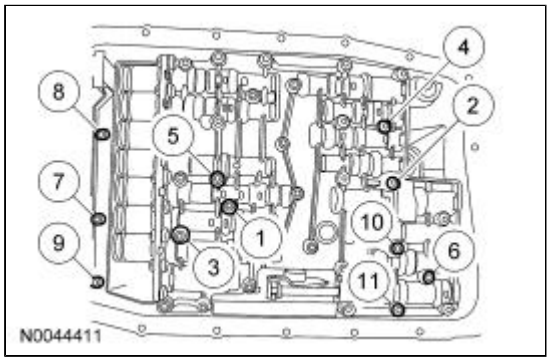
9. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

Position the mechatronic assembly in place and loosely install the 11 bolts.

1. Align the manual valve and control lever linkage.

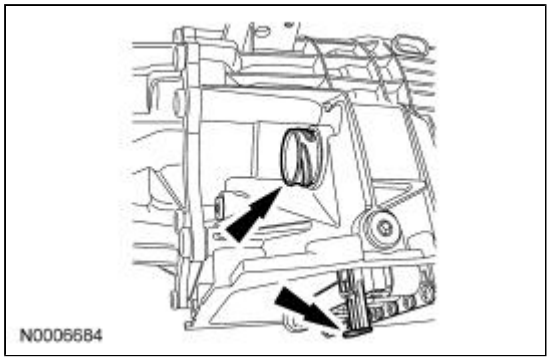


10. Tighten the mechatronic bolts in the sequence shown.
    - Tighten to 6 Nm (53 lb-in).

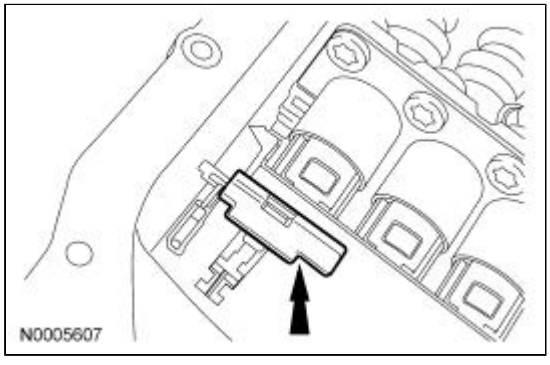


11. **CAUTION: Do not touch the electrical connector pins. Electrostatic discharge may occur and will cause damage to the mechatronic unit.**

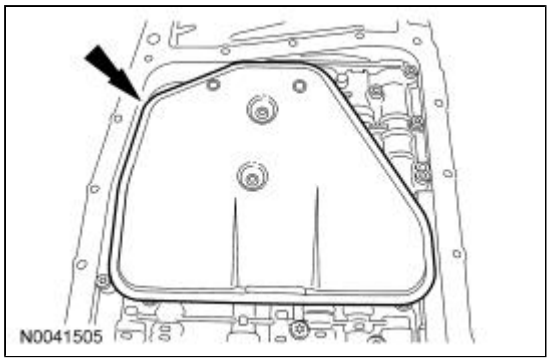
    With the release tab down and unlocked, push the outer shell of the bulkhead electrical connector into the transmission. Make sure that the bulkhead connector is fully seated into the TCM.



12. Press up on the tab and lock the outer shell of the bulkhead electrical connector in place.

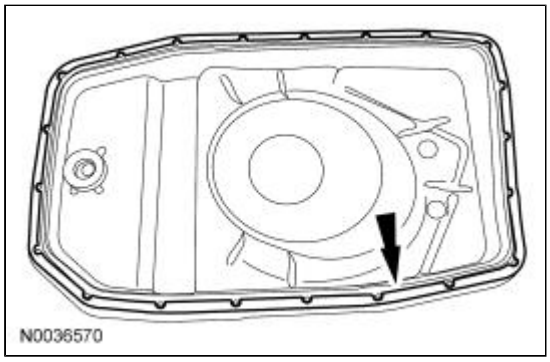


13. Install a new transmission fluid filter.

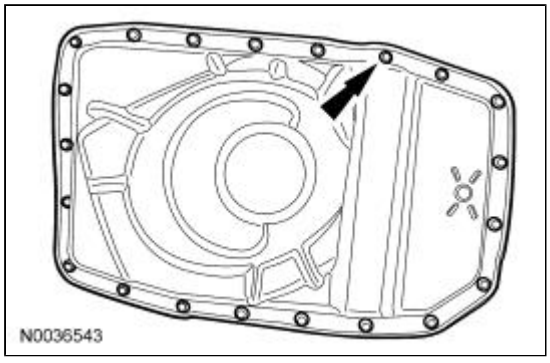


14. **NOTE:** The fluid pan gasket can be reused if not damaged.

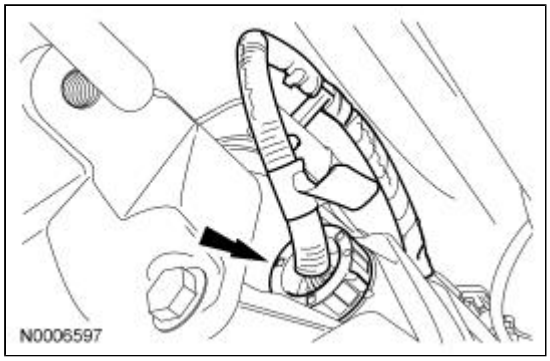
    Install the transmission fluid pan gasket if necessary.



15. Install the fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 14 Nm (10 lb-ft).

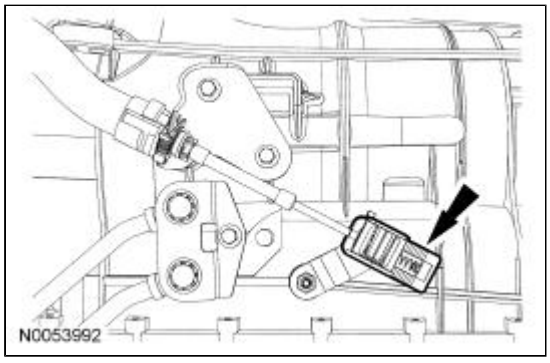


16. Connect the main transmission electrical harness by pushing it in and twisting the outer shell to lock it in place.

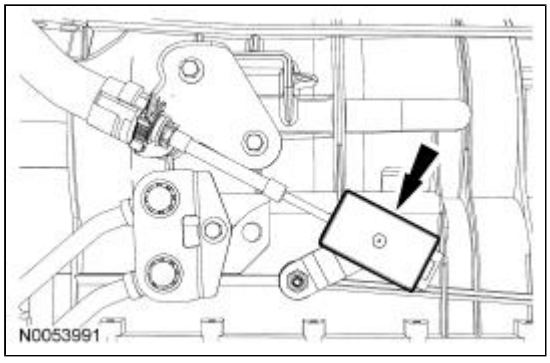


17. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

    Connect the selector lever cable onto the ball stud and move the locking tab down.
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure that it is correctly installed.



18. If equipped, install the heat shield.



19. Using the refill procedure, fill and check the transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

Transmission — Four Wheel Drive (4WD)

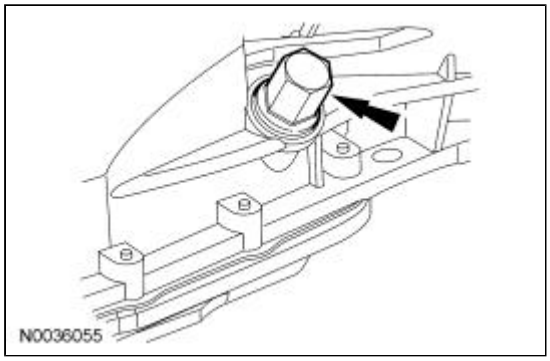
Printable View (678 KB)

Special Tool(s)

ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

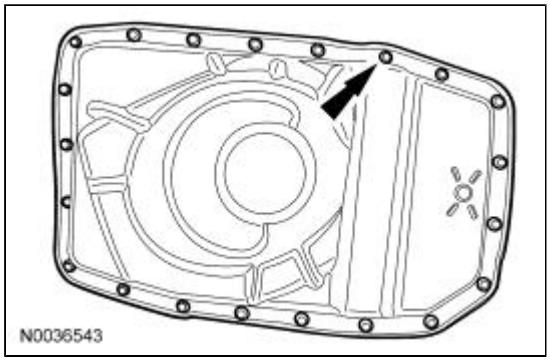
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
3. Remove the fluid fill plug fluid level indicator assembly located on the passenger side front portion of the transmission case. Removal of the plug will relieve any vacuum that might have built up in the transmission. This will aid in allowing the fluid pan to be easily removed when the bolts are removed.

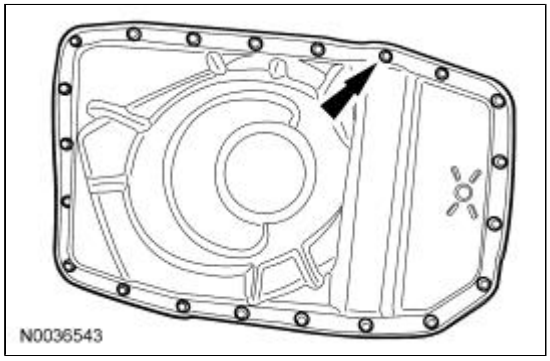


4. **NOTE:** If transmission disassembly or installation of a new transmission is necessary, the transmission fluid will need to be drained.

   Remove the transmission fluid pan and allow the fluid to drain.

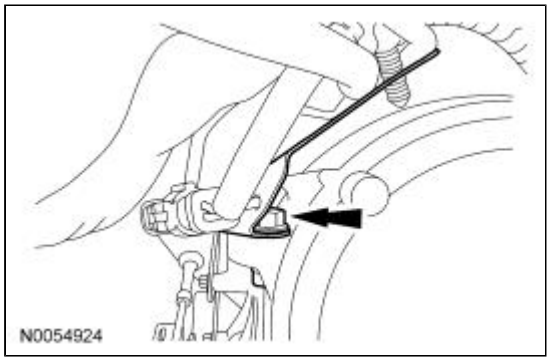


5. Install the fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 14 Nm (10 lb-ft).

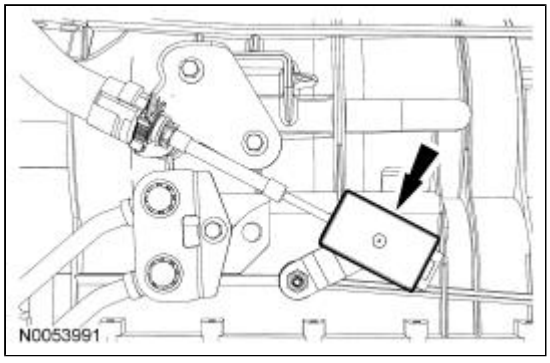


6. Remove the transfer case. For additional information, refer to Section 308-07B .

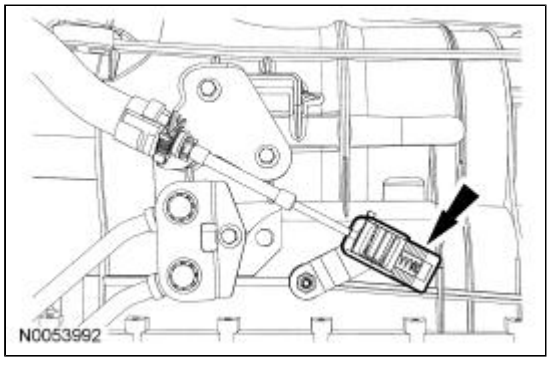
7. Remove the fuel line bracket bolt and position the bracket and lines aside.



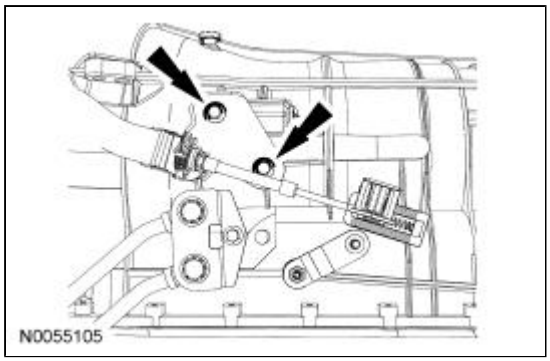
8. If equipped, remove the heat shield.



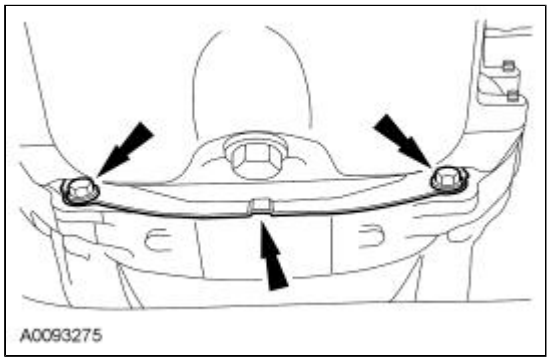
9. Move the locking tab up and disconnect the selector lever cable from the manual lever ball stud.



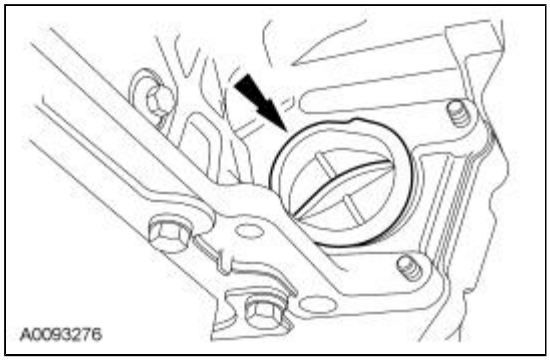
10. Remove the selector lever bracket bolts and remove the bracket.



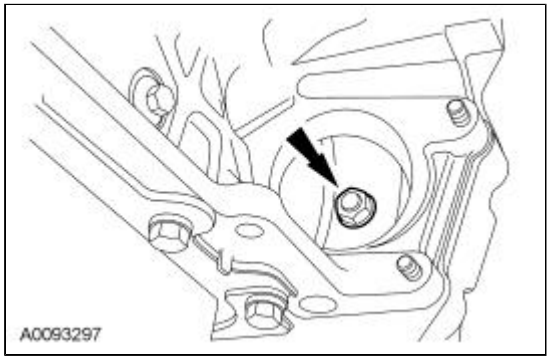
11. Remove the flexplate inspection cover bolts and the inspection cover.



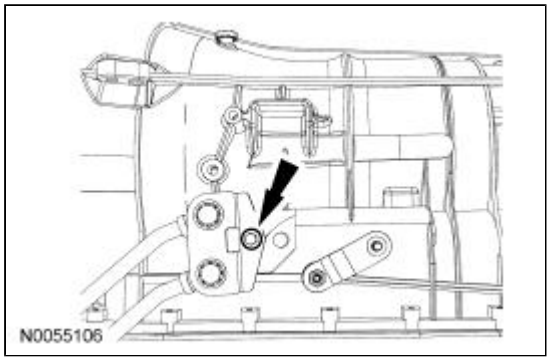
12. Remove the rubber torque converter nut access plug.



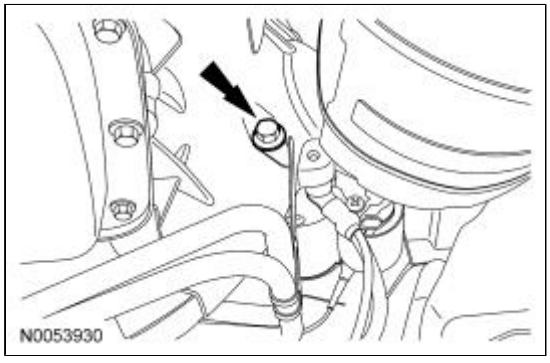
13. Remove and discard the 4 flexplate-to-torque converter nuts.



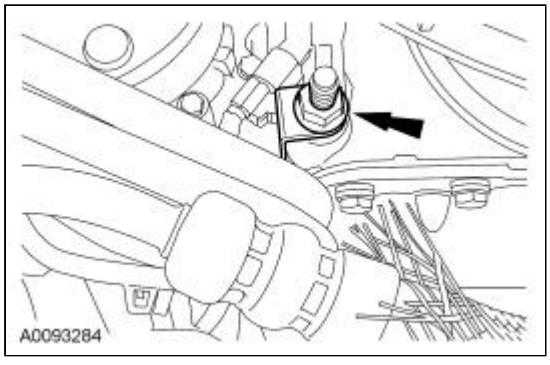
14. Remove the transmission cooler tube bracket bolt.



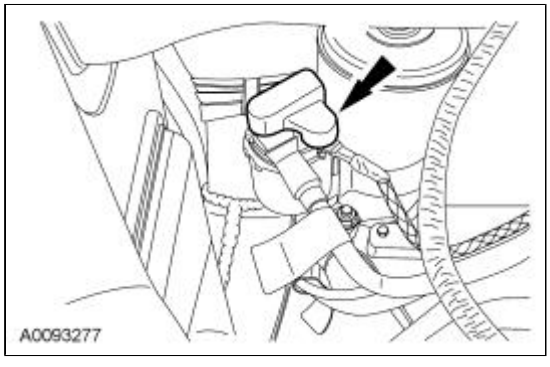
15. Remove the transmission case bolt.



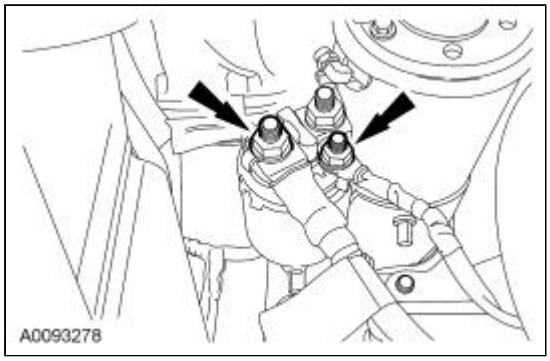
16. Remove the transmission fluid cooler tube bracket nut and position the bracket and tubes aside.



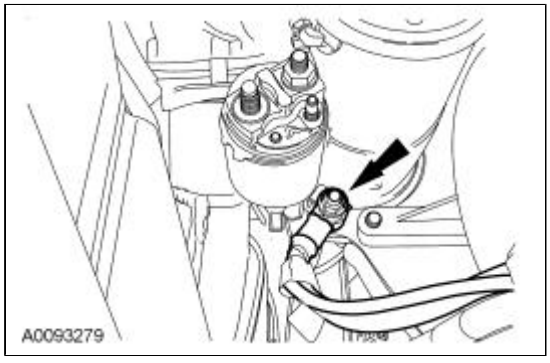
17. Remove the plastic starter motor electrical connector cap.



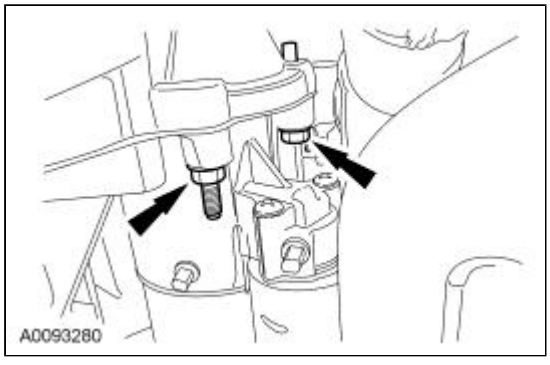
18. Remove the starter motor electrical connectors.



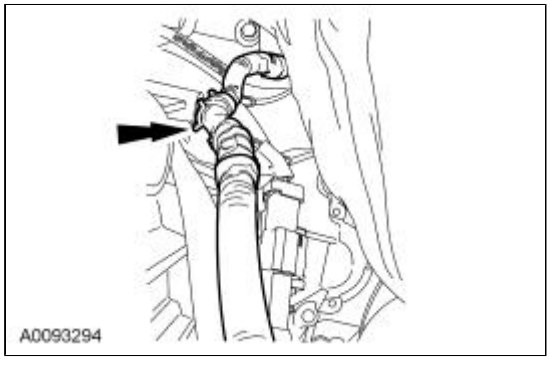
19. Remove the ground wire from the stud.



20. Remove the 3 starter motor bolts and the starter motor.



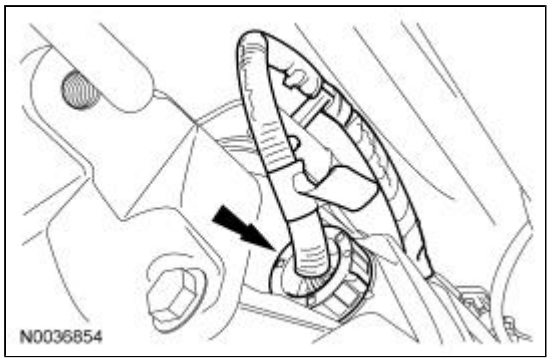
21. Disconnect the wiring harness from the top of the transmission.



22. **CAUTION: Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

    Disconnect the main transmission electrical harness by twisting the outer shell and pulling back

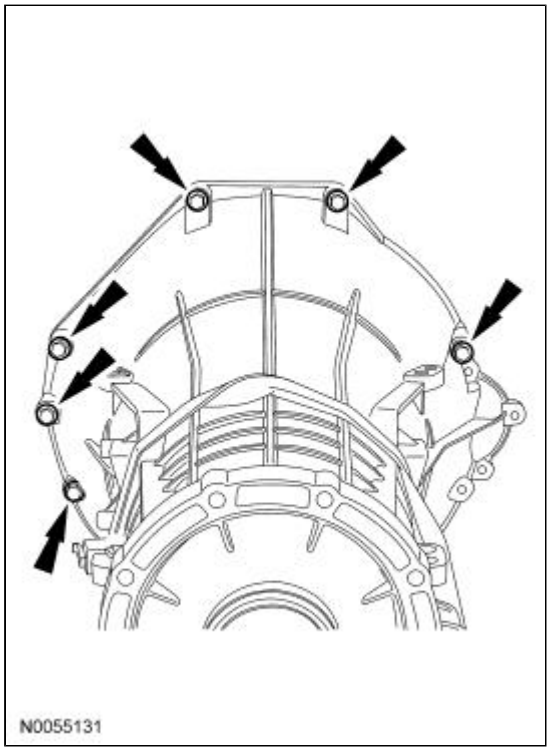
on the connector.



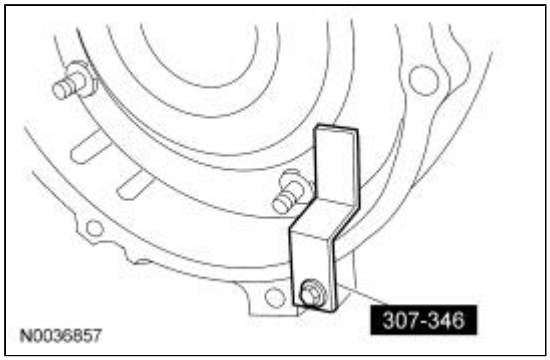
23. **NOTE:** The top 2 transmission case bolts need to be removed prior to removing the rest of the bolts.

    NOTE: The top left bolt secures the fuel line bracket to the transmission case.

    Remove the 6 remaining transmission case bolts.



24. Slide the transmission back enough to install the special tool.



25. Remove the transmission from the vehicle.

26. If the transmission is to be overhauled or if installing a new transmission, carry out transmission fluid cooler backflushing and cleaning. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

Transmission — Rear Wheel Drive (RWD)

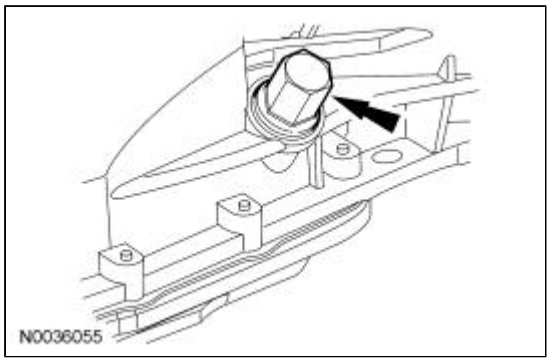
Special Tool(s)

ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

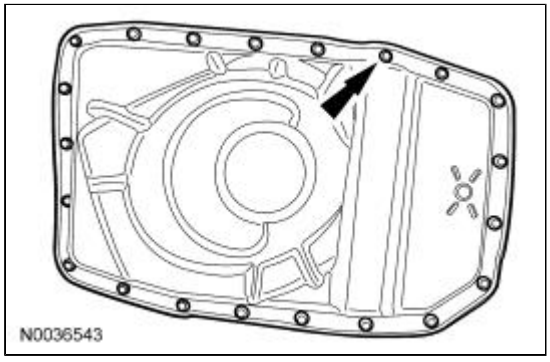
Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the driveshaft. For additional information, refer to Section 205-01 .
3. Remove the fluid fill plug fluid level indicator assembly located on the passenger side front portion of the transmission case. Removal of the plug will relieve any vacuum that might have built up in the transmission. This will aid in allowing the fluid pan to be easily removed when the bolts are removed.



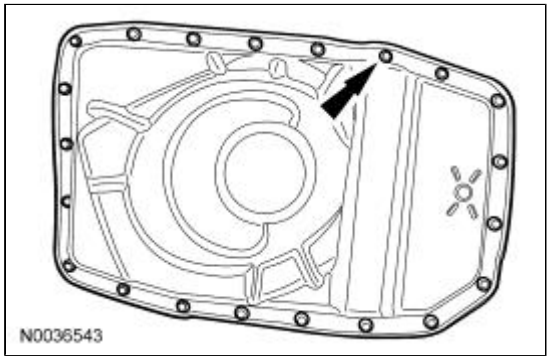
4. **NOTE:** If transmission disassembly or installation of a new transmission is necessary, the transmission fluid will need to be drained.

   Remove the transmission fluid pan and allow the fluid to drain.

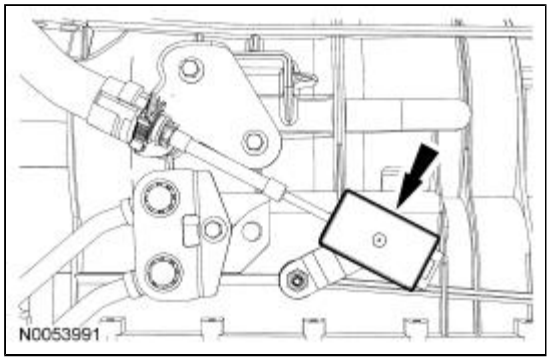


5. Install the fluid pan and tighten the bolts in a crisscross pattern.

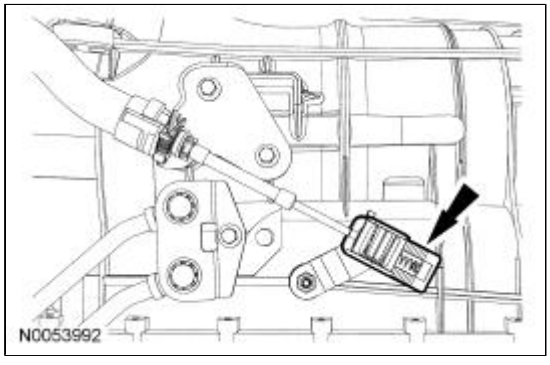
- Tighten to 14 Nm (10 lb-ft).



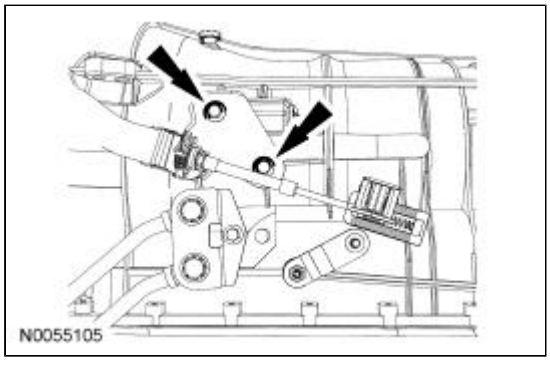
6. If equipped, remove the heat shield.



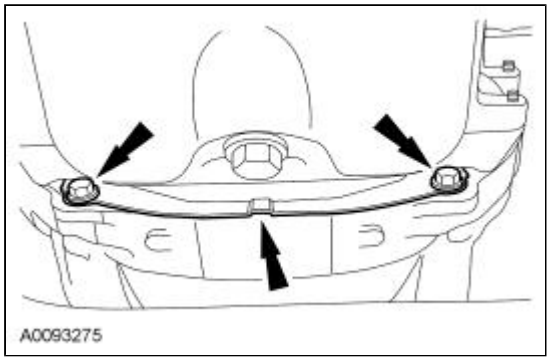
7. Move the locking tab up and disconnect the selector lever cable from the manual lever ball stud.



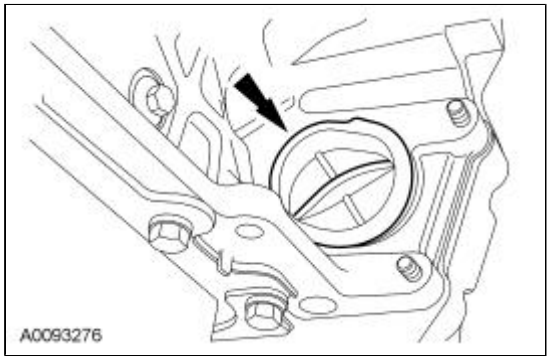
8. Remove the selector lever bracket bolts and remove the bracket.



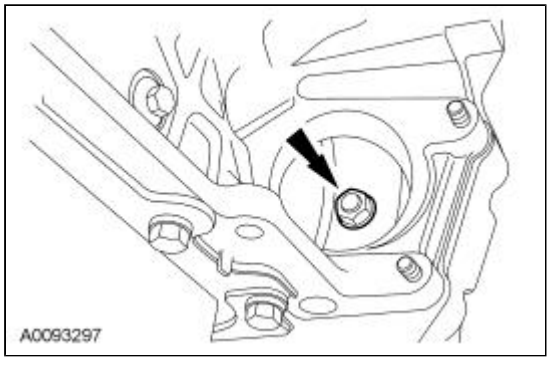
9. Remove the flexplate inspection cover bolts and the inspection cover.



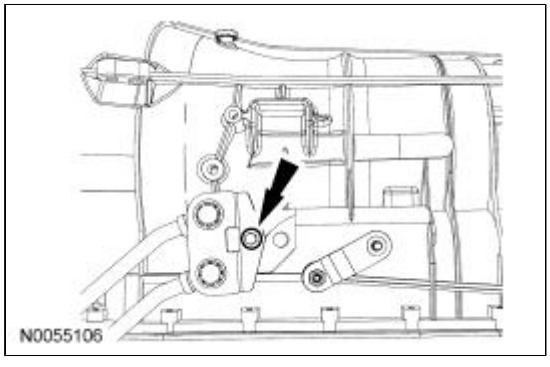
10. Remove the rubber torque converter nut access plug.



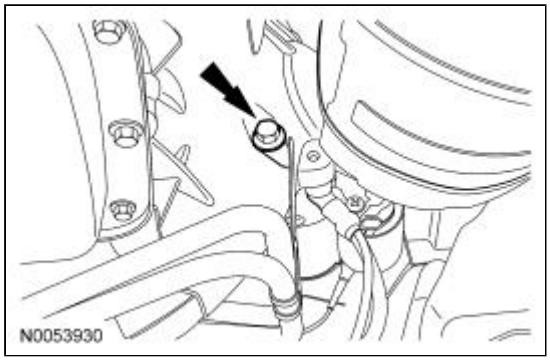
11. Remove and discard the 4 flexplate-to-torque converter nuts.



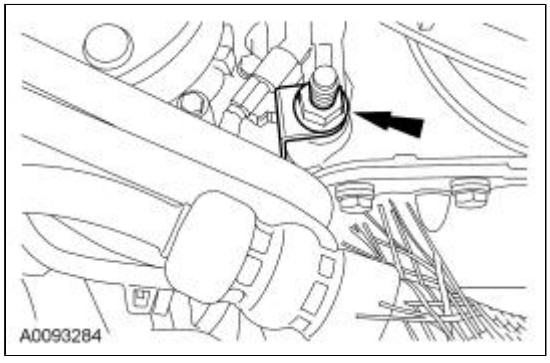
12. Remove the transmission cooler tube bracket bolt.



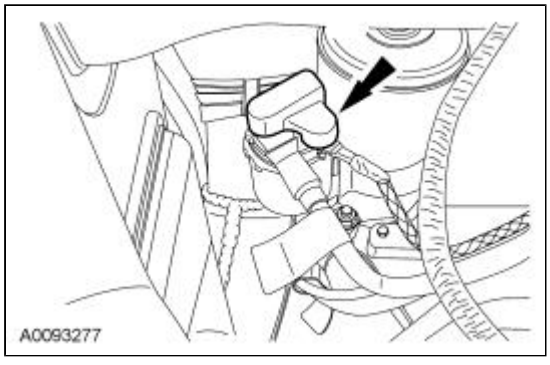
13. Remove the transmission case bolt.



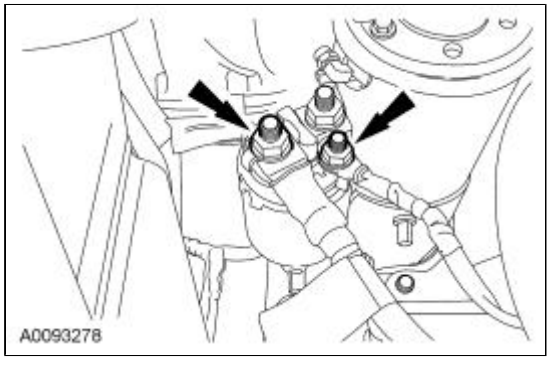
14. Remove the transmission fluid cooler tube bracket nut and position the bracket and tubes aside.



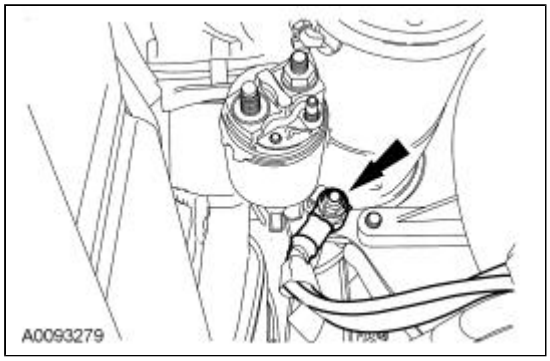
15. Remove the plastic starter motor electrical connector cap.



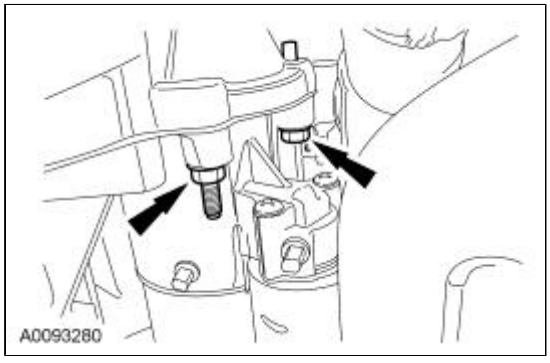
16. Remove the starter motor electrical connectors.



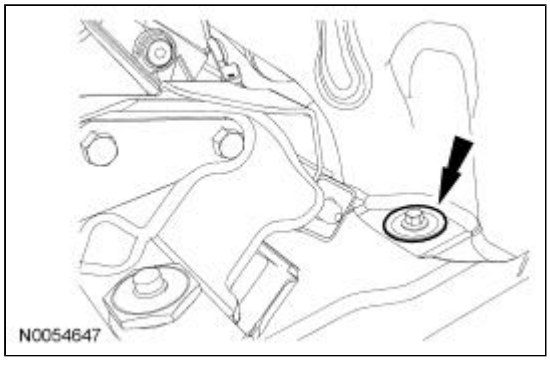
17. Remove the ground wire from the stud.



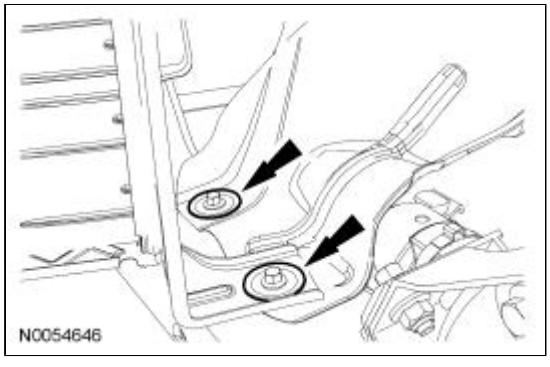
18. Remove the starter motor bolts and the starter motor.



19. Remove the RH exhaust heat shield bolt.

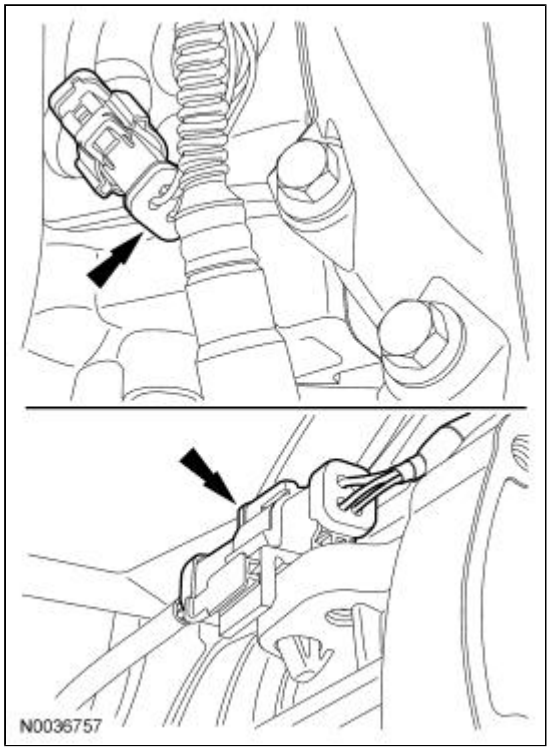


20. Remove the LH exhaust heat shield and evaporative emissions canister assembly bolts.

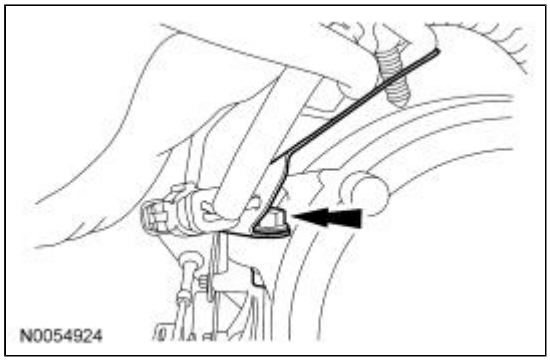


21. **NOTE:** LH shown, RH similar.

    Disconnect the RH and LH heated oxygen sensors (HO2S) and the catalyst monitor sensor (CMS) electrical connectors.



22. Remove the fuel line bracket bolt and position the bracket and lines aside.

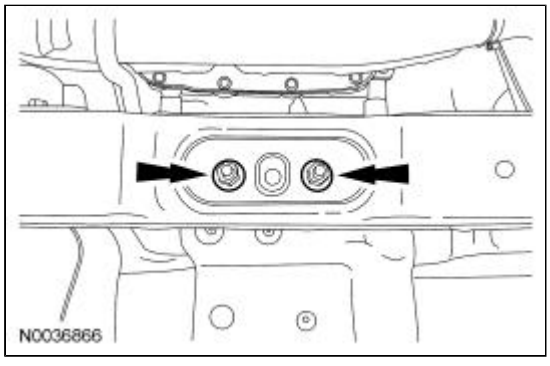


23. **NOTE:** Make sure that the transmission jack makes contact on the outer ribs of the fluid pan.

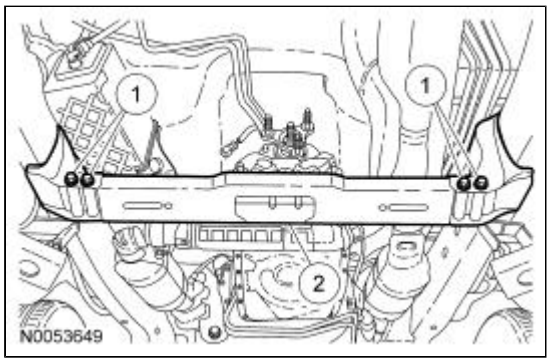
    NOTE: Make sure that the transmission is securely fastened to the transmission jack.

    Position a suitable high-lift transmission jack under the transmission.

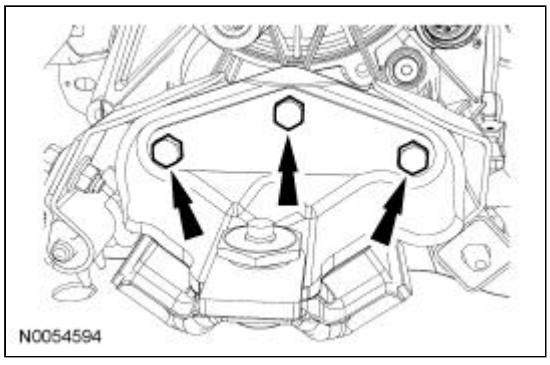
24. Remove the 2 rear crossmember nuts.



25. Remove the rear crossmember.
    1. Remove the 4 crossmember bolts and nuts.
    2. Remove the crossmember.

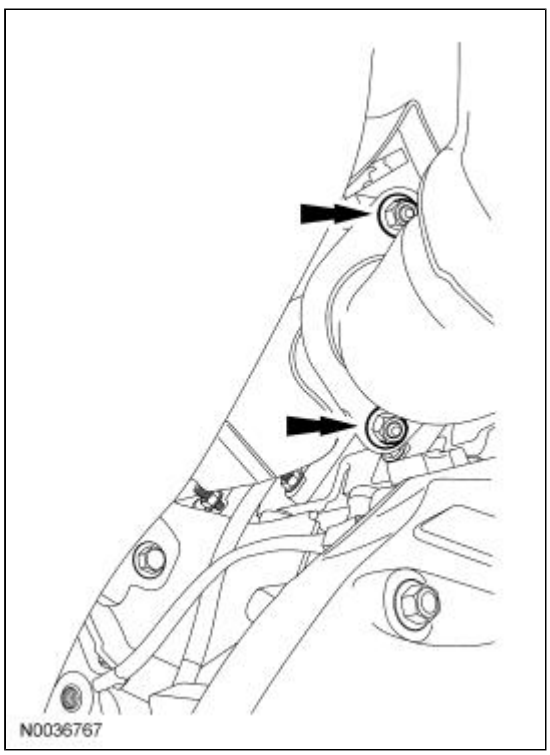


26. Remove the 3 bolts and remove the insulator.

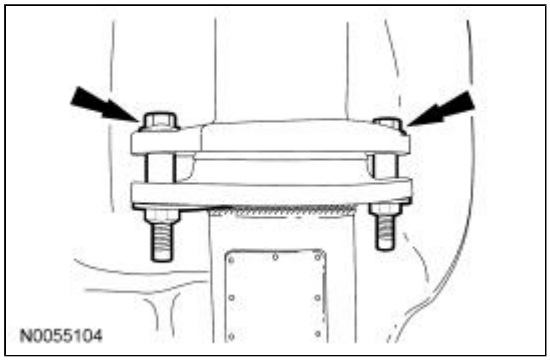


27. **NOTE:** LH shown, RH similar.

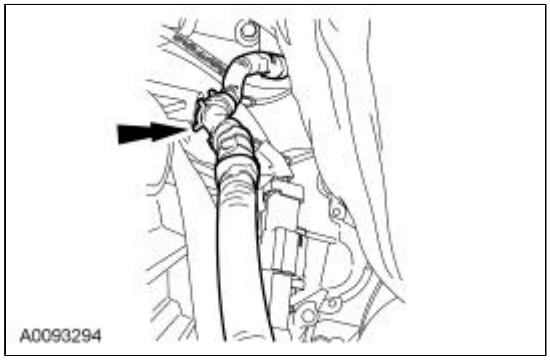
    Remove the RH and LH exhaust flange nuts.



28. Remove the 2 dual converter Y-pipe bolts and the dual converter Y-pipe.

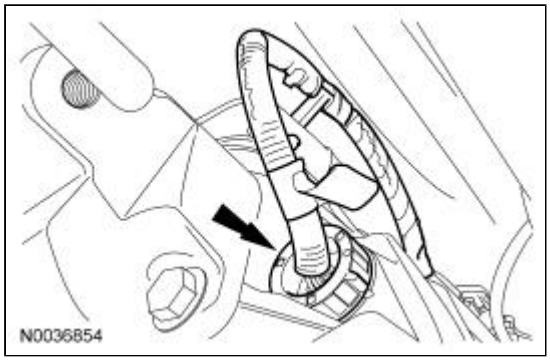


29. Disconnect the wire harness from the top of the transmission.



30. **CAUTION: Do not pull on the wire harness to disconnect the connector or damage to the connector will occur.**

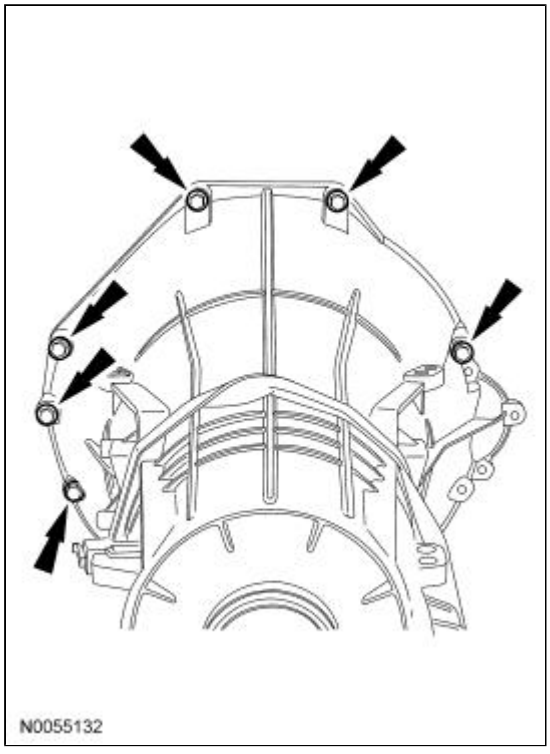
    Disconnect the main transmission electrical harness by twisting the outer shell and pulling back on the connector.



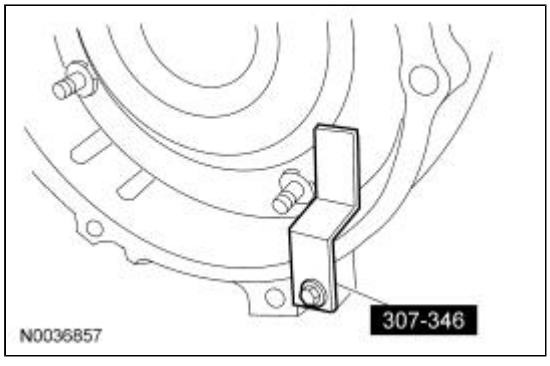
31. **NOTE:** The top 2 transmission-to-engine bolts need to be removed prior to removing the rest of the bolts.

    NOTE: The top left bolt secures the fuel line bracket to the transmission case.

    Remove the 6 remaining transmission case bolts.



32. Slide the transmission back far enough to install the special tool.



33. Remove the transmission from the vehicle.

34. If the transmission is to be overhauled or if installing a new transmission, carry out transmission fluid cooler backflushing and cleaning. For additional information, refer to Transmission Fluid Cooler — Backflushing and Cleaning in this section.

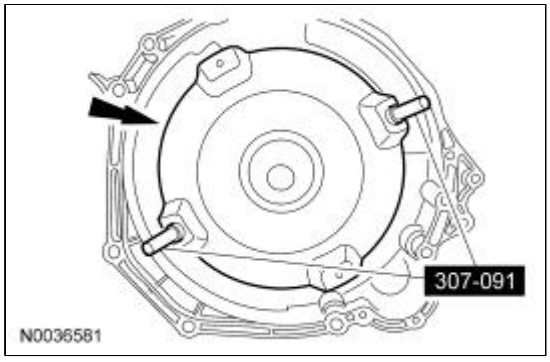
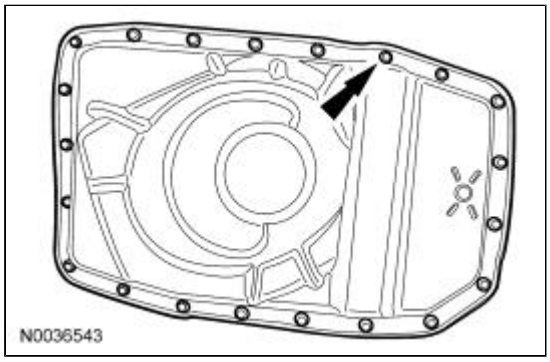
 ST2932-A	and 307-562/2)

All vehicles

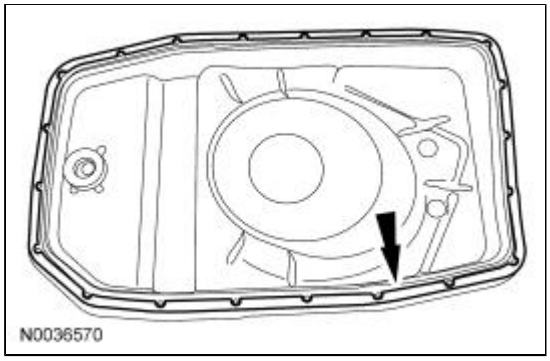
1. Using the special tools, remove the torque converter.



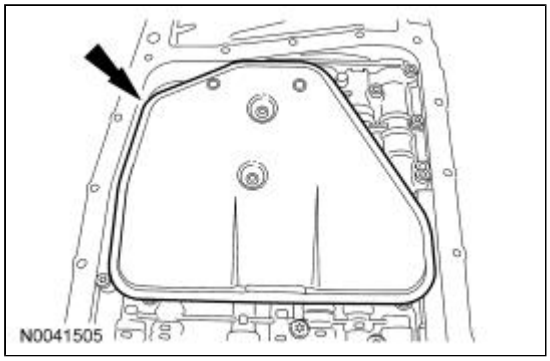
2. Remove the transmission fluid pan.



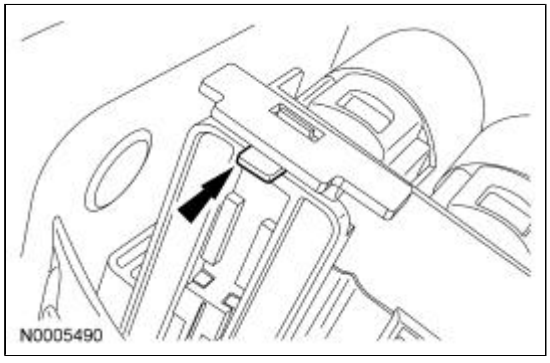
3. Remove the fluid pan gasket.



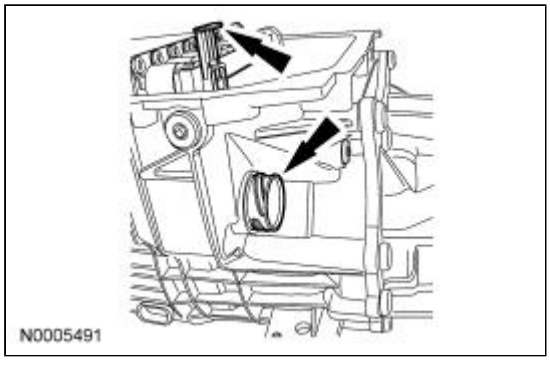
4. Remove and discard the transmission fluid filter.



5. Press the release tab and lift up on the bulkhead connector retainer.

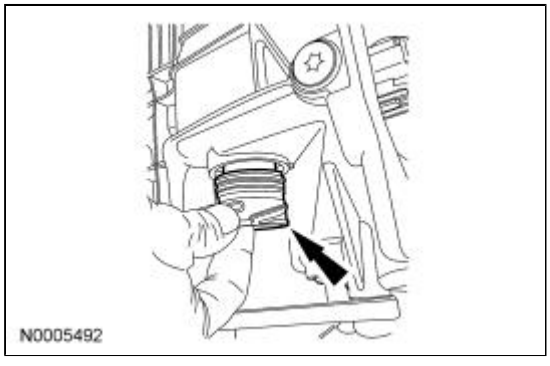


6. With the release tab up, pull the outer shell of the bulkhead electrical connector.

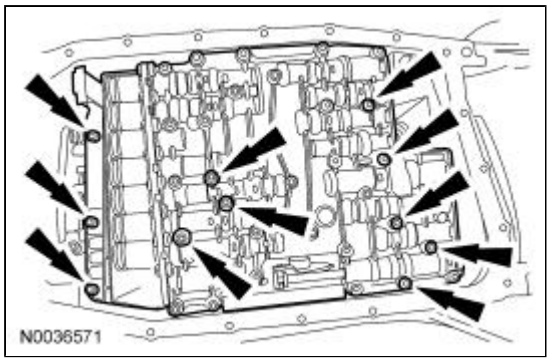


7. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

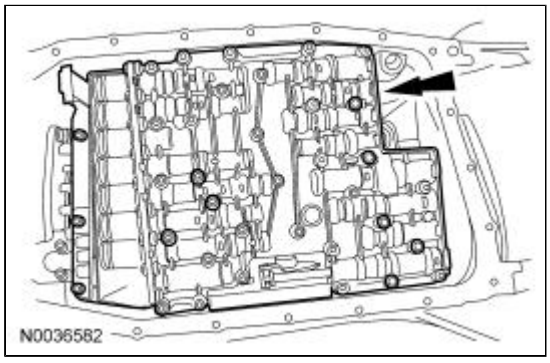
   Pull the outer shell of the bulkhead electrical connector out of the transmission.



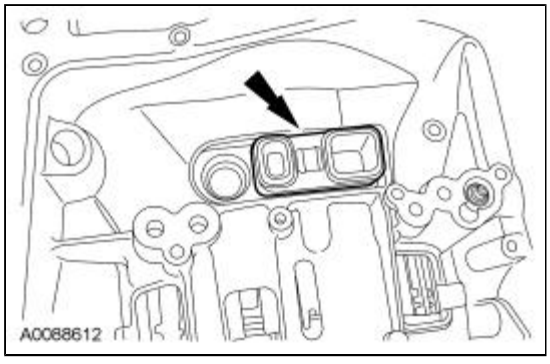
8. Remove the 11 bolts from the mechatronic assembly.



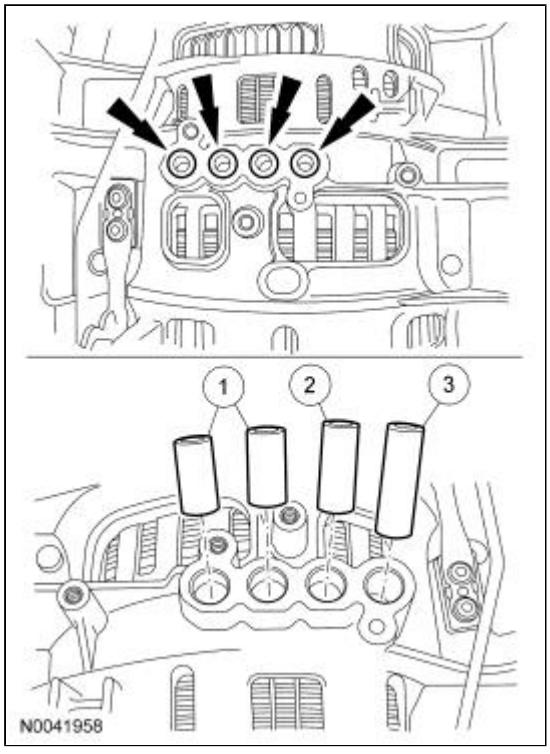
9. Remove the mechatronic assembly.



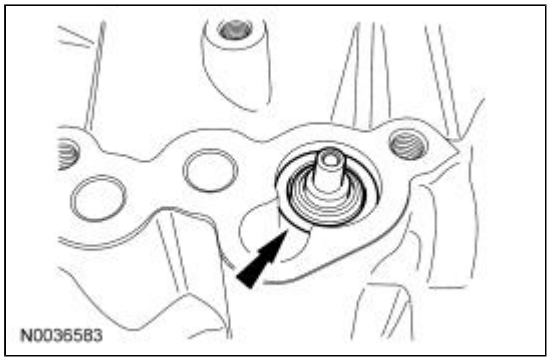
10. Remove the rubber adapter and the fluid filter seal.



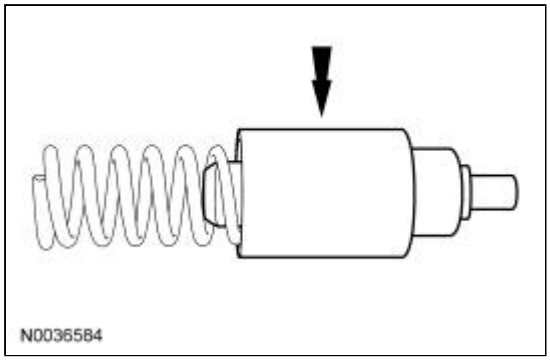
11. Remove and discard the 4 rubber feed tubes for the center support. Note the size and location while removing for correct installation.
    1. Black feed tubes.
    2. Green feed tube.
    3. Blue feed tube.



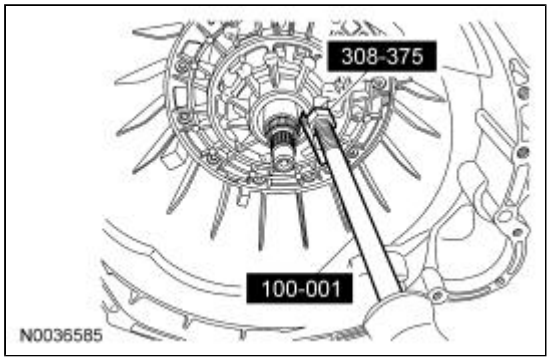
12. Remove the thermal bypass valve from the case.



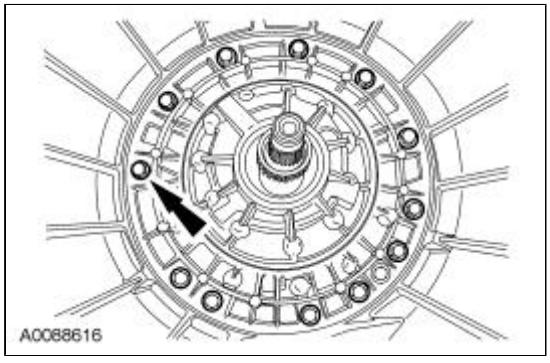
13. Inspect the thermal bypass valve for damage, install a new valve if damage is indicated.



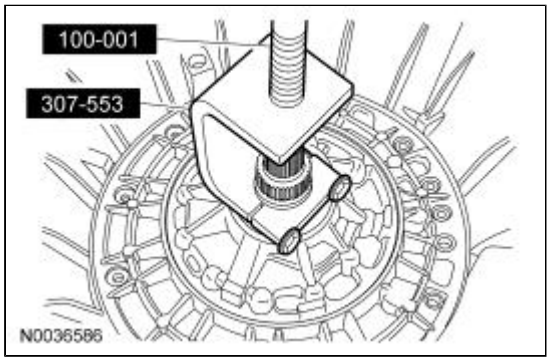
14. Using the special tools, remove and discard the front pump seal.



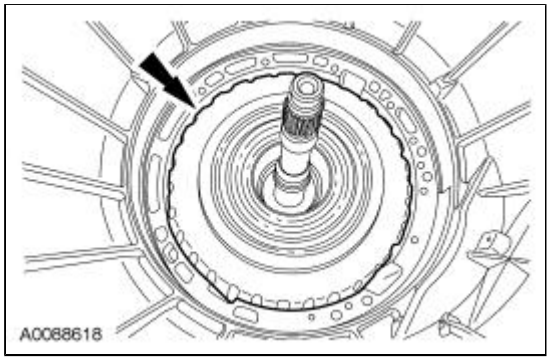
15. Remove and discard the front pump bolts.



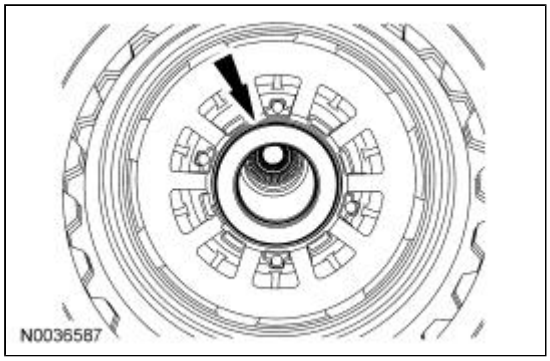
16. Using the special tools, remove the front pump support. Make sure that the selective shim is on the back side of the pump.



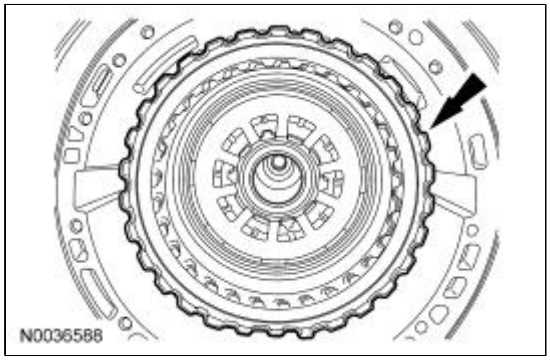
17. Remove the forward (clutch A)/overdrive (clutch E) clutch assembly.



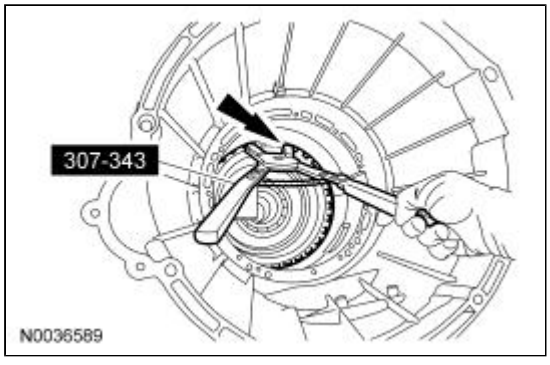
18. Remove the caged roller bearing.



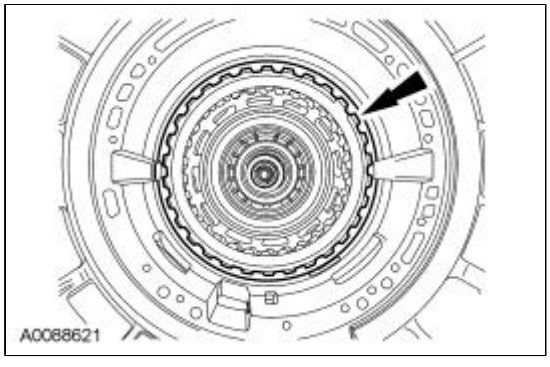
19. Remove the direct clutch assembly.



20. Using the special tool, remove the center support snap ring.

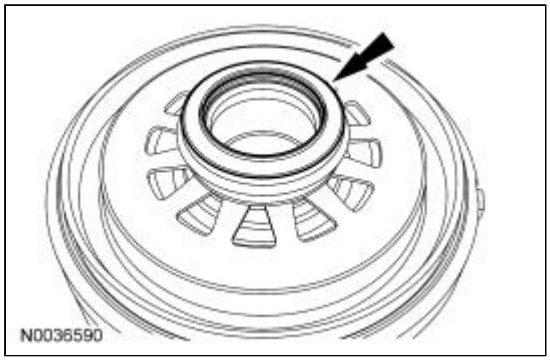


21. Remove the center support.



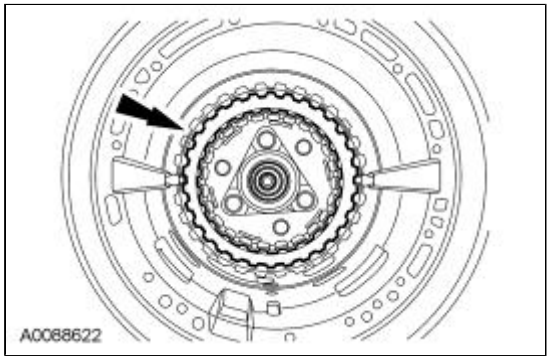
22. **NOTE:** During the removal the bearing may be on the back of the center support.

    Remove the bearing from the back of the center support if it is there.

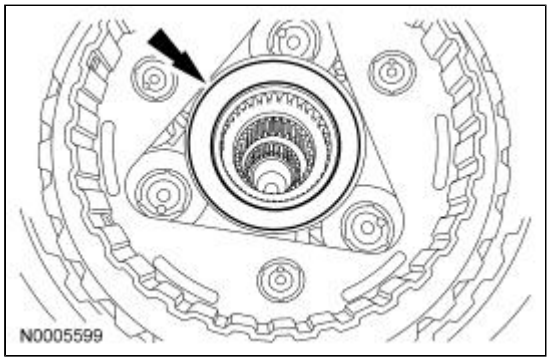


23. **NOTE:** When removing the planet carrier and the low/reverse clutch pack some of the clutch plates may stay in the case. Try to keep all the clutches together.

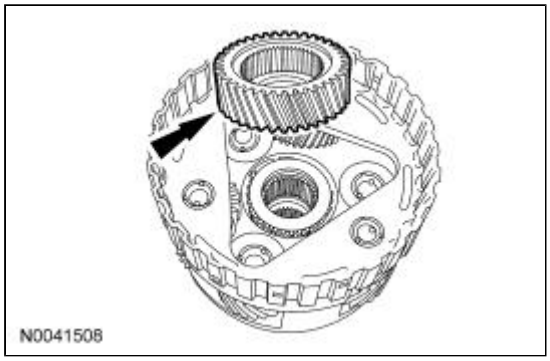
    Remove the planet carrier and the low/reverse clutch pack as an assembly.



24. Remove the low/reverse bearing race.

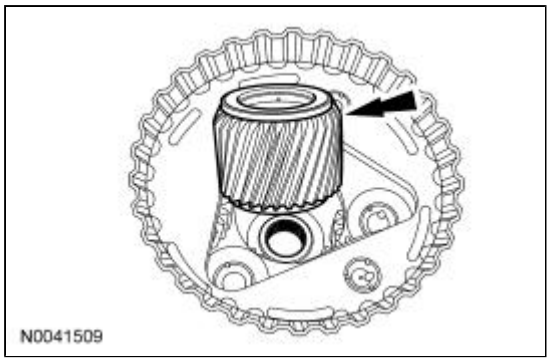


25. Remove the low/reverse sun gear.

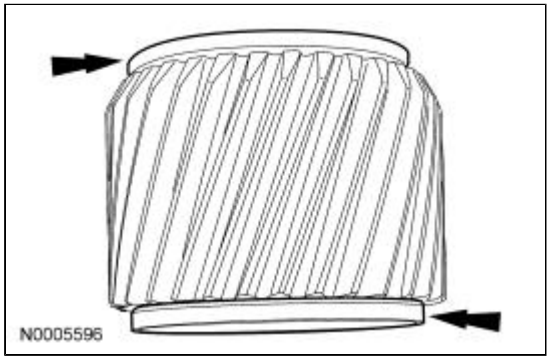


26. **NOTE:** When removing the sun gear, take note that the taper edge is facing up toward the torque converter housing.

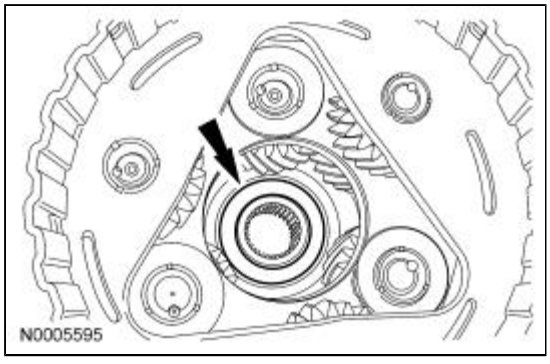
Remove the sun gear into the planet assembly.



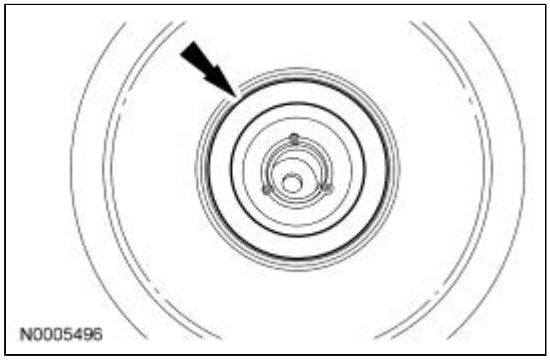
27. Remove the top and the bottom roller bearings from the sun gear.



28. Remove the roller bearing race in the bottom of the carrier.

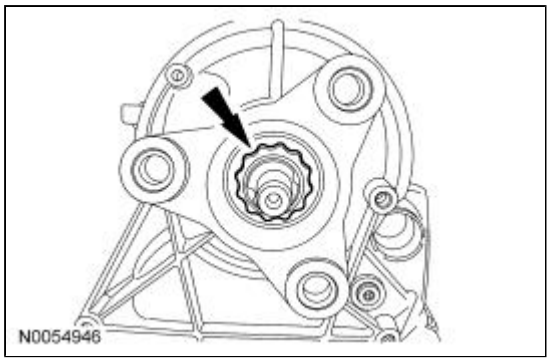


29. Remove the washer.

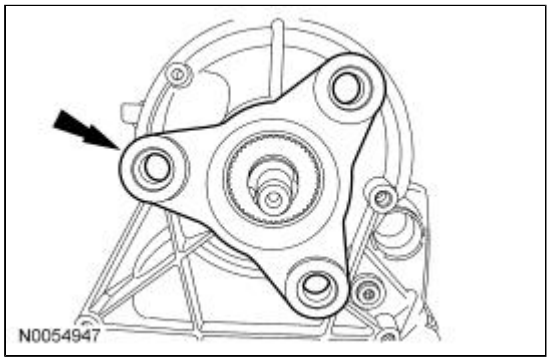


Rear wheel drive (RWD) vehicles

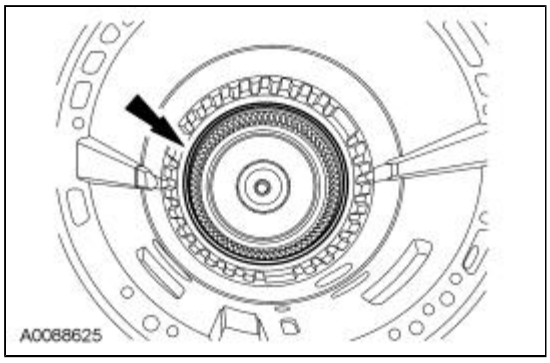
30. Remove and discard the output shaft flange nut.



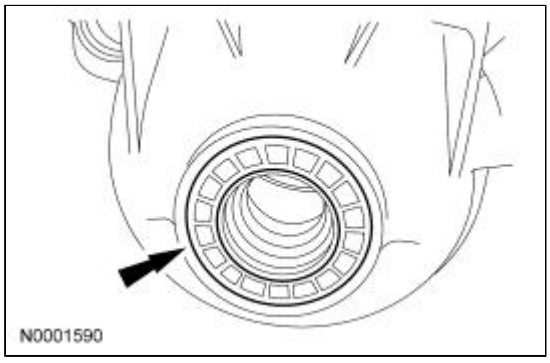
31. Remove the output shaft flange.



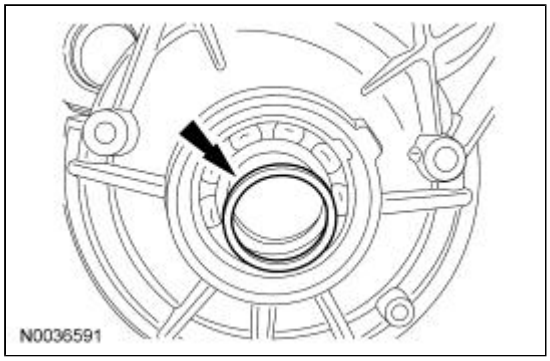
32. Remove the planet carrier hub and output shaft assembly.



33. Remove the output shaft seal.

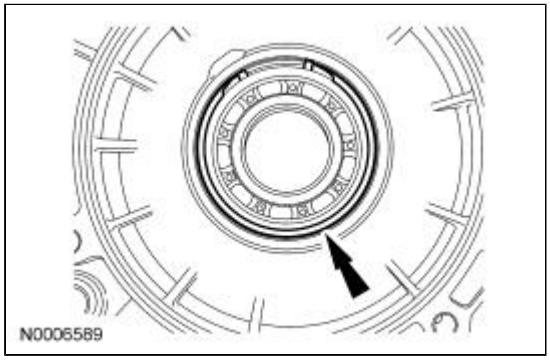


34. Remove the anti-click washer.



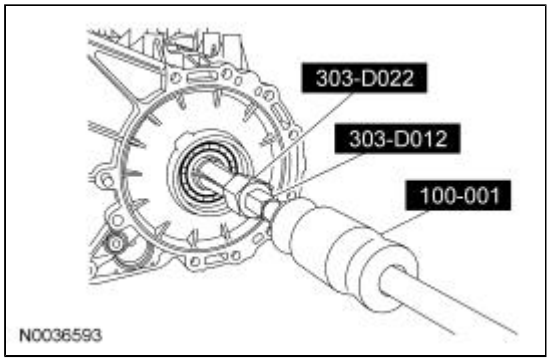
35. **NOTE:** Four wheel drive (4WD) case shown, RWD case similar.

    Remove the snap ring from the case.

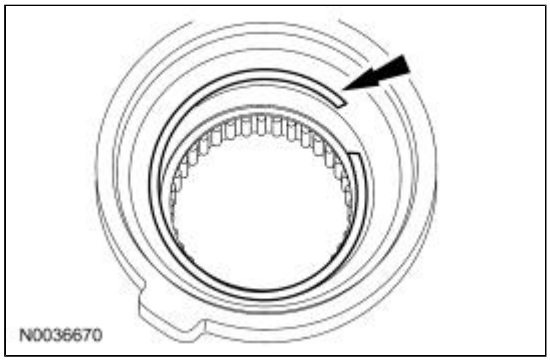


36. **NOTE:** 4WD case shown, RWD case similar.

    Using the special tools, remove the roller bearing.

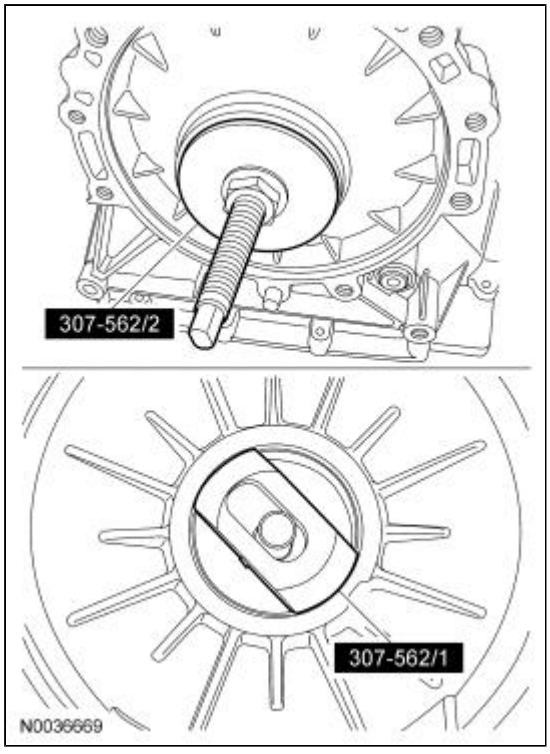


37. Using a suitable tool, remove the inner bearing snap ring.



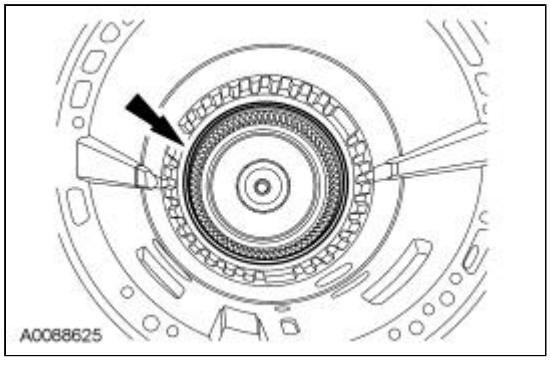
38. **CAUTION: Use care when installing the special tool. Look inside the transmission case to make sure that the tool contacts the bearing only and not the lip of the case, or damage to the case will occur.**

    Using the special tool, remove the bearing assembly.

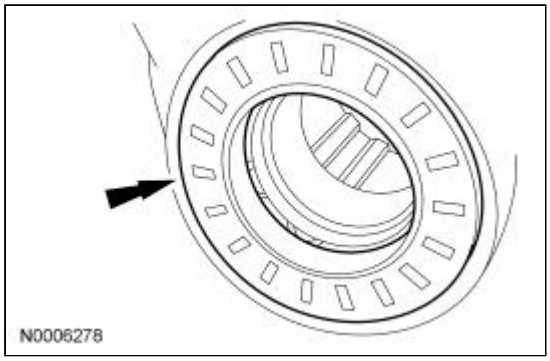


4WD vehicles

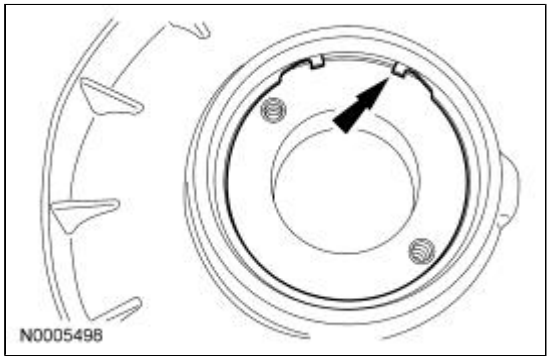
39. Remove the planet carrier hub and output shaft assembly.



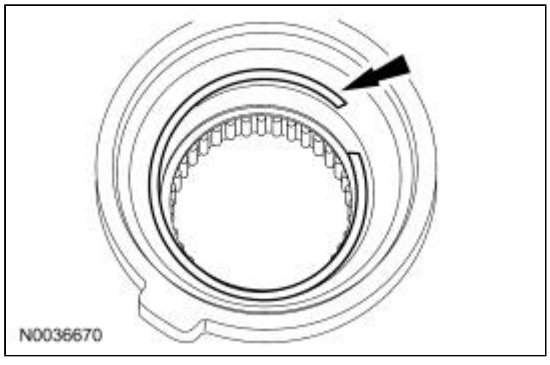
40. Remove and discard the output shaft seal.



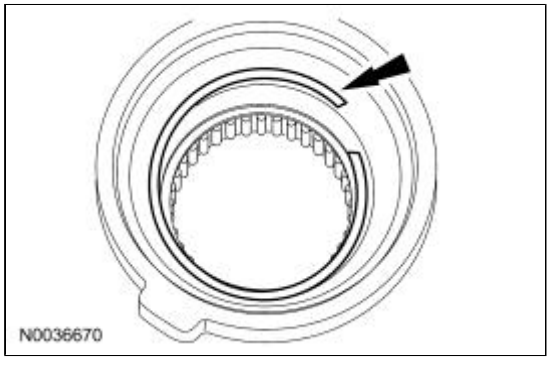
41. Remove the snap ring from the case.



42. Using the special tools, remove the bearing spacer.

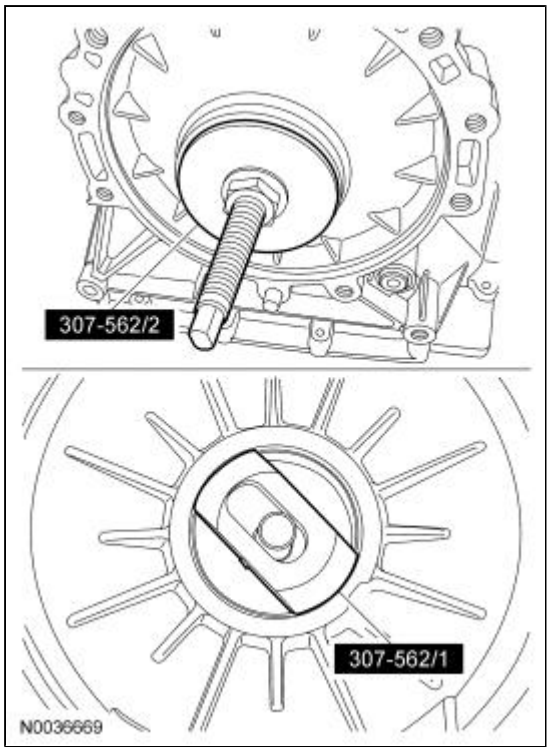


43. Using a suitable tool, remove the inner bearing snap ring.



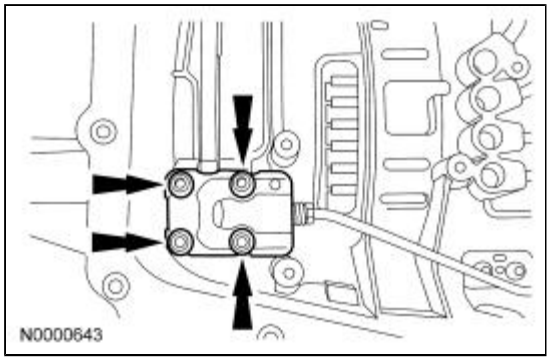
44. **CAUTION: Use care when installing the special tool. Look inside the transmission case to make sure that the tool contacts the bearing only and not the lip of the case, or damage to the case will occur.**

Using the special tool, remove the bearing assembly.

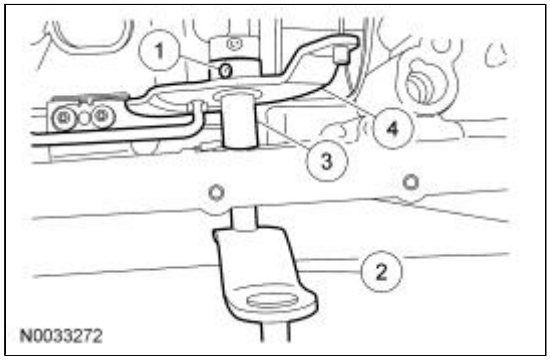


All vehicles

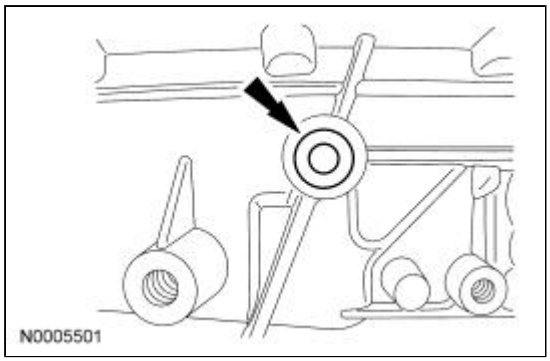
45. Remove the park rod actuating plate.



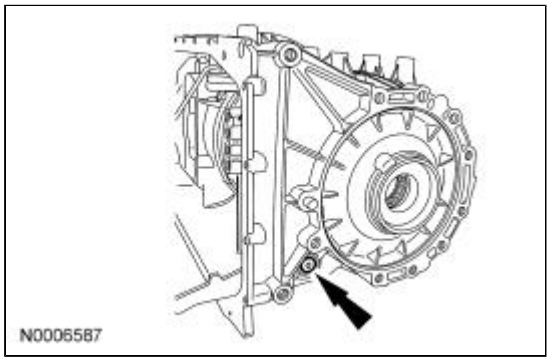
46. Remove the manual control lever.
    1. Remove the roll pin.
    2. Slide the manual control lever shaft out of the case.
    3. Hold the spacer to keep from falling into the case.
    4. Remove the manual valve inner lever and the park rod as an assembly.



47. Remove and discard the manual control lever seal.



48. Remove the bolt from the back of the case to gain access to the park pawl pin.



49. From the inside of the case, push the park pawl pin out toward the back side of the case while holding the spring and the park pawl. Remove the park pawl pin then remove the park pawl and spring.

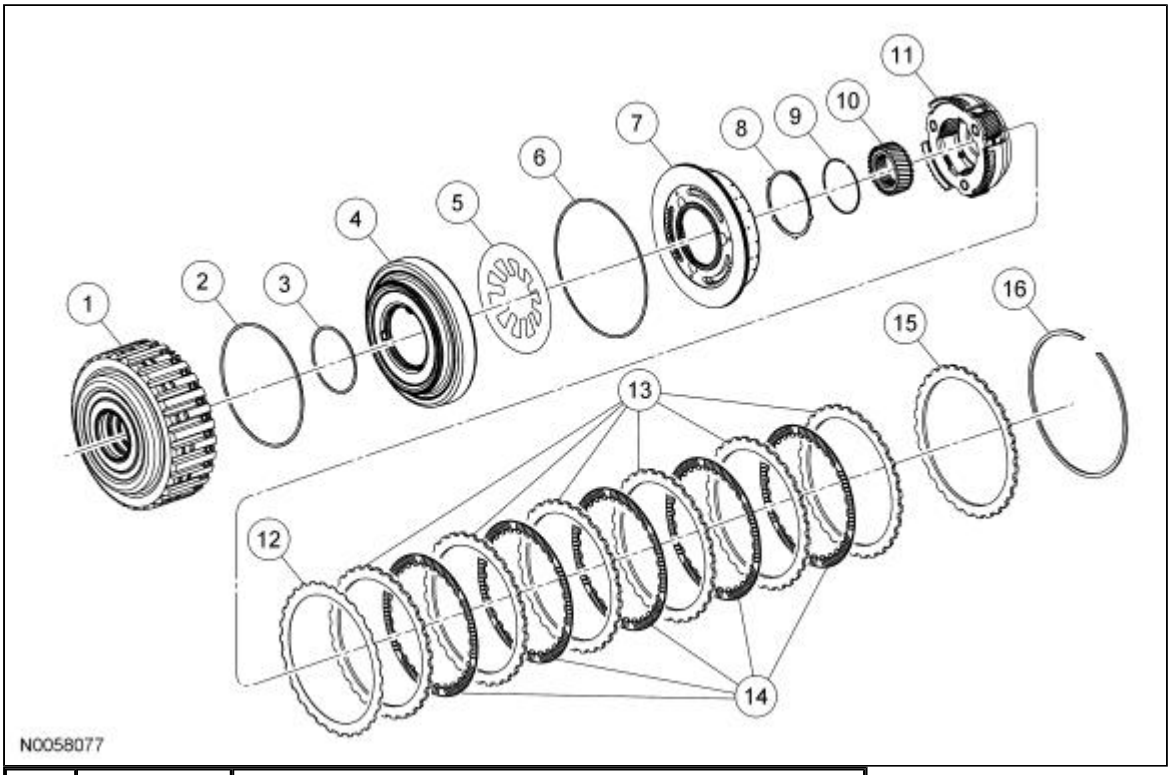
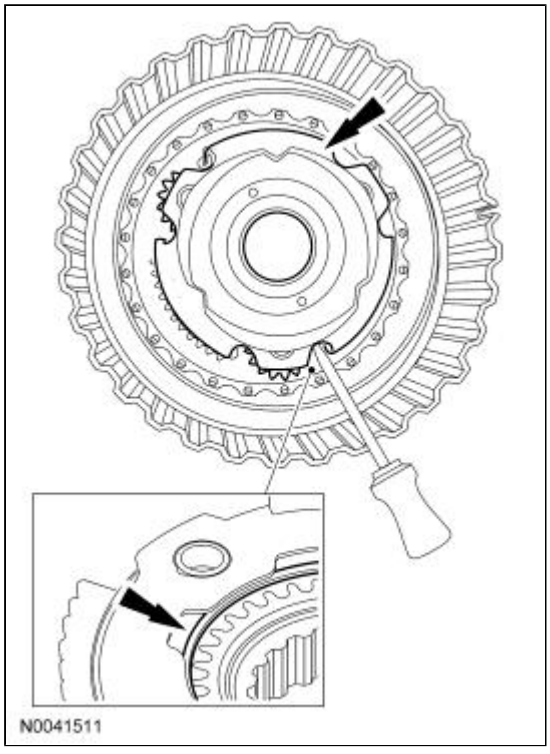
Forward Clutch Assembly (A Clutch)



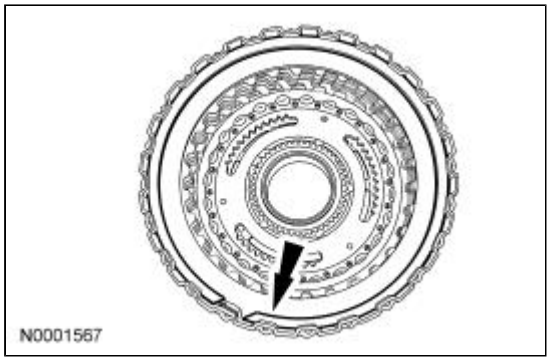
Item	Part Number	Description
1	—	Forward clutch drum
2	—	Forward clutch piston outer O-ring seal
3	—	Forward clutch piston inner O-ring seal
4	—	Forward clutch piston
5	—	Forward clutch piston return spring
6	—	Forward clutch balance dam O-ring seal
7	—	Forward clutch balance dam
8	—	Forward clutch balance dam retaining ring
9	—	Sun gear retaining ring
10	—	Sun gear
11	—	Planetary gear
12	—	Forward clutch wave spring
13	—	Forward clutch external splined steel plates (quantity model dependent)
14	—	Forward clutch internal splined friction plates (quantity model dependent)
15	—	Forward clutch pressure plate
16	—	Forward clutch plate retaining ring.

Disassembly

1. Remove the sun gear from the forward clutch assembly.
    - With a small screwdriver or a suitable pick inserted into the sun gear push on the retaining ring in 3 places while lifting up on the sun gear to remove.

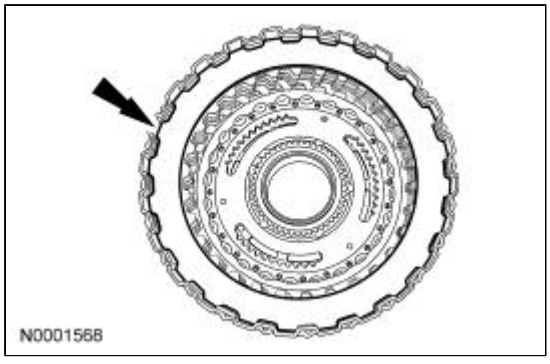


2. Remove the forward clutch pack snap ring.



3. **NOTE:** Inspect the forward clutch drum and the friction and steel plates for damage. Install new components as necessary.

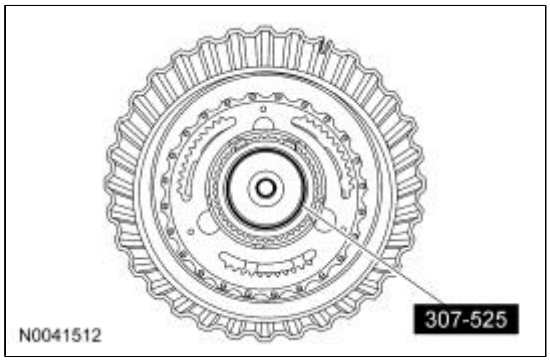
   Remove and inspect the forward clutch steel and friction plates.
   - If the plates are damaged install a new forward clutch assembly.
   - If no damage is indicated the forward clutch can be reassembled



4. **NOTE:** The bottom of the special tool will need to be installed from the back side of the forward

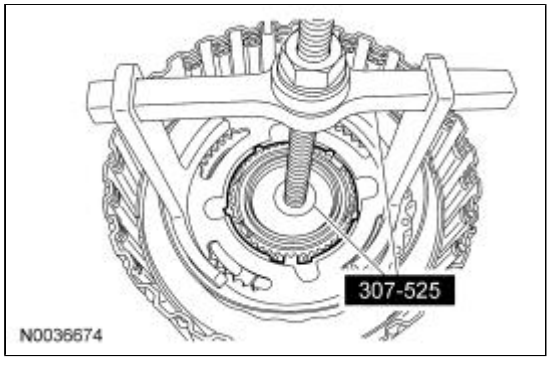
clutch assembly.

Install the special tool under the forward clutch drum.

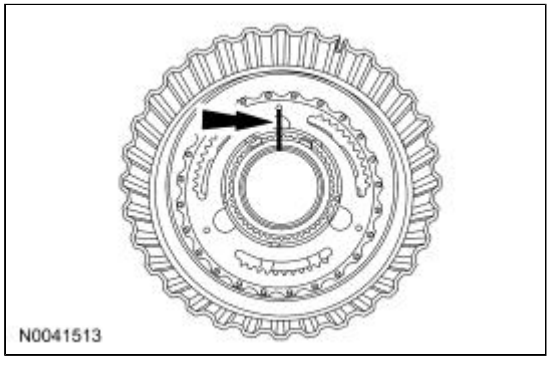


5. **NOTE:** The bottom of the special tool will need to be installed from the back side of the forward clutch assembly.

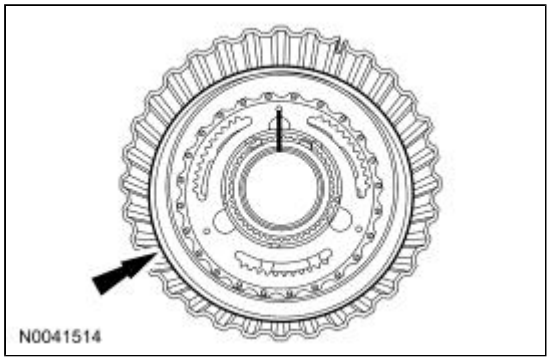
   Using the special tool, slightly collapse the balance dam to gain access to the retaining ring. Remove the retaining ring.



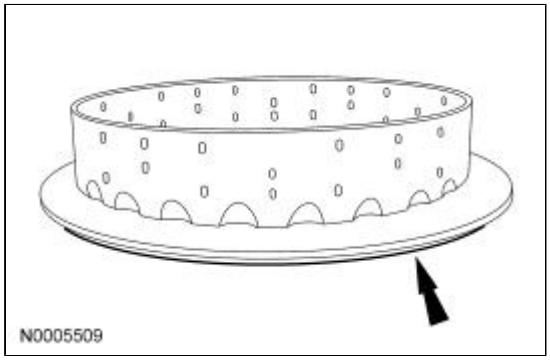
6. Prior to removing the balance dam, make an identifying mark on the balance dam and the center part of the housing. This is for correct alignment during the assembly.



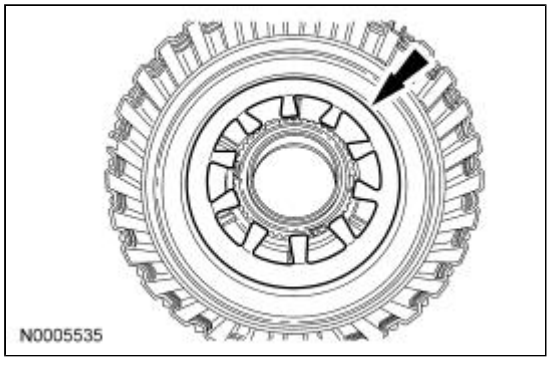
7. Remove the balance dam.



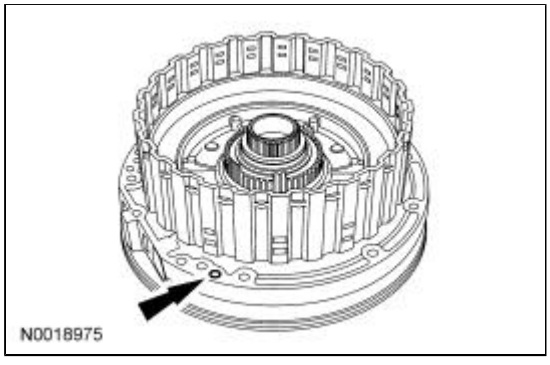
8. Remove and discard the O-ring seal from the balance dam.



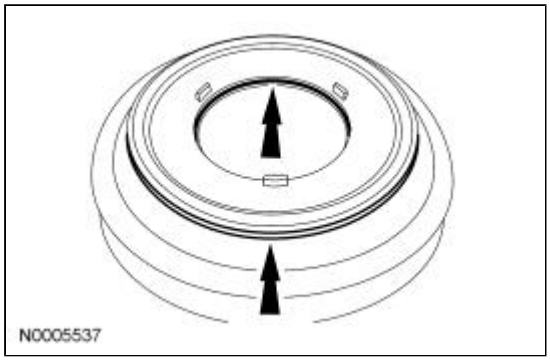
9. Remove the forward clutch return spring.



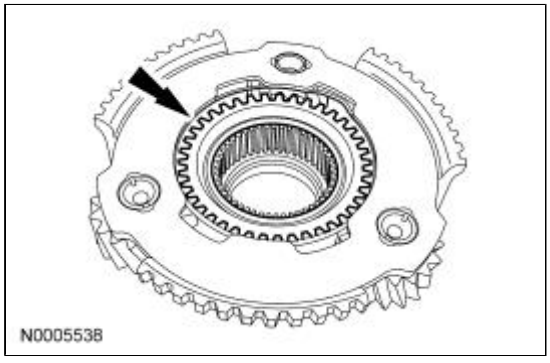
10. Install the forward clutch into the front pump to remove the forward clutch piston. Apply a small amount of shop air to remove the piston.



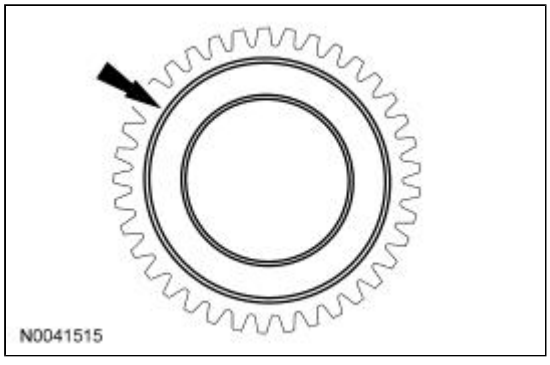
11. Remove and discard the inner and outer piston O-ring seals.



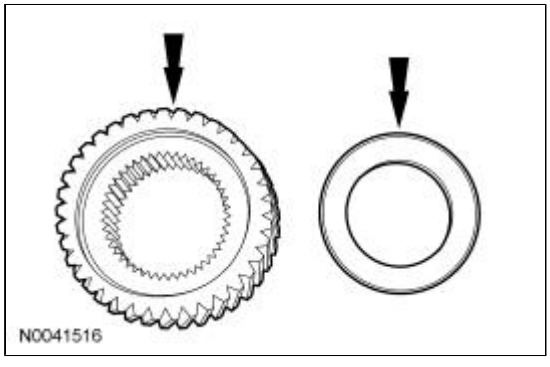
12. Remove the sun gear from the planet assembly.



13. Remove the bearing from the sun gear.

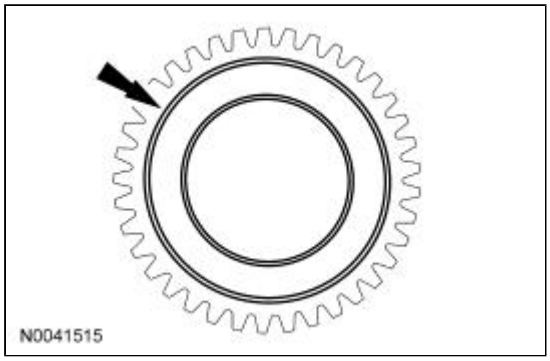


14. Inspect the sun gear and bearing for damage. Install new components as necessary.

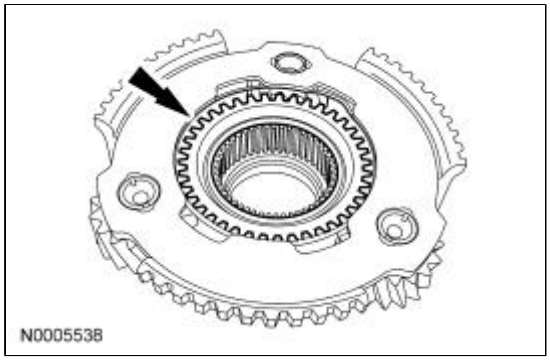


Assembly

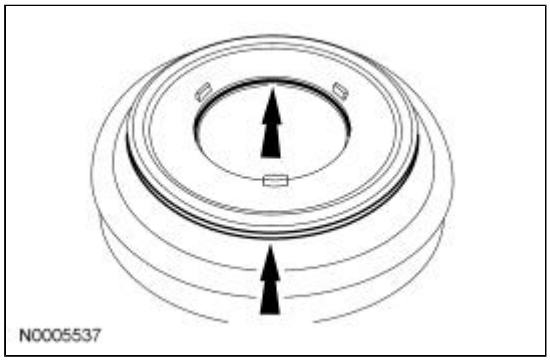
1. Install the bearing onto the sun gear.



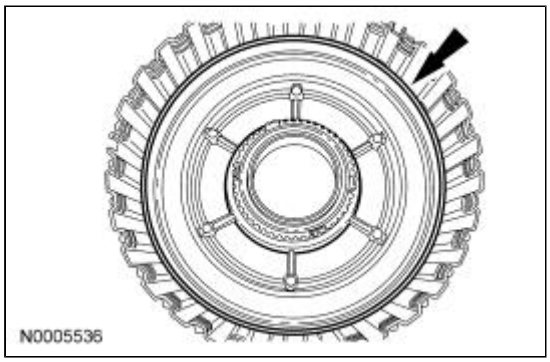
2. Install the sun gear into the planet assembly with the bearing facing down and the recess part of the gear up.



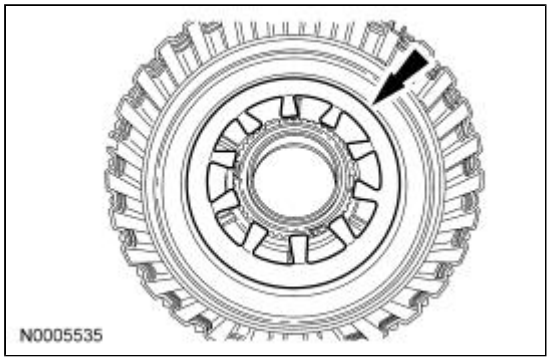
3. Install new O-ring seals onto the forward clutch piston.



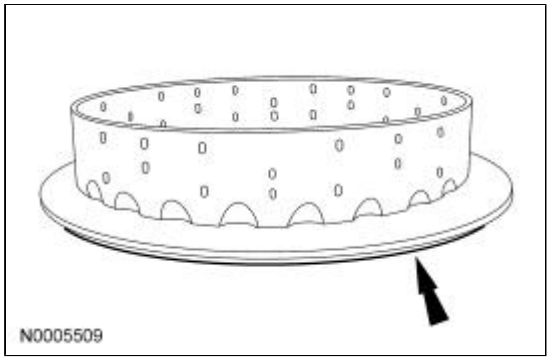
4. Lightly coat the O-ring seals with clean transmission fluid and install the forward clutch piston into the forward clutch drum.



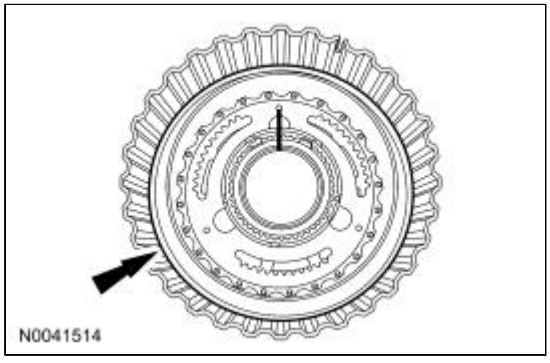
5. Install the forward clutch return spring.



6. Install a new O-ring seal onto the forward clutch balance dam. Lightly coat the O-ring seal with clean transmission fluid.

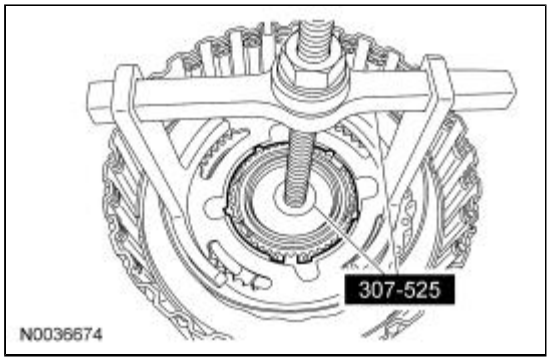


7. Align the marks made during disassembly and install the balance dam into the forward clutch drum.

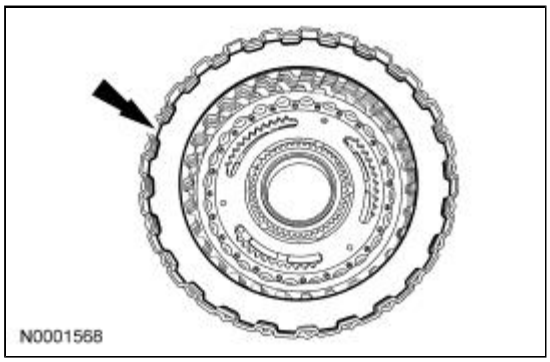


8. **NOTE:** Prior to releasing the special tool, make sure that the snap ring is fully seated.

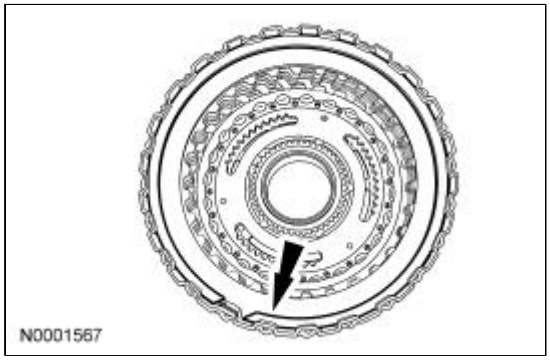
   Using the special tool, slightly collapse the balance dam to install the retaining ring. Install the retaining ring.



9. Install the new forward clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates, and ending up with the pressure plate.

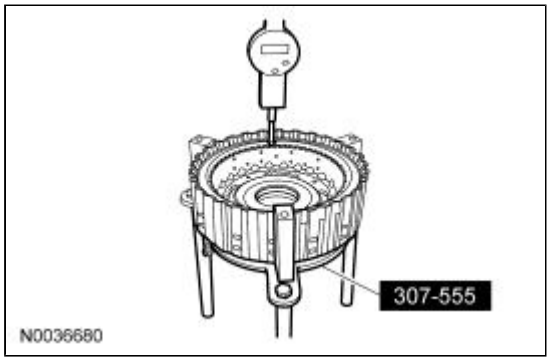


10. Install the forward clutch plate snap ring.



11. **NOTE:** All forward clutch plates, friction and steel are of a wave-type design.

    Install the forward clutch assembly into the special tool so the dial indicator fits into the opening of the snap ring.



12. With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

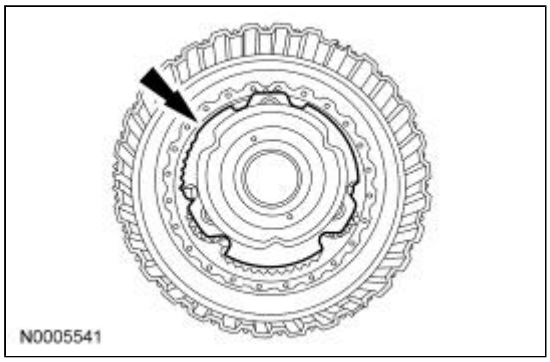
13. Rotate the forward clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

14. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 5.4L engine — 0.71-1.10 mm (0.028-0.043 in).

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

15. Install the sun gear and planetary gearset into the forward clutch drum. Make sure it snaps and locks in place.



Overdrive Clutch Assembly

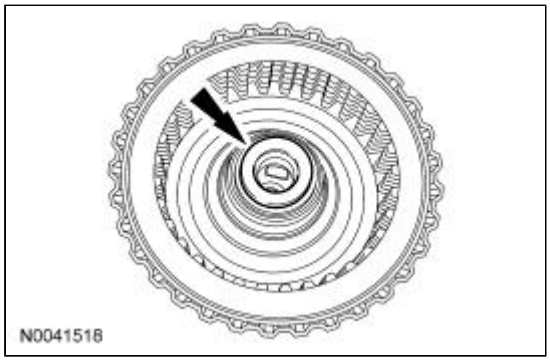
	Part	

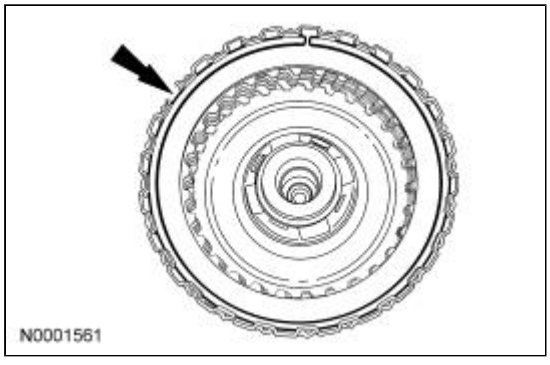
Item	Number	Description
1	7J006	Input shaft
2	7J008	Overdrive clutch piston outer seal
3	7G007	Overdrive clutch piston inner seal
4	7G418	Overdrive clutch piston
5	7N529	Overdrive clutch piston spring
6	7J009	Overdrive balance piston outer seal
7	7J029	Overdrive balance piston
8	7J010	Overdrive balance piston snap ring
9	7N572	Overdrive clutch cushion plate
10	7B164	Overdrive clutch internal splined clutch plates (friction)
11	7B442	Overdrive clutch external splined clutch plates (steel)
12	7C576	Overdrive pressure plate
13	7M157	Overdrive clutch retaining ring
14	7A453	Bearing T3

Disassembly

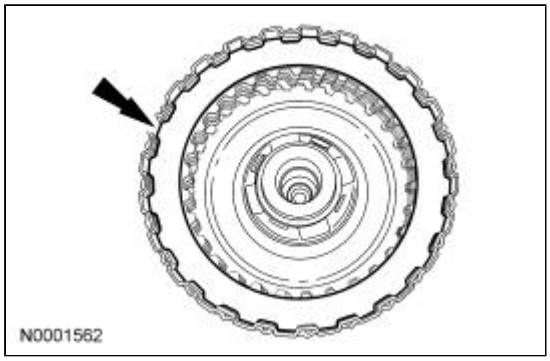
1. Remove the thrust bearing (T3).



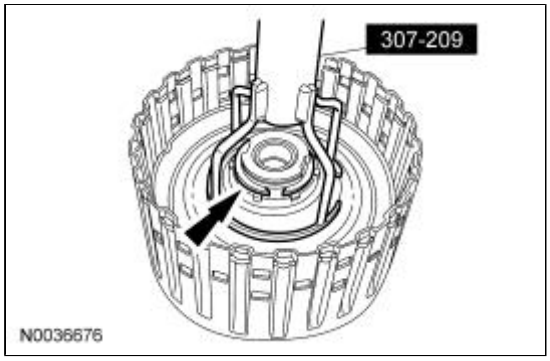
2. Remove the overdrive clutch pack snap ring.



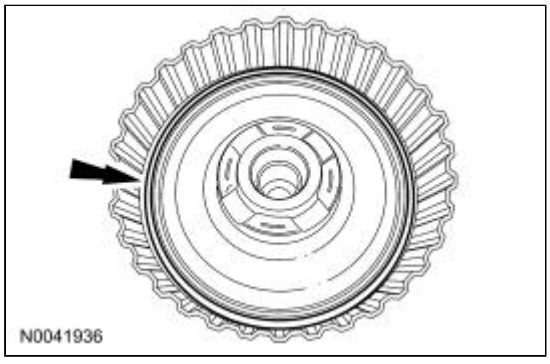
3. Remove the overdrive clutch pack.



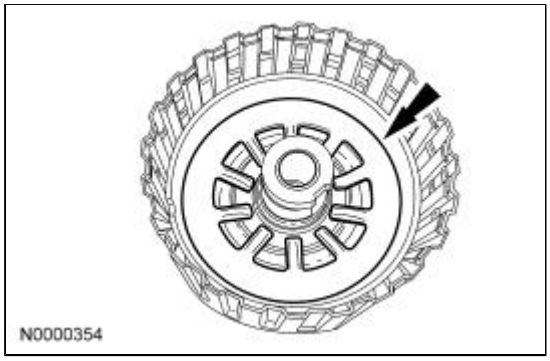
4. Using the special tool and a press, remove and discard the overdrive clutch balance piston retaining ring and keep the original spacer.



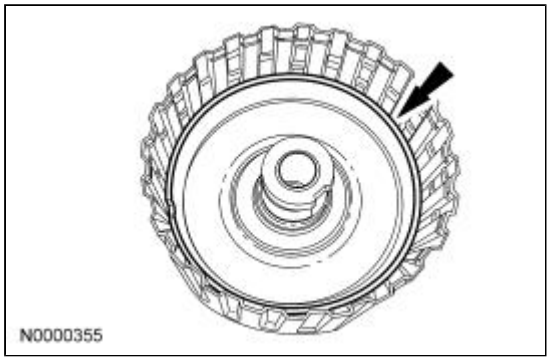
5. Remove the overdrive clutch balance piston.



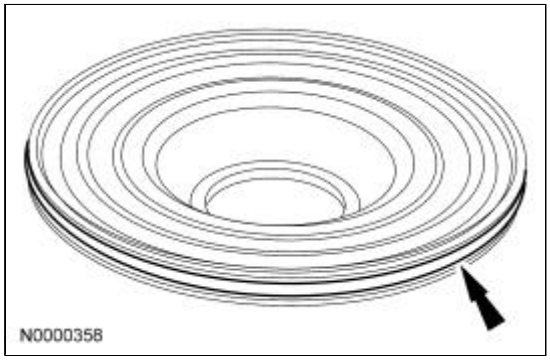
6. Remove the overdrive clutch return spring.



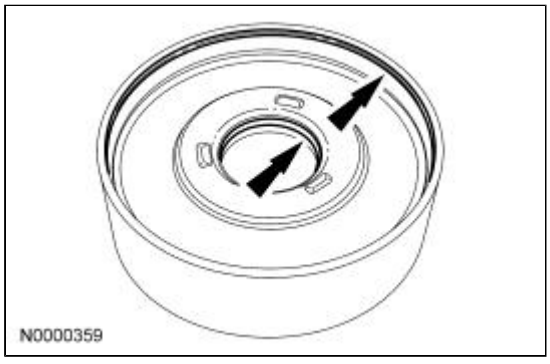
7. Remove the overdrive clutch apply piston.



8. Remove and discard the outer O-ring seal on the overdrive clutch balance piston.

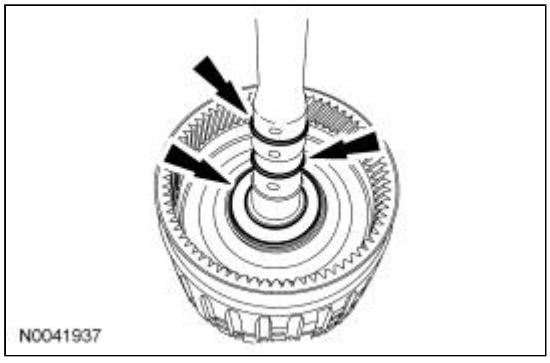


9. Remove and discard both the inner (one large and one small) O-ring seals on the overdrive clutch apply piston.



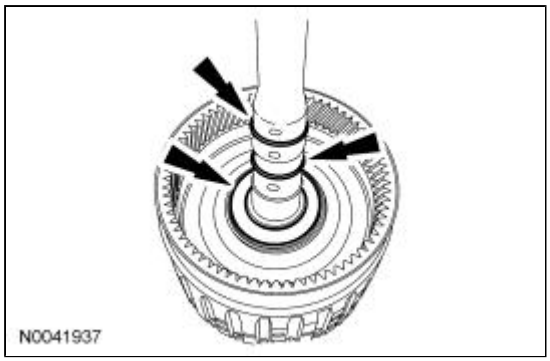
10. **NOTE:** The roller bearing may stick to the forward clutch assembly.

    Remove and discard the 2 scarf cut seals and the roller bearing.

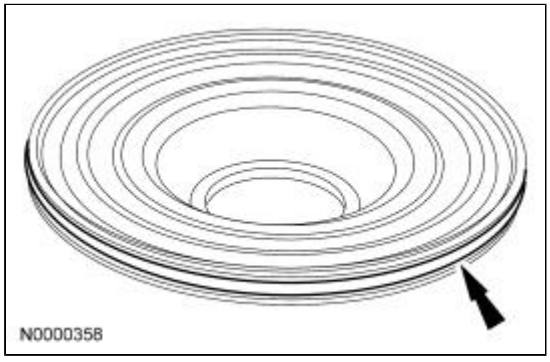


Assembly

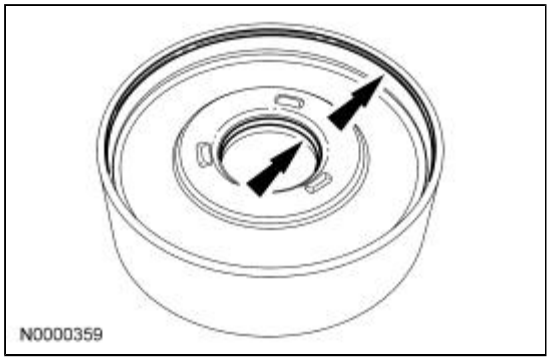
1. Install the 2 scarf cut seals and the roller bearing.



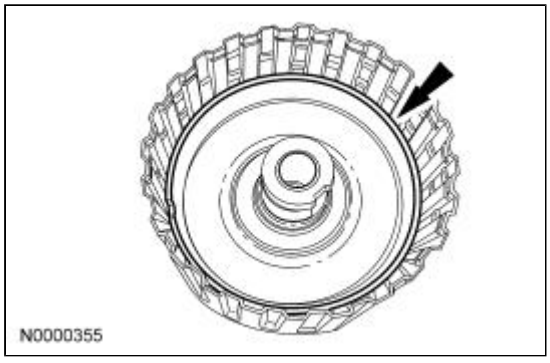
2. Install a new outer O-ring seal on the overdrive clutch balance piston.



3. Install 2 new inner O-ring seals on the overdrive clutch apply piston.

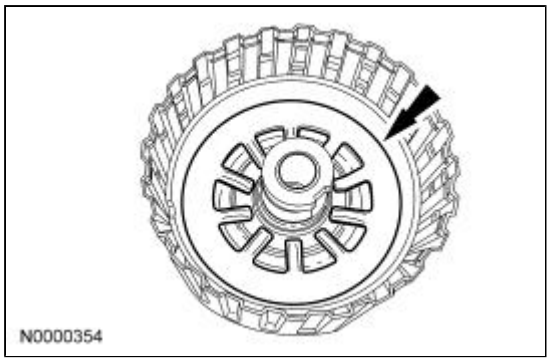


4. Lubricate all the O-ring seals with clean automatic transmission fluid. Install the overdrive clutch apply piston into the drum with the O-ring seals and the 3 pads facing down toward the drum.



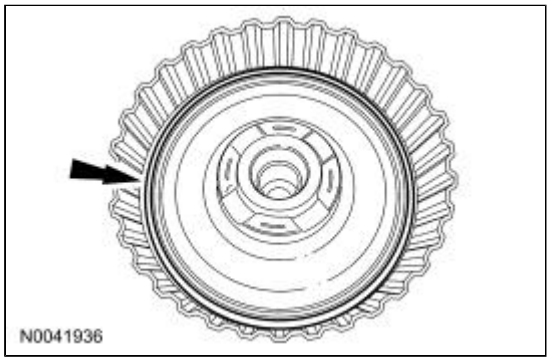
5. **NOTE:** The fingers on the return spring are facing down toward the piston.

Install the overdrive clutch return spring.

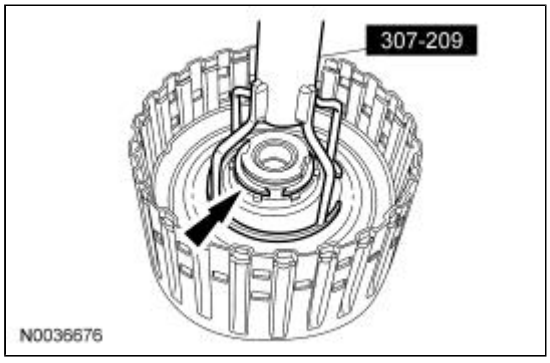


6. **NOTE:** The cone shape of the balance piston must face up when installed correctly.

   Lubricate all the O-ring seals with clean automatic transmission fluid. Install the overdrive clutch balance piston.

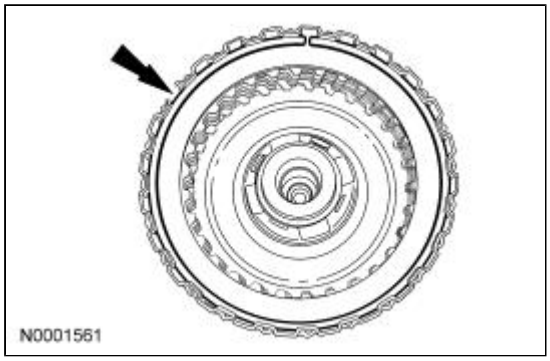


7. Using the special tool, install a new overdrive clutch balance piston retaining ring and the original spacer.



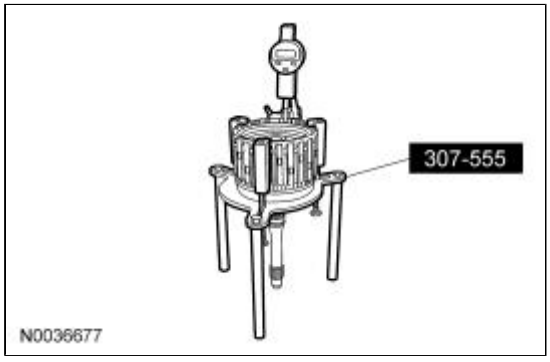
8. Install the new overdrive clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates, and ending with the pressure plate on the top.

9. Install the overdrive clutch pack snap ring.



10. **NOTE:** All overdrive clutch plates, friction and steel are of a wave-type design.

    Install the overdrive clutch assembly into the special tool so the dial indicator fits into the opening of the snap ring.



11. With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

12. Rotate the overdrive clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

13. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 5.4L engine — 0.5-0.9 mm (0.019-0.035 in).

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

14. **NOTE:** Inspect and install new thrust bearings as required.

    Install a new thrust bearing (T3).

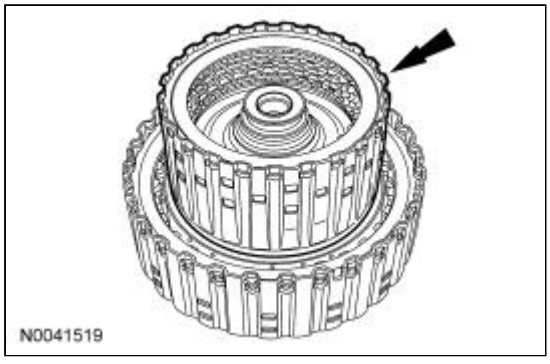
Material

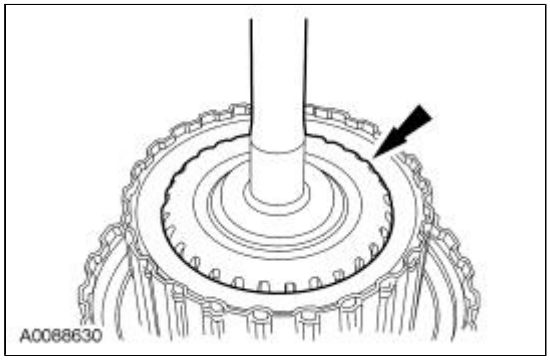
Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Assembly

1. Install the overdrive clutch pack onto the forward clutch and planetary gear set.

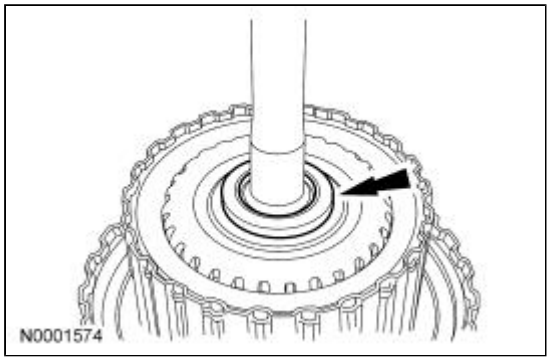


2. Install the intermediate shaft assembly.

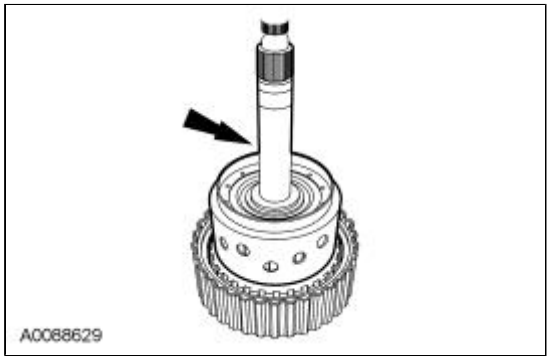


3. **NOTE:** Inspect and install new thrust bearings as required.

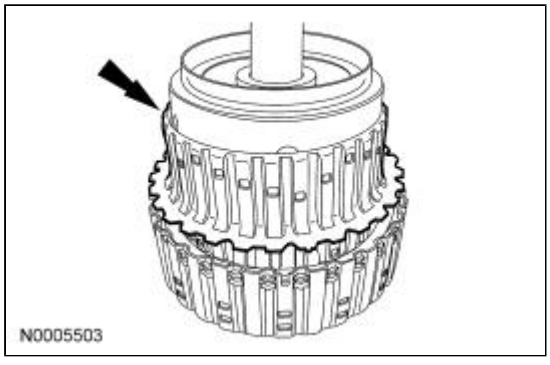
   Install the intermediate shaft bearing (T4).



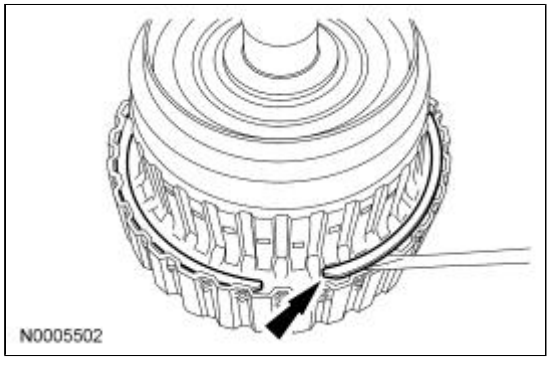
4. Install the forward clutch and sun shaft assembly.



5. Install the direct clutch hub.



6. Install the direct clutch outer shell retaining ring.



Direct Clutch Assembly

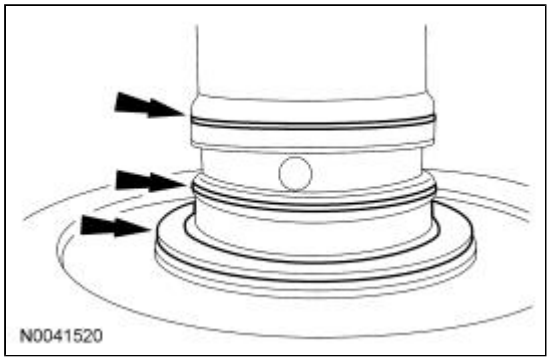
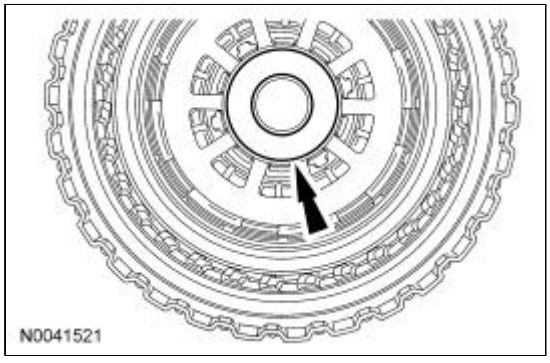
Item	Part Number	Description
1	7B421	Direct clutch pressure plate retaining ring
2	7B447	Direct clutch pressure plate
3	7B164	Direct clutch internal splined friction plates
4	7E314	Direct clutch external splined steel plates
5	—	Direct clutch cushion plate (wave spring)
6	7D283	Bearing (T5)
7	7H363	Direct clutch balance piston snap ring
8	7D427	Direct clutch piston spring retaining ring
9	7B488	Return spring
10	7B488	Piston retaining ring
11	7H359	Direct clutch balance piston
12	7C000	Direct clutch balance piston seal
13	7F254	Direct clutch apply piston
14	7C000	Direct clutch apply piston outer seal
15	7F234	Direct clutch apply piston inner seal
16	7F240	Direct clutch bushing hubs (2 required) (part of 7F281)
17	7C486	Gear shaft tube sleeve
18	7F281	Direct clutch cylinder
19	7B399	Seal shell cylinders

Disassembly

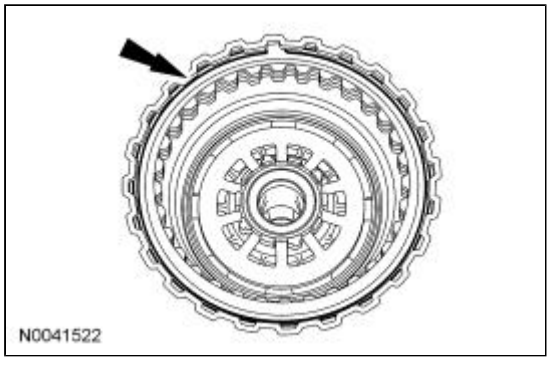
1. Remove and discard the 2 scarf cut seals and the roller bearing.



2. Remove the thrust bearing (T5).

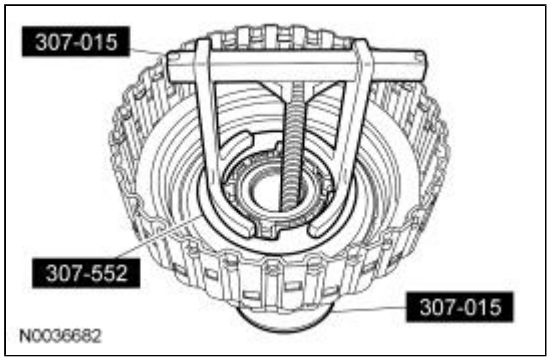


3. Remove the direct clutch snap ring.

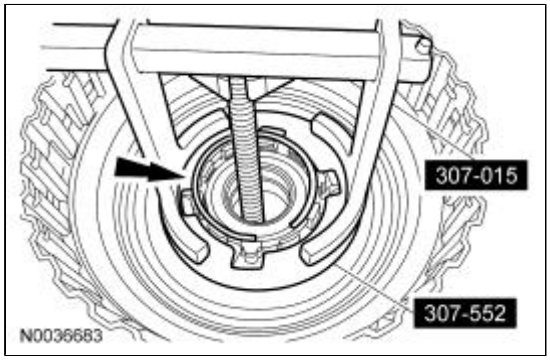


4. Remove the direct clutch steel and friction plates.

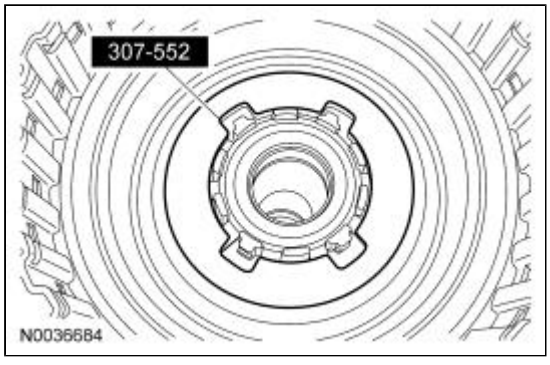
5. Install the special tools onto the direct clutch assembly.



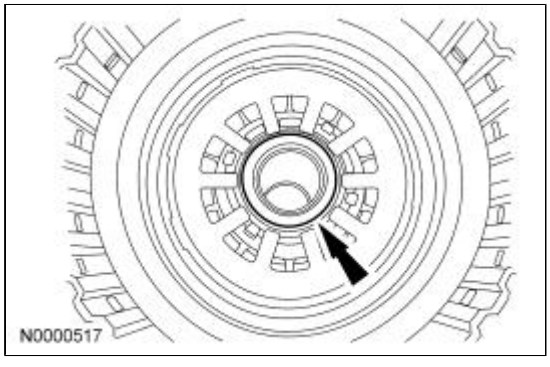
6. Using the special tool, remove the direct clutch return spring retainer.



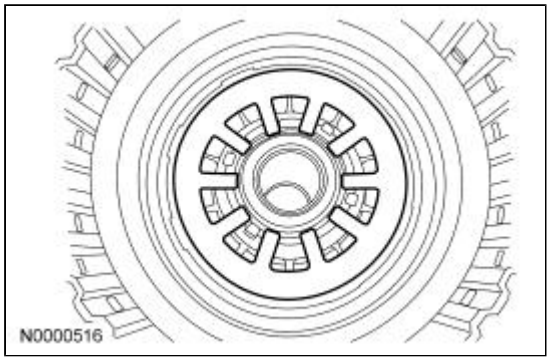
7. Remove the special tool.



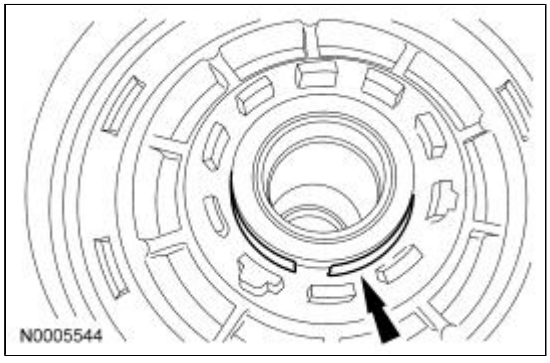
8. Remove the direct clutch return spring washer.



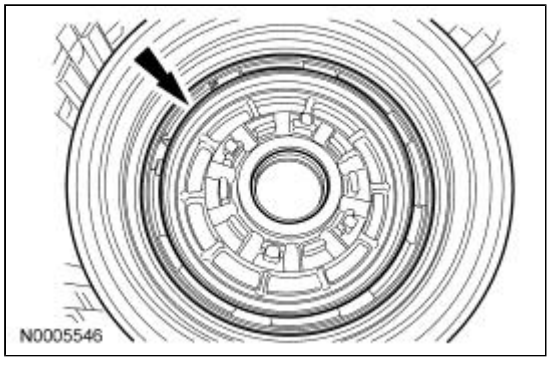
9. Remove the direct clutch return spring.



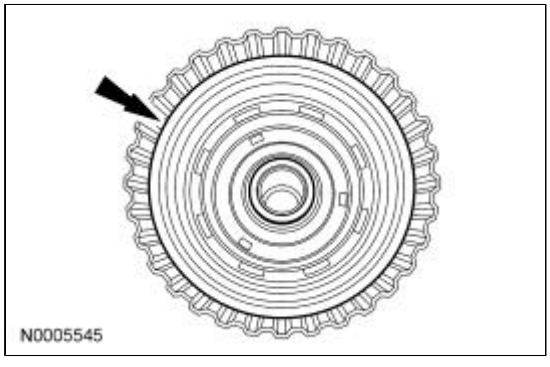
10. Slightly press down on the balance piston and remove and discard the snap ring.



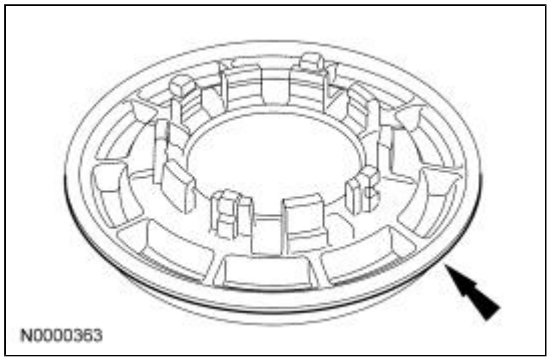
11. Remove the baffle plate from the direct clutch piston.



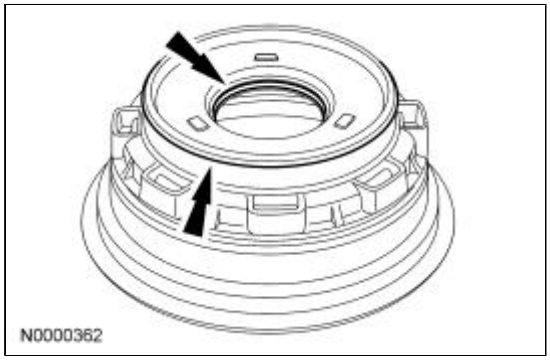
12. Remove the direct clutch piston.



13. Remove and discard the outer O-ring seal from the balance piston.



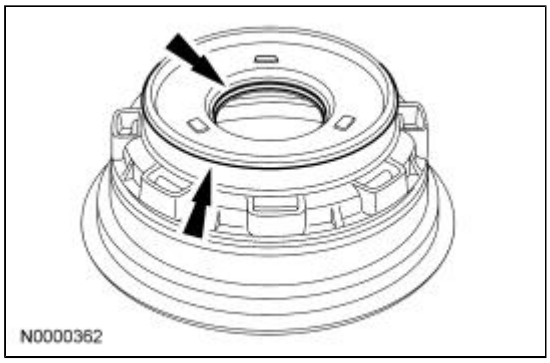
14. Remove and discard the outer and inner O-ring seal from the apply piston.



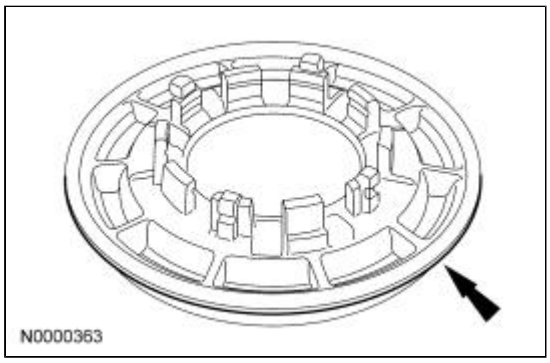
15. Inspect the direct clutch drum for damage. If damage is indicated, install a new direct clutch drum.

Assembly

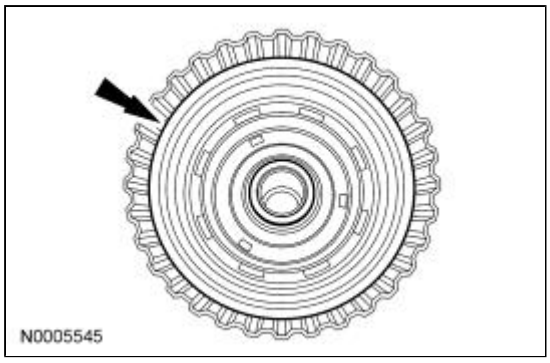
1. Install a new inner and outer O-ring seal on the apply piston.



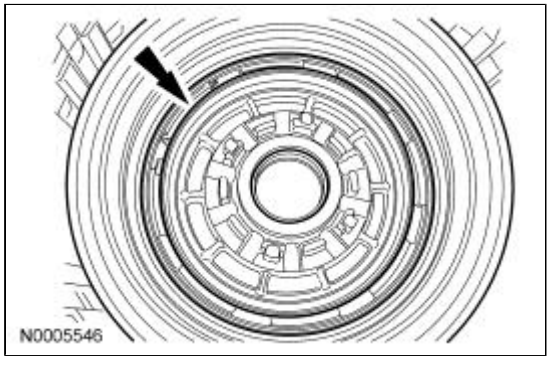
2. Install a new outer O-ring seal on the balance piston.



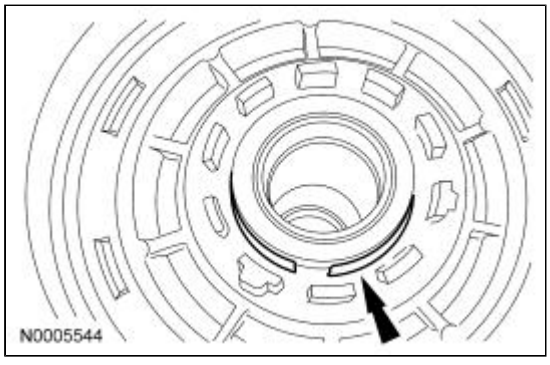
3. Lightly coat the O-ring seals in clean transmission fluid and install the direct clutch piston.



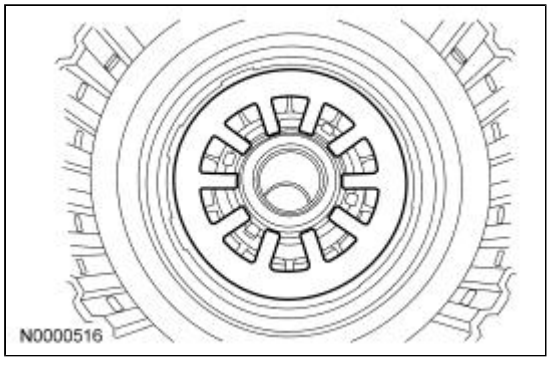
4. Lightly coat the O-ring seals in clean transmission fluid and install the apply piston into the direct clutch balance piston.



5. Slightly press down on the balance piston and install a new snap ring.

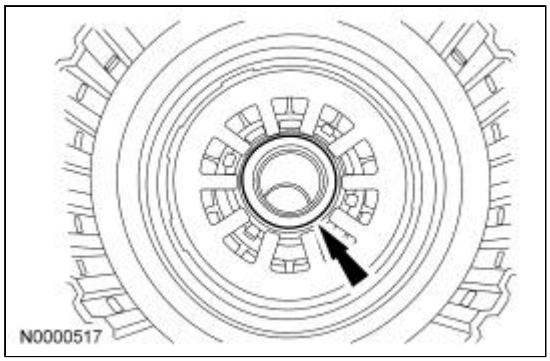


6. Install the direct clutch return spring.

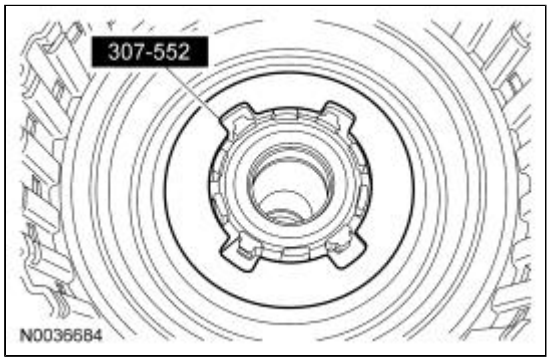


7. **NOTE:** When installing the washer, the stepped edge must face upward.

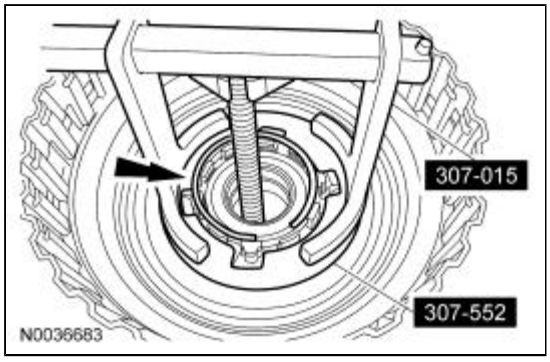
Install the direct clutch return spring washer.



8. Install the special tool.

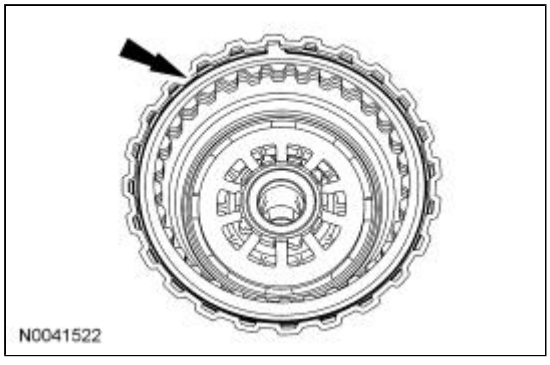


9. Using the special tool, install the direct clutch return spring retainer.



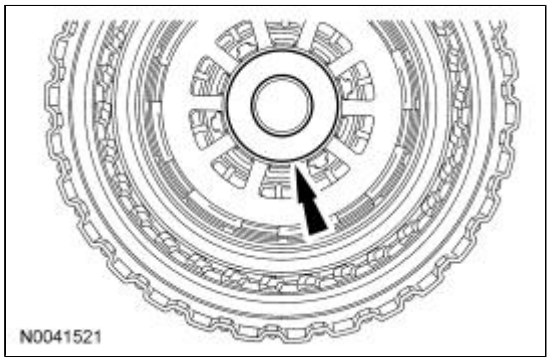
10. Install the new direct clutch plates, starting with the wave spring then a steel plate and alternating between steel and friction plates, and ending with the pressure plate on the top.

11. Install the direct clutch snap ring.



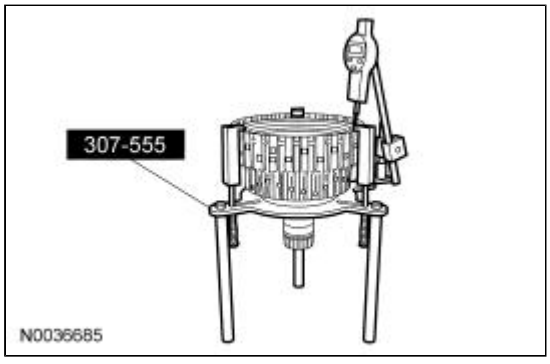
12. **NOTE:** Inspect and install new thrust bearings as required.

    Install a new thrust bearing (T5).



13. **NOTE:** All direct clutch plates, friction and steel are of a wave-type design.

    Install the direct clutch assembly into the special tool so the dial indicator fits into the opening of the snap ring.



14. With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

15. Rotate the direct clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

16. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 5.4L engine — 0.5-1.3 mm (0.019-0.051 in).

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

17. Install 2 new scarf cut seals and the roller bearing.

Intermediate Clutch Assembly

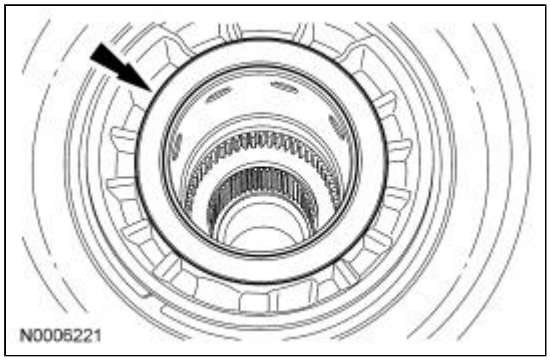
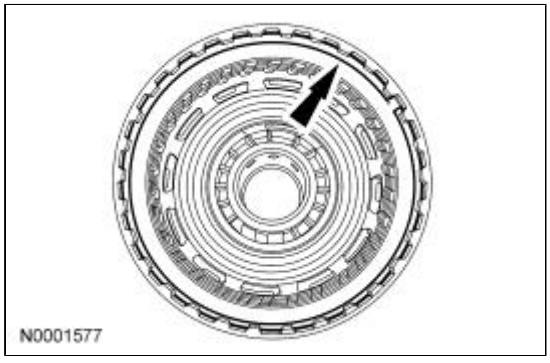
Item	Part Number	Description
1	7L327	Center support retaining ring
2	7B421	Intermediate clutch pack retaining ring
3	7E314	Intermediate clutch pressure plate
4	7B164	Intermediate clutch internal splined friction plates
5	7E314	Intermediate clutch external splined steel plates
6	7H136	Intermediate clutch cushion spring
7	7N169	Intermediate clutch snap ring
8	7B043	Intermediate clutch return spring retaining ring
9	7C151	Intermediate clutch piston return spring
10	7J015	Intermediate clutch piston
11	7F225	Intermediate clutch piston inner seal
12	7F224	Intermediate clutch piston outer seal
13	7F373	Bearing (T6)
14	7G033	Intermediate/low/reverse clutch center support
15	7J135	Center support seals (4 required)

Disassembly

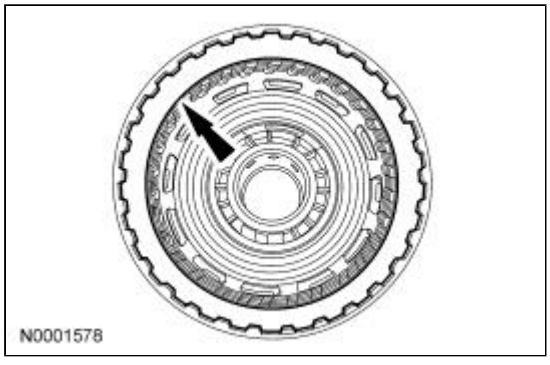
1. Remove the thrust bearing (T6).



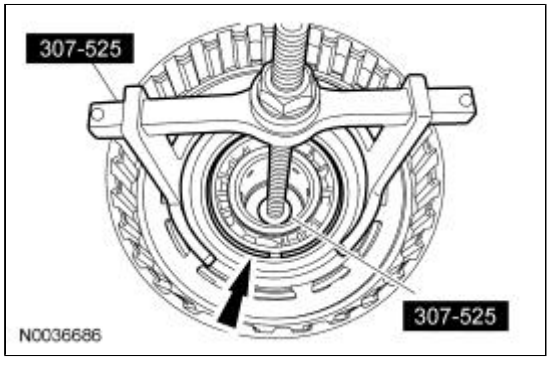
2. Remove the intermediate clutch plate snap ring.



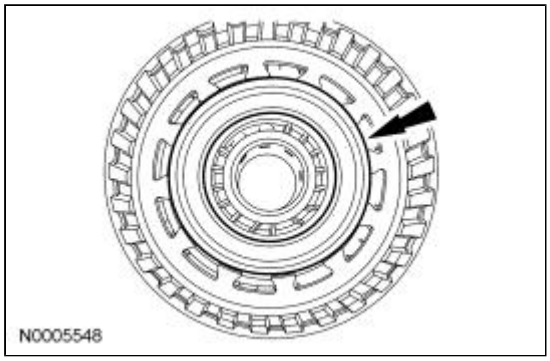
3. Remove the intermediate clutch plates.



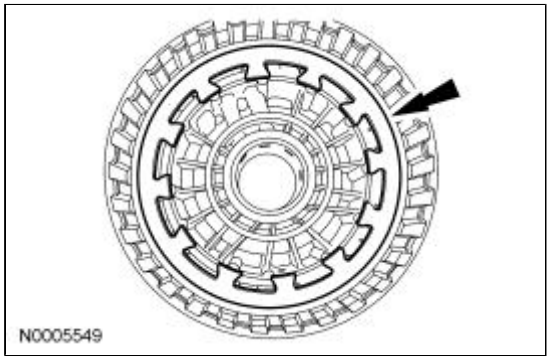
4. Using the special tool, remove and discard the intermediate clutch return spring retainer.



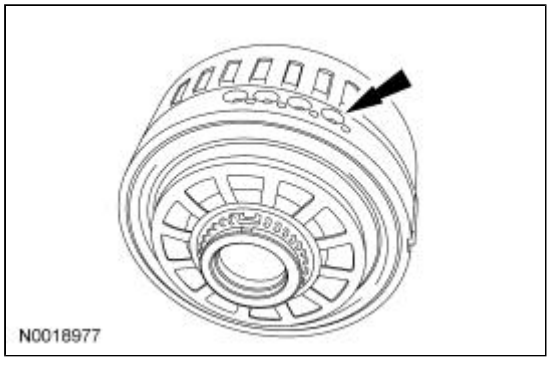
5. Remove the intermediate clutch return spring top plate.



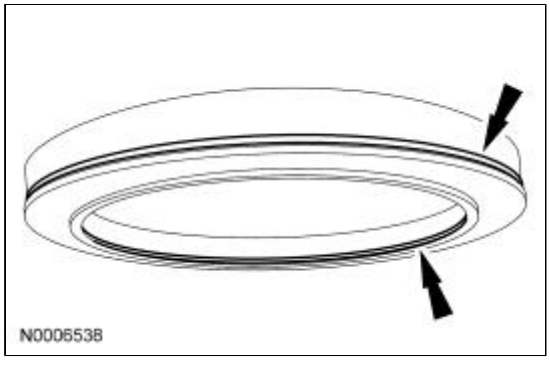
6. Remove the intermediate clutch return spring.



7. Applying a slight amount of air to the port, remove the intermediate clutch piston.

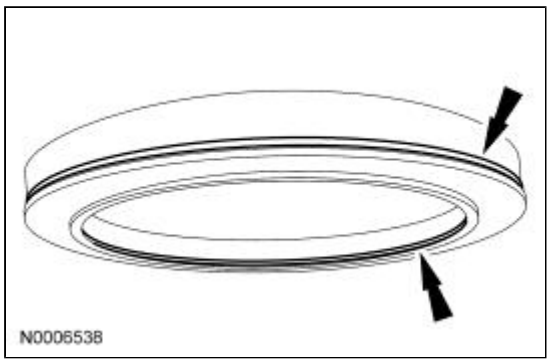


8. Remove and discard the inner and outer intermediate clutch piston O-ring seals.

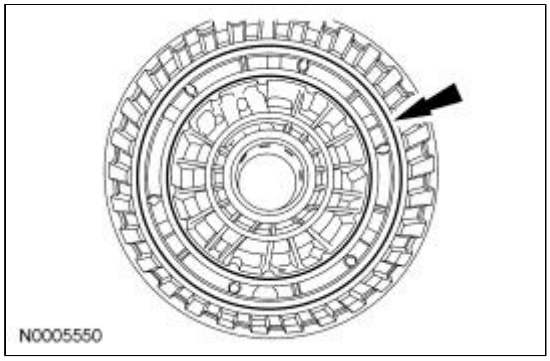


Assembly

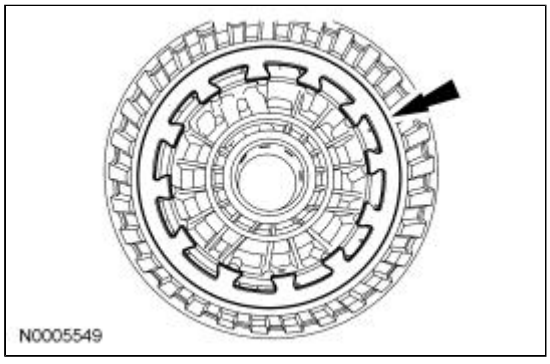
1. Install new inner and outer intermediate clutch piston O-ring seals.



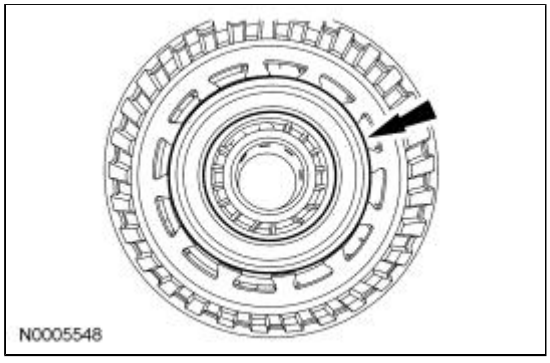
2. Lightly coat the O-ring seals in clean automatic transmission fluid and install the intermediate clutch piston.



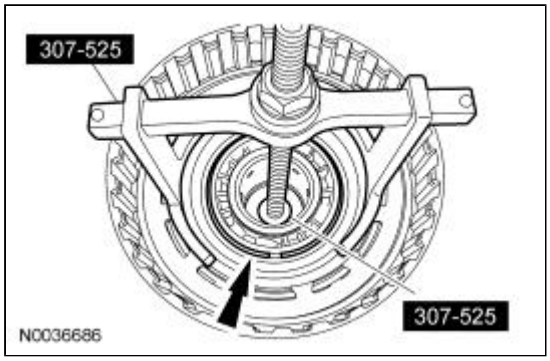
3. Install the intermediate clutch return spring.



4. Install the intermediate clutch return spring top plate.

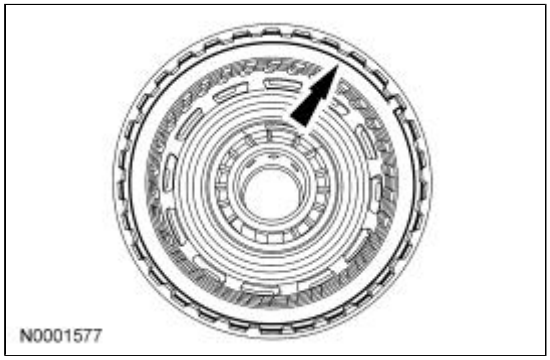


5. Using the special tool, install a new intermediate clutch return spring retainer.



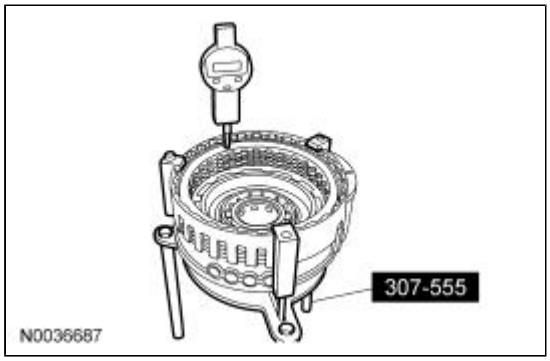
6. Install the new intermediate clutch plates, starting with the wave spring then a steel plate and alternating between friction and steel plates, and ending with the pressure plate.

7. Install the intermediate clutch plate snap ring.



8. **NOTE:** All intermediate clutch plates, friction and steel are of a wave-type design.

   Install the intermediate clutch assembly into the special tool so the dial indicator fits into the opening of the snap ring.



9. With the dial indicator set at zero, lift up on the steel pressure plate so it is against the select fit snap ring. Record this reading as reading A.

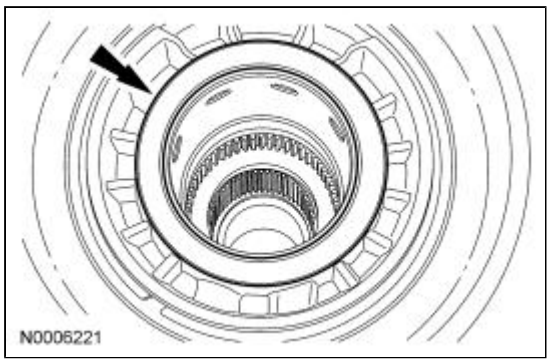
10. Rotate the intermediate clutch assembly 180 degrees from the opening of the snap ring, take a second reading and record this reading as reading B.

Description	Reading
Reading A	
Reading B	
Add reading A to reading B for a total end clearance	
Divide the total reading by 2 for an average end clearance	

11. **NOTE:** If the final measurement is not within specification, install a new snap ring until the correct specification is achieved.
    - 5.4L engine — 0.7-1.1 mm (0.028-0.043 in).

    If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is high, remeasure using a thicker select fit snap ring. If the free pack end clearance between the bottom of the snap ring and the top of the pressure plate is low, remeasure using a thinner select fit snap ring.

12. Install the thrust bearing (T6).



Low/Reverse Clutch Assembly

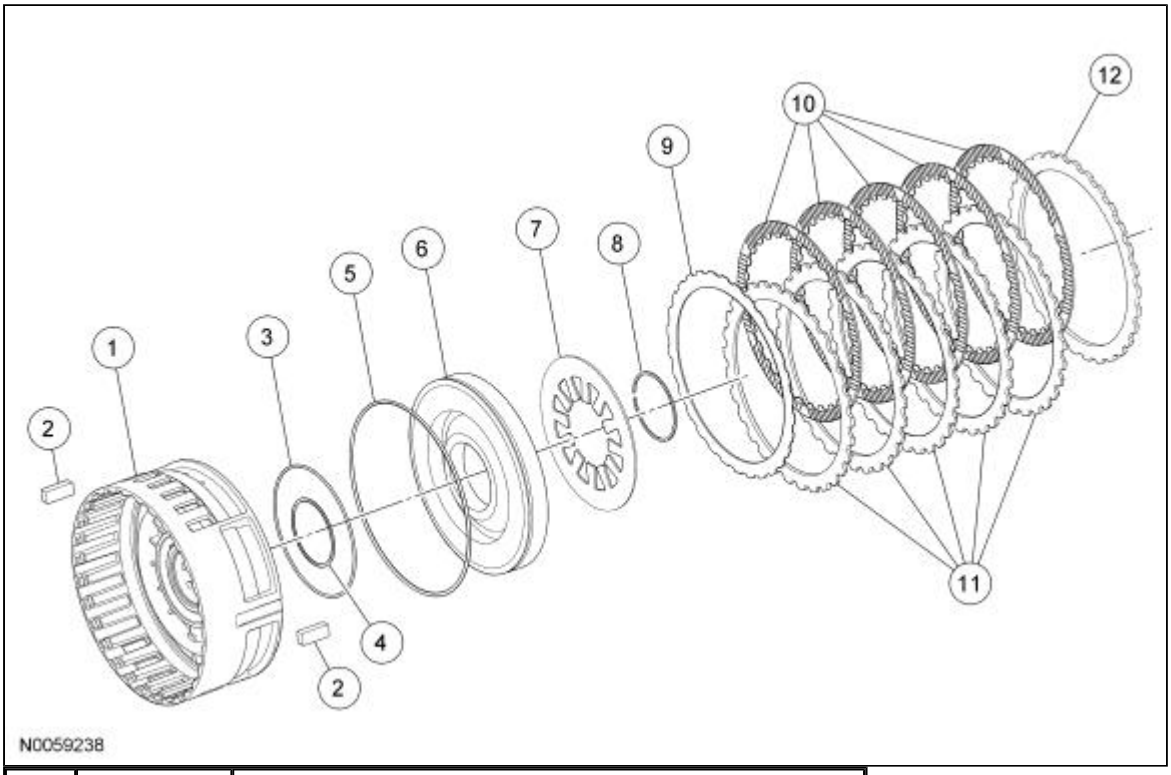
Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Low/Reverse Clutch Assembly

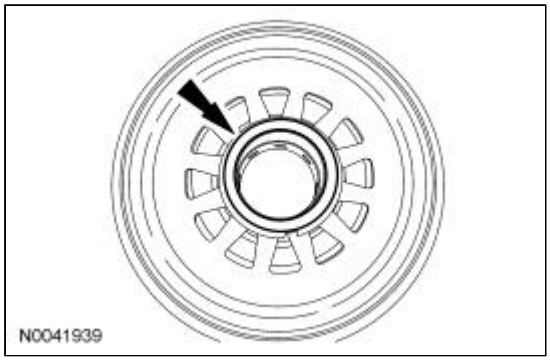


Item	Part Number	Description
1	7G033	Intermediate/low/reverse clutch center support
2	7J135	Center support keys (2 required)
3	7G446	Low/reverse clutch piston center seal
4	7G444	Low/reverse clutch cylinder inner seal
5	7F227	Low/reverse clutch cylinder outer seal
6	7D343	Low/reverse clutch piston
7	7D405	Low/reverse clutch return spring
8	7G494	Low/reverse clutch return spring retainer
9	7N572	Low/reverse clutch cushion spring
10	7B164	Low/reverse clutch internal splined friction plates (internal to case)
11	7E314	Low/reverse clutch external splined steel plates (internal to case)
12	7E314	Low/reverse clutch pressure plate (internal to case) (select fit)

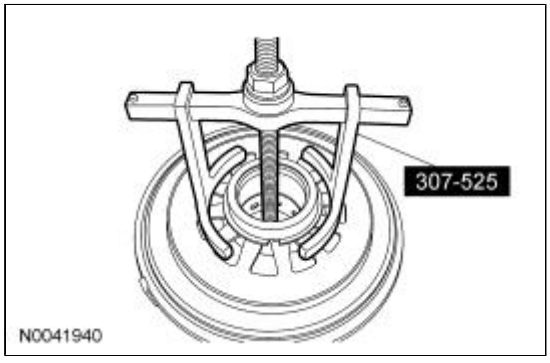
Disassembly

NOTE: The low/reverse clutch plates are installed in the case during the assembly procedure.

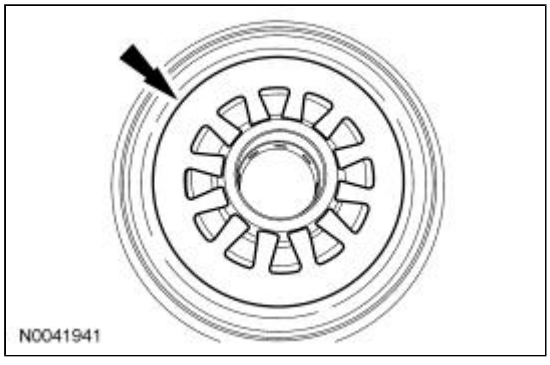
1. Remove the thrust bearing on the center support.



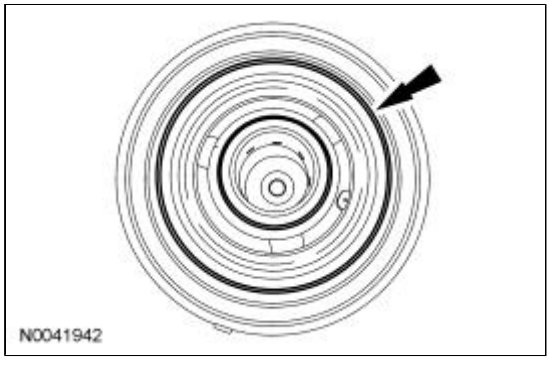
2. Using the special tool, remove the retaining ring.



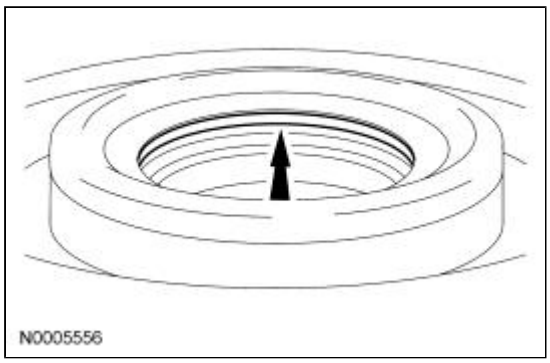
3. Remove the low/reverse clutch return spring.



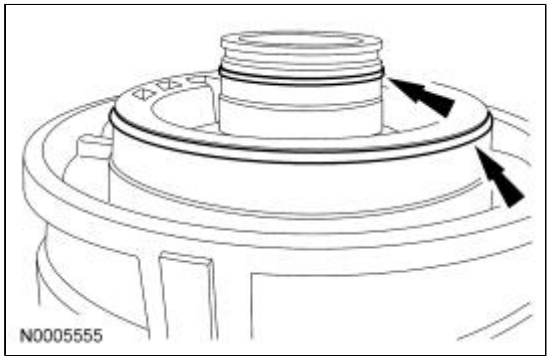
4. Remove the low/reverse clutch piston from the low/reverse clutch drum.



5. Remove and discard the low/reverse outer piston O-ring seals.



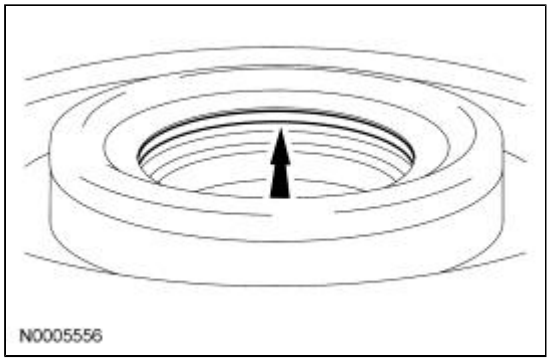
6. Remove and discard the low/reverse drum O-ring seals.



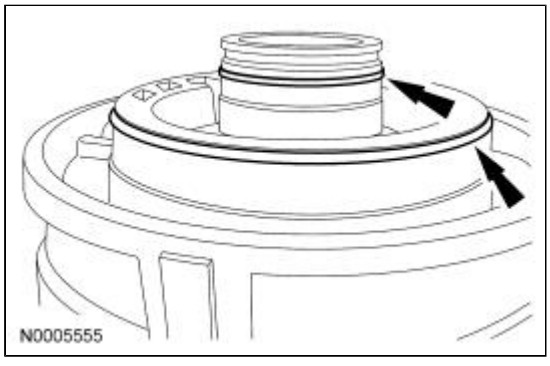
Assembly

Low/reverse piston

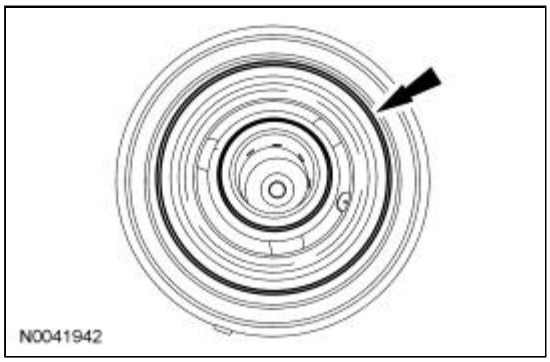
1. Install new low/reverse outer piston O-ring seals.



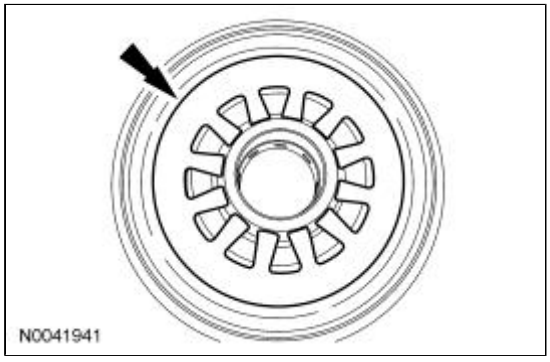
2. Install new low/reverse drum O-ring seals.



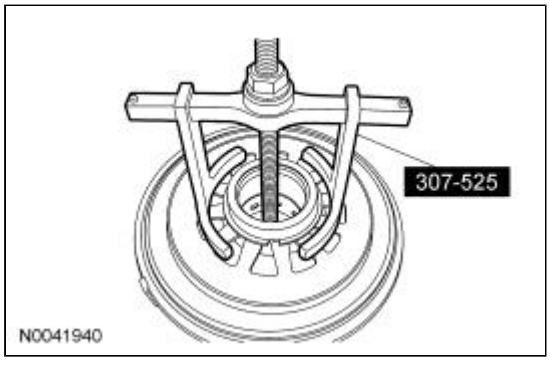
3. Lubricate the O-ring seal with clean automatic transmission fluid and install the low/reverse piston.



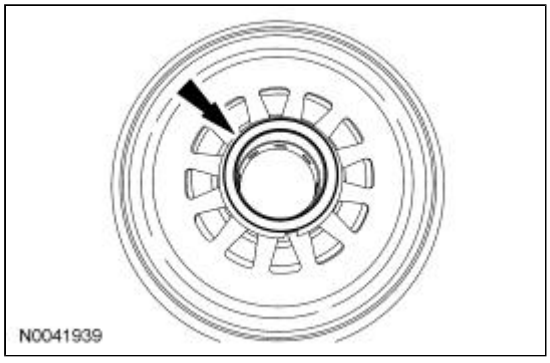
4. Install the low/reverse clutch return spring.



5. Using the special tool, install the retaining ring.



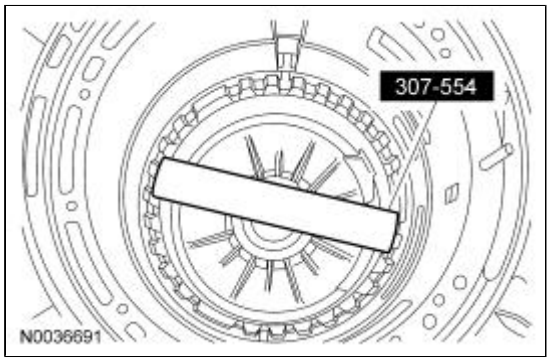
6. Install a new roller bearing on the center support.



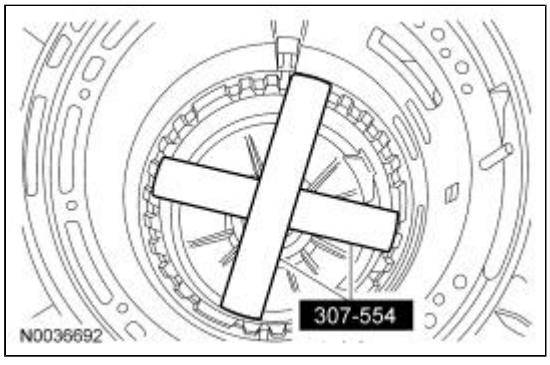
Low/reverse clutch stackup

7. **NOTE:** All intermediate clutch plates, friction and steel are of a wave-type design.

   Install the special tool into the case.

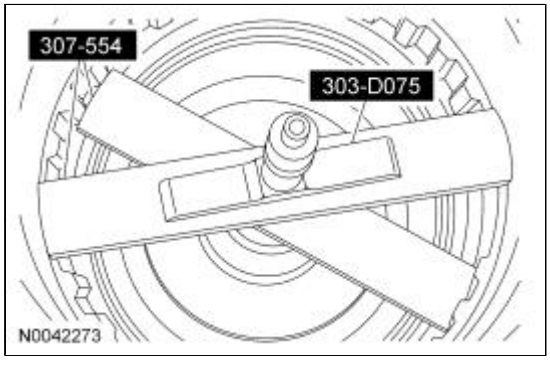


8. Install the special tool into the case as shown.



9. Measure case stop depth.

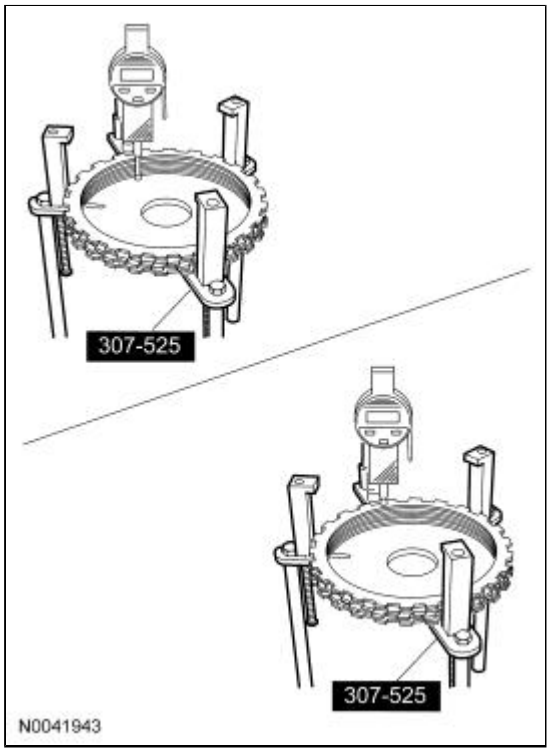
Description	Reading
Measure the distance from the top of the upper gauge bar to the top of the lower gauge bar. Record this reading as the case measurement. Record as reading A	



10. Measure the clutch pack height.

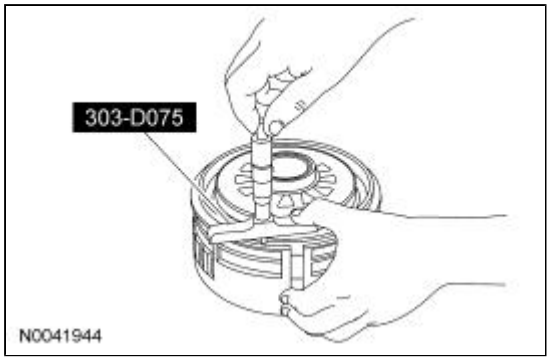
	Description	Reading
A.	Place the clutch pack with the pressure plate on to the special tool with the wave spring down. Slide the clutch off to the side so the probe of the dial indicator is touching the gauge plate of the special tool. Zero out the dial indicator.	
B.	Carefully lift the probe up enough to slide the clutch pack under the probe to take a reading. Record this reading. Rotate the clutch pack 180 degrees and take a second reading. Add the first and second readings together and divide the total by	

2. Record this reading as B.	



11. Measure the piston to center support shoulder height.

Description	Reading
Measure the piston to center support shoulder height. Record this measurement. Rotate the center support 180 degrees and record this measurement. Add the first and the second measurements, then divide by 2. Record this as reading C.	



12. Calculate the end clearance

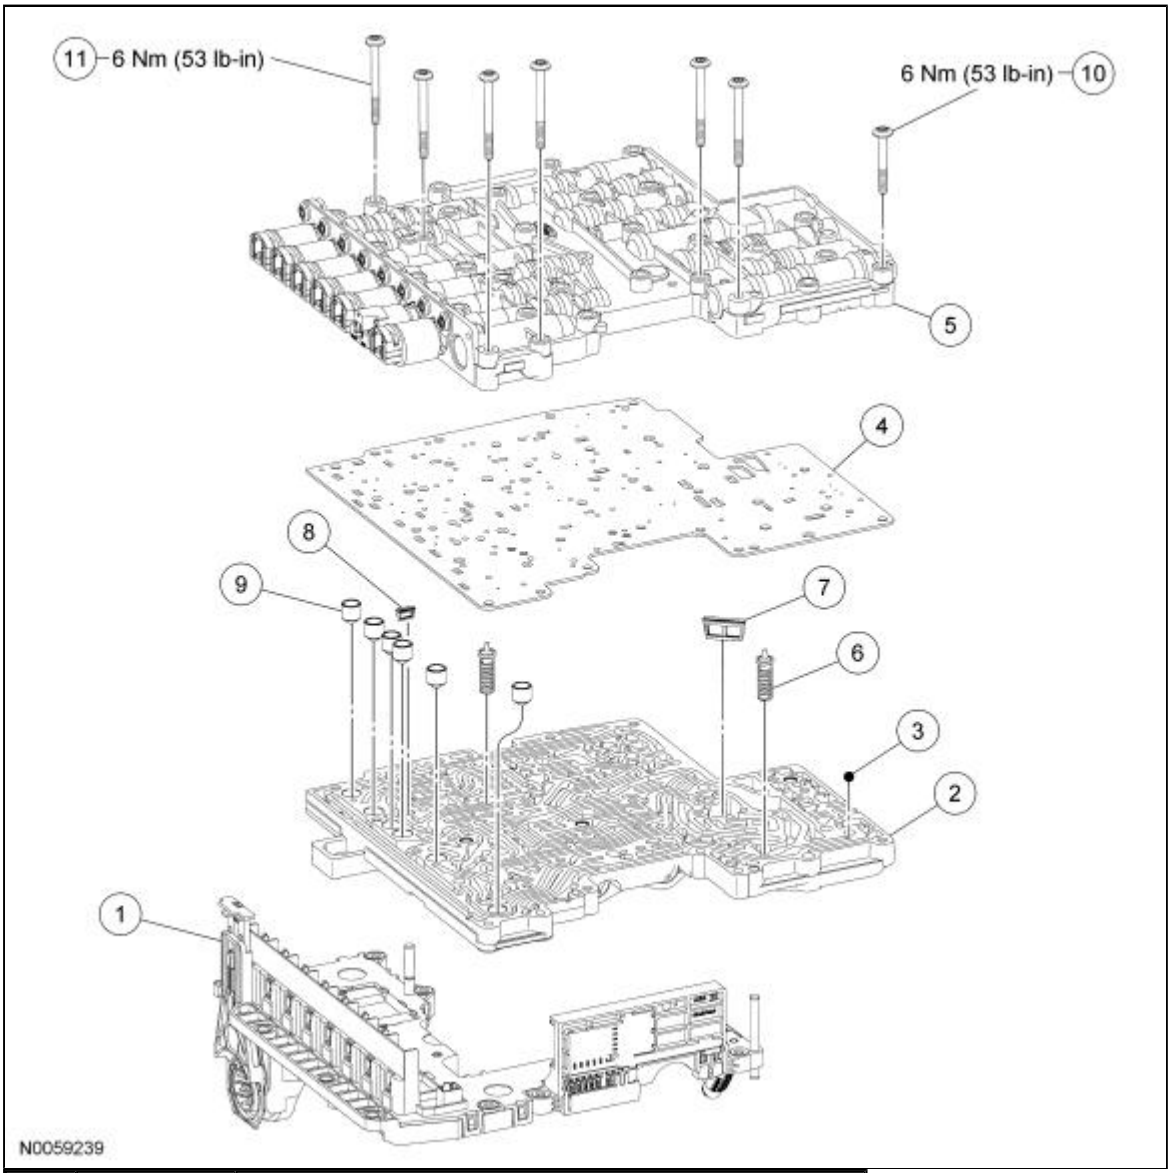
Description	Reading
Subtract B and C from A to determine end clearance	
Total C measurement	
End clearance specification	1.0-1.6 mm (0.039-0.063 in)

Compare the end clearance to the specification. If the end clearance is out of specification, select the next thinner or thicker plate as required and repeat Steps 10, 11 and 12.

Mechatronic Assembly

Printable View (878 KB)

Mechatronic



Item	Part Number	Description
1	7Z369	Transmission control module (TCM)
2	7A092	Transmission control valve body (upper)

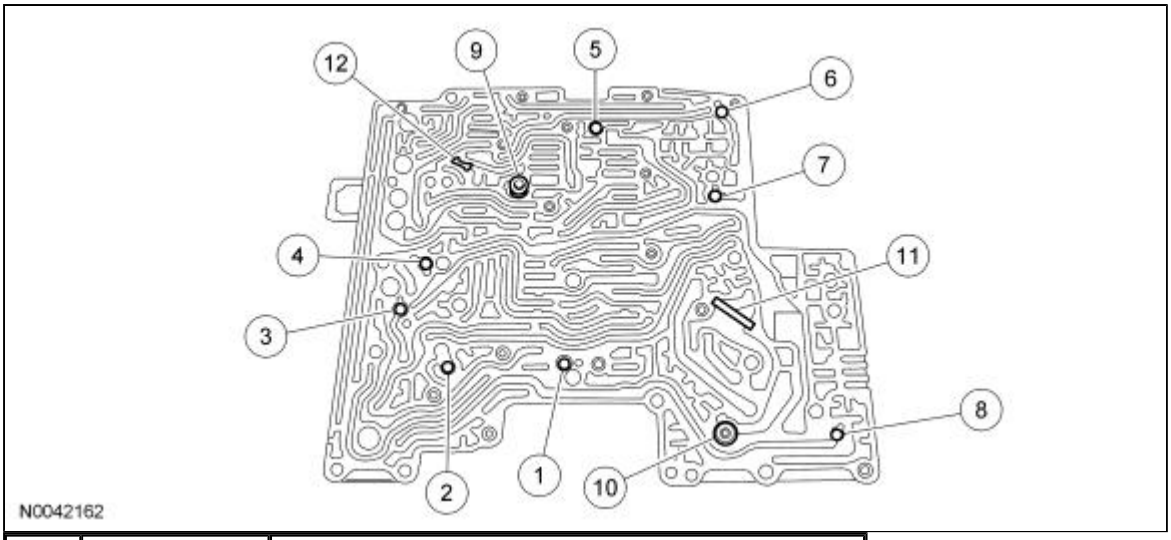
Check Ball Location



Item	Part Number	Description
1	—	Reverse/drive control check ball
2	—	Shift solenoid control check ball
3	—	Intermediate clutch exhaust control check ball
4	—	Direct clutch exhaust control check ball
5	—	Low/reverse clutch exhaust control check ball
6	—	Forward clutch exhaust control check ball
7	—	Overdrive clutch exhaust control check ball
8	—	Reverse exhaust control check ball

9	—	Clutch exhaust valve
10	—	Converter drain back valve
11	—	Large screen
12	—	Small screen

Disassembly

CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the transmission control module (TCM). An electrostatic discharge may occur and may cause damage to the TCM/Mechatronic assembly.

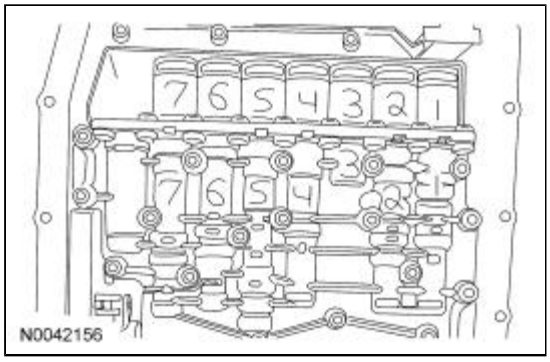
NOTE: Make an identifying mark on each solenoid and the corresponding bore for correct assembly.

NOTE: Solenoids may visually appear the same but their designs/functions are different. Caution must be taken not to assemble the mechatronics assembly incorrectly. Incorrect solenoid installation will result in poor transmission shift quality.

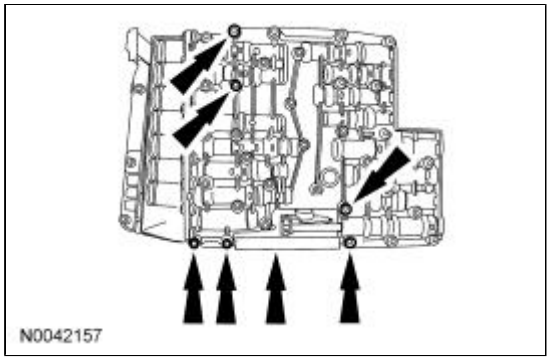
NOTE: Note where the 8 check balls, 6 solenoid dampers, 2 internal valves and springs and 2 internal filters are located for reassembly.

Mechatronic assembly upper half

1. Make an identifying mark on each solenoid and the corresponding bore for correct assembly.

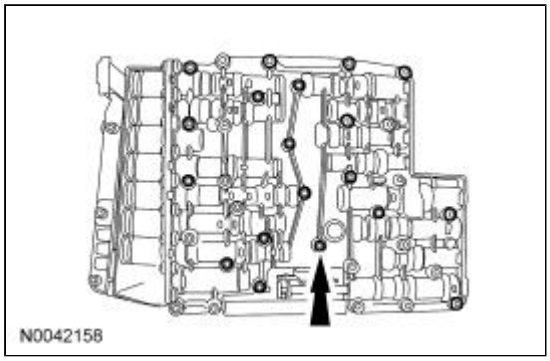


2. Remove the 6 long bolts from the TCM unit.



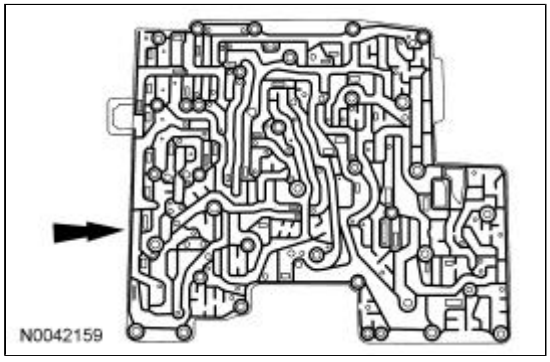
3. Carefully separate the TCM from the mechatronic assembly.

4. Remove 19 short bolts from the mechatronic assembly.



5. Separate the lower half of the mechatronic assembly from the upper half of the mechatronic assembly.

6. Remove and discard the separator plate.



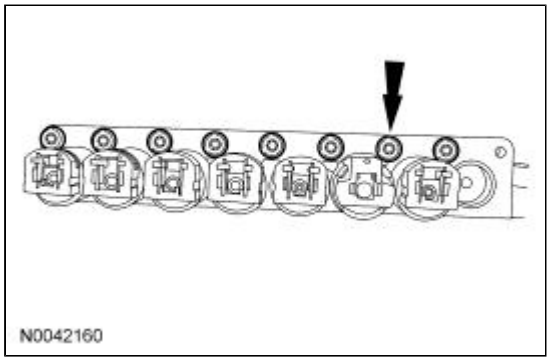
7. Remove from the mechatronic assembly the clips, caps, valves and spring from each bore. Note the location and order for reassembly. Refer to the preceding exploded views.

8. Remove from the mechatronic assembly the transmission control valves, check balls and filter screens. Note the location and order for reassembly. Refer to the preceding exploded views.

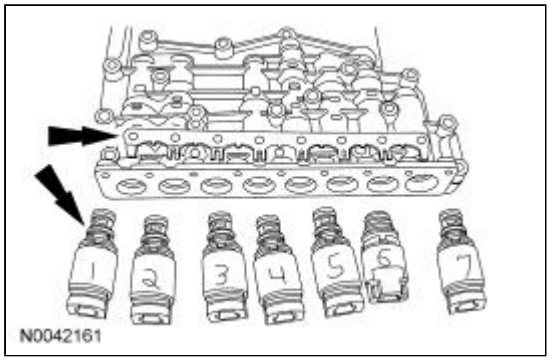
9. Using clean mineral spirits, clean the upper half of the mechatronic assembly.

Mechatronic assembly lower half

10. Remove the 8 solenoid bracket bolts and the solenoid bracket.



11. Remove the solenoids.



12. Remove from the mechatronic assembly the clips, caps, valves and spring from each bore. Note the location and order for reassembly. Refer to the preceding exploded views.

13. Using clean mineral spirits, clean the lower half of the mechatronic assembly.

Assembly

CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. An electrostatic discharge may occur and may cause damage to the TCM/Mechatronic assembly.

Mechatronic assembly upper half

1. **NOTE:** Many components and surfaces in the mechatronic valve body are precision machined. Careful handling during disassembly, cleaning, inspection and assembly will prevent unnecessary damage to machined surfaces.

   Install the clips, caps, valves and spring into each bore. Refer to the preceding exploded views.

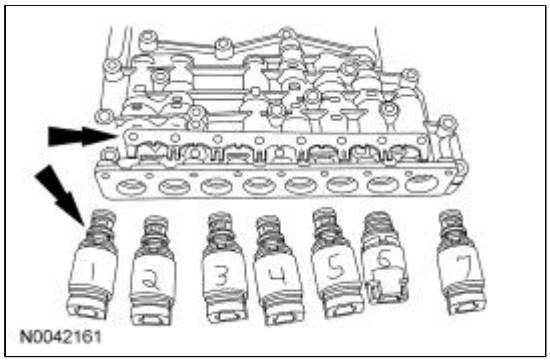
Mechatronic assembly lower half

2. **NOTE:** Many components and surfaces in the mechatronic valve body are precision machined. Careful handling during disassembly, cleaning, inspection and assembly will prevent unnecessary damage to machined surfaces.

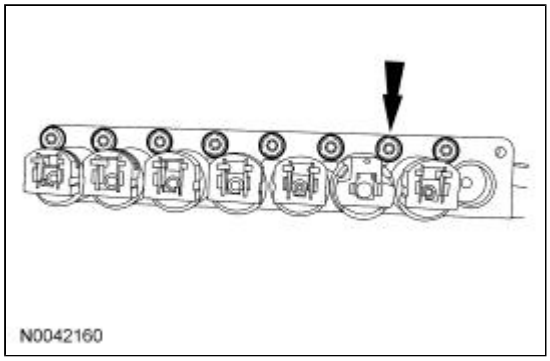
   Install the clips, caps, valves and spring into each bore.

3. **NOTE:** Lubricate the O-ring seals of the solenoids with clean automatic transmission fluid when installing them into the valve body.

   Install the solenoids into their correct bores as indicated during disassembly.

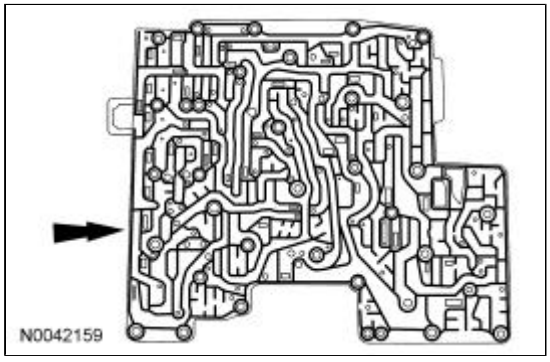


4. Install the solenoid bracket and the 8 bolts.
   - Tighten to 6 Nm (53 lb-in).



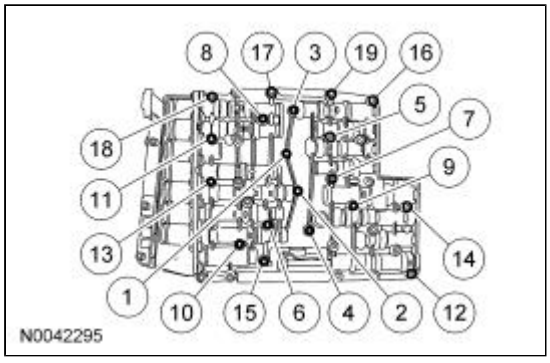
5. Install into the mechatronic assembly the transmission control valves, check balls and filter screens. Refer to the preceding exploded views.

6. Install a new separator plate.



7. Assemble the lower half and the upper half of the mechatronic assembly.

8. Install the 19 short bolts into the mechatronic assembly. Tighten the bolts in the sequence shown.
    - Tighten to 6 Nm (53 lb-in).



9. Carefully install the TCM onto the mechatronic assembly.

10. Install the 6 long bolts into the TCM unit. Tighten the bolts in the sequence shown.
    - Tighten to 6 Nm (53 lb-in).

Pump Assembly

Printable View (280 KB)

Special Tool(s)

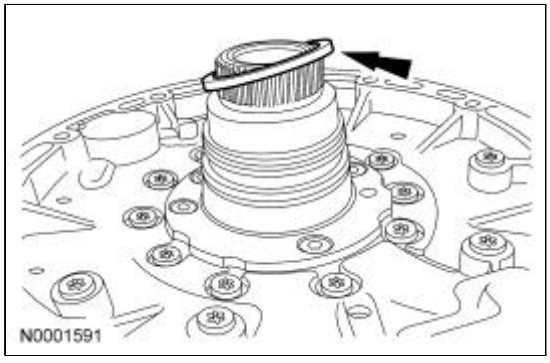
ST2687-A	Installer, Fluid Pump Seal 307-556

Material

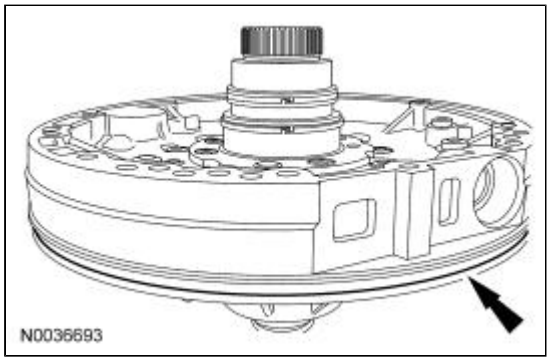
Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Disassembly

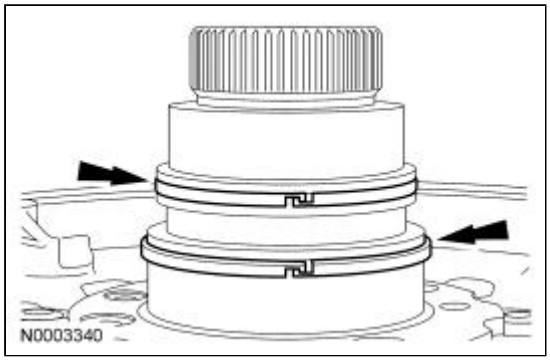
1. Remove the front pump washer.



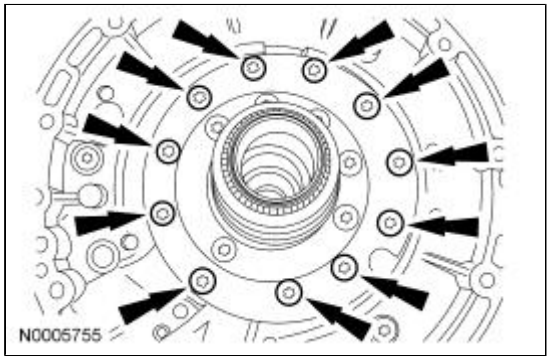
2. Remove and discard the front pump O-ring seal from the plate assembly.



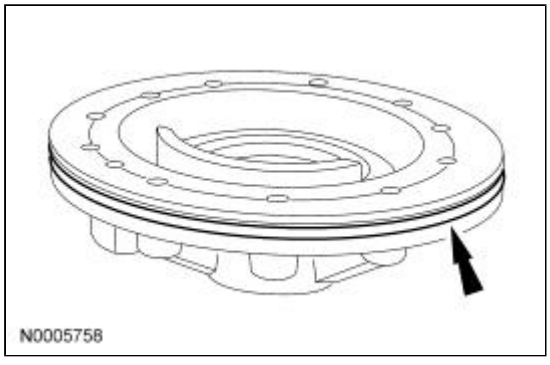
3. Remove and discard the front pump seal rings from the stator support.



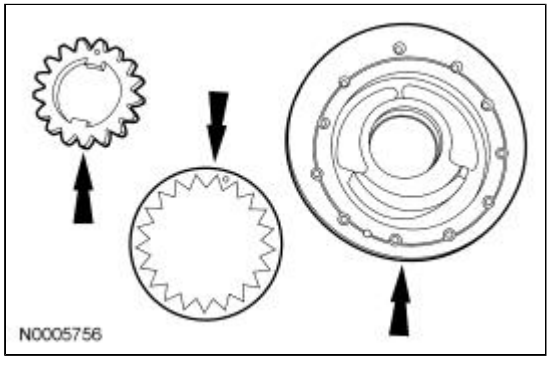
4. Remove the 11 bolts and separate the pump plate assembly from the pump body.



5. Remove and discard the pump body outer seal.



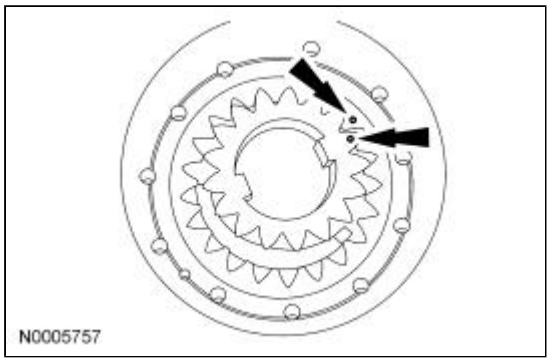
6. Remove and inspect the inner and the outer pump gears.
    - Clean all pump components in solvent.
    - Dry the parts with compressed air.
    - Inspect the pump gears, faces, gear teeth, pump housing and mating surfaces for damage or scoring.
    - Install a new pump as necessary.



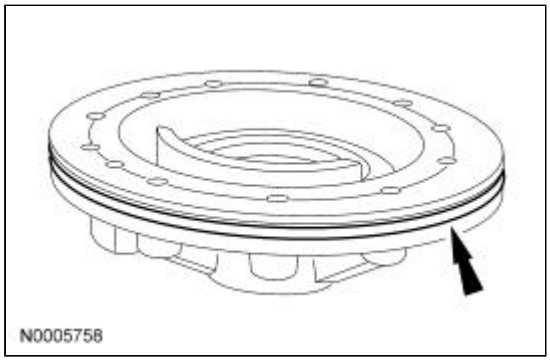
Assembly

1. **NOTE:** Prior to installation, lightly lubricate the pump gears with clean automatic transmission fluid.

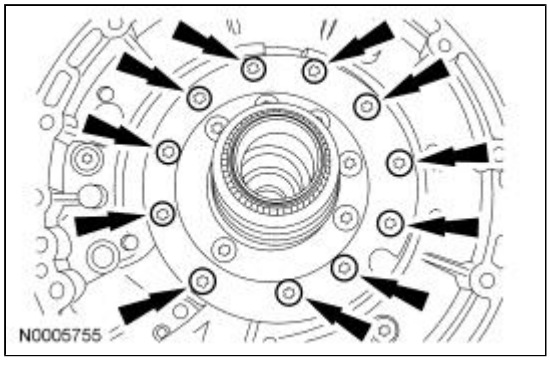
   Install the pump gears with the dot facing the pump plate assembly.



2. Install a new pump body outer seal.

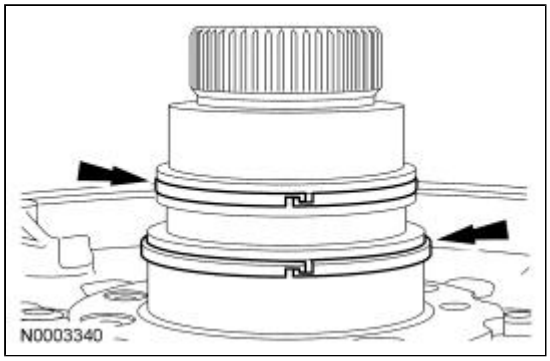


3. Assemble the plate assembly and the pump body assembly.
   - Tighten to 15 Nm (11 lb-ft).

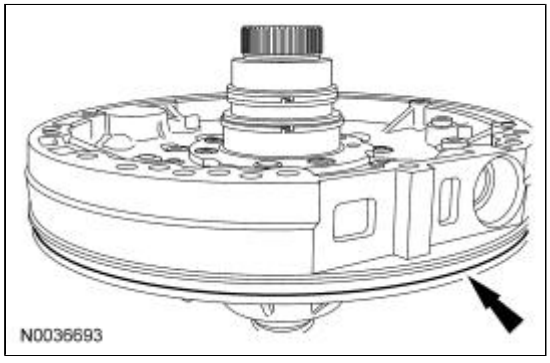


4. **CAUTION: Make sure the seal ends are correctly positioned together and not separated.**

   Install the 2 front pump seal rings onto the stator support. Make sure the seals are fully seated in the stator support seal grooves and the seal ends are oriented 180 degrees apart.

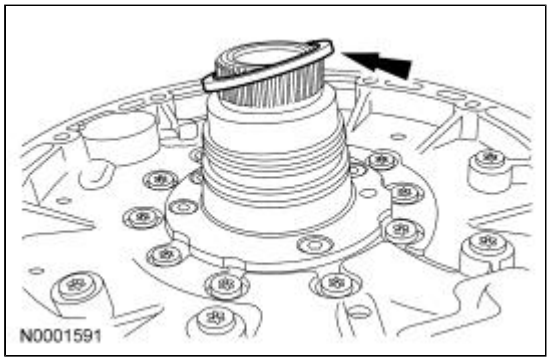


5. Install the pump outer diameter front pump O-ring seal.



6. **NOTE:** Lightly lubricate the thrust washer and the bearing with petroleum jelly to hold them in place during assembly.

   Install the pump thrust washer.



7. Using the special tool, install the front pump seal.

Item	Part Number	Description
1	N800750-S437	Flex plate-to-torque converter nut (4 required)
2	7902	Torque converter
3	7A103	Pump assembly
4	7A248	Front pump oil seal
5	7N877	Torque converter pump retaining ring
6	7B031	Front pump outer oil seal
7	7R166	Front oil pump bearing assembly
8	7N817	Bushing converter stator support

9	7N134	Front pump-to-case bolts (13 required)
10	7A103	Front pump assembly
11	7R078	Bolt — attaches stator support to pump adapter assembly (6 required)
12	W707871-S300	Bolt — attaches pump to pump adapter assembly (11 required)
13	7B261	Converter stator support bushing
14	7G427	Front bushing forward clutch drum
15	7Z463	Clutch support fluid seal
16	7L323	Front pump support seal
17	7G428	Forward clutch rear bushing
18	7D014	Front pump support thrust washer
19	7A511	Forward clutch assembly (clutch A)
20	7J011	Forward clutch cylinder and hub assembly
21	7G242	Forward clutch inner piston seal
22	7F227	Forward clutch outer piston seal
23	7L140	Forward clutch piston
24	7F230	Forward clutch piston retaining spring
25	7J032	Forward clutch balance piston assembly
26	7F227	Forward clutch balance piston outer seal
27	7H365	Forward clutch balance piston snap ring
28	7N572	Forward clutch cushion spring
29	7E314	Forward clutch steel plates (externally splined)
30	7B164	Forward clutch friction plates (internally splined)
31	7B421	Pressure plate retaining snap ring
32	7G231	Front planetary sun gear (No. 1)
33	7H375	Bearing (T1)
34	7G218	Front planetary carrier assembly
35	7H578	Plate transmission fluid collector
36	7L495	Bearing (T2)
37	7L668	Overdrive clutch assembly (clutch E)
38	7G091	Turbine shaft seals (2 required)
39	7J006	Input shaft
40	7C232	Fluid distributor sleeve
41	7B256	Output shaft bushing
42	7J008	Overdrive clutch piston outer seal
43	7G007	Overdrive clutch piston inner seal
44	7G418	Overdrive clutch piston
45	7N529	Overdrive clutch piston spring
46	7J009	Balance piston outer seal
47	7J029	Overdrive balance piston
48	7J010	Balance piston snap ring

49	7N572	Clutch cushion plate
50	7B442	Overdrive clutch steel plates (externally splined)
51	7B164	Overdrive clutch friction plates (internally splined)
52	7C576	Overdrive pressure plate
53	7M157	Overdrive clutch retaining ring
54	7A453	Bearing (T3)
55	7F351	Intermediate clutch shaft
56	7H375	Bearing (T4)
57	7D065	Sun gear bushings (2 required) (part of 7R193)
58	7R193	Sun gear hub and shaft assembly
59	7F236	Direct clutch hub
60	7H076	Direct clutch cylinder retaining ring
61	7C108	Direct clutch assembly (clutch B)
62	7B421	Direct clutch pressure plate retaining ring
63	7B477	Direct clutch pressure plate
64	7B164	Direct clutch friction plates (internally splined)
65	7E314	Direct clutch steel plates (externally splined)
66	7N572	Direct clutch cushion plate
67	7D283	Bearing (T5)
68	7H363	Direct clutch balance piston snap ring
69	7D427	Direct clutch piston spring retainer
70	7B488	Direct clutch piston return spring
71	7B492	Direct clutch piston retaining ring
72	7H359	Direct clutch balance piston
73	7C000	Direct clutch balance seal
74	7F254	Direct clutch piston
75	7C000	Direct clutch piston outer seal
76	7F234	Direct clutch piston inner seal
77	7H240	Direct clutch hub bushings (part of 7F281) (2 required)
78	7C486	Gear shaft tube sleeve
79	7F360	Direct clutch cylinder
80	7B399	Shell cylinder seals (2 required)
81	7L327	Center support retaining ring
82	7F388	Intermediate clutch assembly (clutch C)
83	7B421	Intermediate clutch pressure plate retaining ring
84	7E314	Intermediate clutch pressure plate
85	7E314	Intermediate clutch steel plates (externally splined)
86	7B164	Intermediate clutch friction plates (internally splined)
87	7H136	Intermediate clutch pressure plate spring

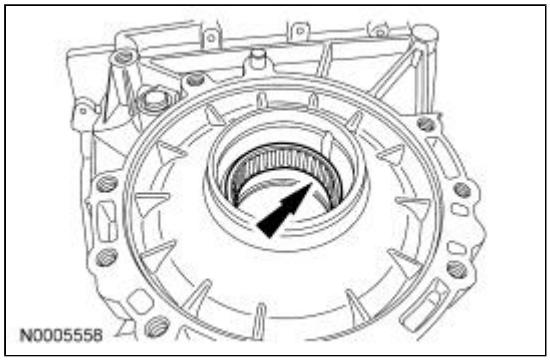
88	7N169	Intermediate clutch retaining ring
89	7B043	Intermediate clutch ring
90	7C151	Intermediate clutch piston spring
91	7J015	Intermediate clutch piston
92	7F225	Intermediate clutch piston inner seal
93	7F224	Intermediate clutch piston outer seal
94	7F373	Bearing (T6)
95	7B314	Center shaft sleeve (part of 7G033)
96	7J114	Center support keys (2 required)
97	7J135	Center support seals (4 required)
98	7G033	Support assembly
99	7G446	Low/reverse clutch piston center seal
100	7G444	Low/reverse clutch piston inner seal
101	7G445	Low/reverse clutch piston outer seal
102	7D343	Low/reverse clutch piston
103	7D405	Low/reverse clutch piston return spring
104	7G494	Low/reverse clutch piston retaining ring
105	7N572	Clutch disc cushion plate
106	7E314	Low/reverse clutch steel plates (externally splined)
107	7B164	Low/reverse clutch friction plates (internally splined)
108	7E314	Low/reverse clutch pressure plate (select fit)
109	7H286	Gear thrust shim (select fit)
110	7C041	Bearing (T7)
111	7H580	Sun gear No. 2
112	7D235	Thrust bearing outer race
113	7D234	Bearing (T8)
114	7A348	Sun gear No. 3
115	7D234	Bearing (T9)
116	7193	Bearing race (T9)
117	7G224	Rear planetary carrier assembly
118	7H583	Fluid collar rear planetary plate (part of 7G224)
119	7A153	Output shaft ring gear assembly
120	7M152	Bearing (T10)
121	7B256	Output shaft bushing (part of 7096)
122	7096	Output shaft parking gear assembly rear wheel drive (RWD)
123	7096	Output shaft parking gear assembly four wheel drive (4WD)
124	7N194	Output shaft retaining ring
125	7006	Transmission case assembly (model dependent)
126	7E389	Transmission case fluid fill plug assembly

127	7E380	Transmission case fluid fill plug
128	7E390	Transmission case fluid fill seal
129	7E049	Transmission oil level indicator
130	7034	Transmission case vent assembly (model dependent)
131	7A415	Output shaft bearing assembly
132	7030A	Output shaft retaining ring
133	7E413	Bearing (T11) (4WD only)
134	7R205	Output shaft bearing (RWD only)
135	7A433	Output shaft spacer (4WD only)
136	7030B	Output shaft bearing retainer shim
137	7N135	Anti-click washer
138	7052	Extension housing seal (RWD)
139	7052	Extension housing seal (4WD)
140	7A021	Output shaft flange (RWD)
141	7K440	Output shaft flange retaining nut (RWD)
142	7E332	Manual valve detent spring
143	W711235-S300	Manual valve detent spring retaining screw and washer
144	7D410	Parking pawl actuating rod
145	7A441	Parking pawl
146	7D070	Parking pawl return spring
147	7D071	Parking pawl shaft
148	7H398	Plug assembly transmission case housing
149	7G101	Parking pawl abutment
150	W711235-S300	Parking pawl abutment retaining screw and washer
151	W708455-S441	Manual control lever nut
152	7A256	Manual control lever
153	7B498	Manual control lever shaft seal
154	7C493	Manual control lever shaft
155	7C257	Manual control lever shaft spacer
156	7A115	Manual valve detent lever assembly
157	7G100	Manual valve detent lever retaining pin
158	7H322	Thermal bypass valve
159	7F401	Front pump adapter seal
160	7A100	Main control assembly
161	7A091	Main control valve body assembly
162	7Z490	Main control valve body separator plate
163	7G423	Lower main control valve body
164	14C247	Control module assembly
165	7H585	Bulkhead connector sleeve

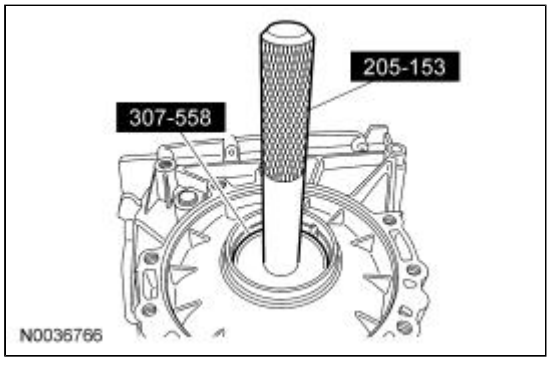
166	—	Transmission fluid filter seal (part of 7G186)
167	7G186	Transmission fluid filter
168	—	Transmission fluid pan magnet
169	7A191	Transmission fluid pan gasket
170	7A194	Transmission fluid pan
171	W500214-S437	Transmission fluid pan bolts

All vehicles

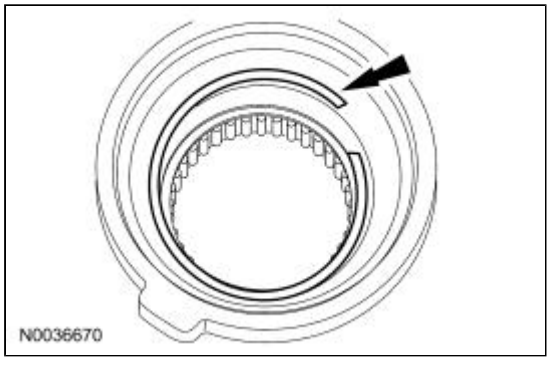
1. If removed, position the rear case roller bearing in the case.



2. Using the special tools, install the roller bearing.

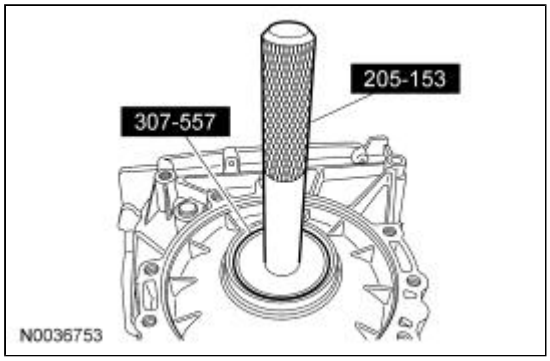


3. Install the snap ring.

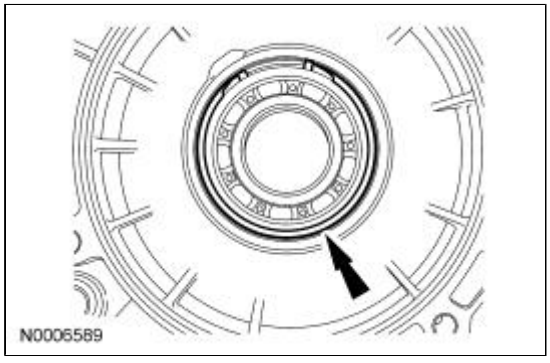


Rear wheel drive (RWD) vehicles

4. Using the special tools, install the rear case roller bearing in the case.

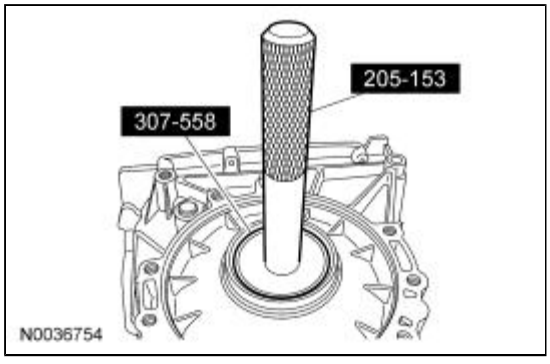


5. Install the roller bearing snap ring.

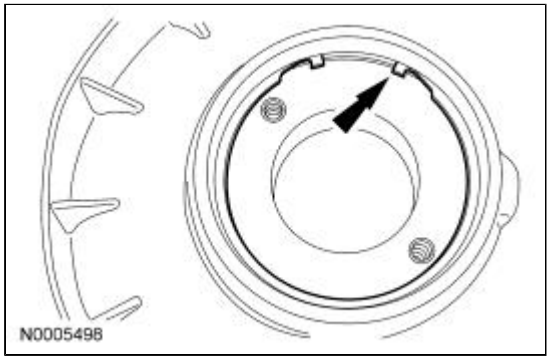


Four wheel drive (4WD) vehicles

6. Using the special tools, install the rear bearing spacer.



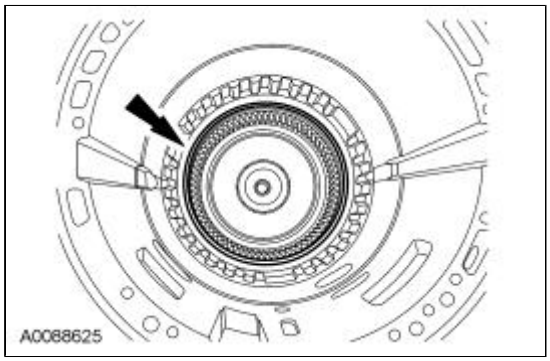
7. Install the rear bearing spacer snap ring.



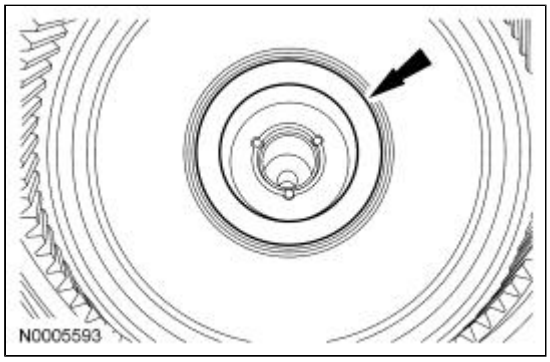
All vehicles

8. Place the transmission in the vertical position.

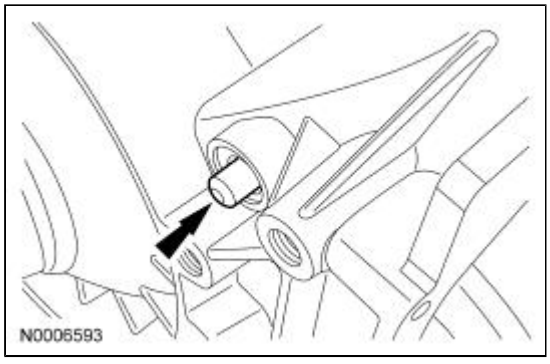
9. Install the planet carrier hub and output shaft assembly.



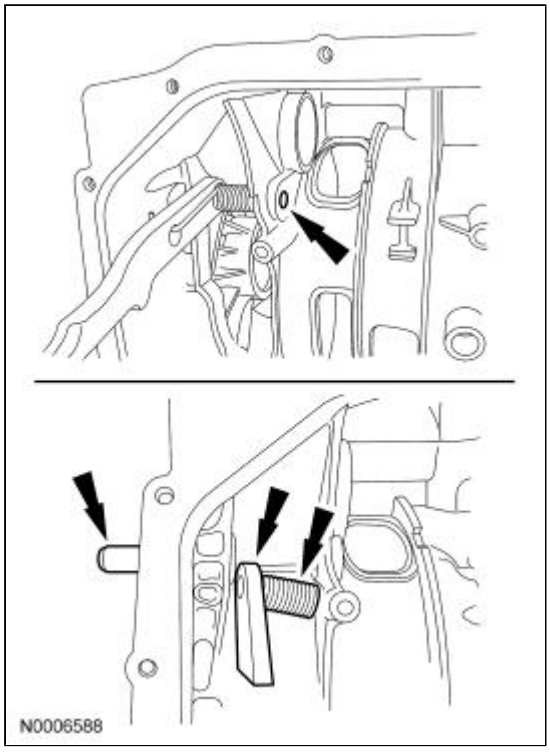
10. Install the silver shim (caged bearing) on the planet carrier hub and output shaft assembly.



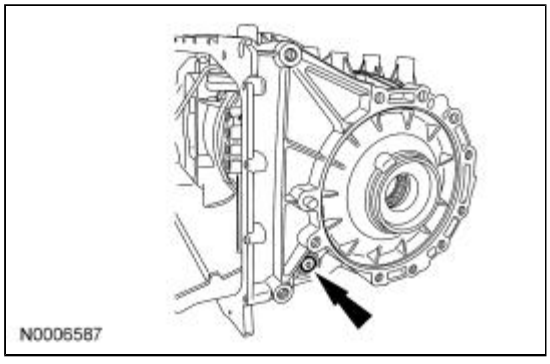
11. Position the park pawl pin into the case.



12. Position the park pawl into the case and push the park pawl pin in to hold the park pawl and spring in position.

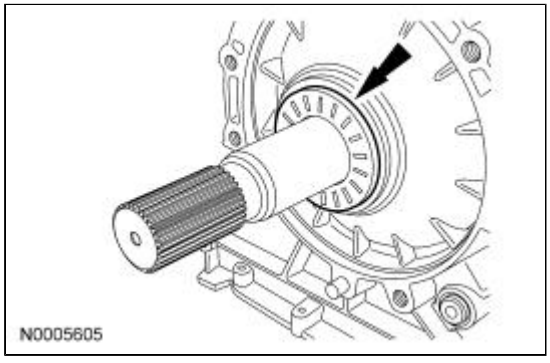


13. Install the park pawl pin bolt.
    - Tighten to 35 Nm (26 lb-ft).

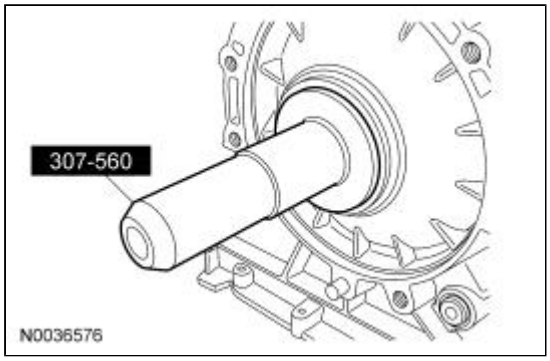


4WD vehicles

14. Position a new output shaft seal in place.

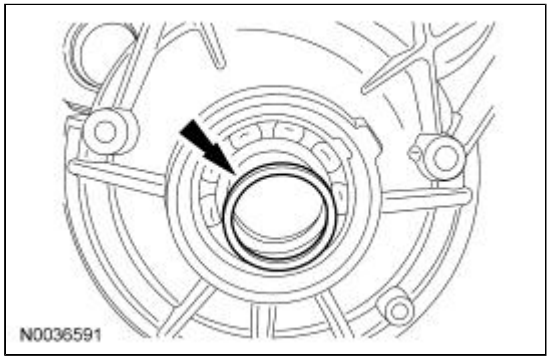


15. Using the special tool, install the output shaft seal.

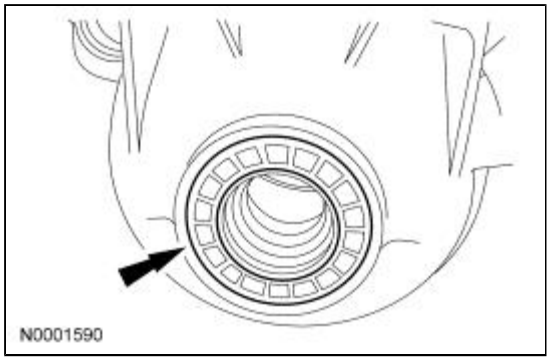


RWD vehicles

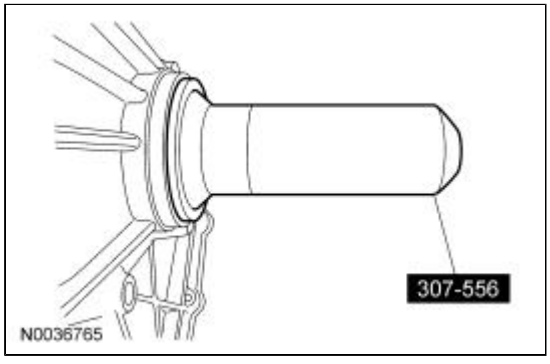
16. Install the anti-click washer.



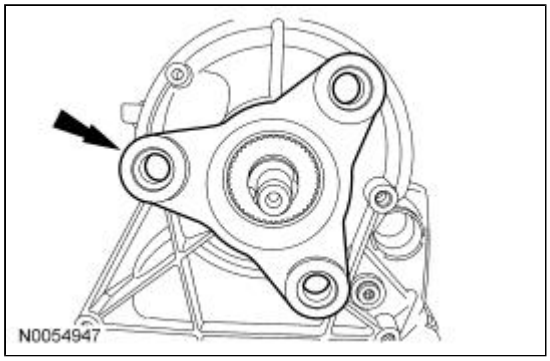
17. Position a new output shaft seal in place.



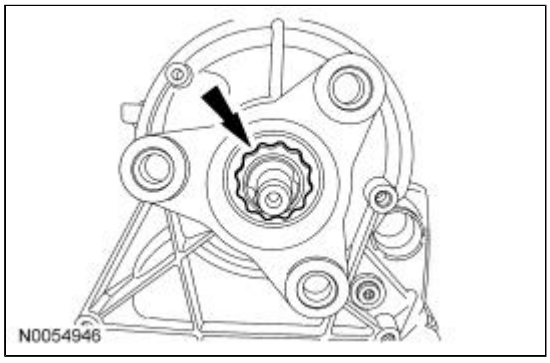
18. Using the special tool, install the output shaft seal.



19. Install the output shaft flange.

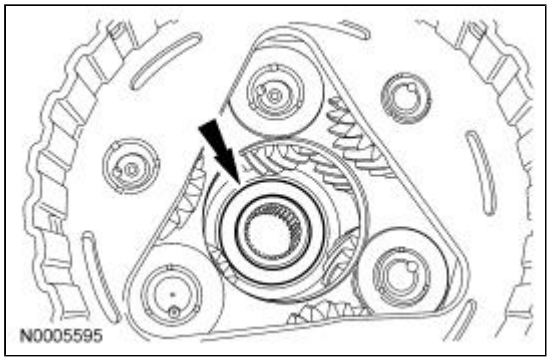


20. Install a new output shaft flange nut.
    - Tighten to 80 Nm (59 lb-ft).

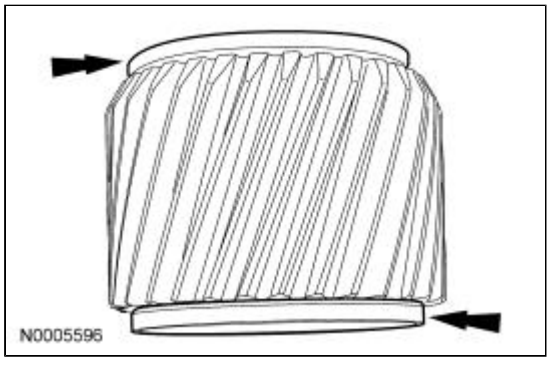


All vehicles

21. Install the roller bearing race in the bottom of the carrier.



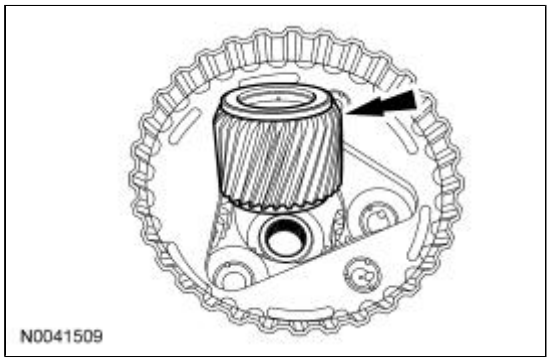
22. Snap the top and the bottom roller bearings onto the sun gear.



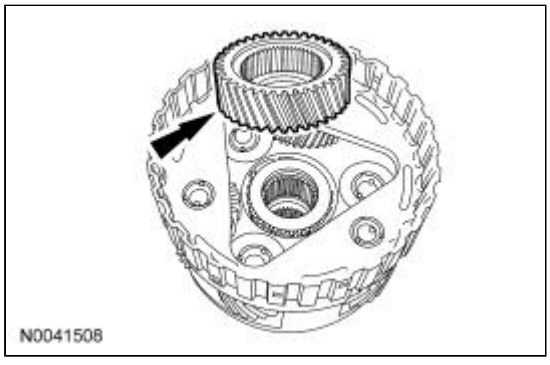
23. **NOTE:** When installing the sun gear, make sure that the taper edge is facing up toward the

torque converter housing.

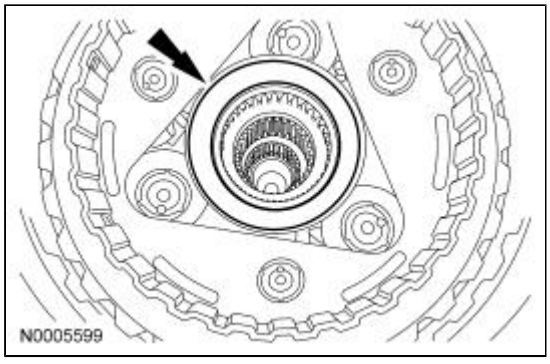
Install the sun gear into the planet assembly.



24. Install the low/reverse sun gear.



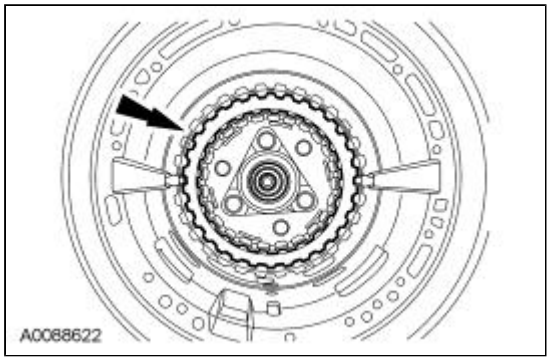
25. Install the low/reverse thrust bearing (T7).



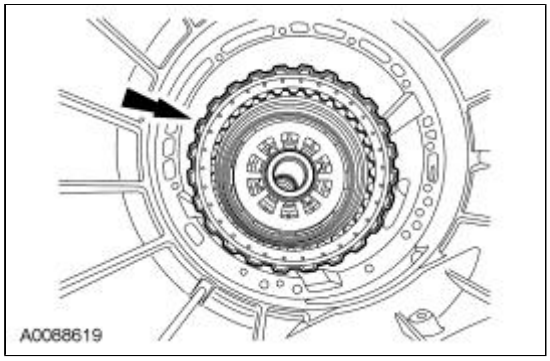
26. **NOTE:** Inspect and install new thrust bearings as required.

    Install the select fit thrust gear shim.

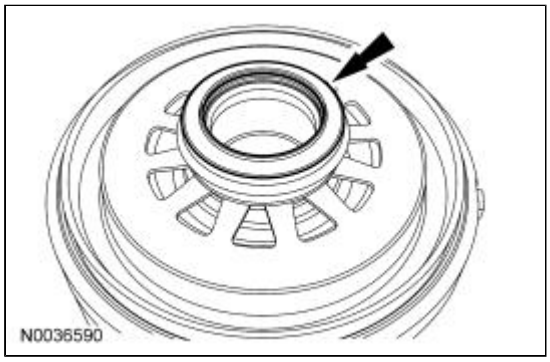
27. Install the planet carrier.



28. Install the low/reverse clutch plates, starting with the pressure plate and alternating between the friction and steel plates, and ending with the wave spring plate on the top.

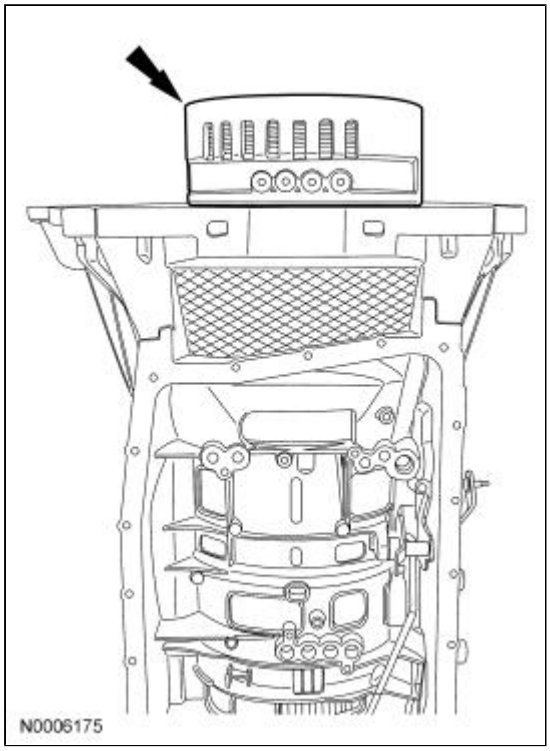


29. Install the roller bearing and shim onto the center support.



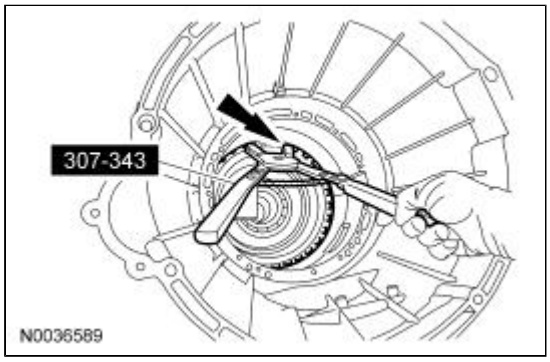
30. **NOTE:** Make sure that when installing the center support the feed holes on the center support are lined up with the feed holes in the case.

    Install the center support into the case.

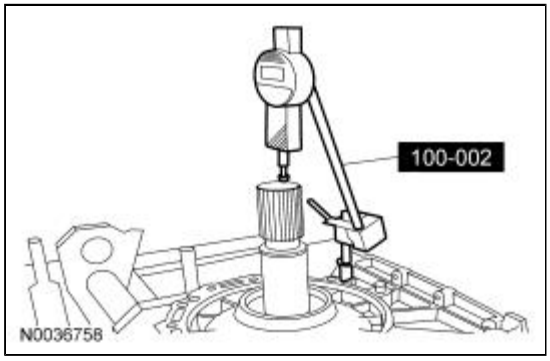


31. **NOTE:** Rotate case 180 degrees.

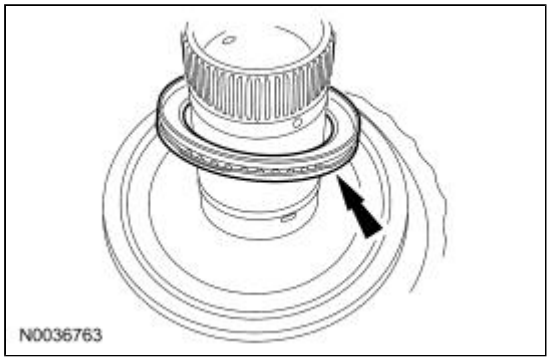
    Using the special tool, install the center support snap ring. Tap the snap ring into the case to make sure that it is seated into the case.



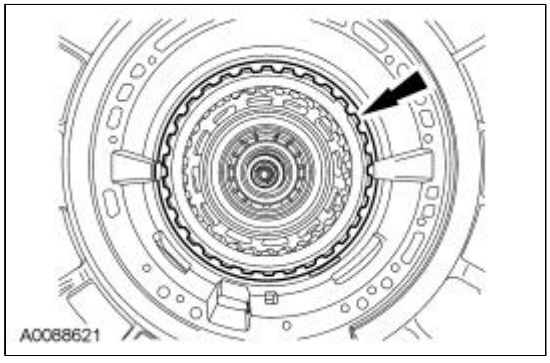
32. Using the special tool, lift up on the output shaft and record the reading. The reading should be within 0.15-0.35 mm (0.006-0.013 in).
    - If the reading is not within the specification, install a different (either thinner or thicker) select fit thrust gear shim.



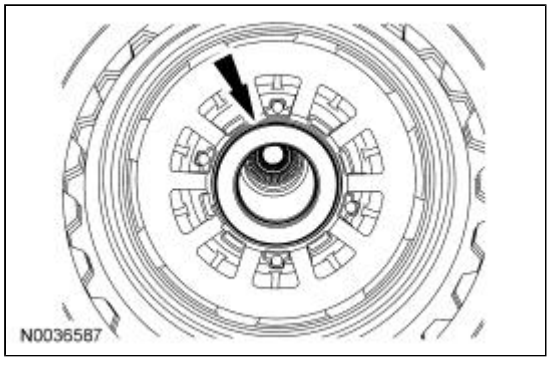
33. Install the roller bearing if not previously installed on the direct clutch drum.



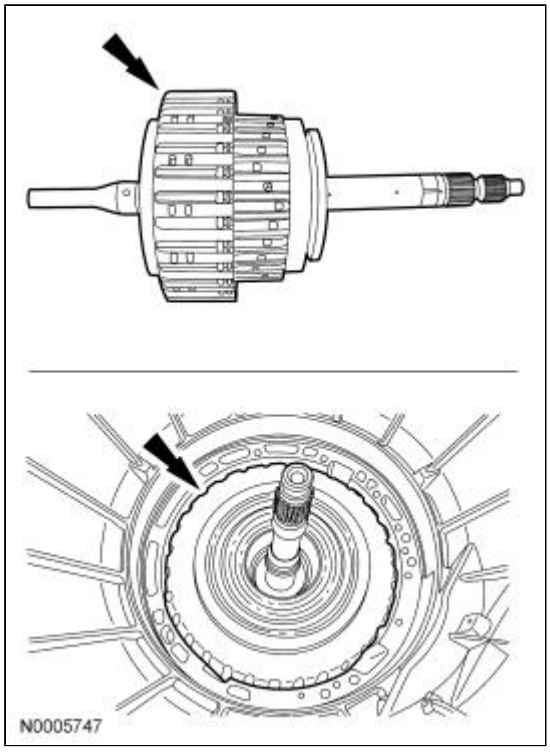
34. Install the direct clutch drum.



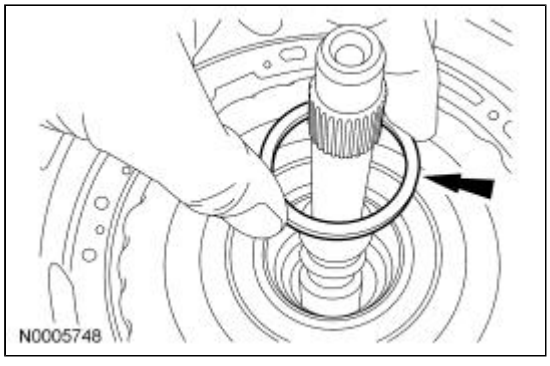
35. Install the bearing on the direct clutch assembly.



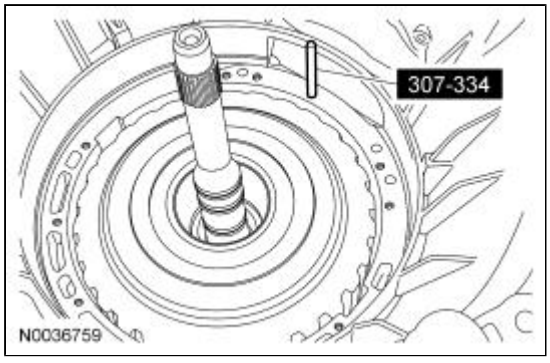
36. Install the forward and overdrive clutch assembly.



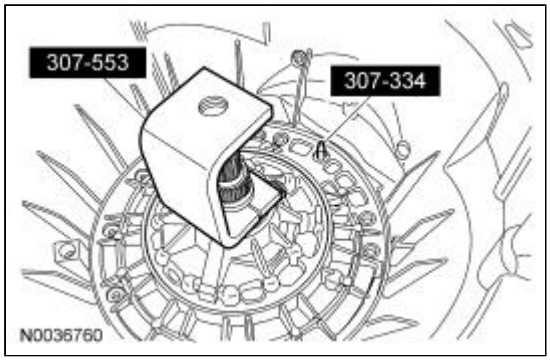
37. Install the pump washer.



38. Install the special tool into the case.

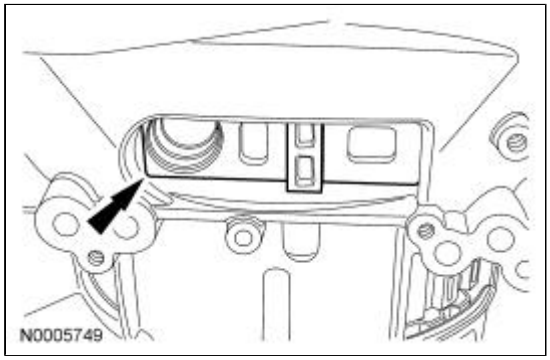


39. Using the special tools, install the front pump.

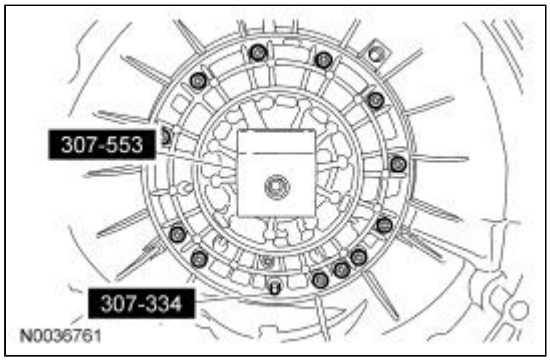


40. **NOTE:** Make sure that the fluid filter seal has been removed. If it has not, use a suitable pick and remove the seal.

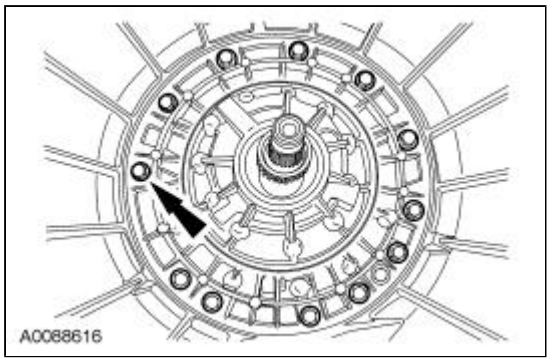
    Make sure that the pump is correctly aligned with the case.



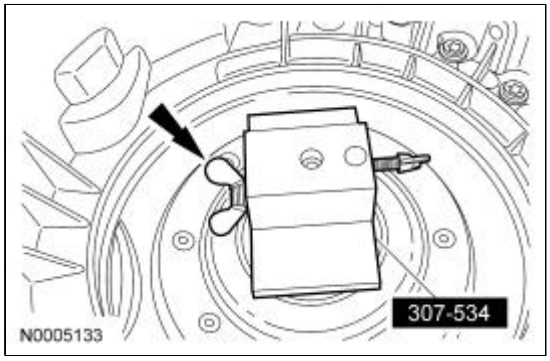
41. Loosely install the new front pump bolts with the new washers.



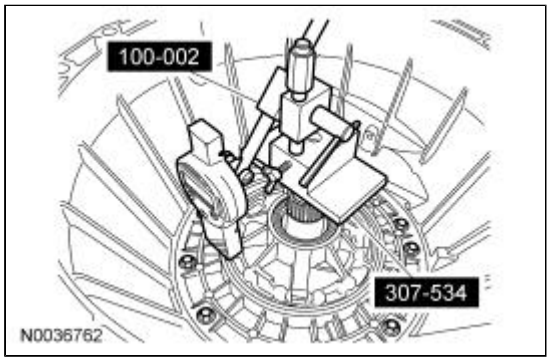
42. Install the remaining front pump bolt. Tighten the bolts in a crisscross pattern.
    - Tighten to 10 Nm (89 lb-in).



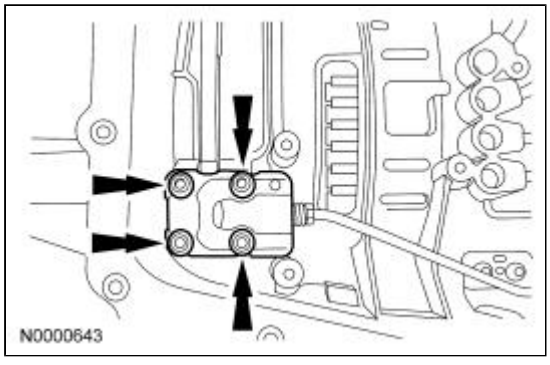
43. Install the special tool onto the input shaft to measure end play.
    - Tighten the wing nut.



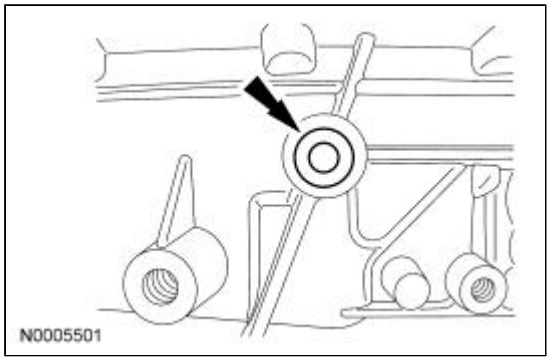
44. Install the remaining special tool.
    - Push down on the special tool and zero out the dial indicator.
    - Lift up on the special tool and record the measurement 0.2-0.4 mm (0.008-0.015 in). If the measurement is not within specification install a new pump washer.
    - Measure the original washer, install a thinner or a thicker washer to achieve the correct measurement.



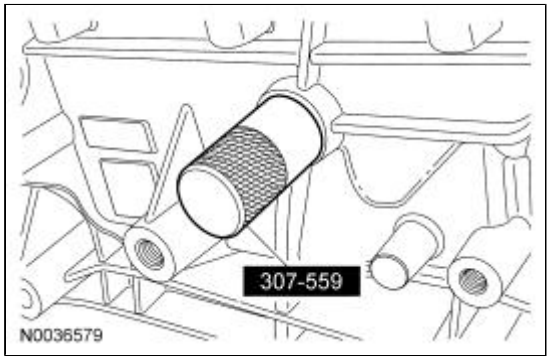
45. Install the park rod actuating plate.
    - Tighten to 10 Nm (89 lb-in).



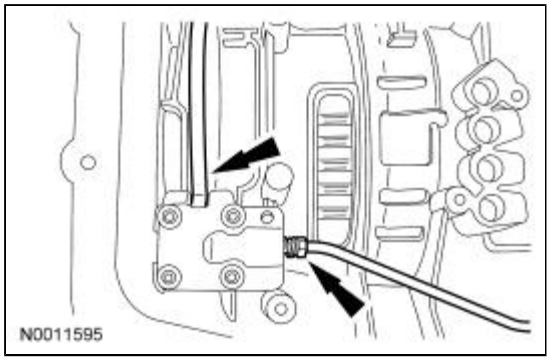
46. Position a new manual control lever seal in place.



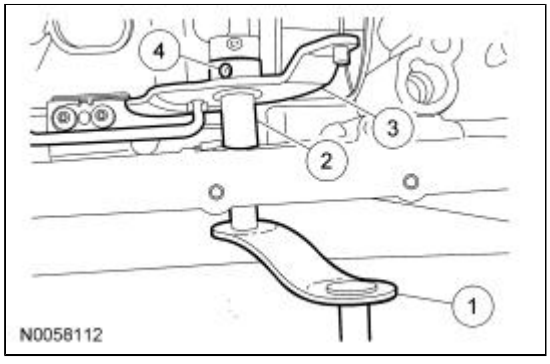
47. Using the special tool, install a new manual control lever shaft seal.



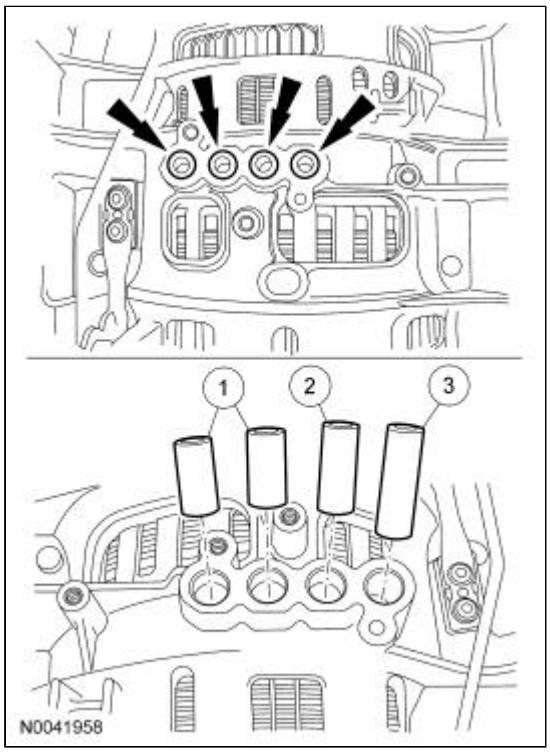
48. Position the manual lever and park rod in place.
    - Push down on the park pawl and slide the park rod in place.



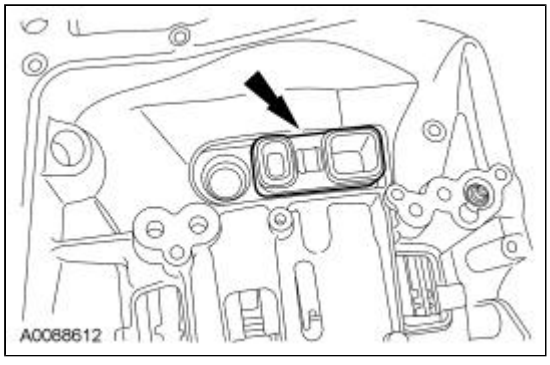
49. Install the manual lever in the case.
    1. Slide the manual lever in the case.
    2. Position the spacer in place while sliding the manual lever into the spacer.
    3. Position the manual valve inner lever while sliding the manual lever and lining up the roll pin hole.
    4. Install the roll pin.



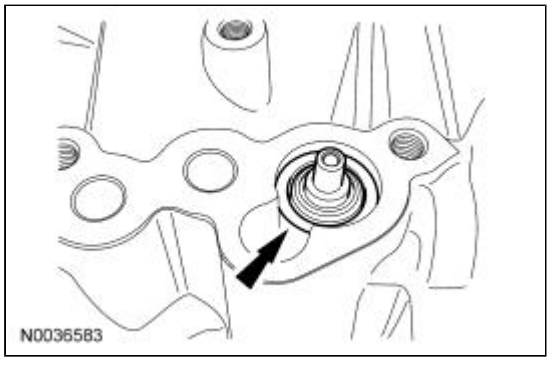
50. Install the 4 rubber feed tubes for the center support.
    1. Black feed tubes.
    2. Green feed tube.
    3. Blue feed tube.



51. Install the rubber adapter.



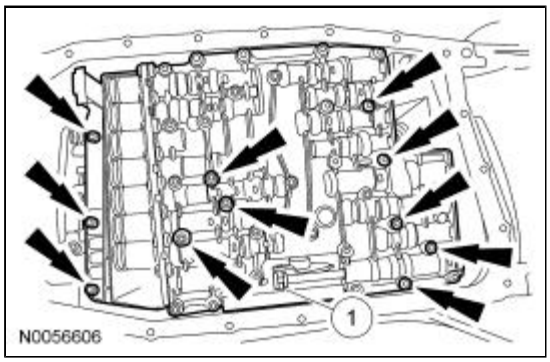
52. Install the thermal bypass valve into the case.



53. **NOTE:** The mechatronic assembly will not lay flush on the case, this is normal, the bolts will pull the mechatronic assembly down.

Loosely install the 11 mechatronic bolts.

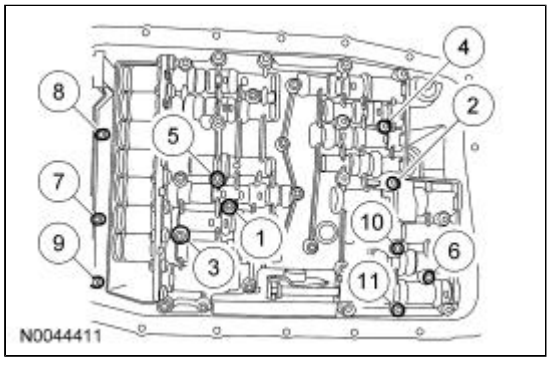
1. Align the manual valve and control lever linkage.



54. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

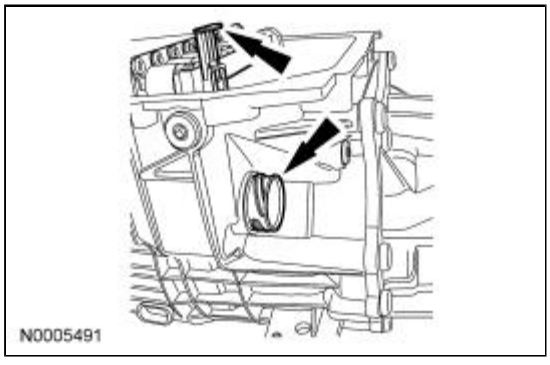
Tighten the bolts in the sequence shown.

- Tighten to 6 Nm (53 lb-in).

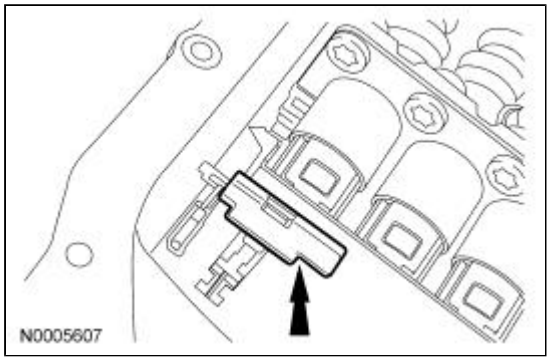


55. **CAUTION: Do not touch the electrical connector pins or the exposed solenoid tabs on the TCM. Electrostatic discharge may occur and may cause damage to the mechatronic unit.**

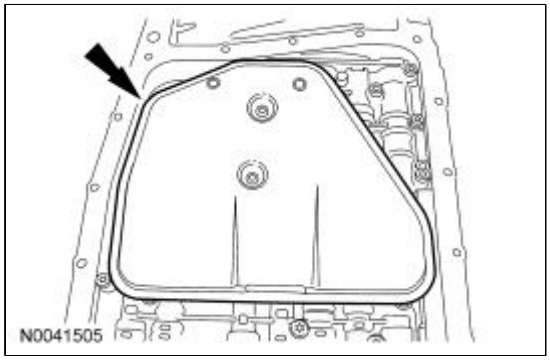
With the release tab up and unlocked, push the outer shell of the bulkhead electrical connector into the transmission. Make sure that the bulkhead connector is fully seated into the TCM.



56. Press down on the tab and lock the outer shell of the bulkhead electrical connector in place. Make sure that the locking tab is securely locked.

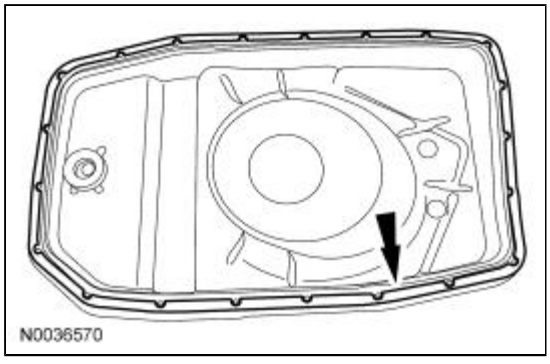


57. Install a new transmission fluid filter.

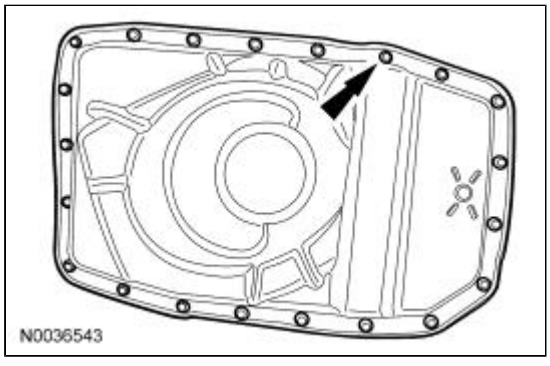


58. **NOTE:** The fluid pan gasket can be reused if not damaged.

    Install a new transmission fluid pan gasket if required.



59. Install the fluid pan and tighten the bolts in a crisscross pattern.
    - Tighten to 14 Nm (10 lb-ft).



60. Using the special tools, install the torque converter.

Special Tool(s)

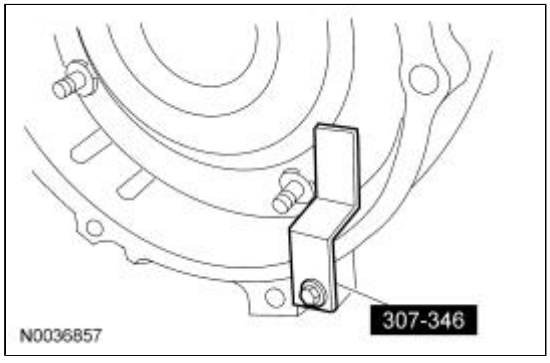
ST1636-A	Retainer, Torque Converter 307-346 (T97T-7902-A)

Material

Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Installation

1. Install the special tool.



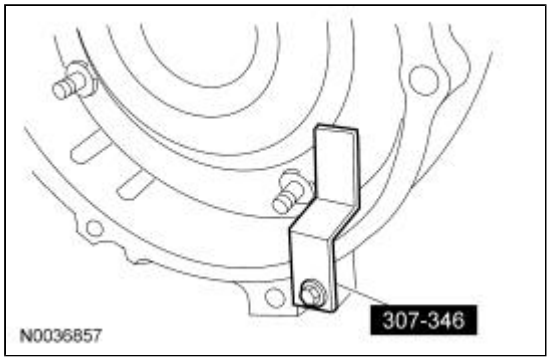
2. **CAUTION: The converter housing is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates that the converter pilot is not binding in the engine crankshaft.**

   NOTE: Make sure that the transmission jack makes contact on the outer ribs of the fluid pan.

   NOTE: Make sure that the transmission is securely fastened to the transmission jack.

   Position and secure the transmission on the high-lift transmission jack. Raise and position the transmission into the vehicle.

3. Remove the special tool.



4. **NOTE:** Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

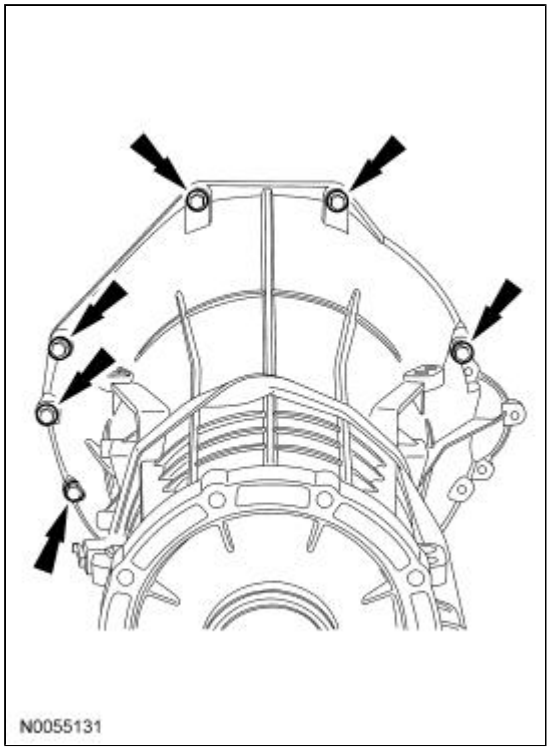
   With the transmission in a horizontal position, move it toward the engine. Align the orange balancing marks between the torque converter studs and the flexplate bolt holes.

5. **NOTE:** Install the transmission case bolts in their correct locations noted during removal.

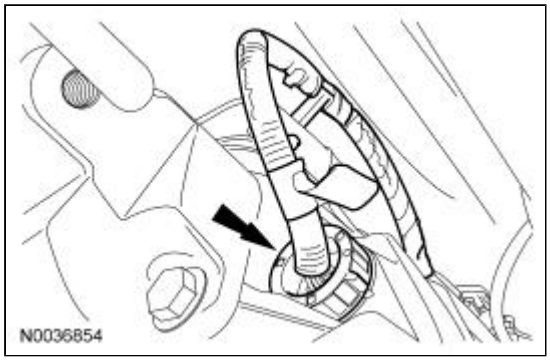
   NOTE: The top 2 transmission case bolts need to be installed prior to installing the rest of the bolts.

   NOTE: The top left bolt is inserted through the fuel line bracket first, then through the transmission case.

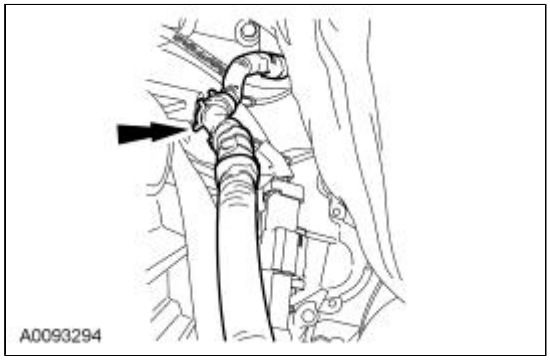
   Install 6 of the 7 transmission case bolts.
   - Tighten to 48 Nm (35 lb-ft).



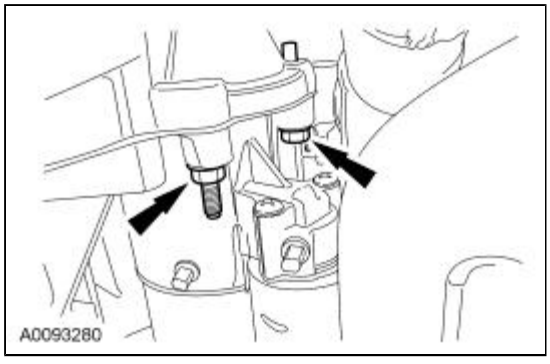
6. Connect the main transmission electrical harness by pushing it in and twisting the outer shell to lock it in place.



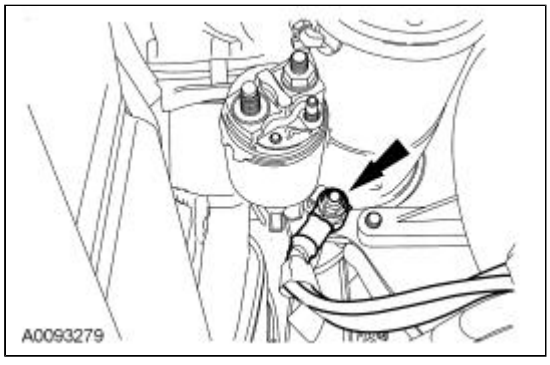
7. Connect the wire harness to the top of the transmission.



8. Install the starter motor and the 3 starter motor bolts.
    - Tighten to 26 Nm (19 lb-ft).

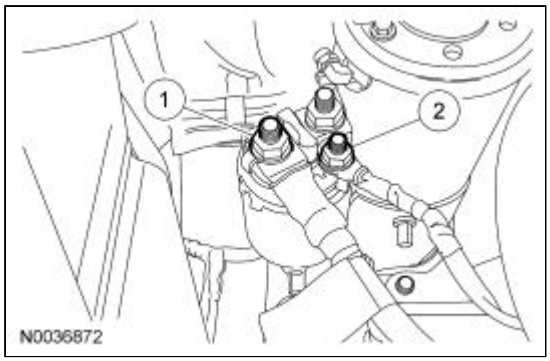


9. Install the ground wire on the stud and install the ground wire nut.
    - Tighten to 23 Nm (17 lb-ft).

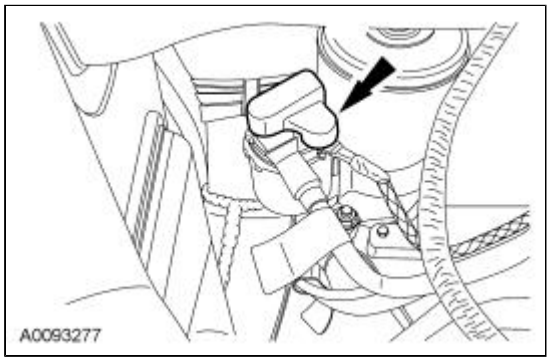


10. Install the starter motor electrical connectors.
    1. Tighten to 12 Nm (9 lb-ft).

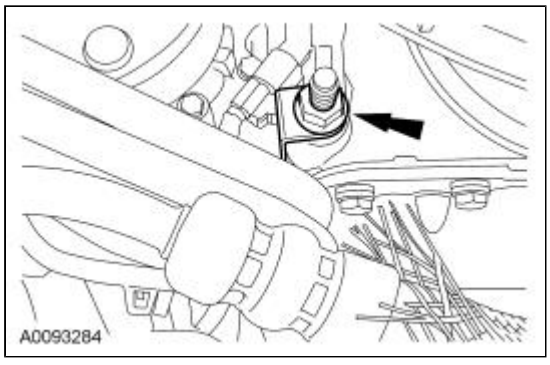
2. Tighten to 6 Nm (53 lb-in).



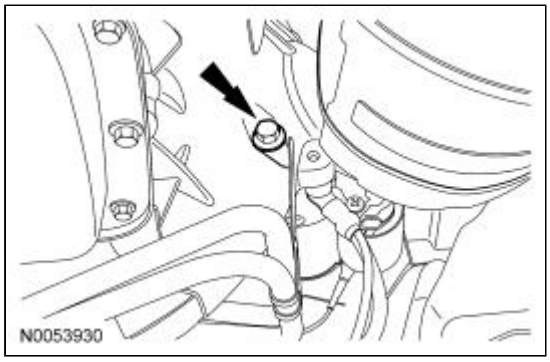
11. Install the plastic starter motor electrical connector cap.



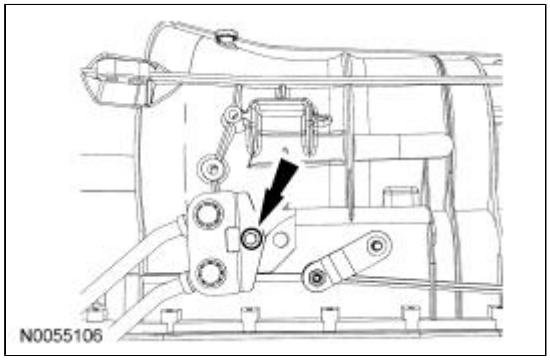
12. Position the transmission cooler tubes in place and install the cooler tube bracket nut.
    - Tighten to 27 Nm (20 lb-ft).



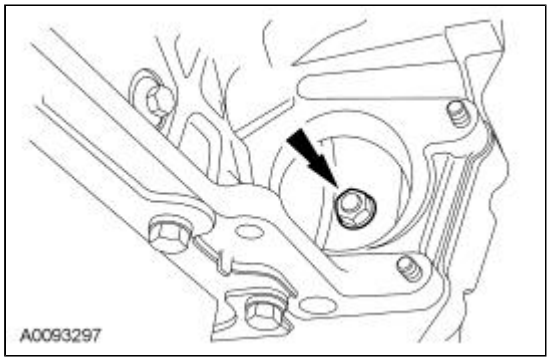
13. Align the bracket and install the remaining transmission case bolt.
    - Tighten to 48 Nm (35 lb-ft).



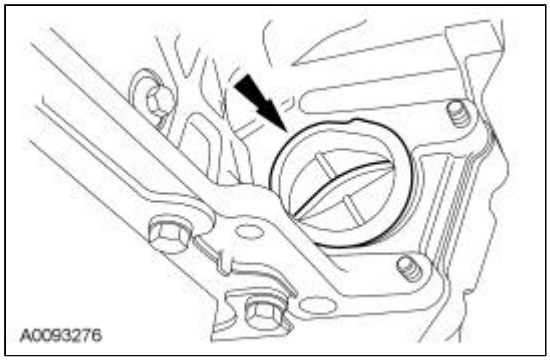
14. Install the transmission cooler tubes and the bracket bolt.
    - Tighten to 23 Nm (17 lb-ft).



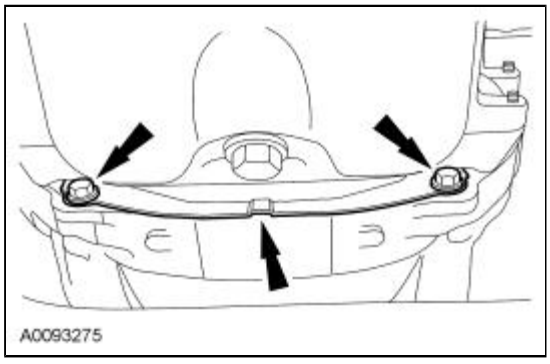
15. Install 4 new flexplate-to-torque converter nuts.
    - Tighten to 35 Nm (26 lb-ft).



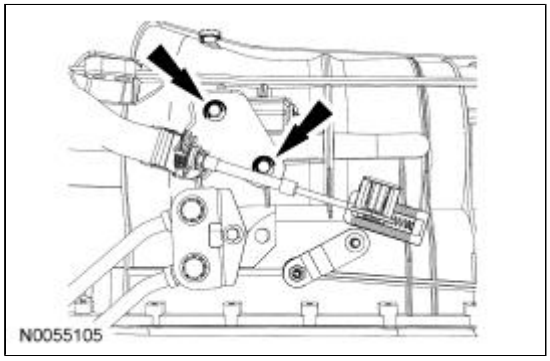
16. Install the rubber access plug.



17. Install the flexplate inspection cover and the inspection cover bolts.
    - Tighten to 35 Nm (26 lb-ft).

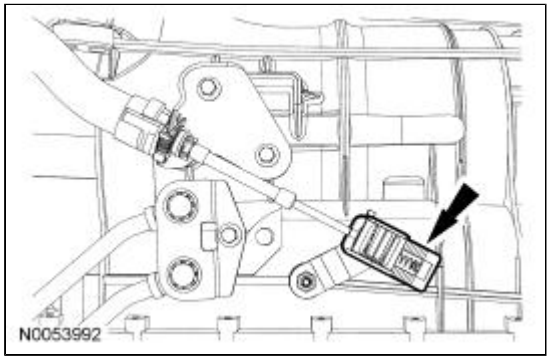


18. Install the selector lever bracket and bolts.
    - Tighten to 48 Nm (35 lb-ft).

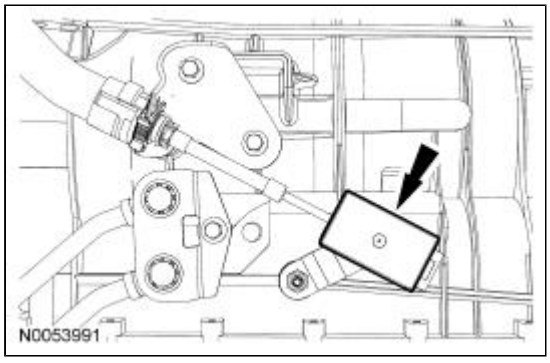


19. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

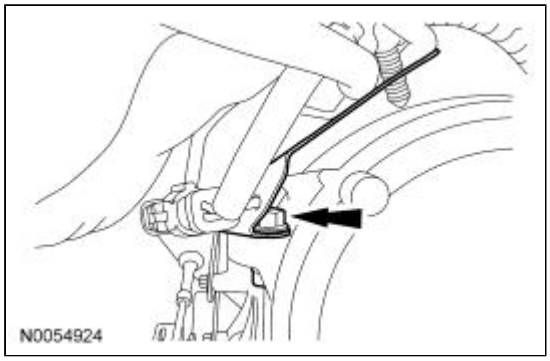
    With the manual lever in NEUTRAL, connect the selector lever cable onto the manual lever ball stud and move the locking tab down.
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure that it is correctly installed.



20. If equipped, install the heat shield.



21. Install the fuel line bracket and bolt.
    - Tighten to 25 Nm (18 lb-ft).



22. Install the transfer case. For additional information, refer to Section 308-07B .

23. Connect the battery ground cable. For additional information, refer to Section 414-01 .

24. Verify that the selector lever cable is correctly adjusted. For additional information, refer to Section 307-05 .

25. Reflash the transmission control module (TCM) to the latest level of software.

26. Fill the transmission with clean automatic transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

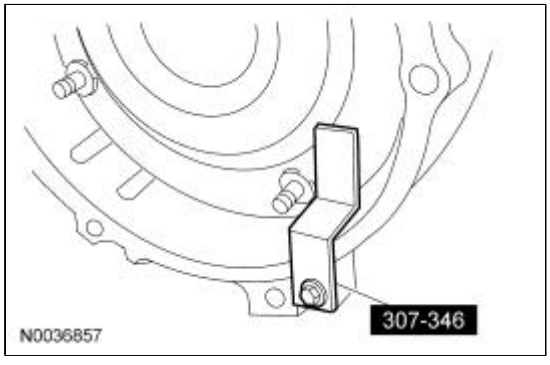
Item	Specification
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Installation

1. Install the special tool.



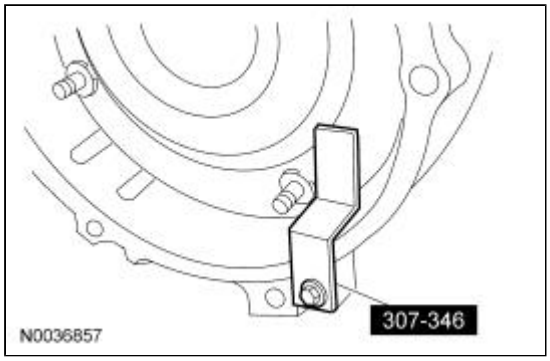
2. **CAUTION: The converter housing is piloted into position by dowels in the rear of the engine block. The torque converter must rest squarely against the flexplate. This indicates that the converter pilot is not binding in the engine crankshaft.**

   NOTE: Make sure that the transmission jack makes contact on the outer ribs of the fluid pan.

   NOTE: Make sure that the transmission is securely fastened to the transmission jack.

   Position and secure the transmission on the high-lift transmission jack. Raise and position the transmission into the vehicle.

3. Remove the special tool.



4. **NOTE:** Make sure the torque converter is fully seated in the transmission before aligning the transmission to the engine.

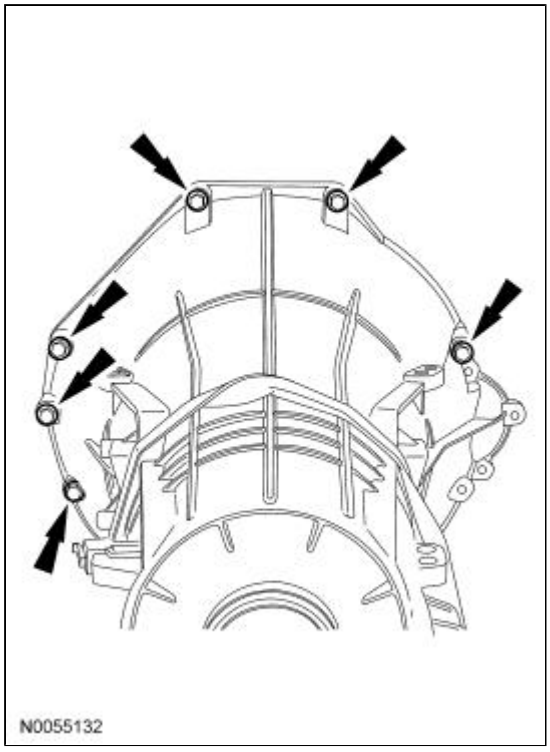
   With the transmission in a horizontal position, move it toward the engine. Align the orange balancing marks between the torque converter studs and the flexplate bolt holes.

5. **NOTE:** Install the transmission case bolts in their correct locations noted during removal.

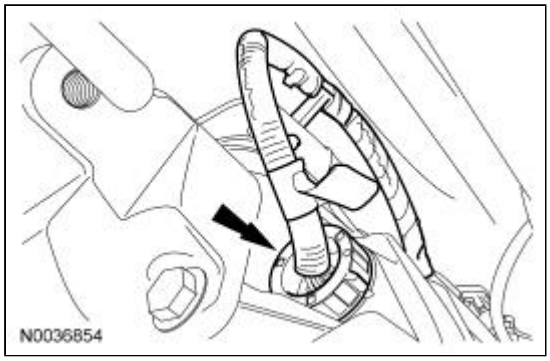
   NOTE: The top 2 transmission case bolts need to be installed prior to installing the rest of the bolts.

   NOTE: The top left bolt is inserted through the fuel line bracket first, then through the transmission case.

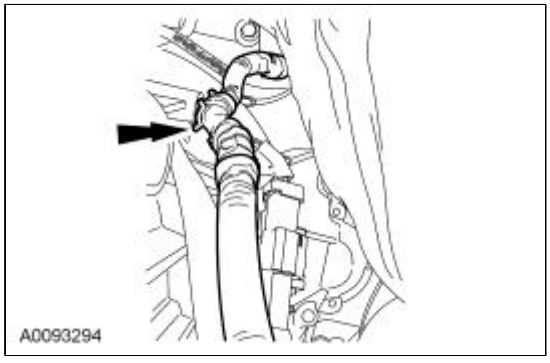
   Install 6 of the 7 transmission case bolts.
   - Tighten to 48 Nm (35 lb-ft).



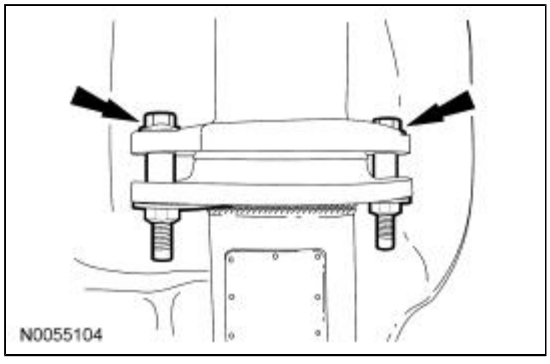
6. Connect the main transmission electrical harness by pushing it in and twisting the outer shell to lock it in place.



7. Connect the wire harness to the top of the transmission.

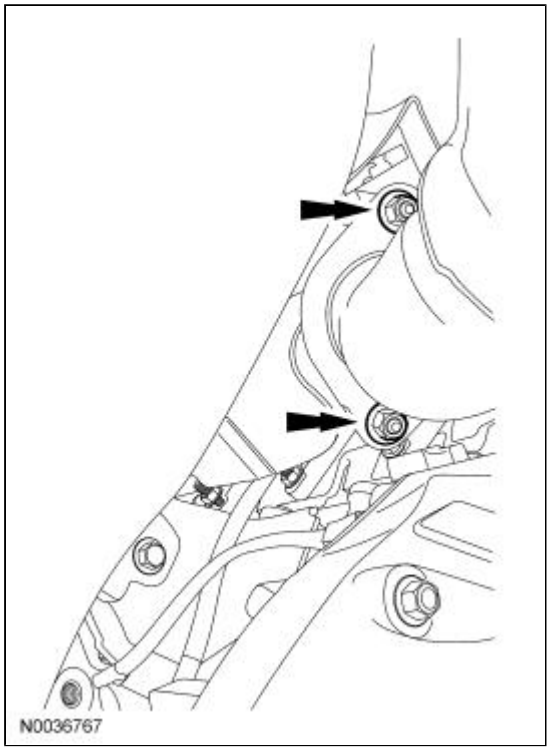


8. Position the dual converter Y-pipe in place and install the 2 dual converter Y-pipe bolts.
    - Tighten to 40 Nm (30 lb-ft).

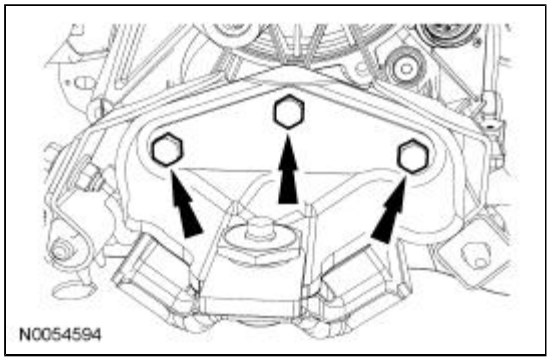


9. **NOTE:** LH shown, RH similar.

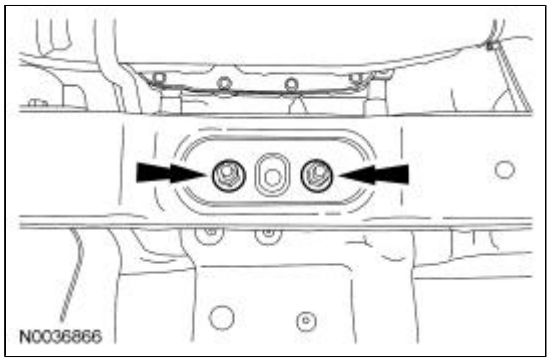
    Install the LH and RH exhaust flange nuts.
    - Tighten to 40 Nm (30 lb-ft).



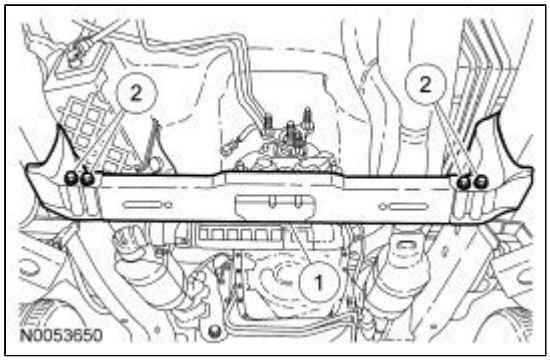
10. Install the 3 bolts and the insulator.
    - Tighten to 90 Nm (66 lb-ft).



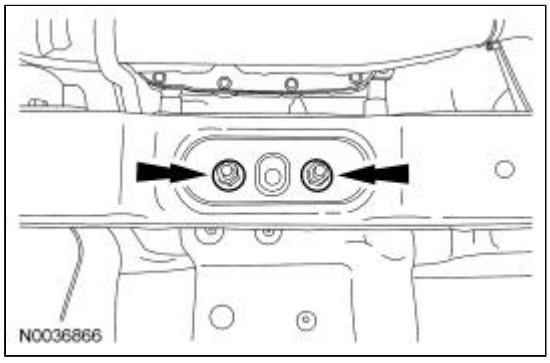
11. Position the rear crossmember in place and loosely install the transmission insulator nuts.



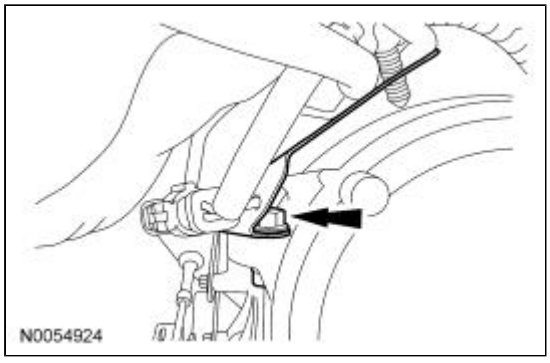
12. Install the rear crossmember.
    1. Install the crossmember.
    2. Install the 4 crossmember bolts and nuts.
        - Tighten to 90 Nm (66 lb-ft).



13. Tighten the transmission insulator nuts.
    - Tighten to 103 Nm (76 lb-ft).

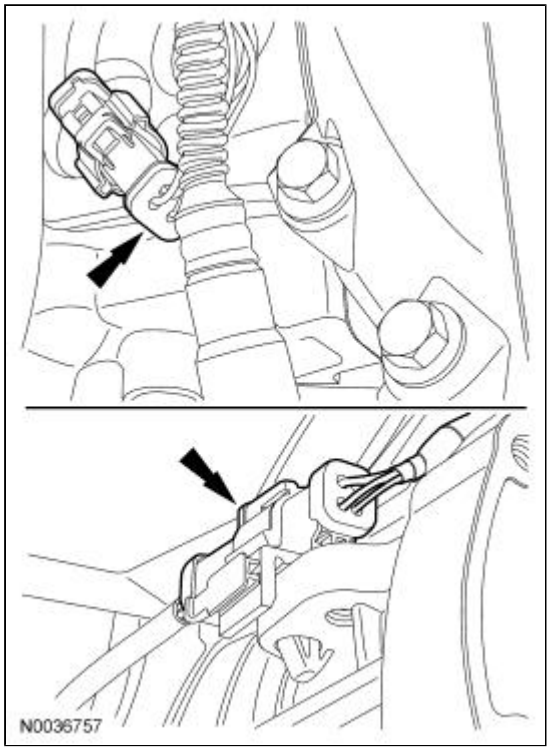


14. Install the fuel line bracket and bolt.
    - Tighten to 25 Nm (18 lb-ft).

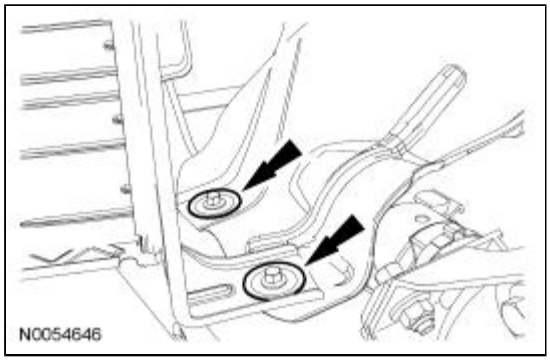


15. **NOTE:** LH shown, RH similar.

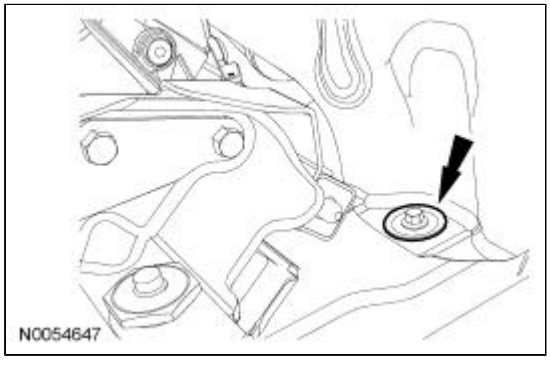
    Connect the RH and LH heated oxygen sensors (HO2S) electrical connectors and the CMS electrical connectors.



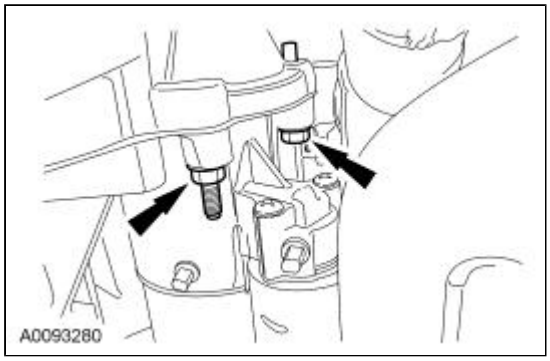
16. Install the LH exhaust heat shield and evaporative emissions canister assembly bolts.
    - Tighten to 15 Nm (11 lb-ft).



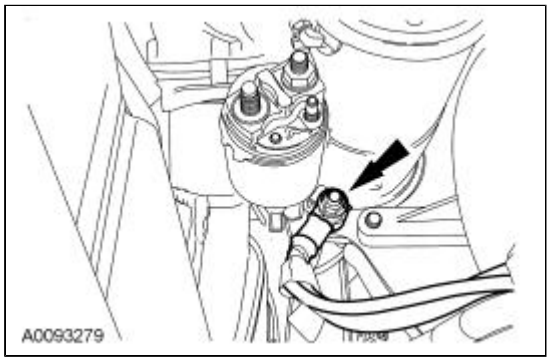
17. Install the RH exhaust heat shield bolt.
    - Tighten to 15 Nm (11 lb-ft).



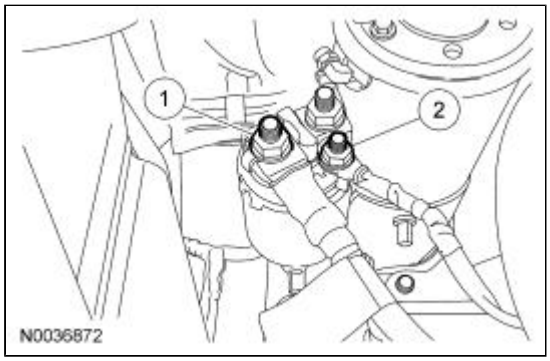
18. Position the starter motor in place and install the 3 starter motor bolts.
    - Tighten to 26 Nm (19 lb-ft).



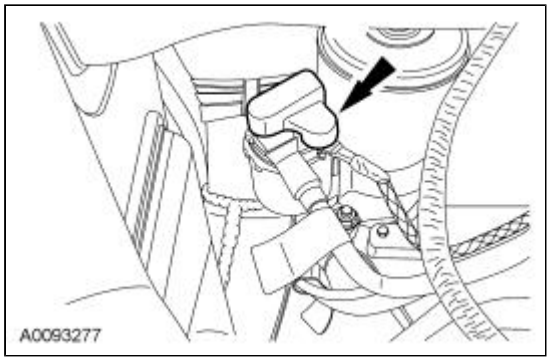
19. Install the ground wire on the stud and install the ground wire nut.
    - Tighten to 23 Nm (17 lb-ft).



20. Install the starter motor electrical connectors.
    1. Tighten to 12 Nm (9 lb-ft).
    2. Tighten to 6 Nm (53 lb-in).

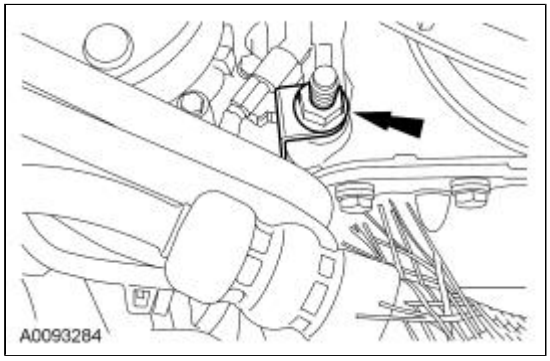


21. Install the plastic starter motor electrical connector cap.

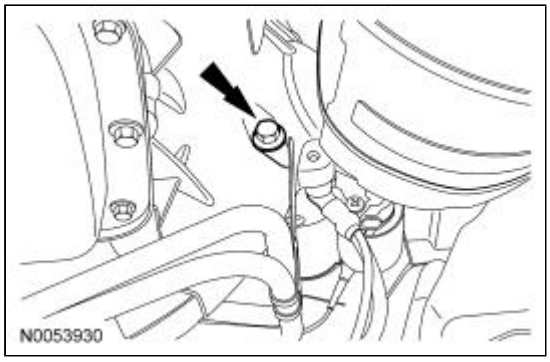


22. Position the transmission cooler tubes in place and install the bracket nut.

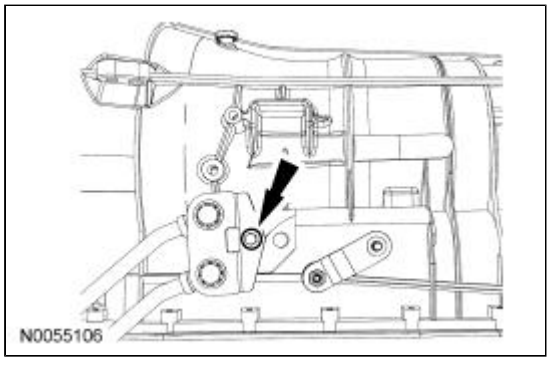
- Tighten to 27 Nm (20 lb-ft).



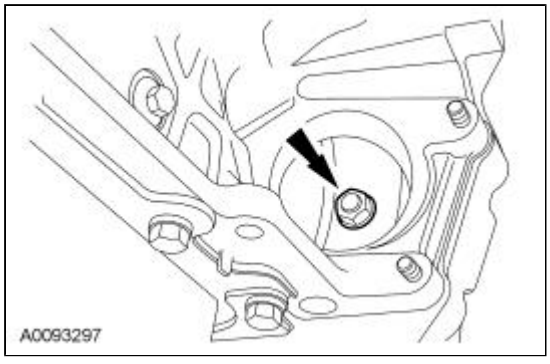
23. Align the bracket and install the remaining transmission case bolt.
    - Tighten to 48 Nm (35 lb-ft).



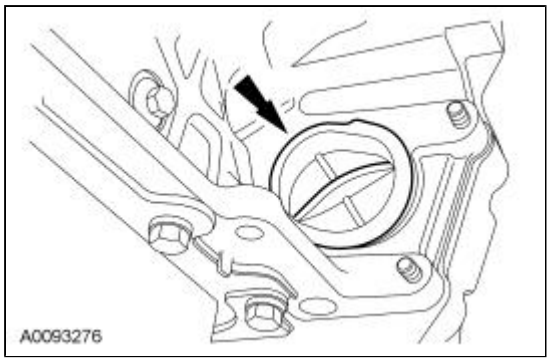
24. Install the transmission cooler tubes and the bracket bolt.
    - Tighten to 23 Nm (17 lb-ft).



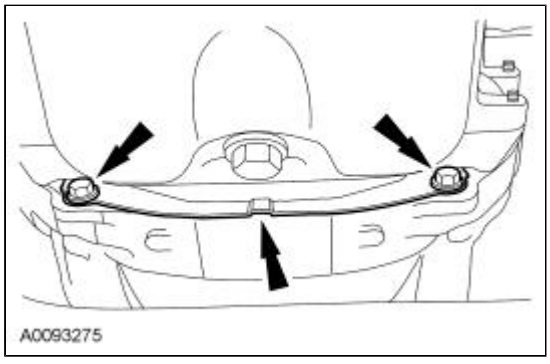
25. Install 4 new flexplate-to-torque converter nuts.
    - Tighten to 35 Nm (26 lb-ft).



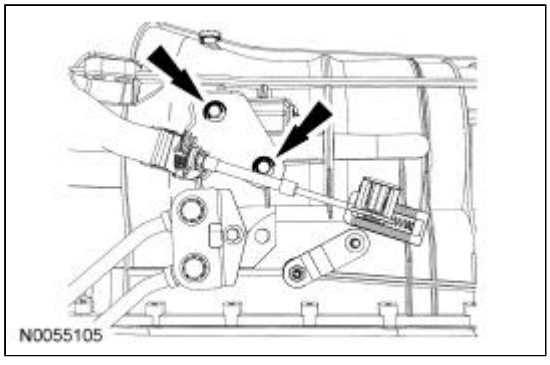
26. Install the rubber access plug.



27. Install the flexplate inspection cover and the flexplate inspection cover bolts.
    - Tighten to 35 Nm (26 lb-ft).

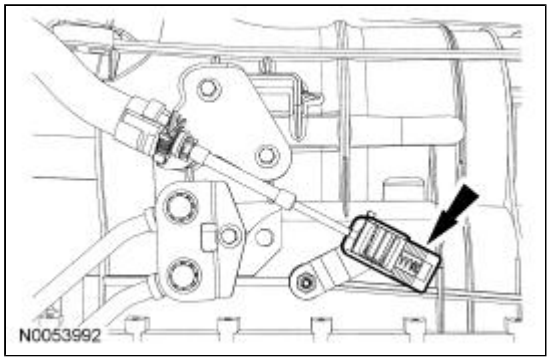


28. Install the selector lever bracket and bolts.
    - Tighten to 48 Nm (35 lb-ft).

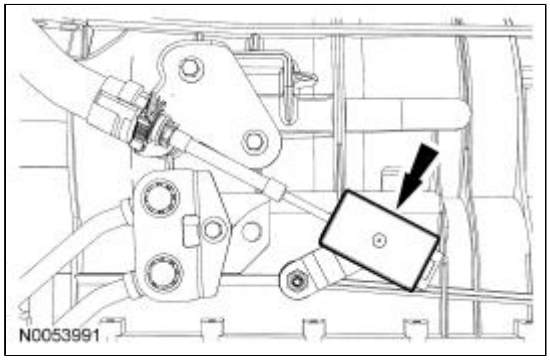


29. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

    With the manual lever in NEUTRAL, connect the selector lever cable onto the manual lever ball stud and move the locking tab down.
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure that it is correctly installed.



30. If equipped, install the heat shield.



31. Install the driveshaft. For additional information, refer to Section 205-01 .

32. Connect the battery ground cable. For additional information, refer to Section 414-01 .

33. Verify that the selector lever cable is correctly adjusted. For additional information, refer to Section 307-05 .

34. Reflash the transmission control module (TCM) to the latest level of software.

35. Fill the transmission with clean automatic transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

General Specifications

Item	Specification
Fluid	
MERCON® SP is not interchangeable with other transmission fluids. The use of any other fluid or cleaning agents will cause internal transmission damage.	
MERCON® SP Automatic Transmission Fluid XT-6-QSP (US); CXT-6-LSP12 (Canada)	MERCON® SP

Torque Specifications

Description	Nm	lb-ft
Engine mount nuts	175	129
Sway bar bracket nuts	55	41
Transmission fluid cooler tube bracket bolt at transmission	48	35
Transmission fluid cooler tube bracket nut to front of engine	40	30
Transmission fluid cooler tubes-to-transmission bracket bolt	25	18

Transmission Cooling

Printable View (390 KB)

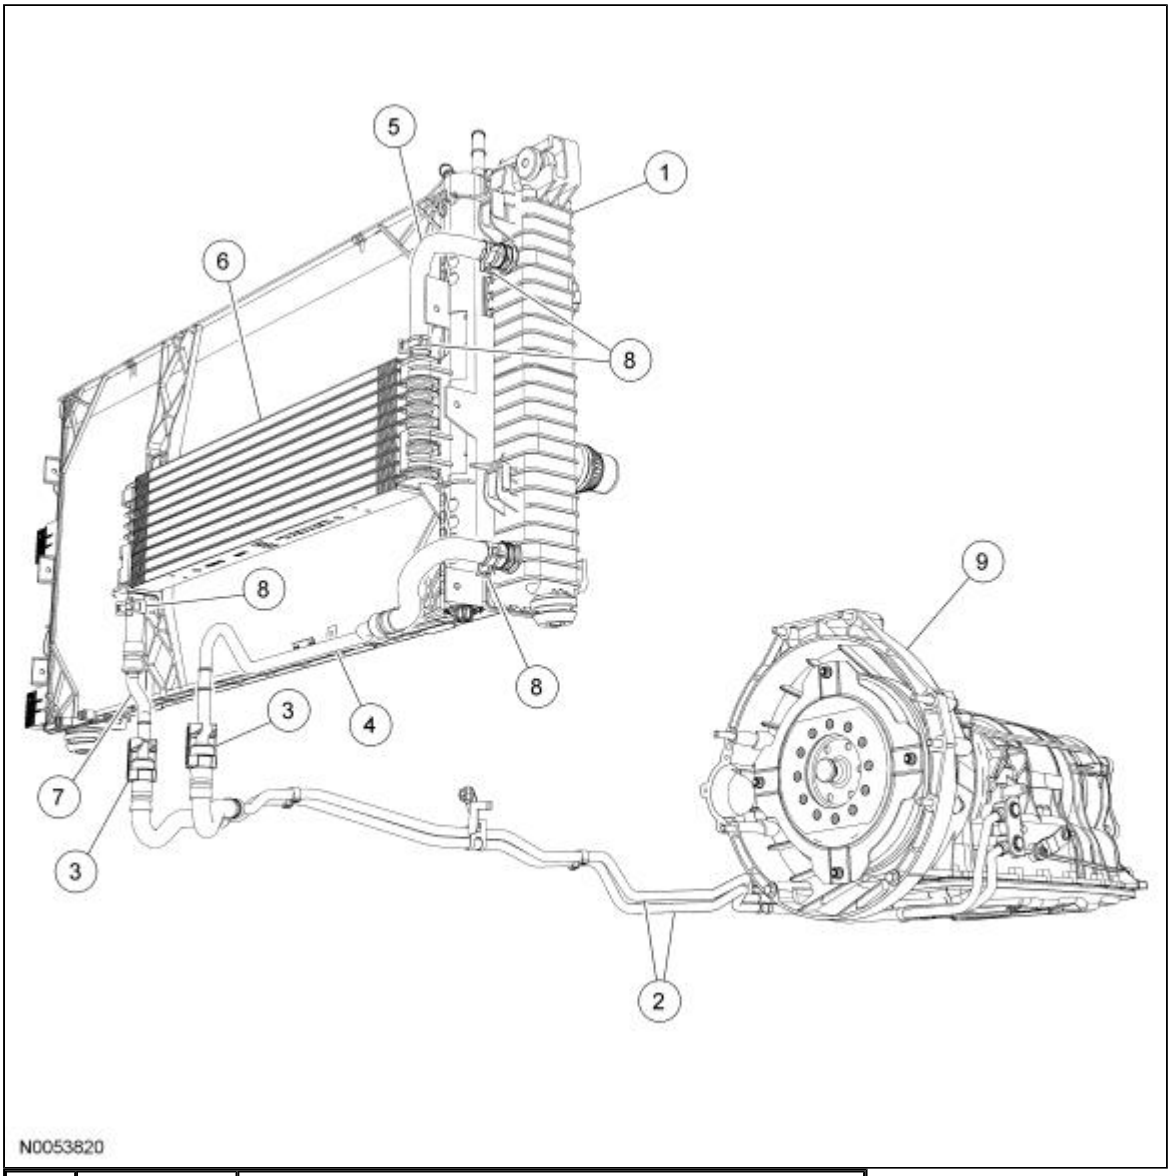
The transmission fluid cooling system consists of:

- fluid cooler inlet and outlet tubes.
- an in-tank fluid cooler inlet tube.
- a non-repairable in-tank transmission fluid cooler.
- an auxiliary fluid cooler inlet tube.
- an auxiliary transmission fluid cooler.
- an auxiliary fluid cooler return tube.

The transmission fluid flows from the transmission to the in-tank transmission fluid cooler, to the auxiliary transmission fluid cooler and returns to the transmission.

For fluid cooler flow testing, backflushing and cleaning procedures, refer to Section 307-01A or Section 307-01B .

6R75 Transmission With Auxiliary Transmission Fluid Cooler



Item	Part Number	Description
1	8005	Radiator
2	7H420	Transmission fluid cooler inlet and outlet tubes

Inspection and Verification

CAUTION: When internal wear or damage occurs in the transmission, metal particles, clutch plate material and band material can travel into the torque converter, the fluid cooler tubes, the in-tank transmission fluid cooler and the auxiliary transmission fluid cooler, if so equipped. These contaminants are a major cause of recurring transmission concerns. To prevent future concerns, remove these contaminants from the cooling system before placing the transmission back into use. Refer to Section 307-01A or Section 307-01B for fluid cooler flow testing, backflushing and cleaning.

1. Visually inspect for obvious signs of mechanical damage, incorrect component installation and system leaks. Repair as necessary.
   - Install a new or remanufactured radiator when fluid is found leaking from the in-tank transmission fluid cooler. Refer to Section 303-03 .
   - Install a new O-ring when transmission fluid is found leaking between the radiator transmission oil cooler and the transmission oil cooler fitting (not the cooler line into the fitting). Refer to the Component Test in this section.
   - Install a new auxiliary transmission fluid cooler if there is leakage from the fluid cooler. Refer to Auxiliary Transmission Fluid Cooler in this section.
2. If the fault is not visually evident, GO to Symptom Chart .

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action
• Transmission overheating	• Excessive vehicle or towing loads, severe vehicle use	• REFER to the vehicle specification manual for load and GVW/GCW information. REFER to the owner's guide.
	• Incorrect fluid level	• CHECK and, if necessary, ADJUST the fluid to the correct level. REFER to Section 307-01A or Section 307-01B .
	• Fluid condition	• CHECK fluid condition. REFER to Section 307-01A or Section 307-01B .
	• Incorrect fluid type	• REFER to Specifications in this section.
	• Transmission cooling system damaged, blocked, restricted or	• CARRY OUT the transmission fluid cooler flow test. REFER to Section

	installed incorrectly	307-01A or Section 307-01B .
	• System leaks	• REFER to Section 307-01A or Section 307-01B .
	• Engine overheating	• REFER to Section 303-03 .
	• Powertrain control system electrical inputs/outputs, vehicle wiring harnesses, powertrain control module (PCM), torque converter clutch (TCC) solenoid	• CARRY OUT on-board diagnostics. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, and Section 307-01A or Section 307-01B .
	• Internal transmission concerns	• REFER to Section 307-01A or Section 307-01B .
• Fluid leak at transmission in-tank cooler	• Transmission fluid cooler fitting	• REFER to the Component Test in this section.

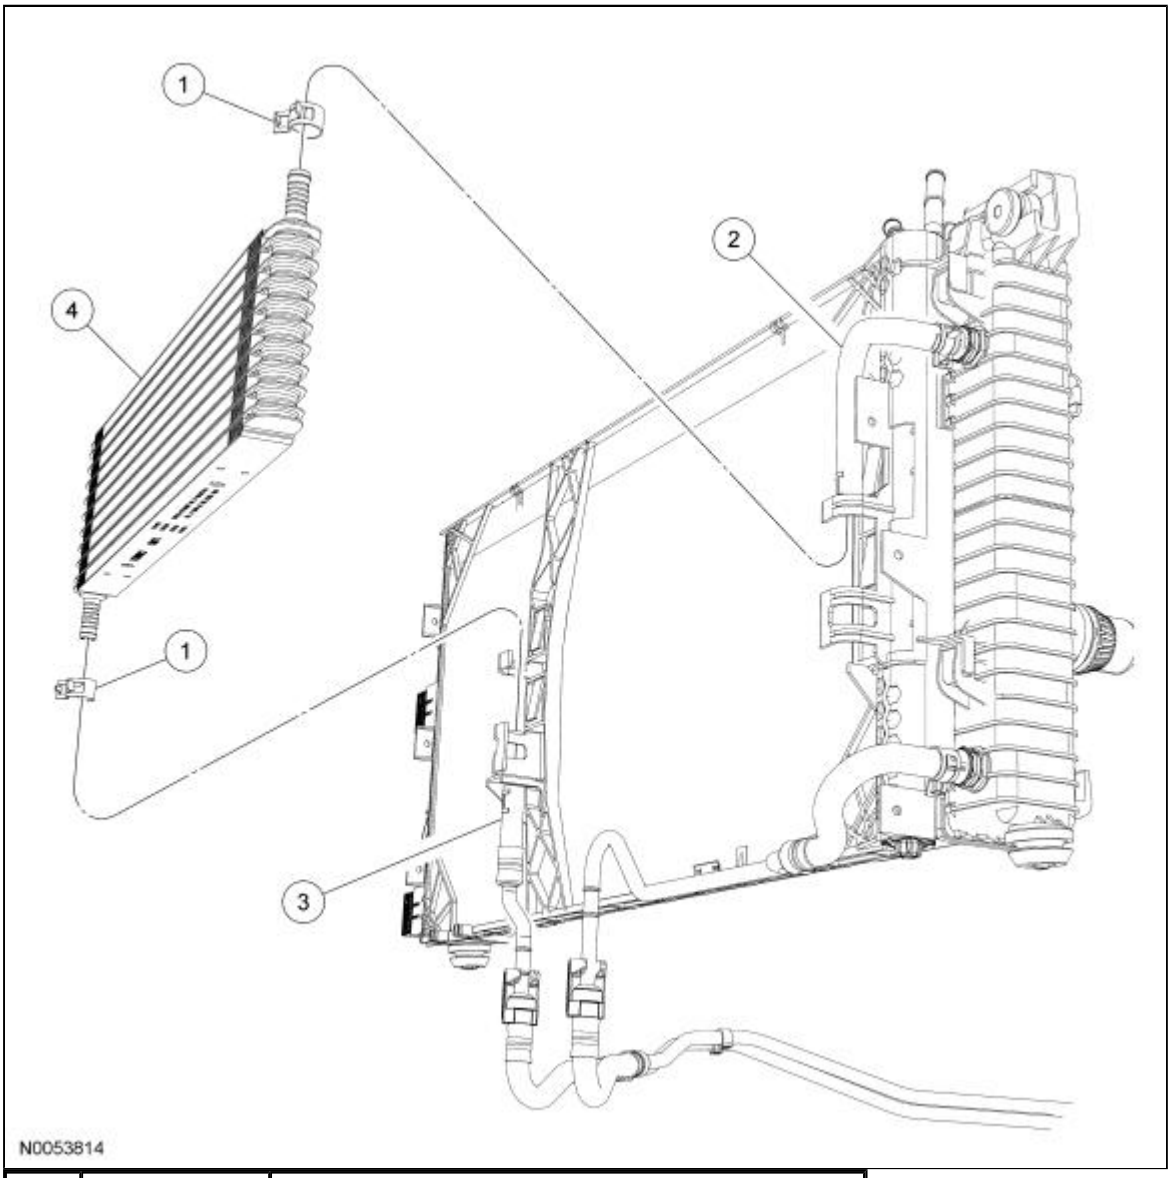
Component Test

Transmission Fluid Cooler Leaks at Radiator

Transmission fluid may leak between the radiator transmission fluid cooler and the transmission fluid cooler fitting (not the cooler line into the fitting), which may result in a residue of transmission fluid on the radiator tank around the fluid cooler fitting. The in-tank transmission fluid cooler is not serviceable. If installation of a new transmission fluid cooler is required, refer to Section 303-03 .

Auxiliary Transmission Fluid Cooler

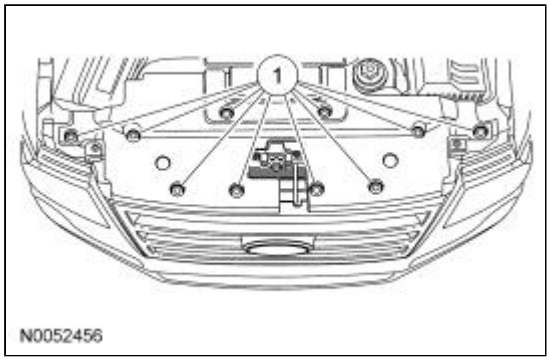
Printable View (240 KB)



Item	Part Number	Description
1	8287	Auxiliary transmission fluid cooler hose clamp
2	7F113	Auxiliary transmission fluid cooler inlet hose
3	7F112	Auxiliary transmission fluid cooler outlet hose
4	7A095	Auxiliary transmission fluid cooler

Removal

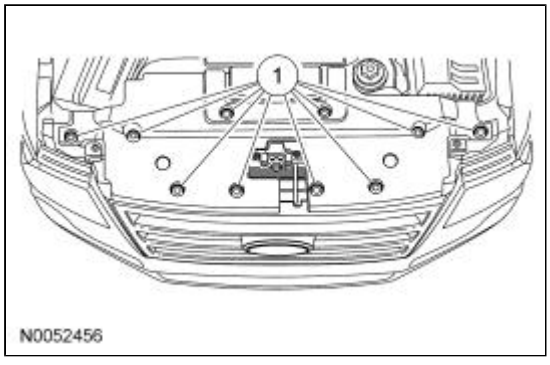
1. Remove the upper radiator cover.
    1. Remove the fasteners.



2. Remove and discard the auxiliary transmission fluid cooler inlet hose clamp.
3. Disconnect the auxiliary transmission fluid cooler inlet hose from the cooler.
4. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
5. Move the flexible air deflector aside, then remove and discard the auxiliary transmission fluid cooler outlet hose clamp.
6. Disconnect the auxiliary transmission fluid cooler outlet hose from the cooler.
7. Remove the auxiliary transmission fluid cooler.

Installation

1. Install the auxiliary transmission fluid cooler.
2. Connect the auxiliary transmission fluid cooler outlet hose to the cooler.
3. Install a new auxiliary transmission fluid cooler outlet hose clamp, then move the flexible air deflector back into place.
4. Connect the auxiliary transmission fluid cooler inlet hose to the cooler.
5. Install a new auxiliary transmission fluid cooler inlet hose clamp.
6. Install the upper radiator cover.
    1. Install the fasteners.



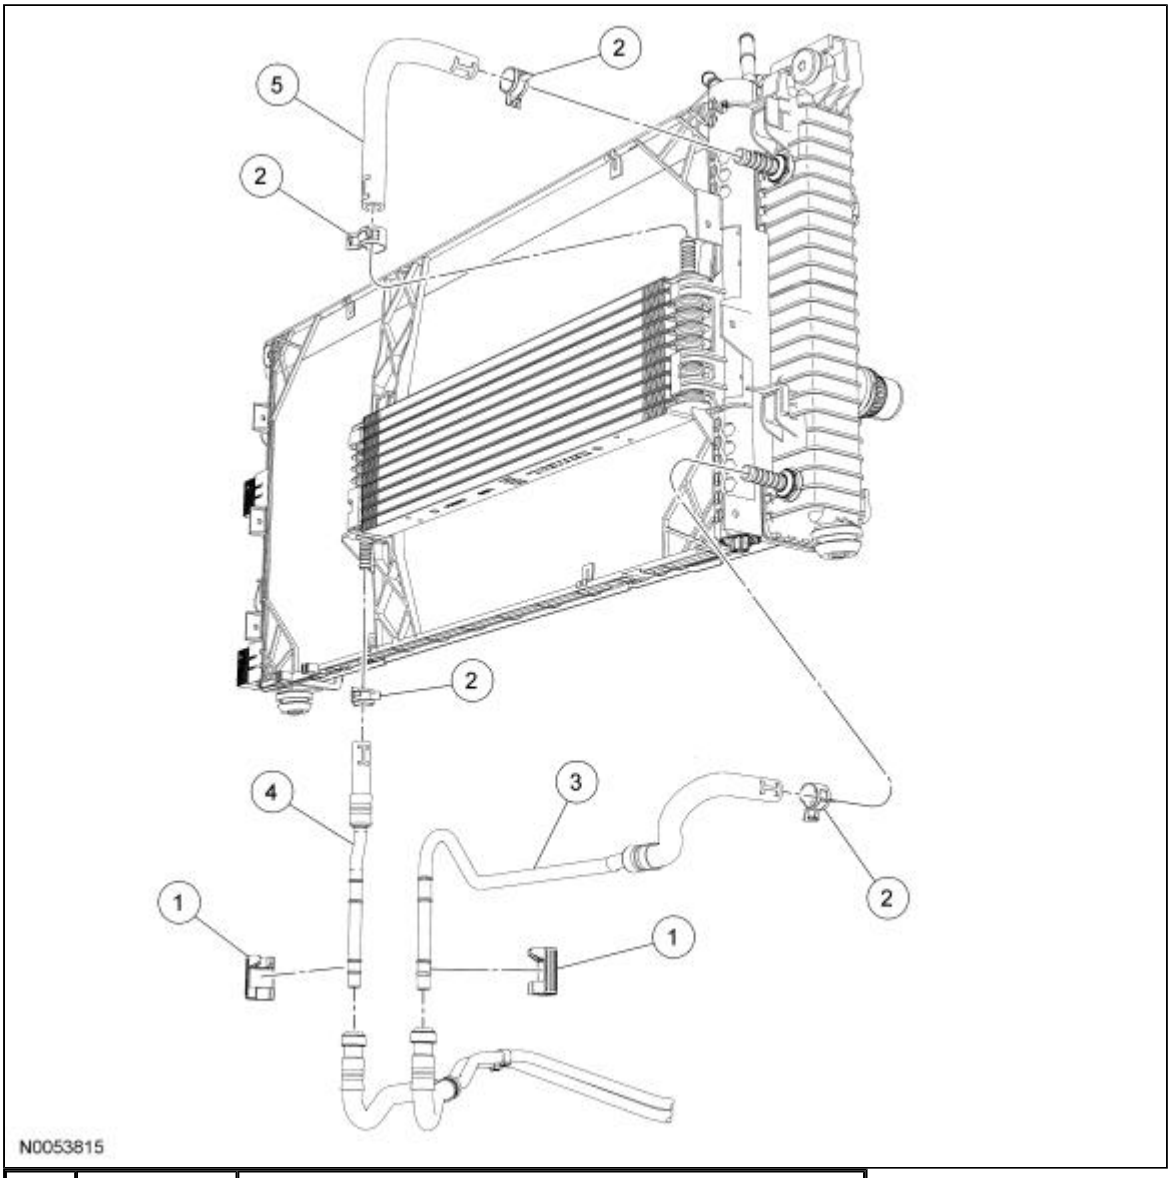
7. Fill the transmission with fluid and verify correct operation. Refer to Section 307-01A or Section 307-01B .

Transmission Fluid Cooler Hoses

Printable View (262 KB)

Special Tool(s)

ST2935A	Disconnect Tool, Transmission Cooler Line 307-459

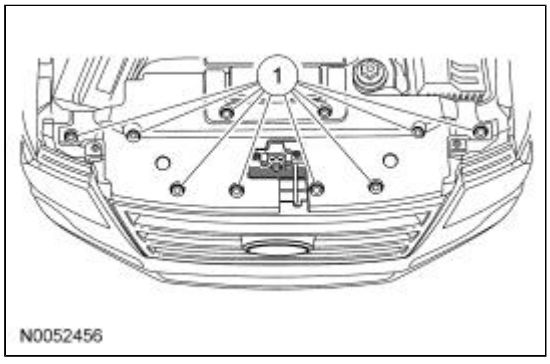


Item	Part Number	Description
1	7J081	Transmission fluid cooler inlet and outlet tube secondary latches

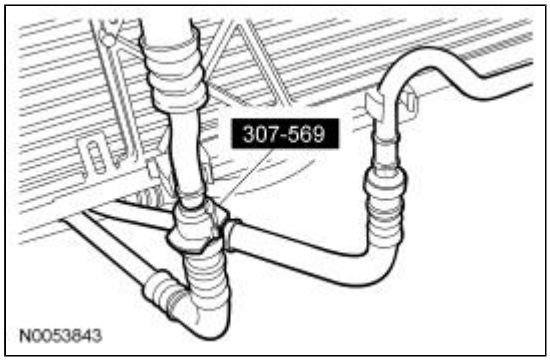
2	8287	Transmission fluid cooler hose clamp
3	7B028	Transmission fluid cooler inlet hose
4	7F112	Auxiliary transmission fluid cooler outlet hose
5	7F113	Auxiliary transmission fluid cooler inlet hose

Removal

1. Remove the upper radiator cover.
    1. Remove the fasteners.



2. Remove and discard the auxiliary transmission fluid cooler inlet hose clamps.
3. Disconnect the auxiliary transmission fluid cooler inlet hose from the coolers.
4. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
5. Move the flexible air deflector aside, then remove and discard the transmission fluid cooler tube secondary latches.
6. Using the special tool, disconnect the transmission fluid cooler hoses from the transmission fluid cooler tubes.



7. Remove and discard the transmission fluid cooler hose clamps.
8. Disconnect the transmission fluid cooler hoses from the coolers.

Installation

1. Connect the transmission fluid cooler hoses to the coolers.
2. Install new transmission fluid cooler hose clamps.

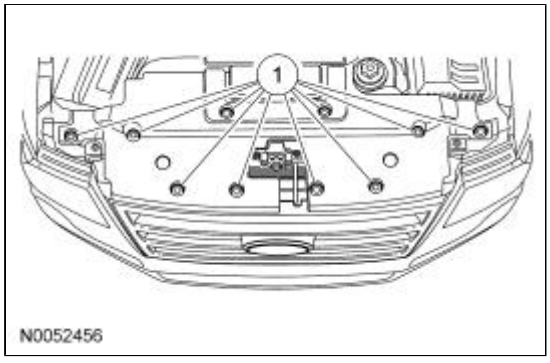
3. Connect the transmission fluid cooler hoses to the transmission fluid cooler tubes.

4. Install new transmission fluid cooler tube secondary latches, then move the flexible air deflector back into place.

5. Connect the auxiliary transmission fluid cooler inlet hose to the coolers.

6. Install new auxiliary transmission fluid cooler inlet hose clamps.

7. Install the upper radiator cover.
    1. Install the fasteners.



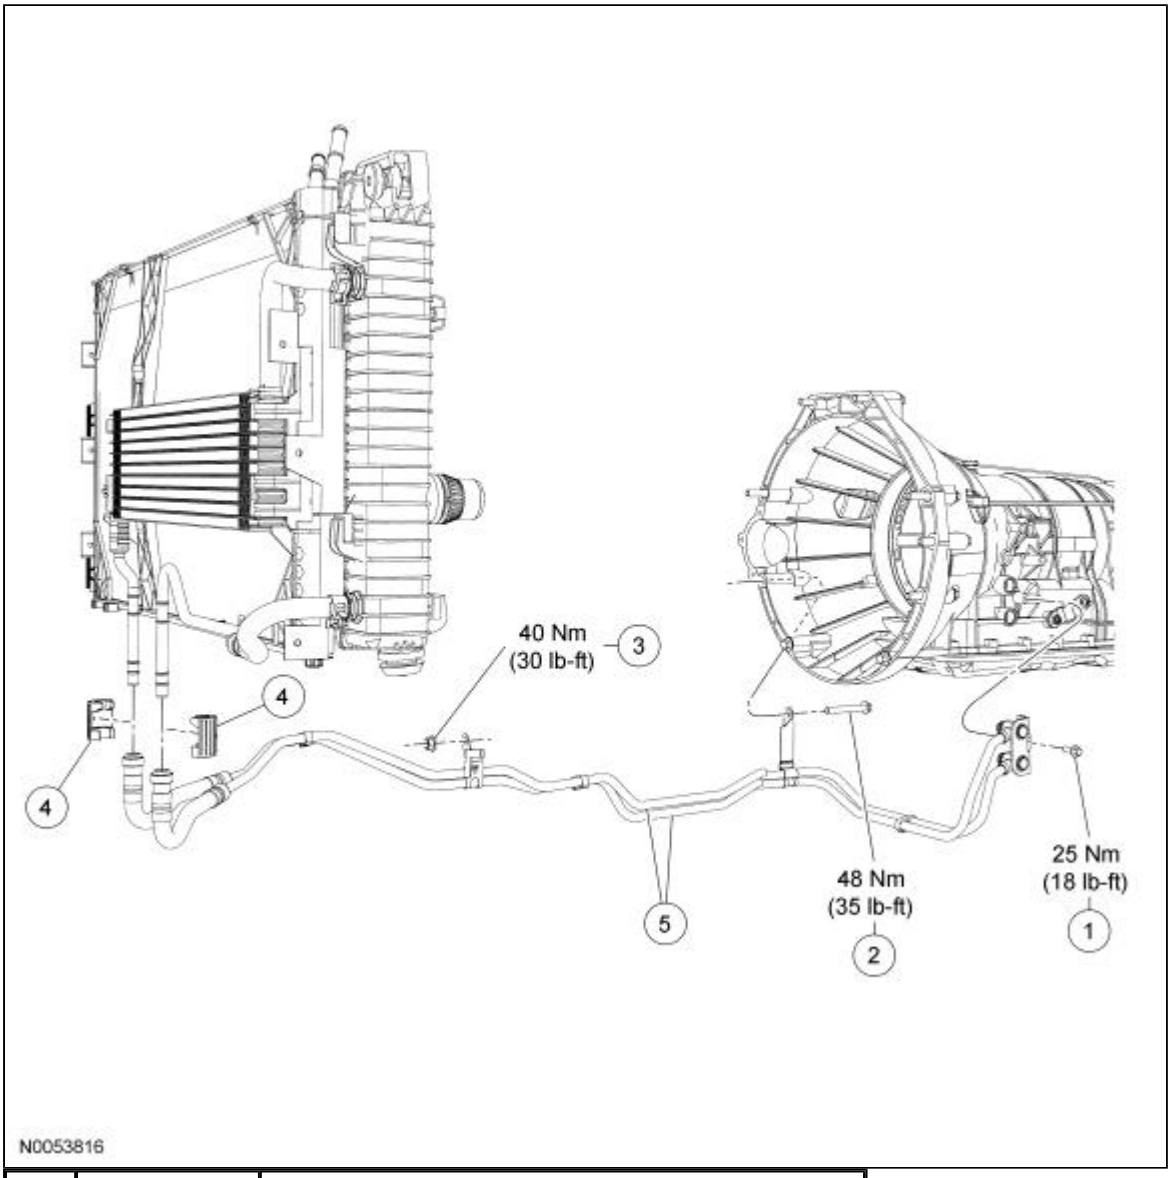
8. Fill the transmission with fluid and verify correct operation. Refer to Section 307-01A or Section 307-01B .

Transmission Fluid Cooler Tubes

Printable View (508 KB)

Special Tool(s)

ST2935A	Disconnect Tool, Transmission Cooler Line 307-569



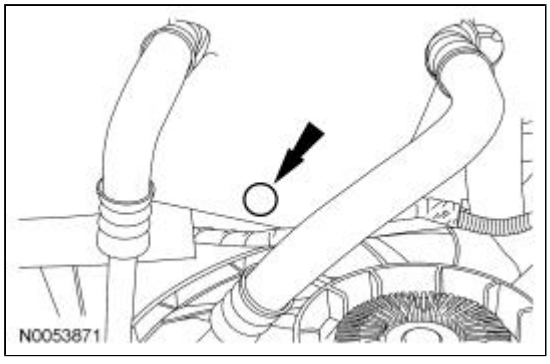
Item	Part Number	Description
1	W500023-S439	Transmission fluid cooler tube bracket bolt
2	—	Transmission fluid cooler tube bracket bolt at

		transmission
3	W707014-S441	Transmission fluid cooler tube bracket nut
4	7J081	Transmission fluid cooler inlet and outlet tube secondary latches
5	7H420	Transmission fluid cooler inlet and outlet tubes

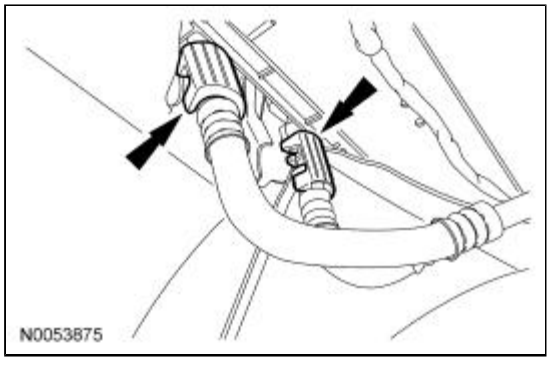
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

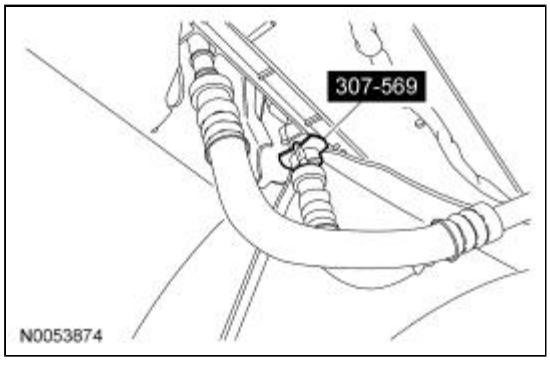
2. Remove the pushpin and move the air deflector aside.



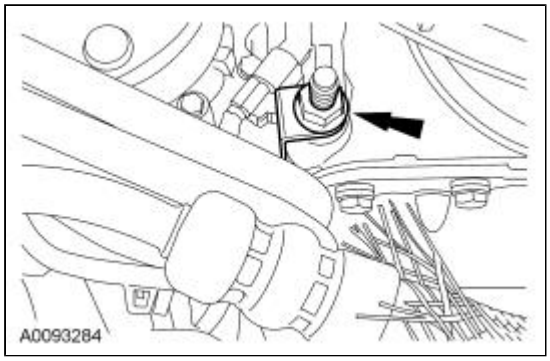
3. Remove the transmission cooler tube secondary latches.



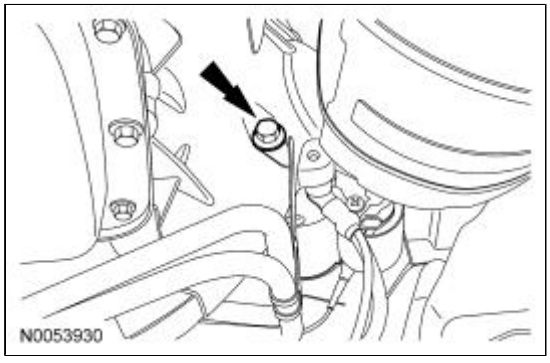
4. Using the special tool, disconnect the transmission fluid cooler tubes from the transmission fluid cooler hoses.



5. Remove the transmission fluid cooler tube bracket nut from the front of the engine.

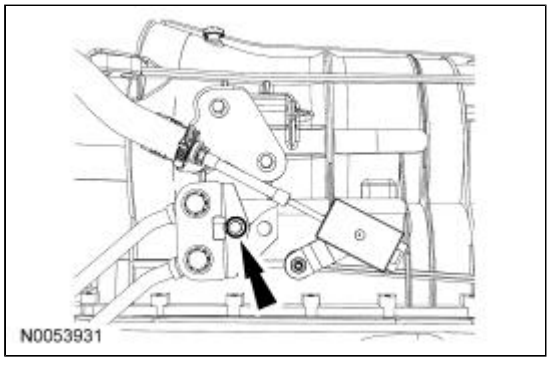


6. Remove the transmission fluid cooler tube bracket from the side of the transmission.

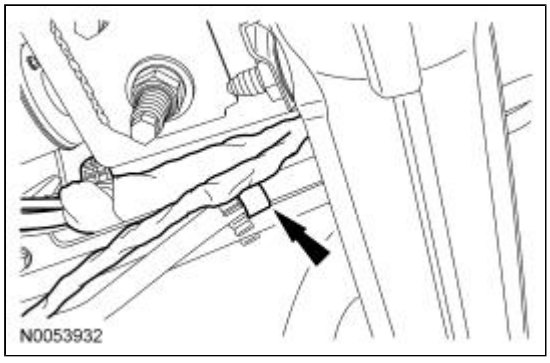


7. **NOTE:** The transmission fluid cooler tube O-rings may remain in the transmission case. Carefully remove them from the case if retained.

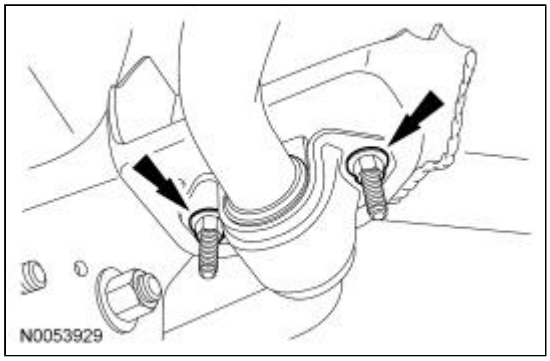
   Remove the bolt and disconnect the transmission fluid cooler tubes from the transmission.



8. Disconnect the electrical harness from the transmission cooler tubes.

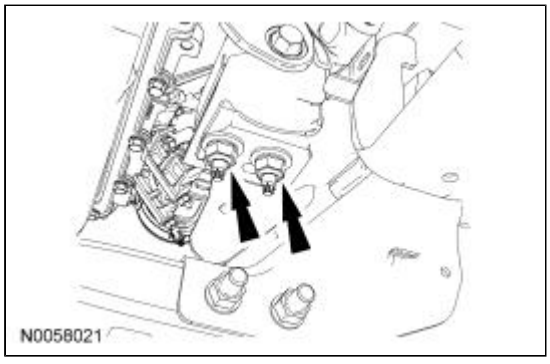


9. Remove the 4 nuts and lower the front sway bar.



10. **CAUTION: Only use hand tools when removing the engine mount nuts or damage to the engine mount may occur.**

    For four wheel drive (4WD), remove the LH engine mount nuts and lift the engine to gain clearance for the trans cooler tubes.

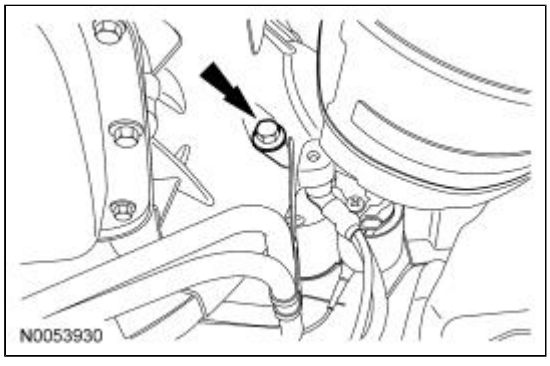


11. Remove the transmission fluid cooler tubes from the vehicle.

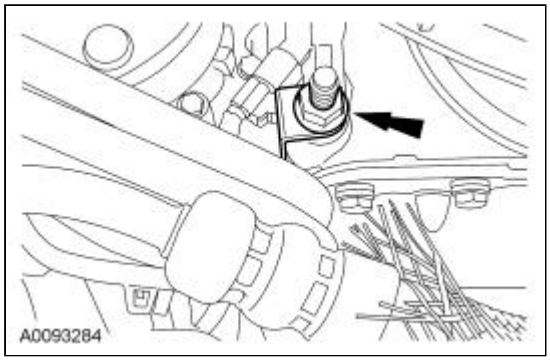
Installation

1. Position the transmission fluid cooler tubes in the vehicle.

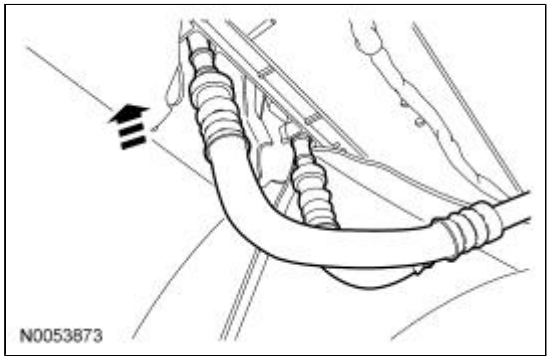
2. Install the bolt and transmission fluid cooler tube bracket to the side of the transmission.
   - Tighten to 48 Nm (35 lb-ft).



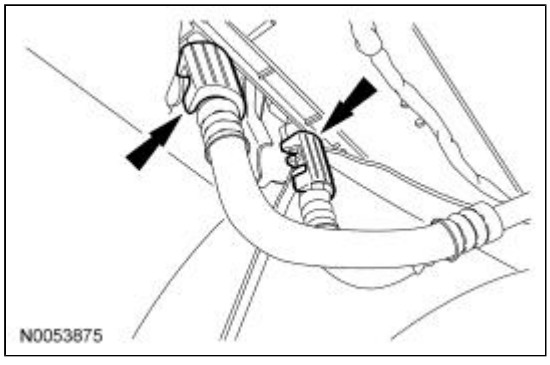
3. Install the nut and transmission fluid cooler tube bracket to the front of the engine.
   - Tighten to 40 Nm (30 lb-ft).



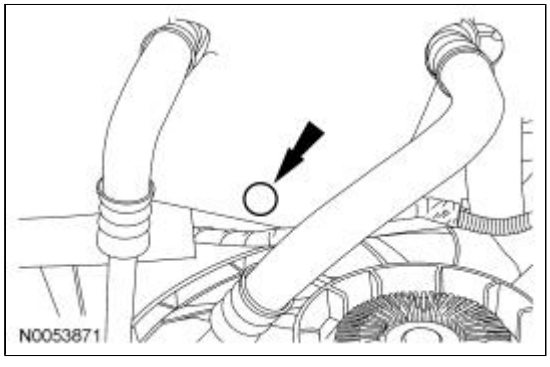
4. Connect the transmission fluid cooler tubes to the transmission fluid cooler hoses.



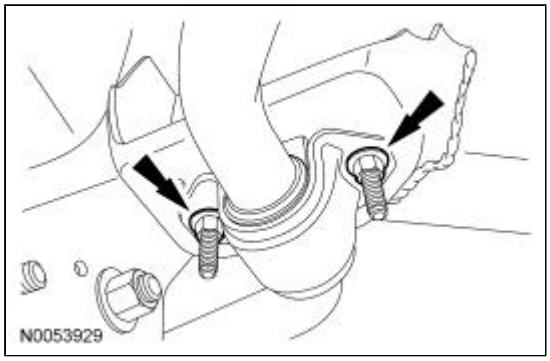
5. Install the transmission cooler tube secondary latches.



6. Reposition the air deflector and install the pushpin.

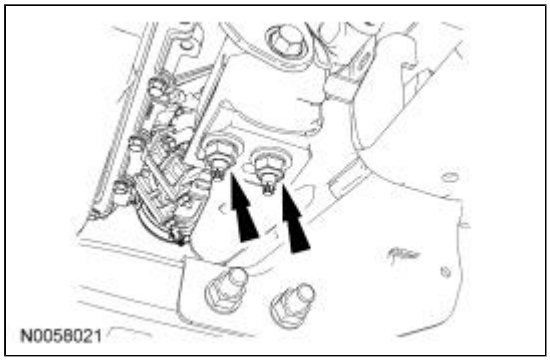


7. Position the sway bar in place and install the 4 nuts.
    - Tighten to 55 Nm (41 lb-ft).

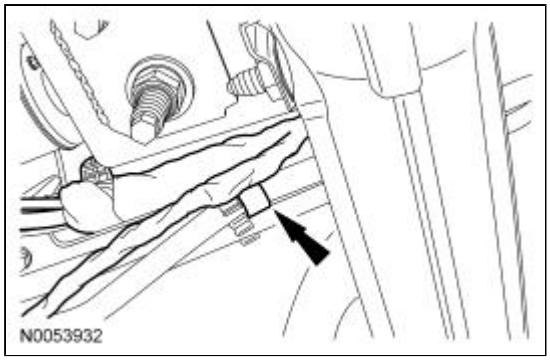


8. **CAUTION: Only use hand tools when installing the engine mount nuts or damage to the engine mount may occur.**

   For 4WD, lower the engine and install the LH engine mount nuts.
   - Tighten to 175 Nm (129 lb-ft).



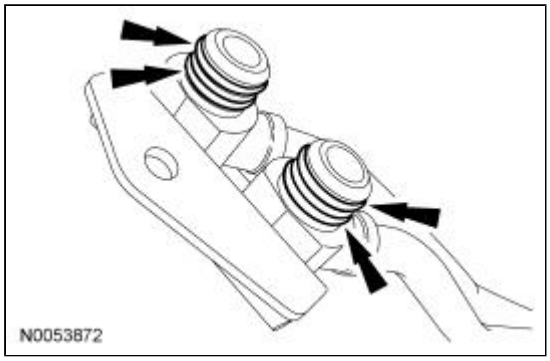
9. Connect the electrical harness to the transmission cooler tubes.



10. **NOTE:** Inspect the case to make sure that the old O-rings are not stuck in the case.

    NOTE: Install new O-rings on the ends of the cooler lines prior to installing.

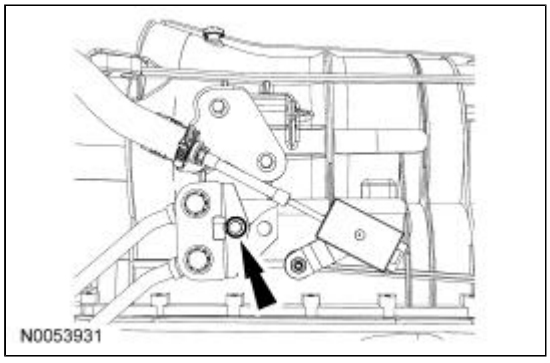
    Install new O-rings on the transmission fluid cooler tubes.



11. **NOTE:** Inspect the case to make sure that the old O-rings are not stuck in the case.

    NOTE: Install new O-rings on the ends of the cooler lines prior to installing.

    Position the transmission fluid cooler tubes into the transmission, then install the bolt.
    - Tighten to 25 Nm (18 lb-ft).



12. Fill the transmission with fluid and verify correct operation. Refer to Section 307-01A or Section 307-01B .

External Controls

Printable View (63 KB)

The transmission selector lever cable transfers the transmission operating mode from the selector lever to the automatic transmission. The indicated position of the transmission selector lever is transferred to the transmission through the steering column mounted selector lever on the 6R75 transmission, or the floor mounted selector lever on 6HP26 and 6R75 transmissions, then to the cable and down to the manual control lever on the transmission.

Shift Interlock System — Column

The shift interlock system prevents shifting from PARK unless the brake pedal is depressed. The shift interlock system consists of a shift interlock actuator mounted at the upper end of the steering column. If the ignition switch is in the RUN position, the shift interlock actuator is on unless the brake pedal is depressed.

Shift Interlock System — Floor

The shift interlock system prevents shifting from PARK unless the brake pedal is depressed. The shift interlock system consists of a shift interlock actuator mounted on the floor selector lever. If the ignition switch is in the RUN position, the shift lock actuator is on unless the brake pedal is depressed.

Transmission Control (TC) Switch

The transmission control (TC) switch is a momentary contact switch that is located on the end of the column selector lever or on the floor selector lever knob. Pushing the TC switch will either disengage or engage the overdrive function of the automatic transmission. If OVERDRIVE is disengaged, the word OD/OFF will illuminate on the instrument panel.

External Controls — Column Shift

Printable View (141 KB)

Refer to Wiring Diagrams Cell 37 , Shift Lock for schematic and connector information.

Special Tool(s)

ST1137-A	73 Digital Multimeter 105-R0051 or equivalent

Inspection and Verification

1. Verify the customer concern by operating the transmission external control.
2. Visually inspect for obvious signs of mechanical and electrical damage; refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical

• Damaged brake shift interlock actuator (BSIA)
• Damaged transmission control (TC) switch
	• Failed fuse(s)
	  ▪ Smart power distribution junction box (SPDJB) 5 (10A)
	  ▪ Power distribution box (PDB) 31 (15A)
	• Damaged wiring harness
	• Loose or corroded connections

3. If the fault is not visually evident, determine the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action

• The brake shift interlock system does not release/lock correctly	• Circuitry
	• Fuse(s):
	  ▪ SPDJB 5 (10A)
	  ▪ PDB 31 (15A)
	• BSIA
	• Brake pedal position (BPP) switch
		• Go To Pinpoint Test A .

• The shift control is out of correct gear relationship	• Transmission selector lever cable and bracket	• Go To Pinpoint Test B .

	• Selector lever indicator • Shift control linkage	
• Transmission range (TR) indicator does not correspond to the gear	• Transmission selector lever cable bracket	• TIGHTEN bolts holding the transmission selector lever cable bracket.
	• EPRNDL malfunction	• REFER to Section 413-01 .
	• Transmission selector lever cable loose in the transmission retainer bracket	• VERIFY cable is fully seated in the transmission bracket.
	• Shift linkage	• VERIFY transmission selector lever cable adjustment. REFER to Selector Lever Cable Adjustment in this section.
	• Clip securing the transmission selector lever cable to the steering column bracket	• INSTALL clip correctly.
• Transmission range indicator lamp does not illuminate	• EPRNDL • Circuitry	• REFER to Section 413-00 .
• TC switch does not operate correctly	• TC switch • TC switch not cycled during self-test • Transmission control module (TCM) • Circuitry	• Go To Pinpoint Test C .
• The transmission control indicator lamp (TCIL) is not operating correctly	• Bulb • Instrument cluster • TCM	• REFER to Section 413-01 .
• Rattle, buzz or other noise	• Selector lever knob	• INSTALL a new selector lever knob.
	• Selector lever	• TIGHTEN housing bolts.
	• Cable assembly grommet	• SECURE grommet to floor panel.
• Water enters inside the vehicle	• Cable assembly grommet	• SECURE grommet to floor panel.
	• Torn cable assembly grommet	• INSTALL a new transmission selector lever cable.
• Excessive shift effort	• Transmission selector lever cable	• INSTALL a new transmission selector lever cable.
	• Cable bracket	• ADJUST cable. TIGHTEN cable bracket screws.
• Transmission selector lever will not shift	• Transmission selector lever cable	• INSTALL a new transmission selector lever cable.

	• Column bracket clip • Broken transmission selector lever cable	• INSTALL a new bracket clip. • INSTALL a new transmission selector lever cable.

Pinpoint Tests

PINPOINT TEST A: THE SHIFT INTERLOCK SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

Test Step	Result / Action to Take
A1 TEST THE BRAKE LIGHTS	
• Key in ON position. • Apply the brake pedal and observe the brake lights. • **Do the brake lights illuminate?**	**Yes** GO to A2 . **No** REFER to Section 417-01 .
A2 TEST SPDJB FUSE 5 (10A)	
• Check fuse: SPDJB FUSE 5 (10A). • **Is the resistance less than 5 ohms?**	**Yes** GO to A4 . **No** GO to A3 .
A3 CHECK CIRCUIT CDC37 (GY/VT) FOR A SHORT TO GROUND	
• Disconnect: BSIA C2008. • Disconnect: SPDJB C2280e. • Inspect for damaged or pushed-out pins, corrosion or loose wires. Repair as necessary. • Measure the resistance between brake shift interlock actuator (BSIA) C2008-3, circuit CDC37 (GY/VT), harness side and ground.  N0054929 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A4 . **No** SERVICE circuit CDC37 (GY/VT) for short to ground. TEST the system for normal operation.
A4 CHECK CIRCUIT CDC37 (GY/VT) FOR AN OPEN	
• Measure the resistance between BSIA C2008-3, circuit CDC37 (GY/VT), harness side and smart power distribution junction box (SPDJB) C2280e-23, circuit CDC37 (GY/VT), harness side.	**Yes** GO to A5 . **No** SERVICE circuit CDC37 (GY/VT) for an open. TEST the system for normal

 N0054930 • **Is the resistance less than 5 ohms?**	operation.
A5 TEST CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between BSIA C2008-1, circuit GD138 (BK/WH), harness side and ground.  N0054931 • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** SERVICE circuit GD138 (BK/WH) for an open. TEST the system for normal operation.
A6 TEST CIRCUIT CDC37 (GY/VT) FOR VOLTAGE	
• Connect: SPDJB C2280e. • Measure the voltage at the BSIA C2008-3, circuit CDC37 (GY/VT), harness side, while applying the brake pedal  N0054932 • **Is the voltage greater than 10 volts with the brake pedal applied?**	**Yes** INSTALL a new BSIA. Refer to Brake Shift Interlock Actuator — Column Shift in this section. **No** INSTALL a new SPDJB. Refer to Section 418-00 .

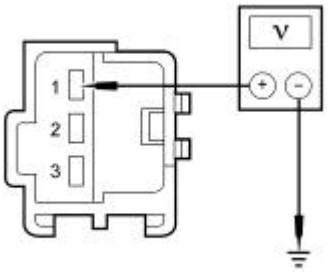
PINPOINT TEST B: THE SHIFT CONTROL IS OUT OF CORRECT GEAR RELATIONSHIP

Test Step	Result / Action to Take
B1 CHECK THE SHIFT CONTROL LINKAGE	
• Apply the brake pedal. • Gain access to the column shift control linkage. • Actuate the transmission selector lever in all ranges.	**Yes** INSTALL new column shift control linkage. TEST the system for normal operation. **No**

• Observe all linkages during operation. • **Is the linkage damaged?**	GO to B2 .
B2 CHECK THE TRANSMISSION SELECTOR LEVER CABLE	
• Check transmission selector lever cable and bracket for installation and tightness. • **Is the transmission selector lever cable correctly installed and adjusted?**	**Yes** VERIFY the transmission selector lever cable adjustment. REFER to Selector Lever Cable Adjustment in this section. ADJUST the transmission selector lever cable if necessary. GO to B3 . **No** REPAIR as necessary. TEST the system for normal operation.
B3 CHECK THE LINKAGE/CABLE FOR CORRECT GEAR RELATIONSHIP	
• Apply the brake pedal. • Actuate the transmission selector lever in all ranges. • **Does the indicator match the gear selection?**	**Yes** System OK. TEST the system for normal operation. **No** REFER to Section 413-01 .

PINPOINT TEST C: THE TRANSMISSION CONTROL (TC) SWITCH DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
C1 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Disconnect: TC switch C2135. • Inspect for damaged or pushed-out pins, corrosion or loose wires. Repair as necessary. • Measure the resistance between TC switch C2135-1, circuit GD133 (BK), harness side and ground.  N0054933 • **Is the resistance less than 5 ohms?**	**Yes** GO to C2 . **No** REPAIR circuit GD133 (BK). RECONNECT all components. TEST the system for normal operation.
C2 CHECK CIRCUIT GD133 (BK) FOR A SHORT TO VOLTAGE	
• Measure the voltage between TC switch C2135-1, circuit GD133 (BK), harness side and ground.	**Yes** REPAIR circuit GD133 (BK). RECONNECT all components. TEST the system for normal operation. **No** GO to C3 .



N0054934

- **Is the voltage greater than 10 volts?**

C3 CHECK CIRCUIT CET34 (BN/GN) FOR AN OPEN • Disconnect: TCM C1548. • Inspect for damaged or pushed-out pins, corrosion or loose wires. Repair as necessary. • Measure the resistance between TC switch C2135-2, circuit CET34 (BN/GN) harness side, and TCM C1548-1, circuit CET34 (BN/GN) harness side.  N0054935 • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR circuit CET34 (BN/GN). RECONNECT all components. TEST the system for normal operation.
C4 CHECK CIRCUIT CET34 (BN/GN) FOR A SHORT TO VOLTAGE • Measure the voltage between TC switch C2135-2, circuit CET34 (BN/GN) harness side, and ground.  N0054936 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit CET34 (BN/GN). RECONNECT all components. TEST the system for normal operation. **No** GO to C5 .
C5 CHECK THE TC SWITCH • Measure the resistance between TC switch C2135-1 and C2135-2, while cycling the switch.	**Yes** INSTALL a new TCM. REFER to Section 307-01B . RECONNECT all components. TEST the system for normal operation. **No** INSTALL a new transmission selector lever. REFER to

 N0054937 • **Is the resistance less than 5 ohms while pressed and greater than 10k ohms when released?**	Selector Lever — Column Shift in this section. RECONNECT all components. TEST the system for normal operation.

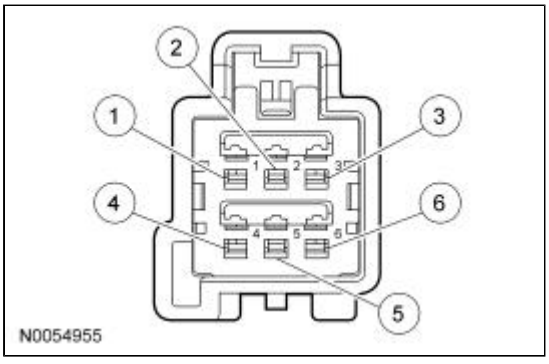
• Transmission range indicator does not correspond to the gear	• Transmission selector lever cable bracket	• TIGHTEN bolts holding transmission selector lever cable bracket.
	• Transmission selector lever cable loose from the transmission retainer bracket	• SECURE transmission selector lever cable.
	• Shift linkage	• VERIFY transmission selector lever cable adjustment. REFER to Selector Lever Cable Adjustment in this section. ADJUST transmission selector lever cable if necessary. If selector lever cable adjustment is correct, INSTALL a new main control valve body. REFER to Section 307-01A or Section 307-01B .
• Transmission range indicator does not illuminate	• Bulb • Circuitry	• REFER to Section 413-00 .
• The transmission control (TC) switch does not operate correctly	• TC switch • TC switch not cycled during self-test • Powertrain control module • Circuitry	• Go To Pinpoint Test F .
• The transmission control indicator lamp (TCIL) is not operating correctly	• Bulb • Instrument cluster • Powertrain control module	• REFER to Section 413-01 .
• Rattle, buzz or other noise	• Selector lever knob • Cable assembly grommet • Transmission selector lever	• INSTALL a new selector lever knob. • SECURE grommet to floor panel. • TIGHTEN housing bolts.
• Water enters inside the vehicle	• Cable assembly grommet • Torn selector lever cable assembly grommet	• SECURE grommet to floor panel. • INSTALL a new selector lever cable.
• Excessive shift effort	• Transmission selector lever cable	• INSTALL a new transmission selector lever cable.

	• Cable bracket	• ADJUST cable. TIGHTEN cable bracket screws.
• Transmission selector lever will not shift	• Transmission selector lever cable • Brake shift interlock failure • Selector lever knob • Broken transmission selector lever	• REINSTALL transmission selector lever cable. • Go To Pinpoint Test D . • INSTALL a new selector lever knob. • INSTALL a new transmission selector lever.

Pinpoint Tests



Pin Number	Circuit Function
1	Solenoid Control
2	Park Detect
3	Illumination
4	Ground
5	TC Switch
6	TC Switch

Pin-Out Table

Pin to Pin		Function	Resistance Reading	Selector Lever Position
1	4	BSIA Solenoid	22-26 ohms	Any
2	4	Park Detect Switch	Open (greater than 10K ohms)	P with knob release button not pressed (released)
2	4	Park Detect Switch	Closed (less than 5 ohms)	R, N, (D), 3, 2, 1
5	6	TC Switch	Open (greater than 10K ohms)	With button not pressed (released)
5	6	TC Switch	Closed (less than 5 ohms)	With button pressed

PINPOINT TEST D: THE SHIFT INTERLOCK SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

Test Step	Result / Action to Take
D1 TEST THE BRAKE LIGHTS • Key in ON position. • Apply the brake pedal and observe the brake lights. • **Do the brake lights illuminate?**	**Yes** GO to D2 . **No** REFER to Section 417-01 .
D2 TEST SPDJB FUSE 5 (10A) • Check fuse: SPDJB FUSE 5 (10A). • **Is the resistance less than 5 ohms?**	**Yes** GO to D4 . **No** GO to D3 .
D3 CHECK CIRCUIT CDC37 (GY/VT) FOR A SHORT TO GROUND • Disconnect: Selector Lever C2096. • Disconnect: SPDJB C2280e. • Inspect for damaged or pushed-out pins, corrosion or loose wires. Repair as necessary. • Measure the resistance between selector lever C2096-1, circuit CDC37 (GY/VT), harness side and ground.  N0054975 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D4 . **No** SERVICE circuit CDC37 (GY/VT) for short to ground. TEST the system for normal operation.
D4 CHECK CIRCUIT CDC37 (GY/VT) FOR AN OPEN • Measure the resistance between selector lever C2096-1, circuit CDC37 (GY/VT), harness side and smart power distribution junction box (SPDJB) C2280e-23, circuit CDC37 (GY/VT), harness side.  N0054976 • **Is the resistance less than 5 ohms?**	**Yes** GO to D5 . **No** SERVICE circuit CDC37 (GY/VT) for an open. TEST the system for normal operation.
D5 TEST CIRCUIT GD143 (BK/VT) FOR AN OPEN • Measure the resistance between selector lever C2096-4, circuit GD143 (BK/VT), harness side and ground.	**Yes** GO to D6 .

 N0054977 • **Is the resistance less than 5 ohms?**	**No** SERVICE circuit GD143 (BK/VT) for an open. TEST the system for normal operation.
D6 TEST CIRCUIT CDC37 (GY/VT) FOR VOLTAGE	**Yes** INSTALL a new selector lever. REFER to Selector Lever — Floor Shift in this section. **No** INSTALL a new SPDJB. REFER to Section 418-00.
• Connect: SPDJB C2280e. • Measure the voltage at selector lever C2096-1, circuit CDC37 (GY/VT), harness side, while applying the brake pedal  N0054978 • **Is the voltage greater than 10 volts with the brake pedal applied?**	

PINPOINT TEST E: THE SHIFT CONTROL IS OUT OF CORRECT GEAR RELATIONSHIP

Test Step	Result / Action to Take
E1 CHECK THE SHIFT CONTROL LINKAGE	
• Apply the brake pedal. • Gain access to the shift control linkage. • Actuate the transmission selector lever in all ranges. • Observe all linkages during operation. • **Is the shift linkage damaged?**	**Yes** INSTALL a new selector lever. REFER to Selector Lever — Floor Shift in this section. TEST the system for normal operation. **No** GO to E2.
E2 CHECK THE TRANSMISSION SELECTOR LEVER CABLE	
• Check the transmission selector lever cable and bracket installation and tightness. • **Is the transmission selector lever cable correctly installed and adjusted?**	**Yes** VERIFY the transmission selector lever cable adjustment. REFER to Selector Lever Cable Adjustment in this section. ADJUST the transmission selector lever cable if necessary. If selector lever cable adjustment is correct, INSTALL a new main control valve body. REFER to Section 307-01A or Section 307-01B. GO to E3.

	No REPAIR as necessary. TEST the system for normal operation.
E3 CHECK THE LINKAGE/CABLE FOR CORRECT GEAR RELATIONSHIP	
• Apply the brake pedal. • Actuate the transmission range selector lever in all ranges. • **Does the indicator match the gear selection?**	**Yes** System OK. TEST the system for normal operation. **No** REFER to Selector Lever Cable Adjustment in this section. TEST the system for normal operation.

PINPOINT TEST F: THE TRANSMISSION CONTROL (TC) SWITCH DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
F1 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Disconnect: Selector lever C2096. • Inspect for damaged or pushed-out pins, corrosion or loose wires. Repair as necessary. • Measure the resistance between selector lever C2096-6, circuit GD133 (BK), harness side, and ground.  N0054979 • **Is the resistance less than 5 ohms?**	**Yes** GO to F2. **No** REPAIR circuit GD133 (BK). RECONNECT all components. TEST the system for normal operation.
F2 CHECK CIRCUIT GD133 (BK) FOR A SHORT TO VOLTAGE	
• Measure the voltage between selector lever C2096-6, circuit GD133 (BK), harness side, and ground.  N0054980 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit GD133 (BK). RECONNECT all components. TEST the system for normal operation. **No** GO to F3.
F3 CHECK CIRCUIT CET34 (BN/GN) FOR AN OPEN	
• Disconnect: TCM C1548. • Inspect for damaged or pushed-out pins, corrosion or	**Yes** GO to F4.

loose wires. Repair as necessary. • Measure the resistance between selector lever C2096-5, circuit CET34 (BN/GN) harness side, and TCM C1548-1, circuit CET34 (BN/GN) harness side.  N0054981 • **Is the resistance less than 5 ohms?**	**No** REPAIR circuit CET34 (BN/GN). RECONNECT all components. TEST the system for normal operation.
F4 CHECK CIRCUIT CET34 (BN/GN) FOR A SHORT TO VOLTAGE	
• Measure the voltage between selector lever C2096-5, circuit CET34 (BN/GN) harness side, and ground.  N0055560 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit CET34 (BN/GN). RECONNECT all components. TEST the system for normal operation. **No** GO to F5 .
F5 CHECK THE TC SWITCH	
• Measure the resistance between selector lever C2096-5 and C2096-6, while cycling the switch.  N0054983 • **Is the resistance less than 5 ohms while pressed and greater than 10k ohms when released?**	**Yes** INSTALL a new TCM. REFER to Section 307-01A or Section 307-01B . RECONNECT all components. TEST the system for normal operation. **No** INSTALL a new transmission selector lever. REFER to Selector Lever Knob in this section. RECONNECT all components. TEST the system for normal operation.

Brake Shift Interlock Override — Column Shift

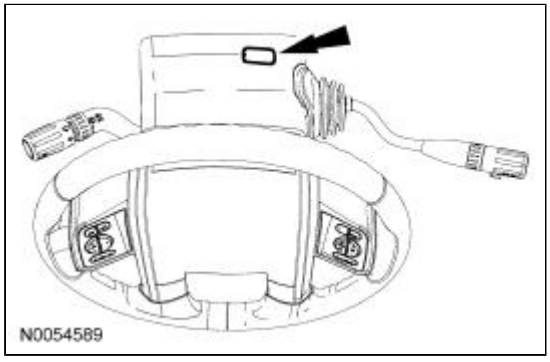
Printable View (119 KB)

NOTE: If it is necessary to use the override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown and the brake lights are not operational. Before driving the vehicle, verify that the brake lights are working.

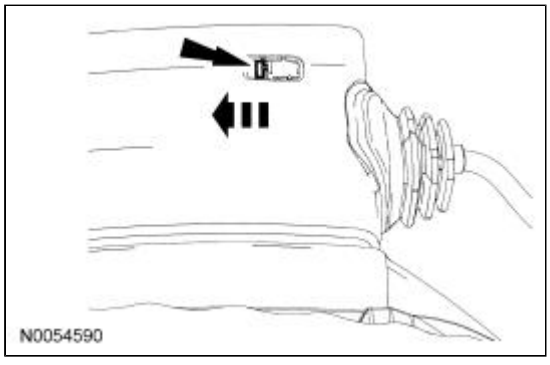
This vehicle is equipped with a brake shift interlock feature that prevents the selector lever from being moved out of PARK when the ignition is in the ON position unless the brake pedal is depressed.

If the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is depressed:

1. Apply the parking brake.
2. Turn the key to the ON position.
3. Remove the access panel.



4. Using an suitable tool, move the brake shift interlock actuator spindle outward, apply the brake, and move the selector lever into NEUTRAL.



5. Start the vehicle.
6. To install, reverse the procedure.

Brake Shift Interlock Override — Floor Shift

Printable View (104 KB)

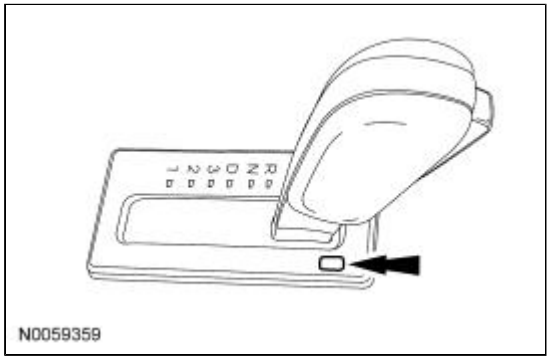
NOTE: If it is necessary to use the override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown and the brake lights are not operational. Before driving the vehicle, verify that the brake lights are working.

This vehicle is equipped with a brake shift interlock feature that prevents the selector lever from being moved out of PARK when the ignition is in the ON position unless the brake pedal is depressed.

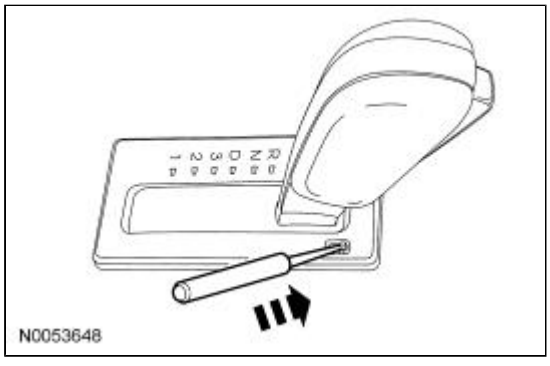
If the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is depressed:

1. Apply the parking brake and remove the ignition key.
2. **NOTE:** Relief located at the front of the access panel.

   Remove the access panel.



3. Using an suitable tool, depress the brake shift interlock override mechanism on the selector lever, apply the brake, depress the button on the selector lever and move the selector lever into NEUTRAL.



4. Start the vehicle.
5. To install, reverse the procedure.

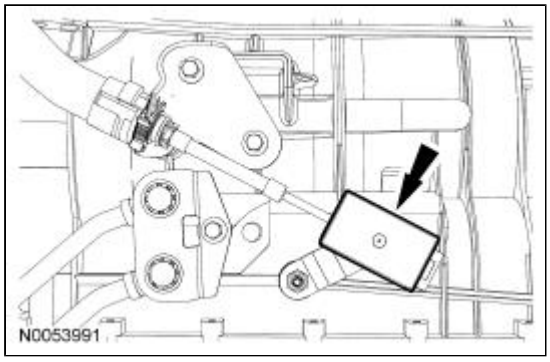
Selector Lever Cable Adjustment

Printable View (293 KB)

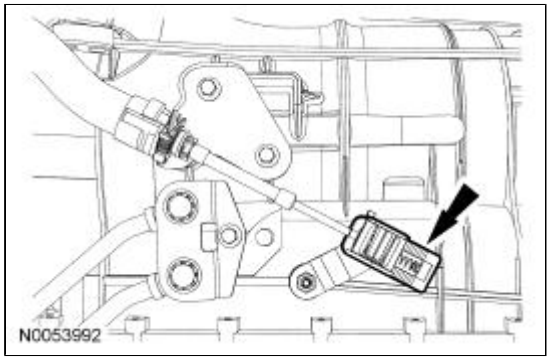
1. With the vehicle in NEUTRAL, position the vehicle on a hoist. For additional information, refer to Section 100-02 .

2. Place the selector lever in the DRIVE position.

3. If equipped, remove the heat shield.

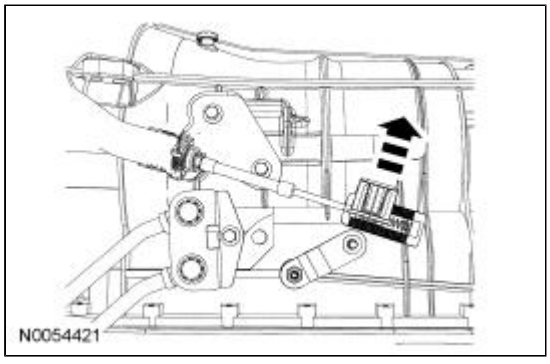


4. Disconnect the selector lever cable from the manual control lever.



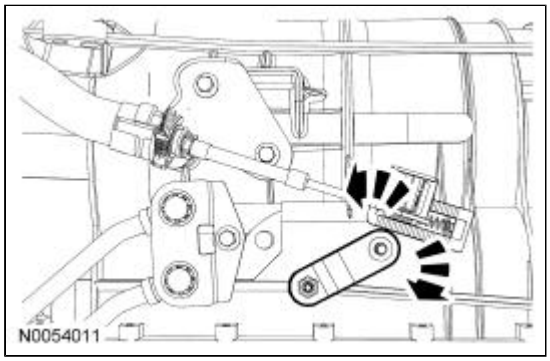
5. **NOTE:** Make sure the cable moves freely.

   Unlock the lock tab on the selector lever cable.



6. Place the manual control lever in the DRIVE position.

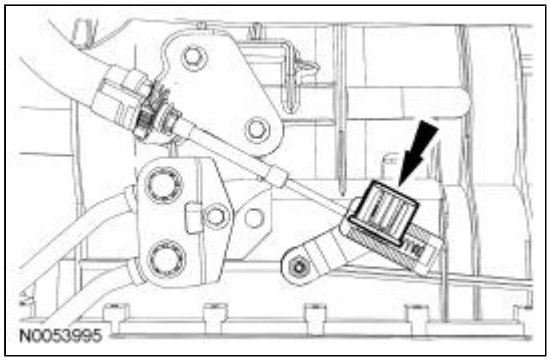
- Place the manual control lever in the 1st gear position.
- Move the manual control lever 3 detents to the DRIVE position.



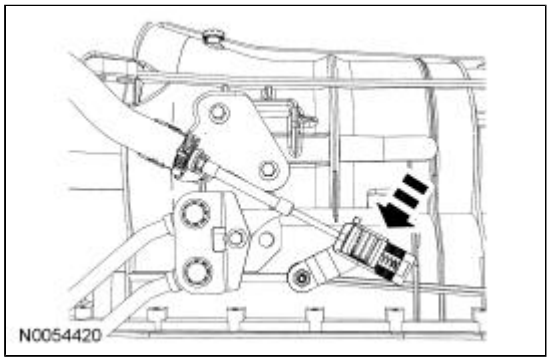
7. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

   NOTE: Apply pressure to the selector lever cable end while connecting it to the manual lever to make sure the selector lever has not moved out of the DRIVE position.

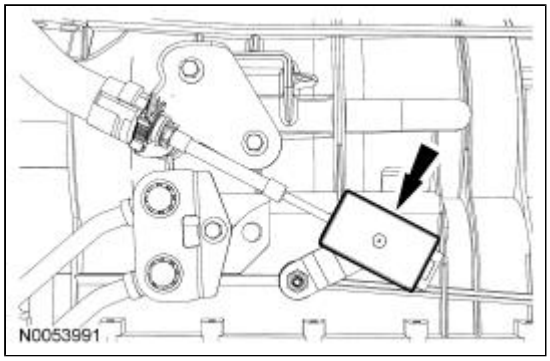
   Connect the selector lever cable to the manual control lever.
   - Listen for the audible click.
   - Pull back on the selector lever cable to make sure it is correctly installed.



8. Lock the selector lever cable lock tab.



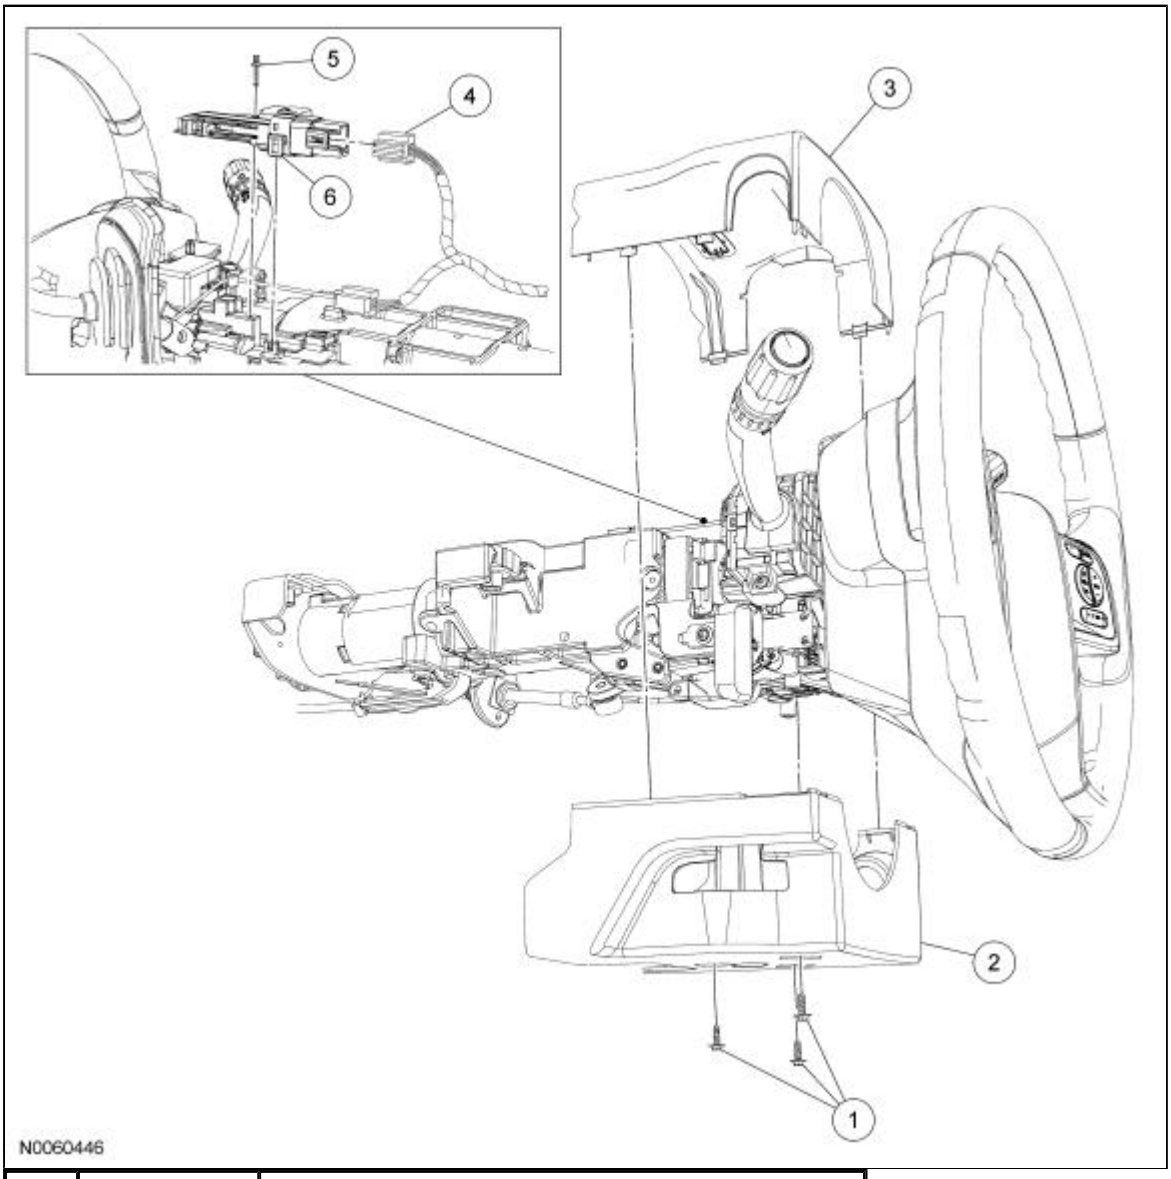
9. If equipped, install the heat shield.



10. Carefully move the manual control lever from detent to detent and compare with transmission settings. Verify that the vehicle will start in PARK or NEUTRAL and backup lamps illuminate in REVERSE. If not, Steps 1 through 9 must be repeated.
    - Readjust if necessary.

Brake Shift Interlock Actuator — Column Shift

Printable View (252 KB)



Item	Part Number	Description
1	W710485-S	Lower steering column shroud screws
2	3533-B	Lower steering column shroud
3	3530-B	Upper steering column shroud
4	—	Brake shift interlock actuator electrical connector
5	3F907-A	Brake shift interlock actuator screw
6	3F770	Brake shift interlock actuator (BSIA)

Removal and Installation

1. Set the parking brake.

2. Remove the steering column shrouds.

3. Turn the ignition to the accessory position and apply the brake or actuate the brake shift interlock actuator (BSIA) override.

4. Put the selector lever into the NEUTRAL position.

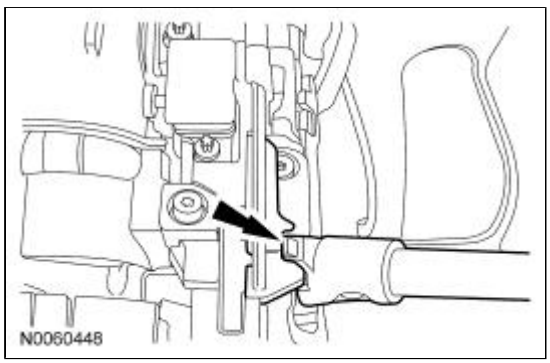
5. Disconnect the BSIA electrical connector.

6. Remove the BSIA screw.

7. Gently pry the clip up and remove the BSIA.

8. **NOTE:** During installation, verify that the BSIA override has been activated and the slider is fully rearward. Before rotating the selector lever from NEUTRAL into PARK, align the selector lever tab into the BSIA.

   To install, reverse the removal procedure.



Brake Shift Interlock Actuator — Floor Shift

Printable View (78 KB)

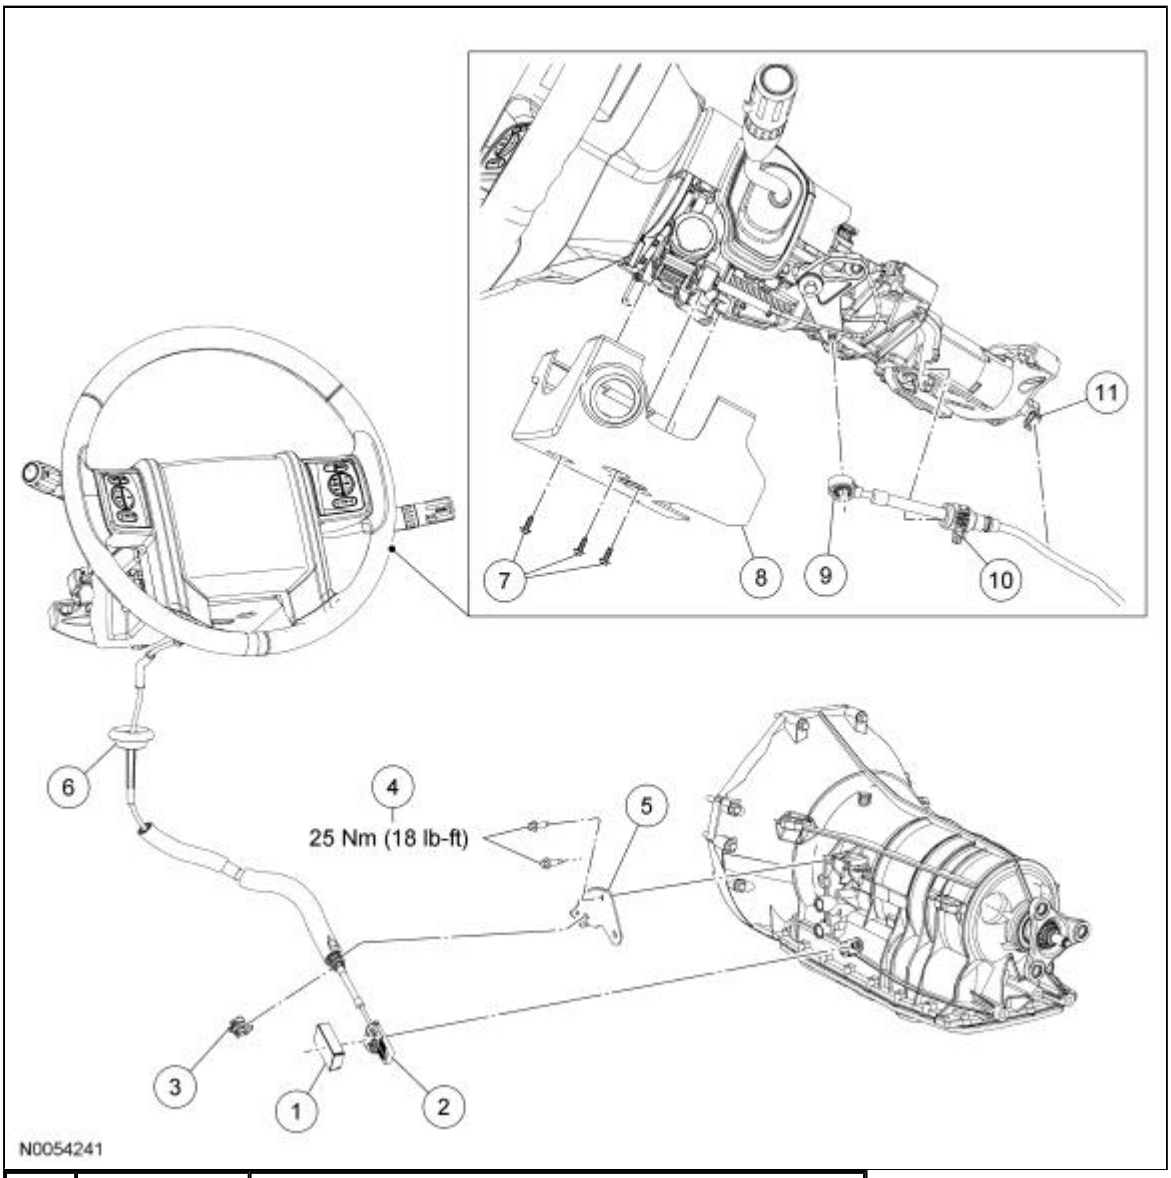
Removal and Installation

NOTE: The brake shift interlock actuator is not serviced individually. If replacement is required, install a new floor shift selector lever assembly.

For additional information, refer to Selector Lever — Floor Shift in this section.

Selector Lever Cable and Bracket — Column Shift

Printable View (645 KB)



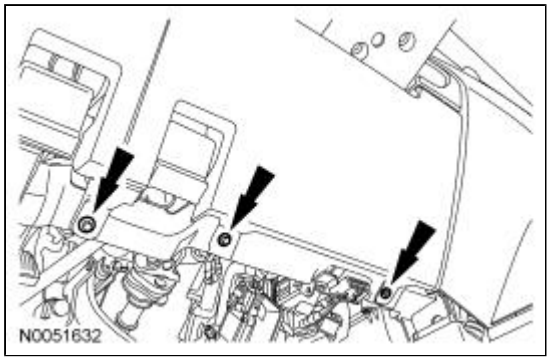
Item	Part Number	Description
1	—	Selector lever cable eyelet heat shield (part of 7E395)
2	7E395	Selector lever cable
3	7H181-A	Selector lever cable clip
4	W500223-S	Selector lever cable bracket bolts
5	7B229-A	Selector lever cable bracket
6	—	Selector lever cable grommet (part of 7E395)
7	W710485-S	Steering column lower shroud screws
8	3533-B	Steering column lower shroud

9	—	Selector lever cable eyelet (part of 7E395)
10	—	Selector lever cable clip (part of 7E395)
11	—	Selector lever cable retainer (part of 7E395)

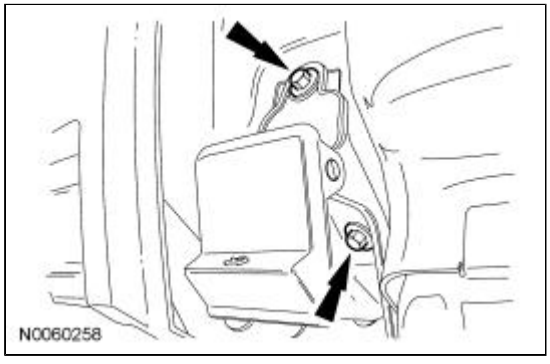
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

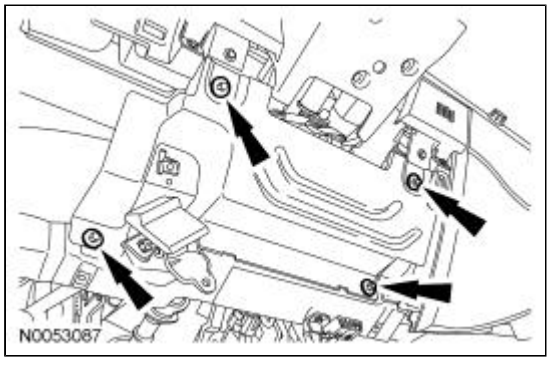
2. Remove the instrument panel lower finish panel.



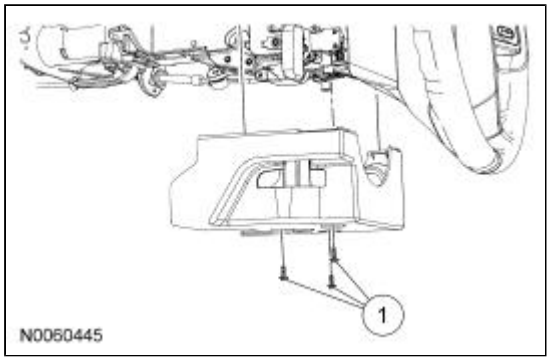
3. Remove the hood release cable lever.



4. Remove the instrument panel lower reinforcement panel.

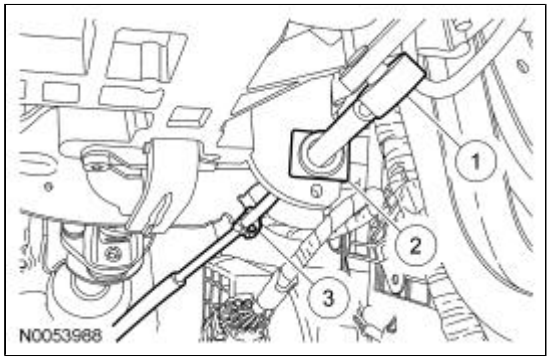


5. Remove the steering column lower shroud.
    1. Remove the screws and the lower shroud.

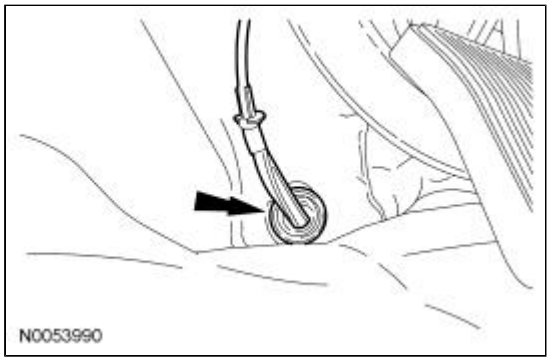


6. **NOTE:** To prevent cable damage, do not apply force to the selector lever cable assembly between the steering column selector lever arm and the steering column bracket.

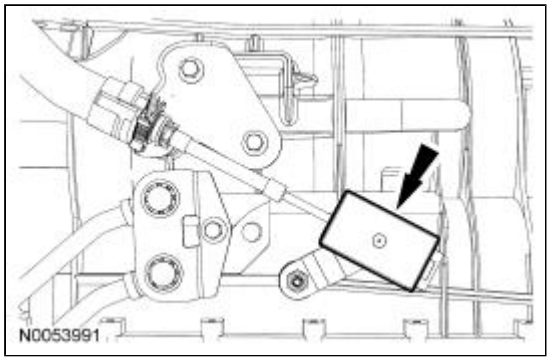
   Disconnect the selector lever cable from the steering column.
   1. Disconnect the selector lever cable from the selector lever arm ball stud.
   2. Carefully lift the locking tab and disconnect the selector lever cable from the steering column bracket.
   3. Disconnect the selector lever cable retainer.



7. Push the rubber grommet and selector lever cable down through the floor panel.

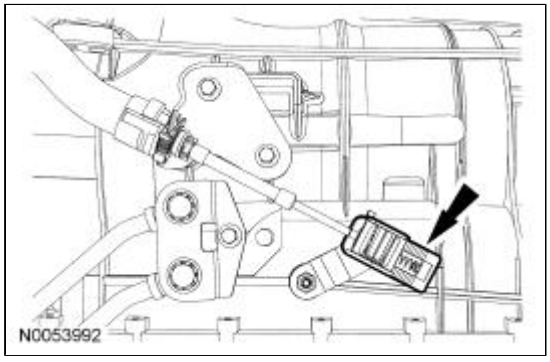


8. If equipped, remove the heat shield.

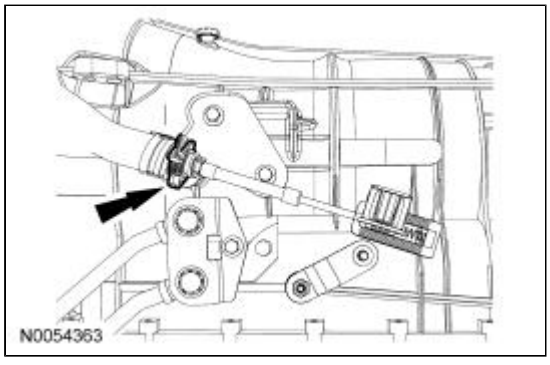


9. **NOTE:** To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.

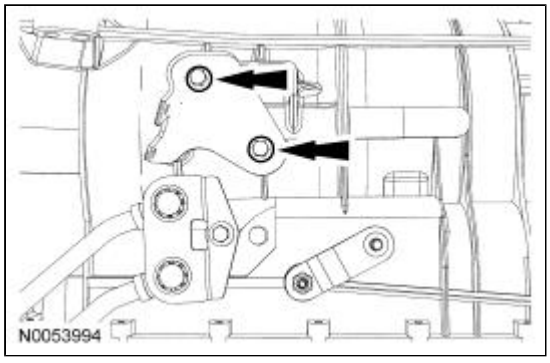
   Move the locking tab up and disconnect the selector lever cable from the manual control lever.



10. Remove the selector lever cable clip to release the selector lever cable from the bracket.

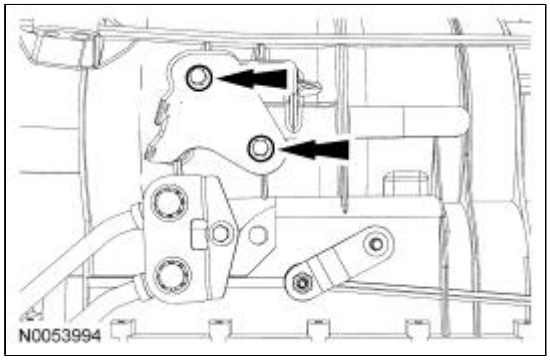


11. Remove the bolts and the selector lever cable bracket from the transmission.



Installation

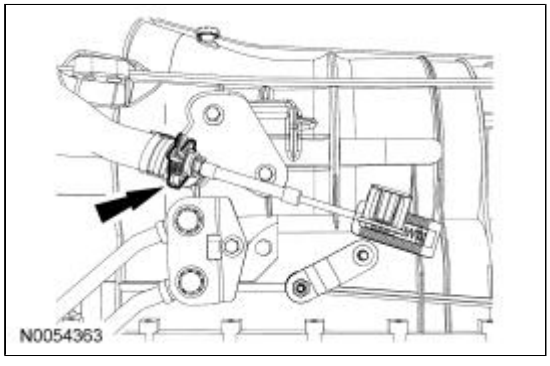
1. Install the selector lever cable bracket and bolts onto the transmission.
    - Tighten to 25 Nm (18 lb-ft).



2. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

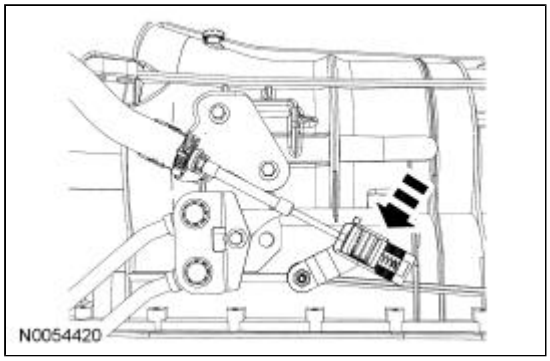
   NOTE: To prevent selector lever cable damage, do not apply force to the selector lever cable between the manual control lever and the selector lever cable bracket.

   Install the selector lever cable into the bracket and install the clip.

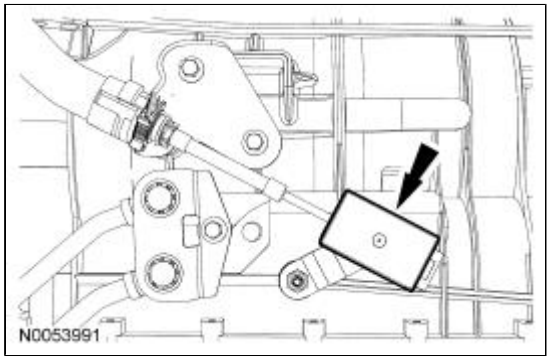


3. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

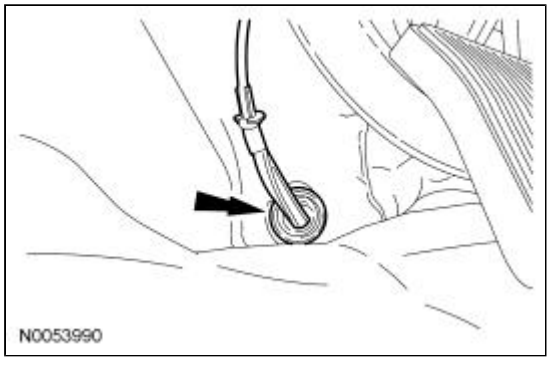
   Connect the selector lever cable onto the manual control lever and move the locking tab down.
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure that it is correctly installed.



4. If equipped, install the heat shield.



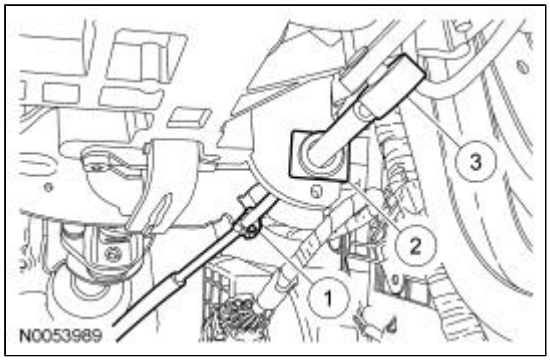
5. Push the selector lever cable and rubber grommet up through the floor panel.



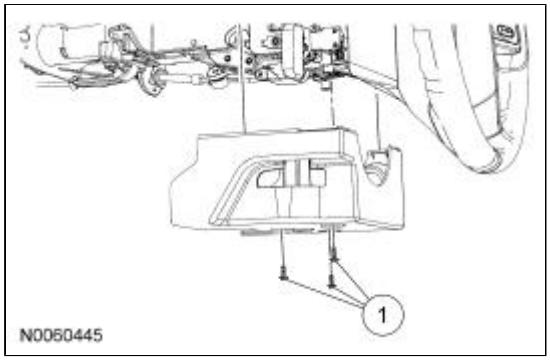
6. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

   NOTE: To prevent cable damage, do not apply force to the selector lever cable assembly between the steering column selector lever arm and the steering column bracket.

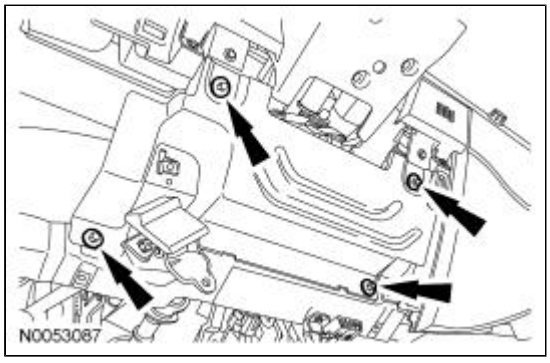
   Connect the selector lever cable onto the steering column.
   1. Connect the selector lever cable retainer.
   2. Connect the selector lever cable onto the steering column bracket.
   3. Connect the selector lever cable onto the selector lever arm ball stud.
      - Listen for the audible click.
      - Pull back on the selector lever cable to make sure that it is correctly installed.



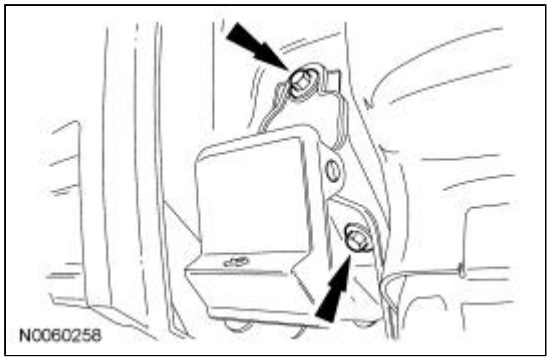
7. Install the steering column lower shroud.
    1. Install the lower shroud.



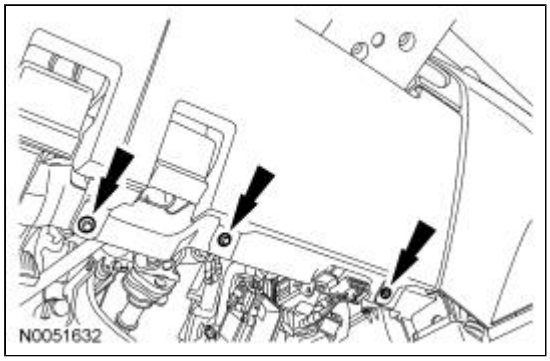
8. Install the instrument panel lower reinforcement panel.
    - Tighten to 9 Nm (80 lb-in).



9. Install the hood release cable lever.
    - Tighten to 9 Nm (80 lb-in).



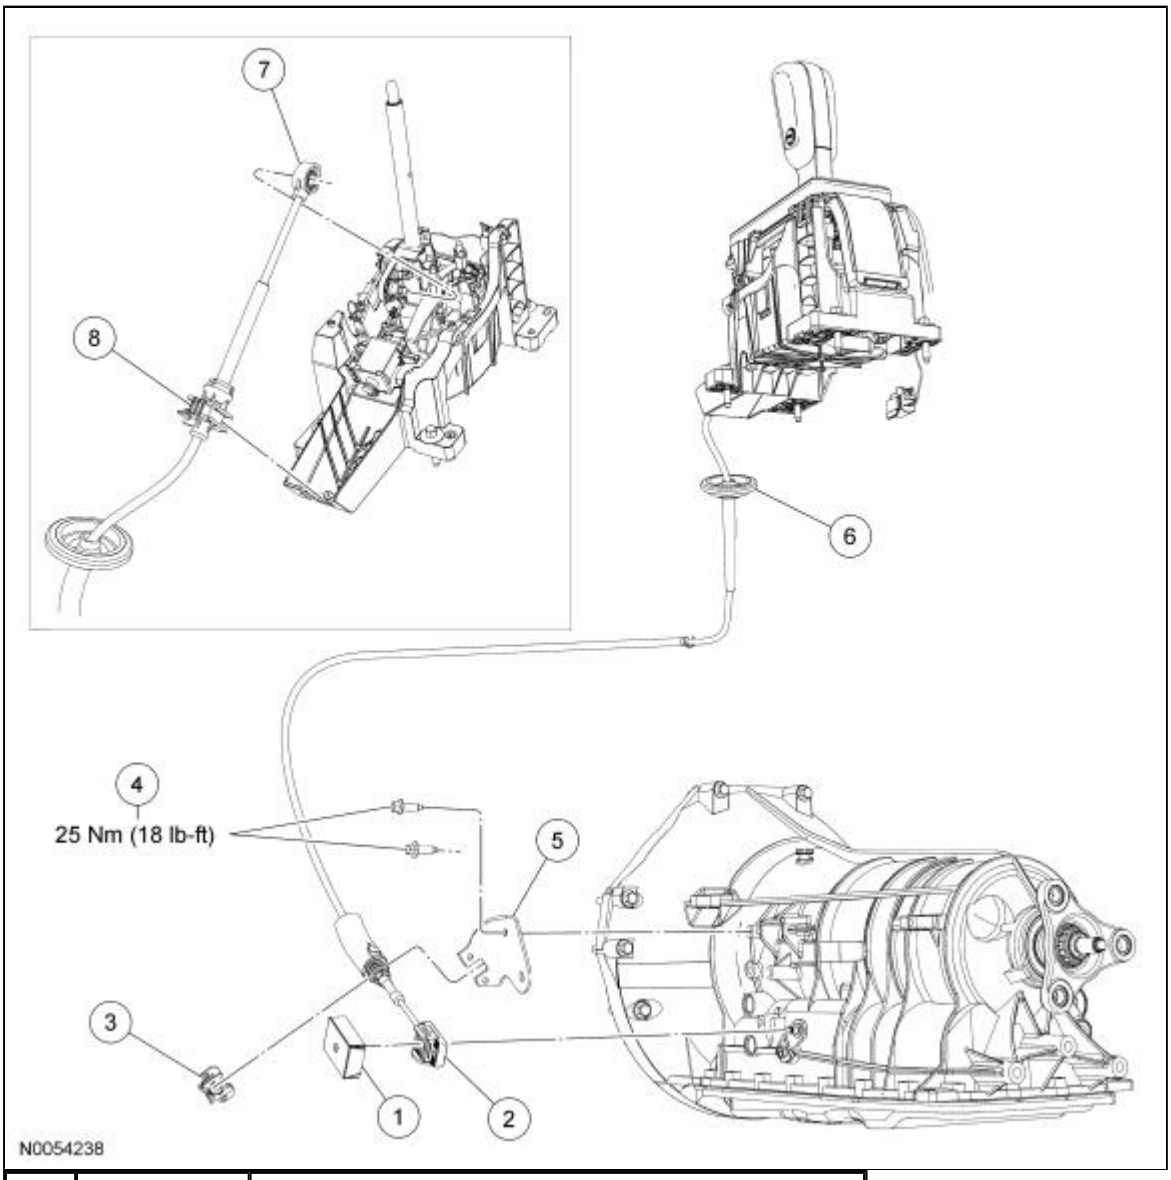
10. Install the instrument panel lower finish panel.



11. Adjust the selector lever cable. Refer to Selector Lever Cable Adjustment in this section.

Selector Lever Cable and Bracket — Floor Shift

Printable View (757 KB)



Item	Part Number	Description
1	—	Selector lever cable eyelet heat shield (part of 7E395)
2	7E395	Selector lever cable
3	7H181-A	Selector lever cable clip
4	W500223-S	Selector lever cable bracket bolts
5	7B229-A	Selector lever cable bracket
6	—	Selector lever cable grommet (part of 7E395)
7	—	Selector lever cable eyelet (part of 7E395)
8	—	Selector lever cable clip (part of 7E395)

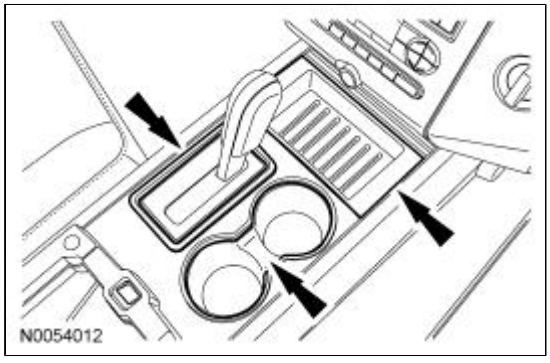
Removal

All vehicles

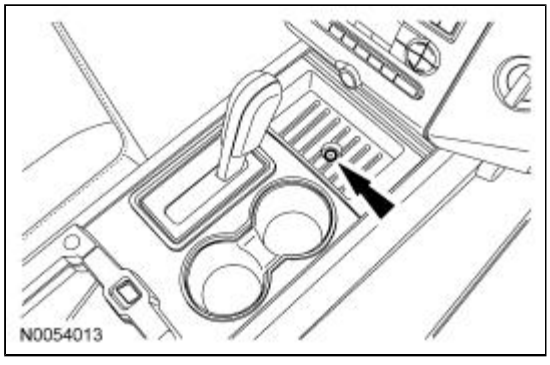
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

Vehicles equipped with a 6R75 transmission

2. Remove the PRNDL trim, console tray and cup holder insert.

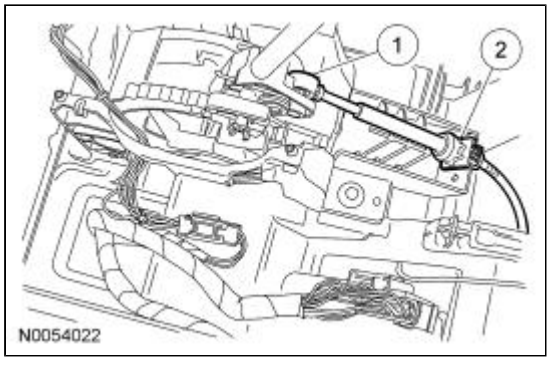


3. Remove the screw and the console upper trim.



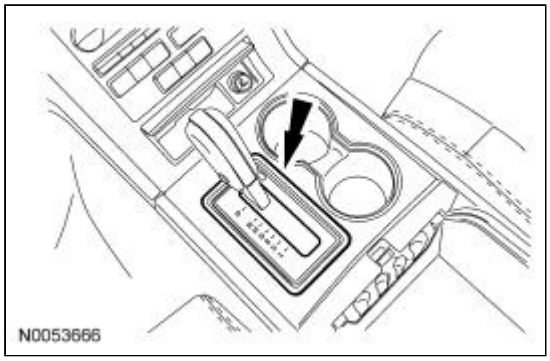
4. **NOTE:** Selector lever bezel removed for clarity.

   Disconnect the selector lever cable from the selector lever.
   1. Disconnect the selector lever cable from the selector lever arm ball stud.
   2. Disconnect the selector lever cable from the selector lever housing.



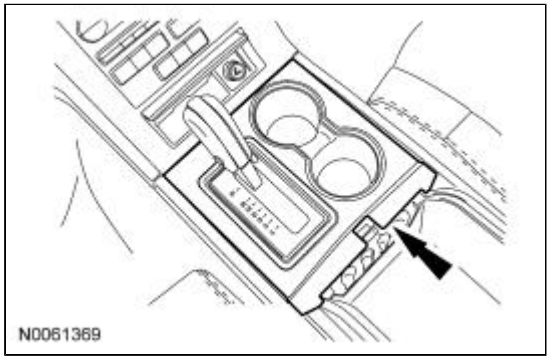
Vehicles equipped with a 6HP26 transmission

5. Remove the selector lever trim plate.



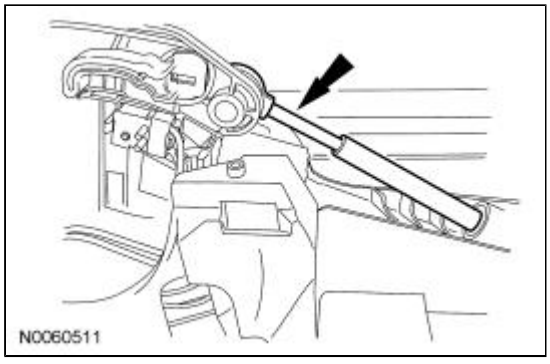
6. **NOTE:** Using a suitable tool, lift and remove the floor console upper panel from the rear.

   Remove the floor console upper panel.

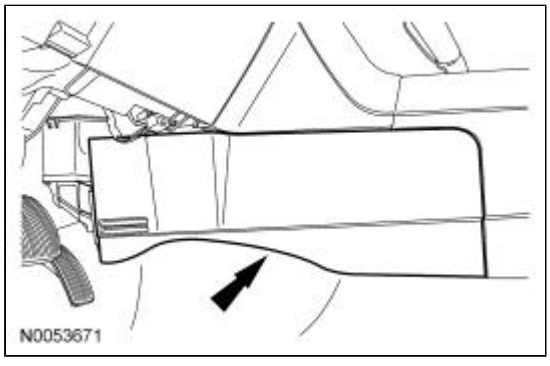


7. **NOTE:** Selector lever bezel removed for clarity.

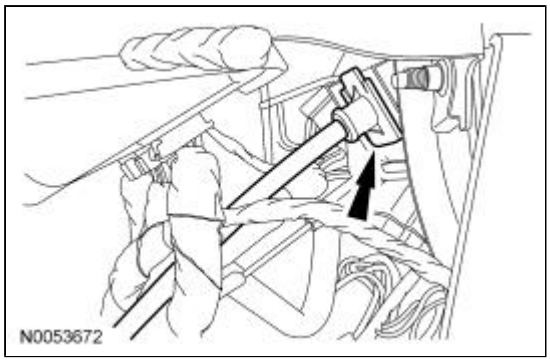
   Disconnect the selector lever cable from the selector lever arm ball stud.



8. Remove the center console LH kick panel.

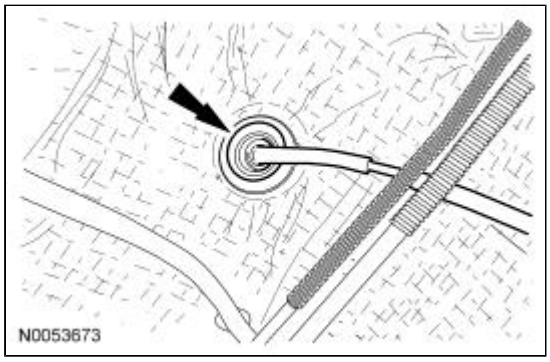


9. Disconnect the selector lever cable from the selector lever housing.

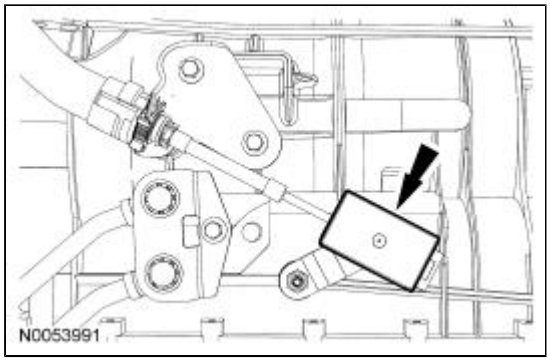


All vehicles

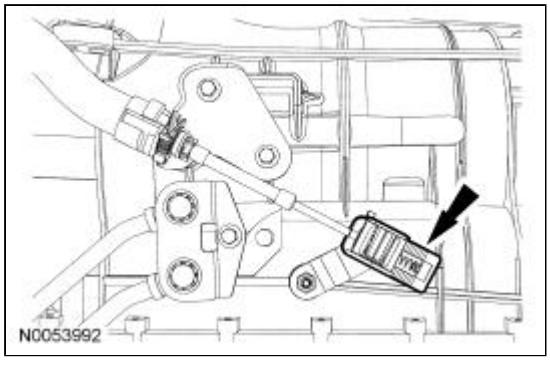
10. Remove the selector lever cable and grommet.



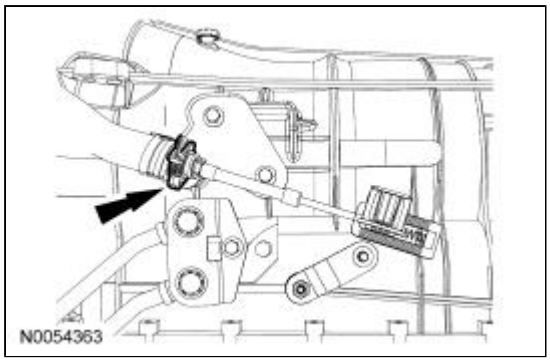
11. If equipped, remove the heat shield.



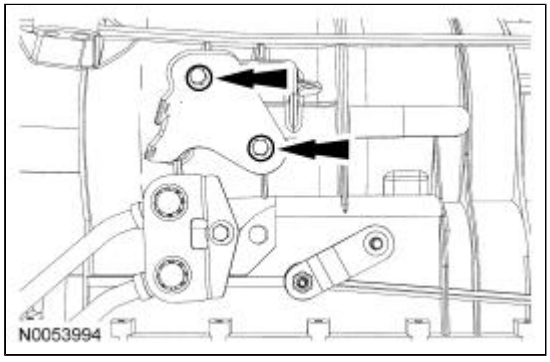
12. Move the locking tab up and disconnect the selector lever cable from the manual control lever ball stud.



13. Remove the selector lever cable clip to release the selector lever cable from the bracket.



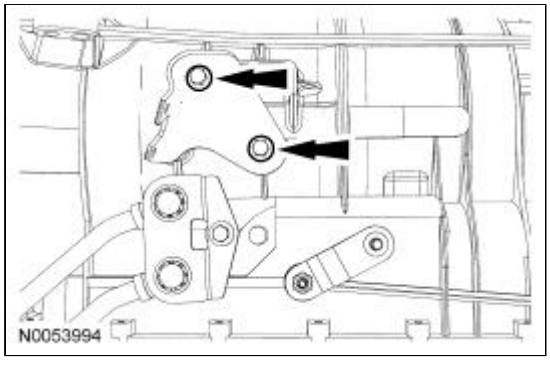
14. Remove the bolts and the selector lever cable bracket from the transmission.



Installation

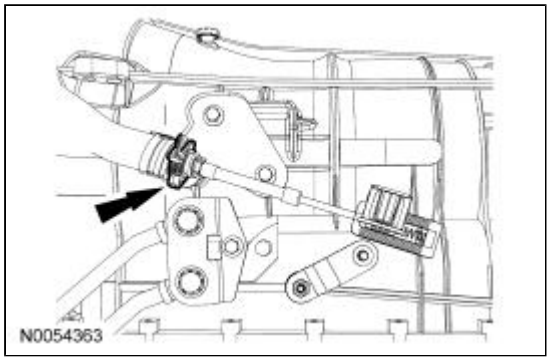
All vehicles

1. Install the selector lever cable bracket and bolts onto the transmission.
    - Tighten to 25 Nm (18 lb-ft).



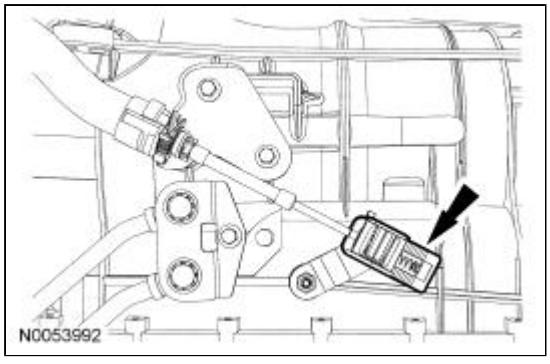
2. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

   Install the selector lever cable into the bracket and install the clip.

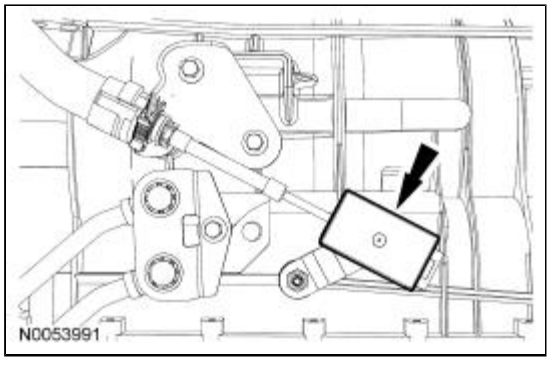


3. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

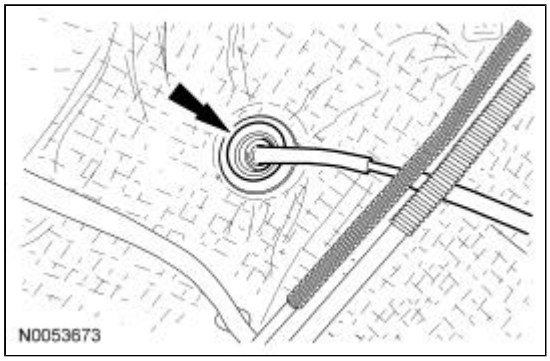
   Connect the selector lever cable onto the manual control lever ball stud and move the locking tab down.
   - Listen for the audible click.
   - Pull back on the selector lever cable to make sure that it is correctly installed.



4. If equipped, install the heat shield.



5. Install the selector lever cable and grommet.

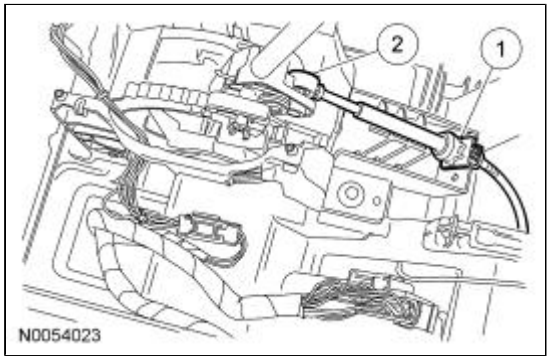


Vehicles equipped with a 6R75 transmission

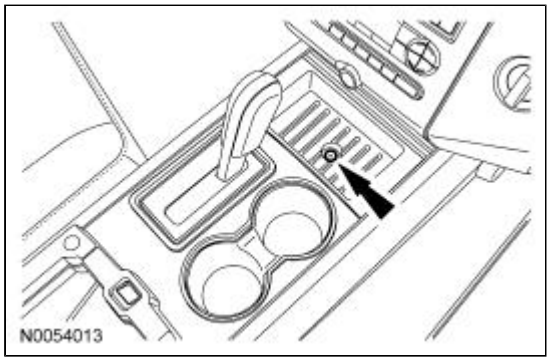
6. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

   NOTE: Selector lever bezel removed for clarity.

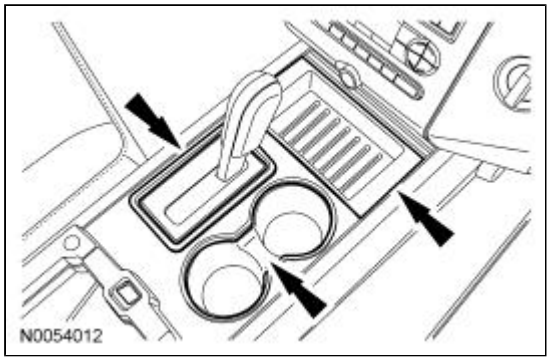
   Connect the selector lever cable onto the selector lever.
   1. Connect the selector lever cable onto the selector lever housing.
   2. Connect the selector lever cable onto the selector lever arm ball stud.
      - Listen for the audible click.
      - Pull back on the selector lever cable to make sure that it is correctly installed.



7. Install the console upper trim and the screw.



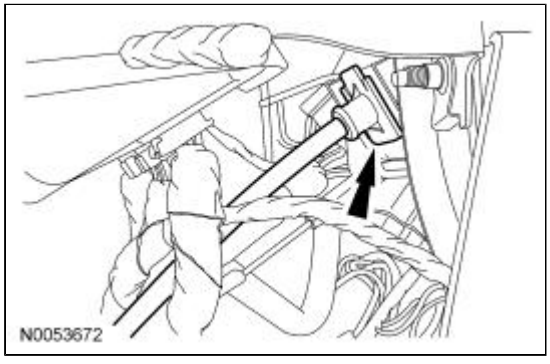
8. Install the PRNDL trim, console tray and cup holder insert.



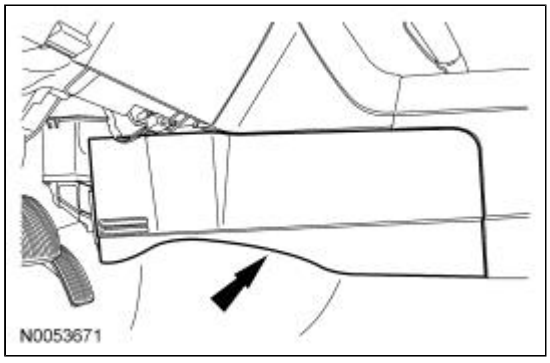
Vehicles equipped with a 6HP26 transmission

9. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

   Connect the selector lever cable onto the selector lever housing.



10. Install the center console LH kick panel.

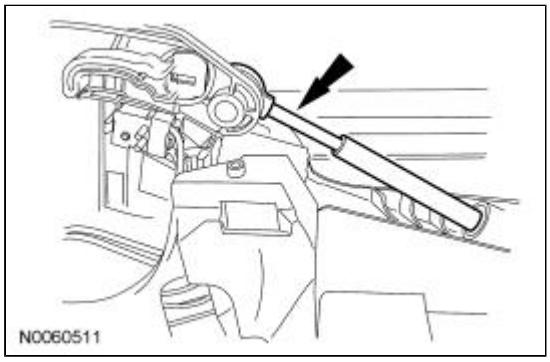


11. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

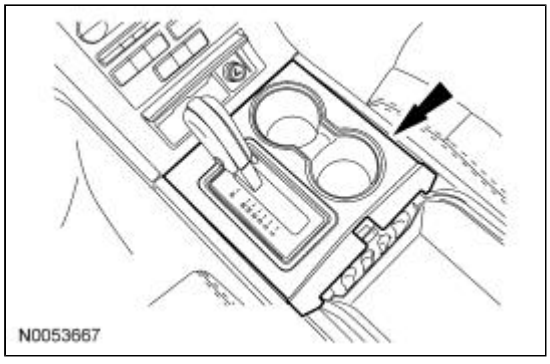
    NOTE: Selector lever bezel removed for clarity.

    Connect the selector lever cable onto the selector lever arm ball stud.

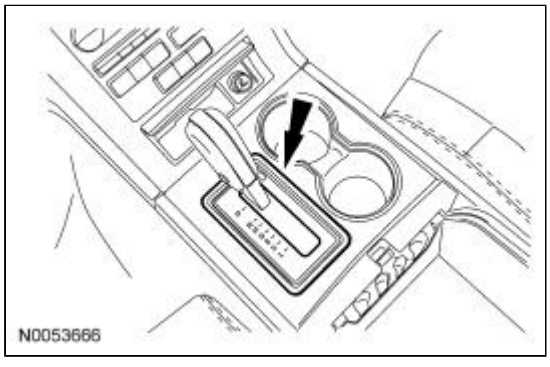
- Listen for the audible click.
- Pull back on the selector lever cable to make sure that it is correctly installed.



12. Install the floor console upper panel.



13. Install the selector lever trim plate.

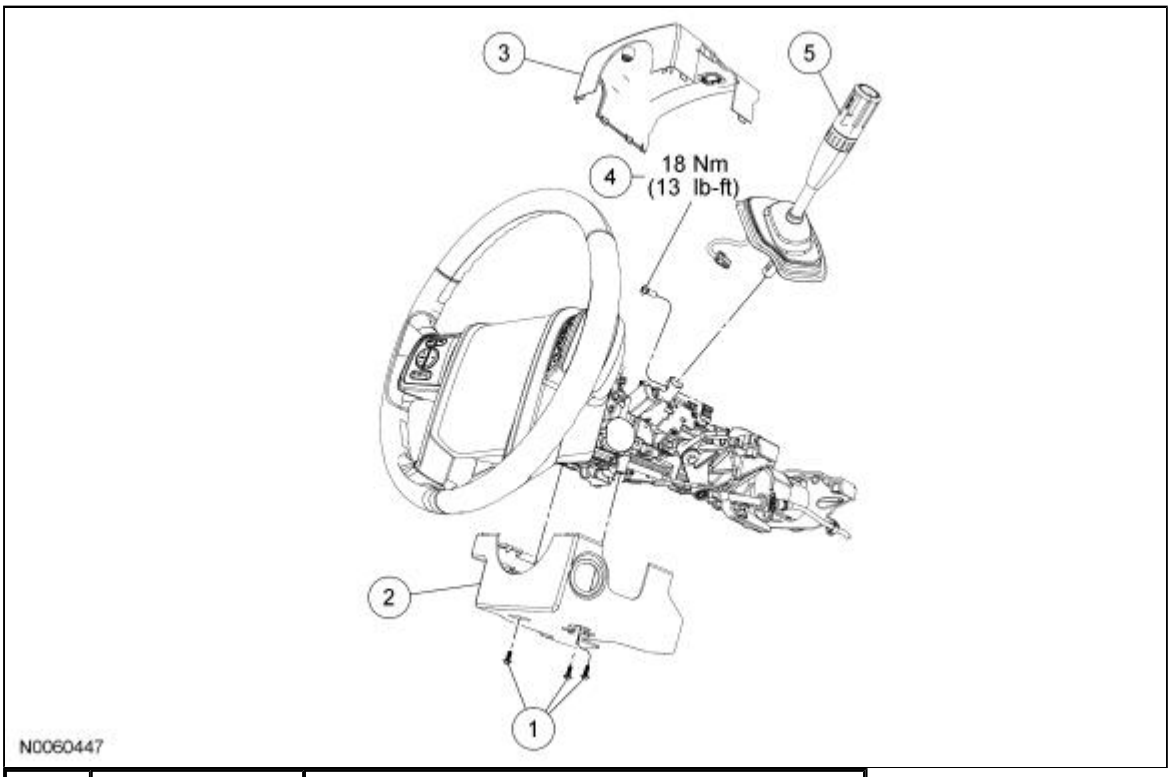


All vehicles

14. Adjust the selector lever cable. Refer to Selector Lever Cable Adjustment in this section.

Selector Lever — Column Shift

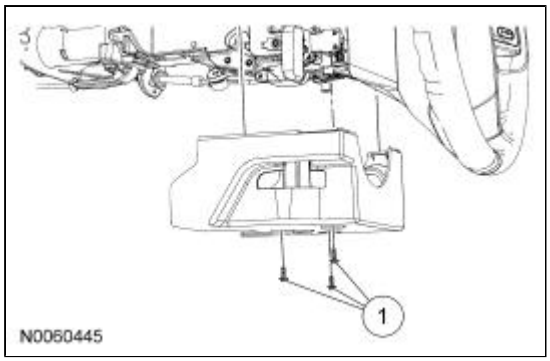
Printable View (258 KB)



Item	Part Number	Description
1	W710485-S	Lower steering column shroud screws
2	3533-B	Lower steering column shroud
3	3530-B	Upper steering column shroud
4	W712000-S	Selector lever bolt
5	7202	Selector lever

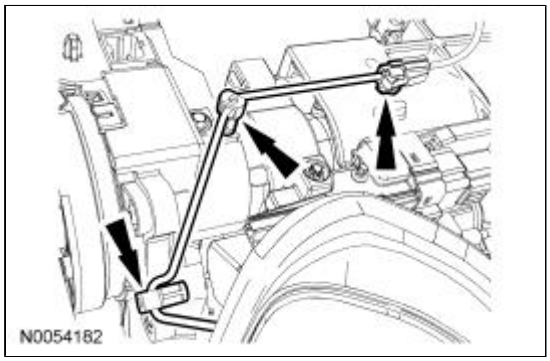
Removal and Installation

1. Remove the lower steering column shroud.
    1. Remove the screws and the lower steering column shroud.

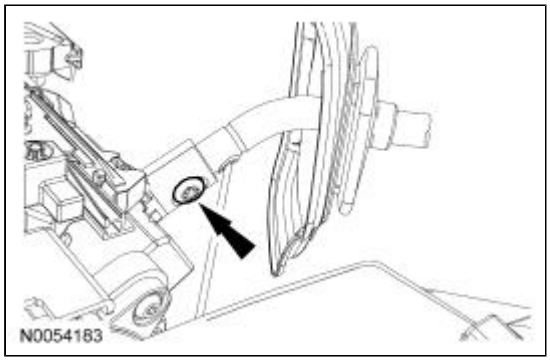


2. Remove the upper steering column shroud.

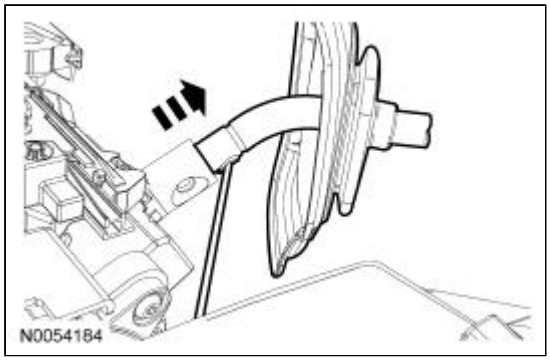
3. Disconnect the electrical connector and the harness from the retaining clips.



4. Remove the selector lever bolt.
    - To install, tighten to 18 Nm (13 lb-ft).



5. Remove the selector lever.



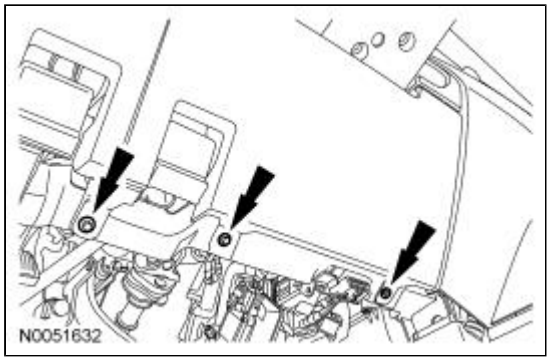
6. To install, reverse the removal procedure.

Selector Lever Mechanism

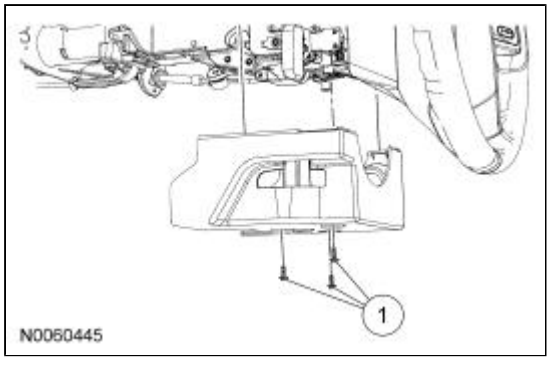
Printable View (688 KB)

Removal

1. Remove the instrument panel lower finish panel.

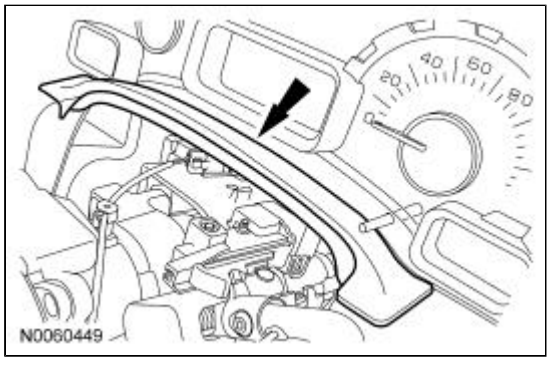


2. 2. Remove the steering column lower shroud.
    1. Remove the screws and the lower shroud.

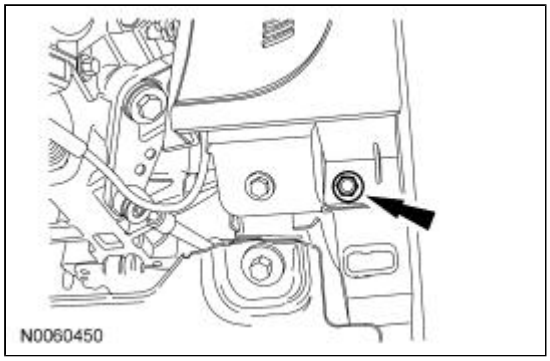


3. Remove the steering column upper shroud.

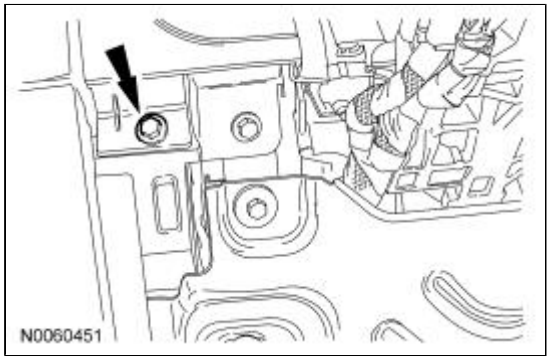
4. Remove the instrument panel (IP) cluster-to-shroud trim.



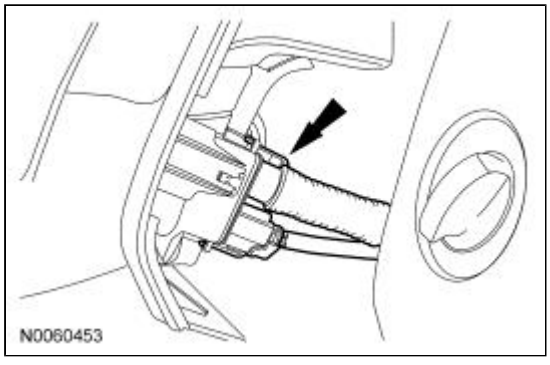
5. Remove the RH IP cluster trim screw.



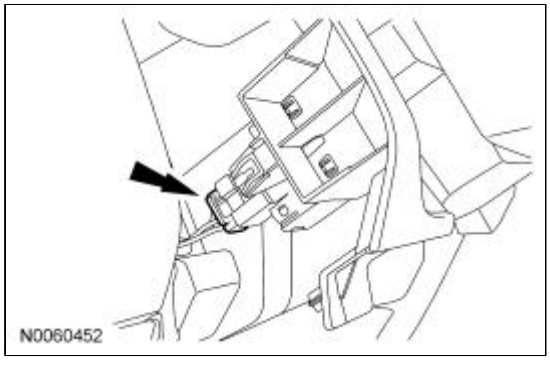
6. Remove the LH IP cluster trim screw and pull the IP cluster trim from the IP.



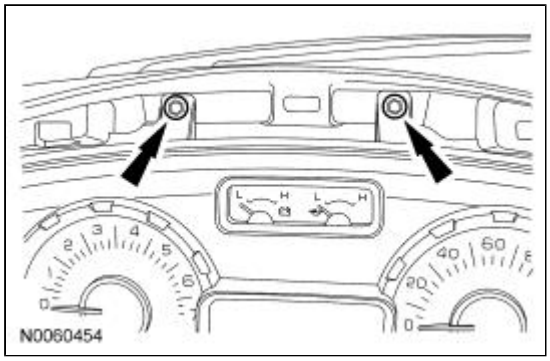
7. If equipped, disconnect the in-vehicle temperature sensor connector.



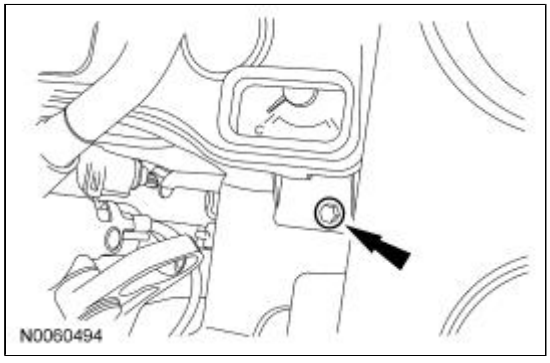
8. Disconnect the dimmer switch electrical connector and remove the IP cluster trim.



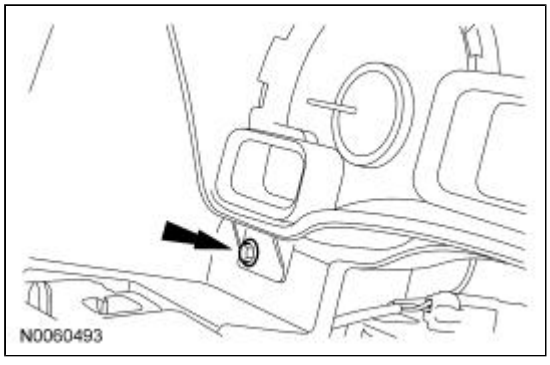
9. Remove the upper IP cluster screws.



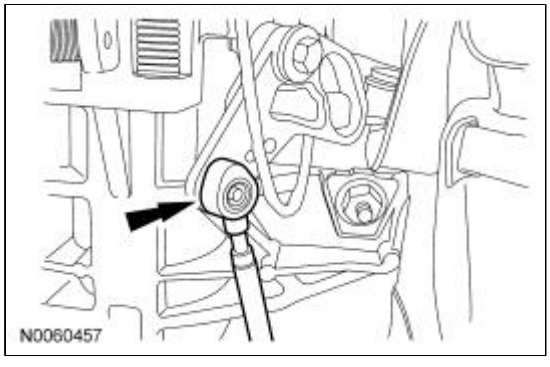
10. Remove the RH lower IP cluster screw.



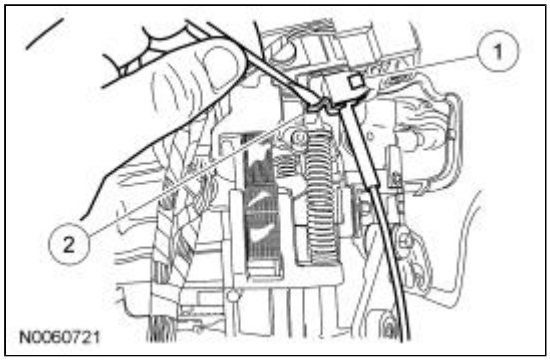
11. Remove the LH lower IP cluster screw and position the IP cluster aside.



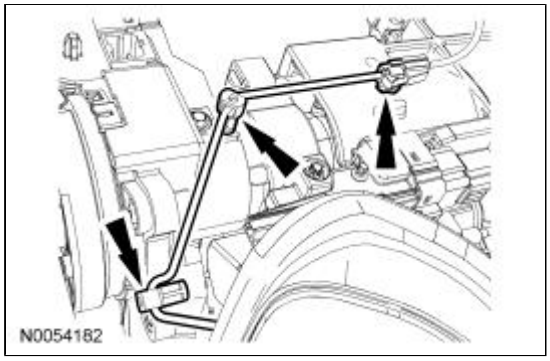
12. Disconnect the selector lever cable.



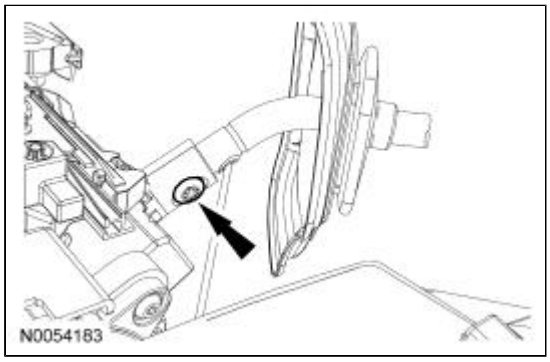
13. Remove the locking pin and the park lock cable (PLC).
    1. Remove and discard the locking pin.
    2. Disconnect the PLC.



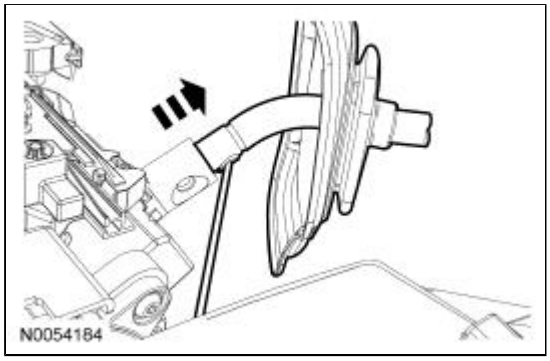
14. Disconnect the tranmission control (TC) switch electrical connector and the harness from the retaining clips.



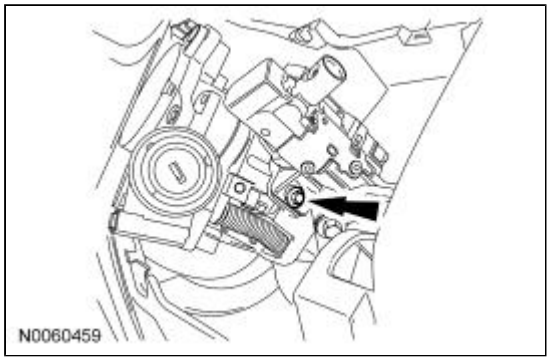
15. Remove the selector lever bolt.



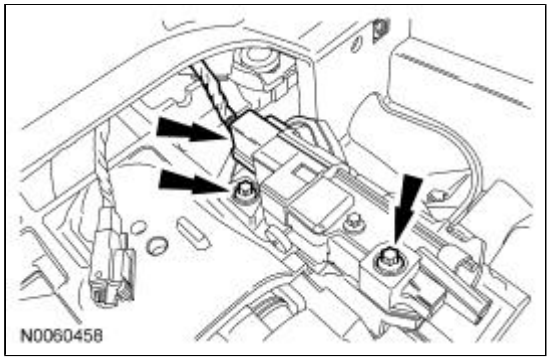
16. Remove the selector lever.



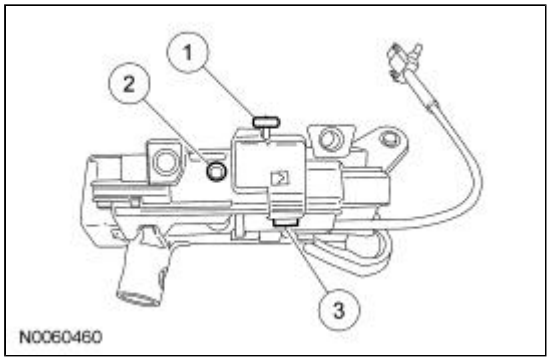
17. Remove the selector lever mechanism lower bolt.



18. Disconnect the brake shift interlock actuator (BSIA) electrical connector and remove the selector lever mechanism upper bolts and the selector lever mechanism from the vehicle.

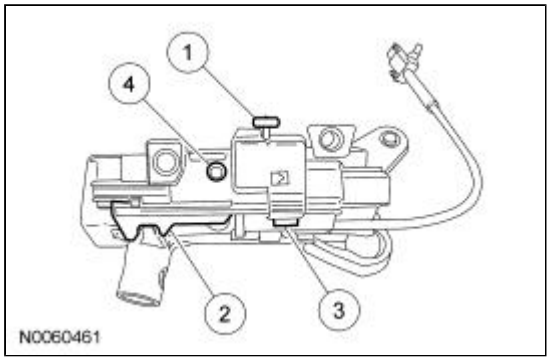


19. Remove the BSIA from the selector lever mechanism.
    1. Pull the BSIA override button.
    2. Remove the BSIA screw.
    3. Gently pry the clip up and remove the BSIA.

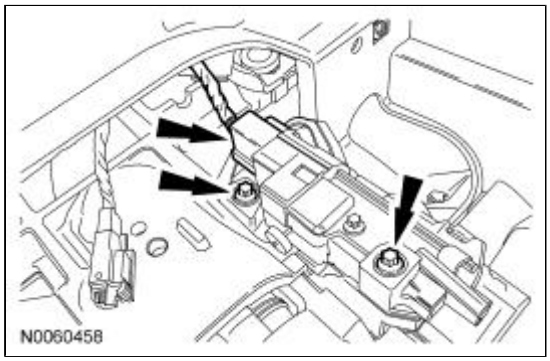


Installation

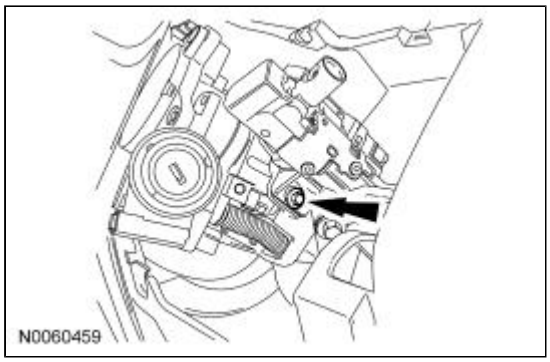
1. Install the BSIA onto the selector lever mechanism.
    1. Pull the BSIA override button.
    2. Align the selector lever tab into the BSIA.
    3. Position and secure the BSIA with the clip.
    4. Install the screw.



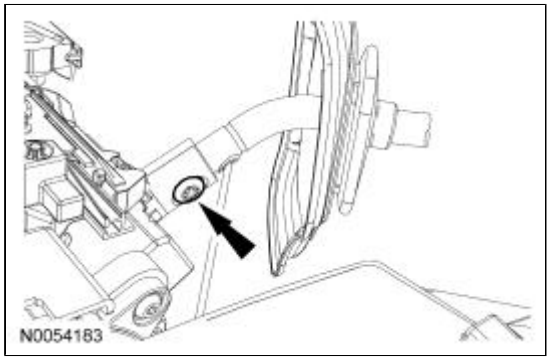
2. Install the selector lever mechanism into the vehicle, install the upper bolts and connect the BSIA electrical connector.
    - Tighten to 6 Nm (53 lb-in).



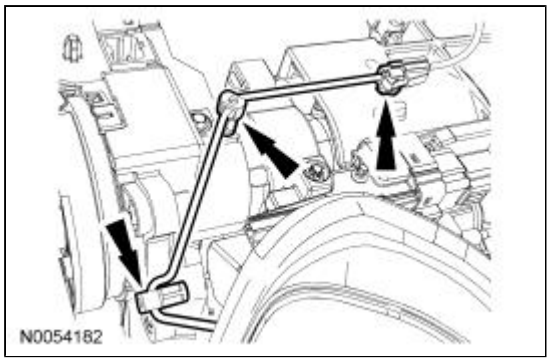
3. Install the selector lever mechanism lower bolt.
    - Tighten to 6 Nm (53 lb-in).



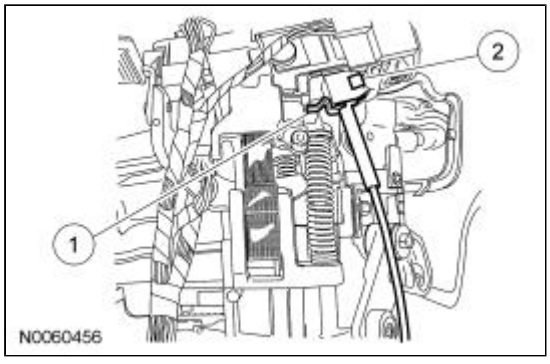
4. Install the selector lever.
    - Tighten to 18 Nm (13 lb-ft).



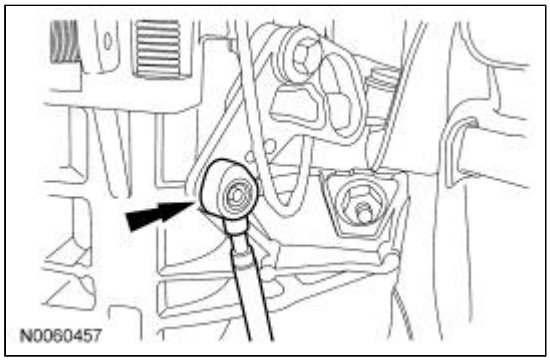
5. Connect the TC switch electrical connector and the harness into the retaining clips.



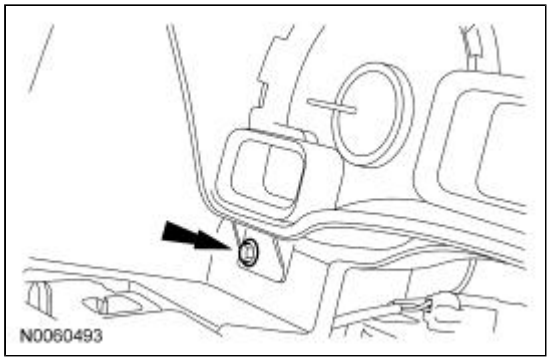
6. Install the locking pin and the PLC.
    1. Connect the PLC.
    2. Install a new locking pin.



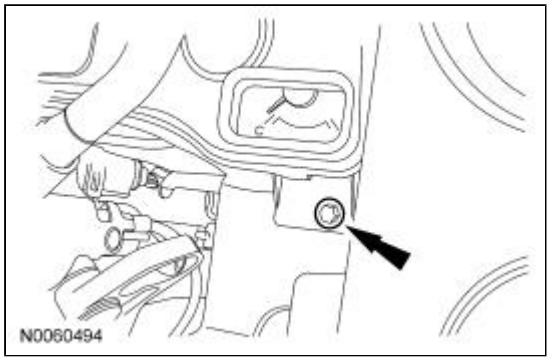
7. Connect the selector lever cable.



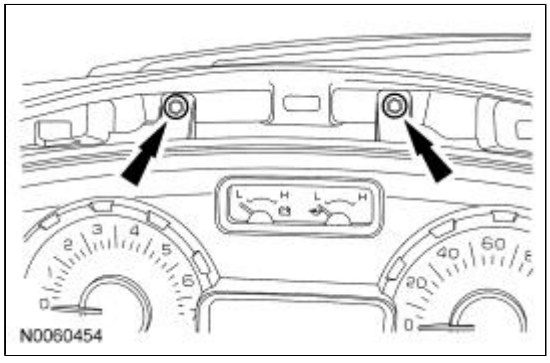
8. Position the IP cluster and install the LH lower IP cluster screw.



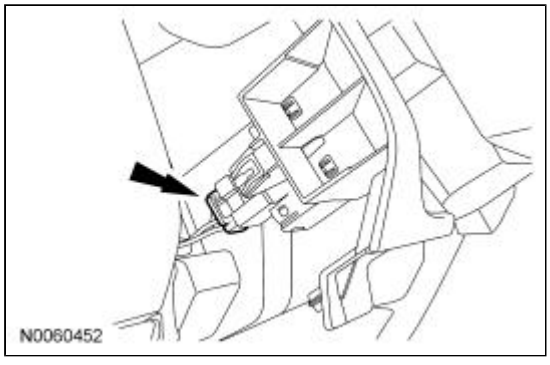
9. Install the RH lower IP cluster screw.



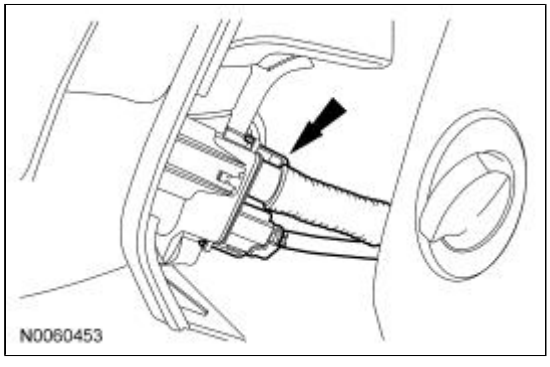
10. Install the upper IP cluster screws.



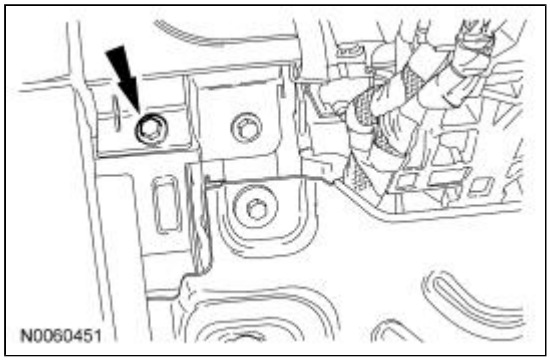
11. Position the IP cluster trim and connect the dimmer switch electrical connector.



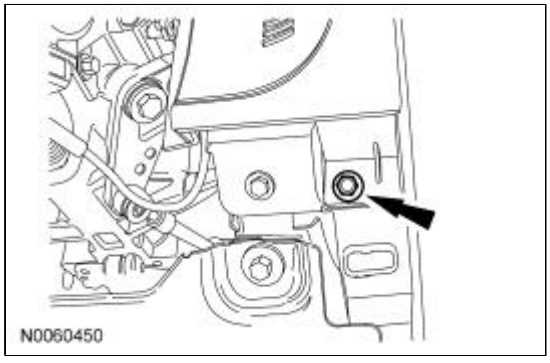
12. If equipped, connect the in-vehicle temperature sensor connector.



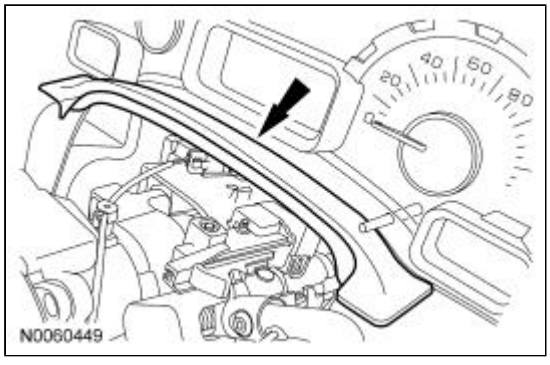
13. Install the LH IP cluster trim screw.



14. Install the RH IP cluster trim screw.

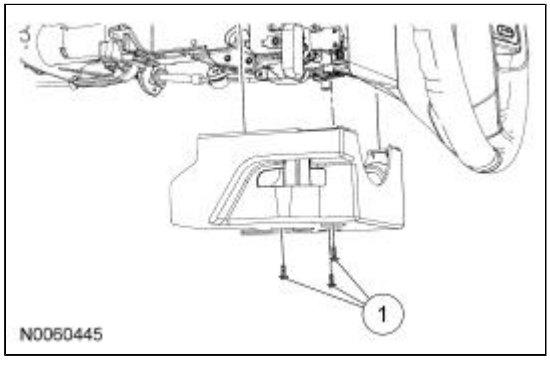


15. Install the IP cluster-to-shroud trim.



16. Install the steering column upper shroud.

17. Install the steering column lower shroud.



18. Install the instrument panel lower finish panel.

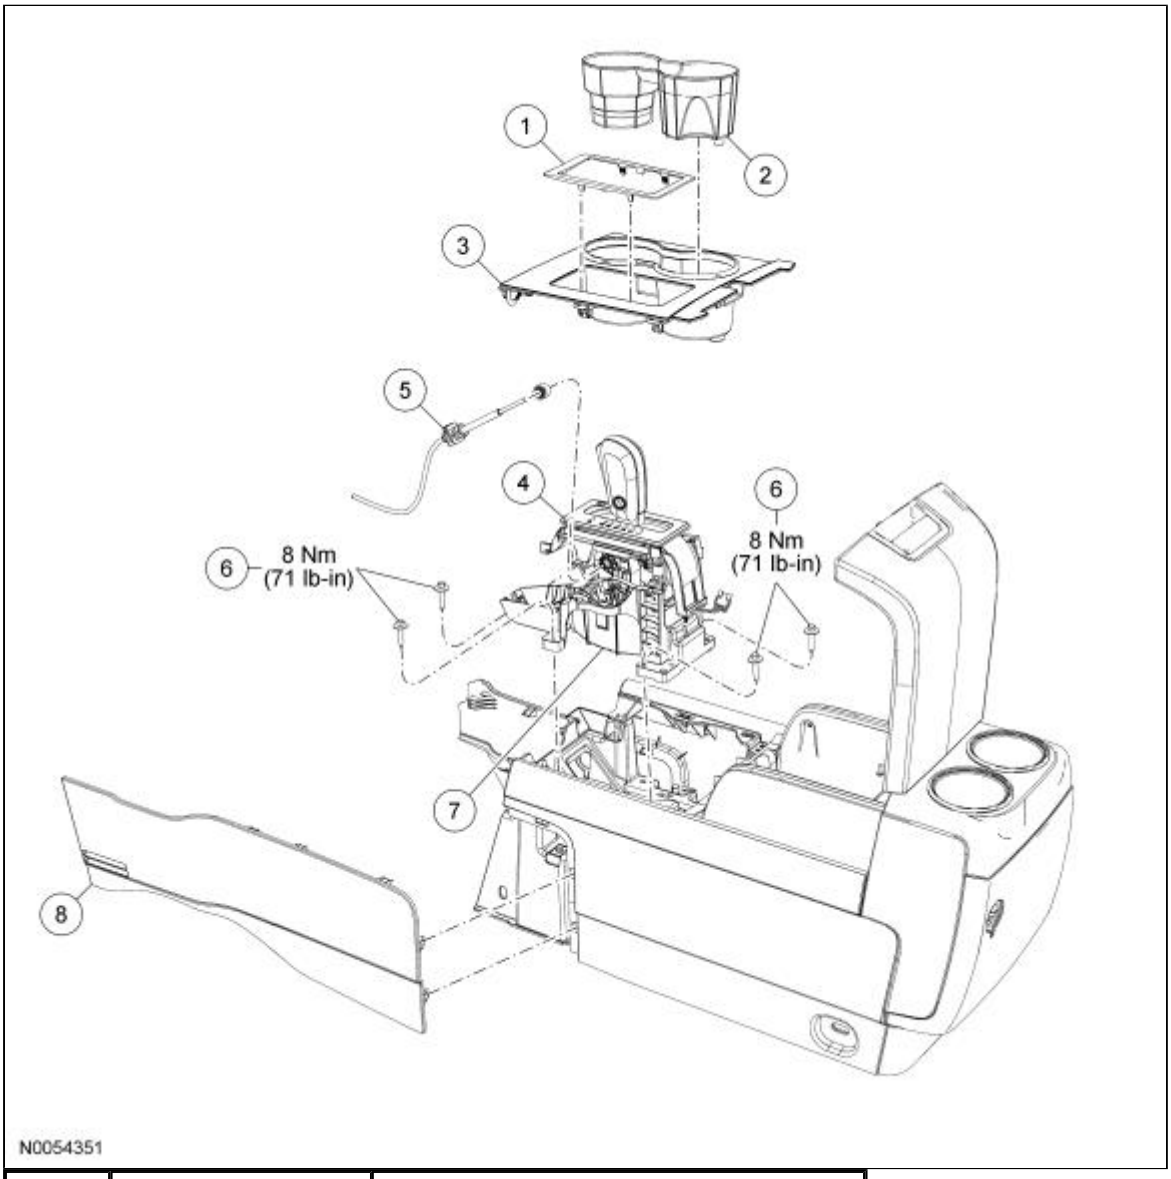
Vehicles Equipped With a 6HP26 Transmission

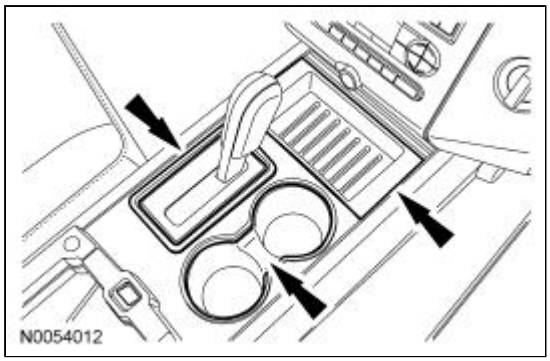


Item	Part Number	Description
1	—	PRNDL trim plate
2	78046B94-B	Console cup holder insert
3	78044J76-A	Console upper trim panel
4	7E034-A	Selector lever bezel
5	7E395-B	Selector lever cable
6	N606678-S	Selector lever bolts
7	7C453-A	Selector lever assembly
8	—	Side console access panel

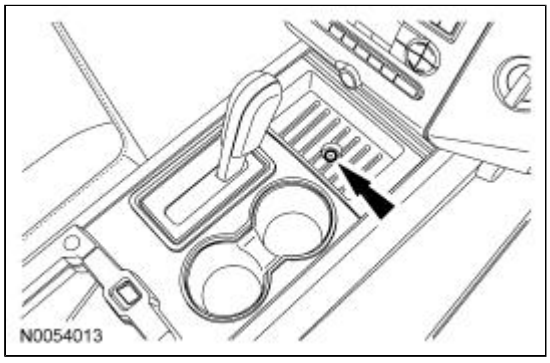
Removal

Vehicles equipped with a 6R75 transmission

1. Remove the PRNDL trim, console tray and cup holder insert.

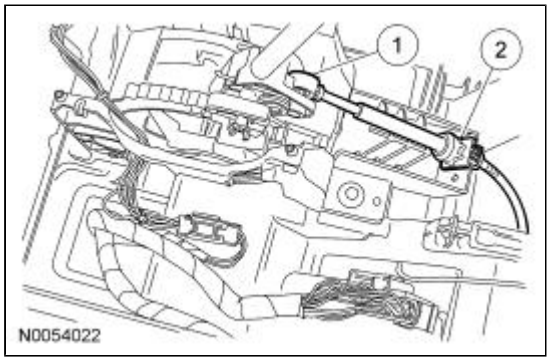


2. Remove the screw and the console upper trim.

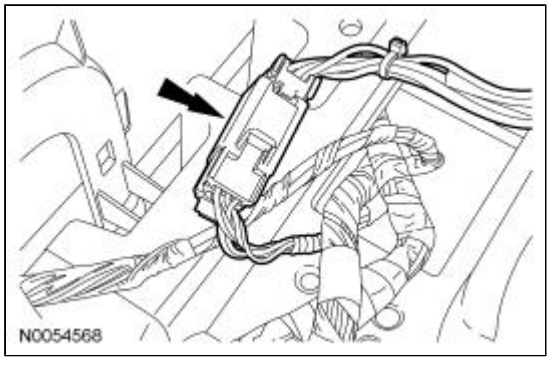


3. **NOTE:** Selector lever bezel removed for clarity.

   Disconnect the selector lever cable from the selector lever.
   1. Disconnect the selector lever cable from the selector lever arm ball stud.
   2. Disconnect the selector lever cable from the selector lever housing.

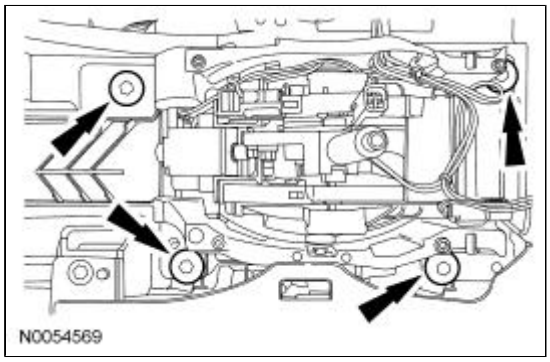


4. Disconnect the selector lever electrical connector.



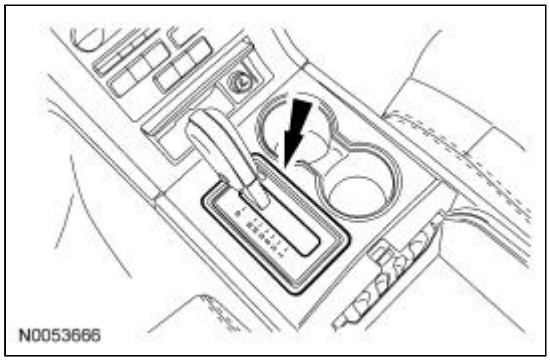
5. **NOTE:** Selector lever bezel removed for clarity.

   Remove the bolts and lift the selector lever out of the console.



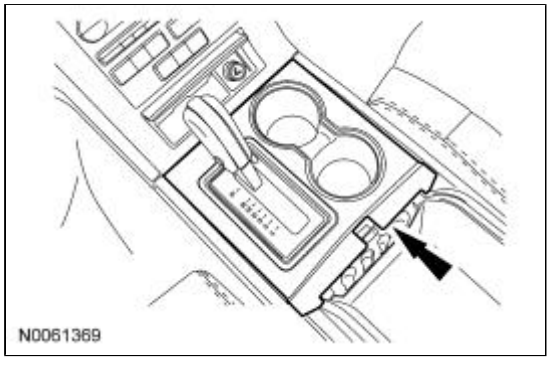
Vehicles equipped with a 6HP26 transmission

6. Remove the selector lever trim plate.



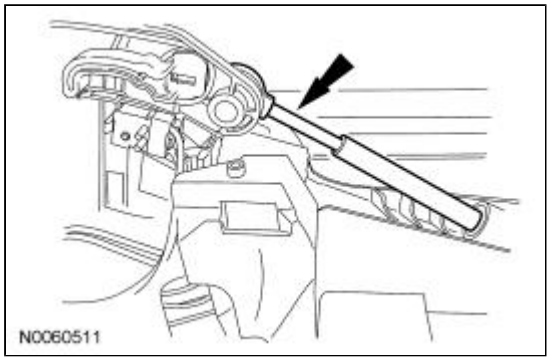
7. **NOTE:** Using a suitable tool, lift and remove the floor console upper panel from the rear.

   Remove the floor console upper panel.

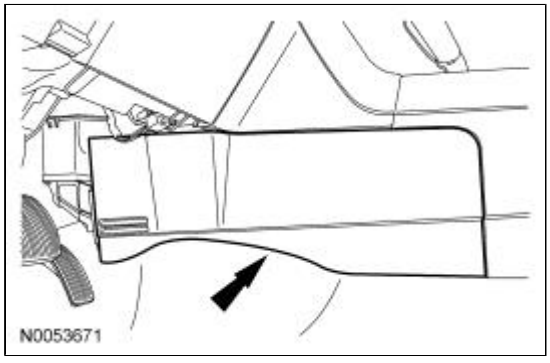


8. **NOTE:** Selector lever bezel removed for clarity.

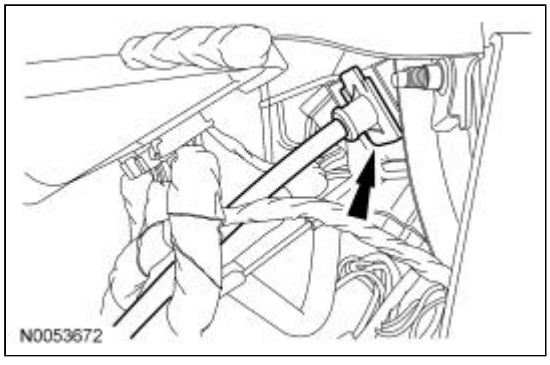
   Disconnect the selector lever cable from the selector lever arm ball stud.



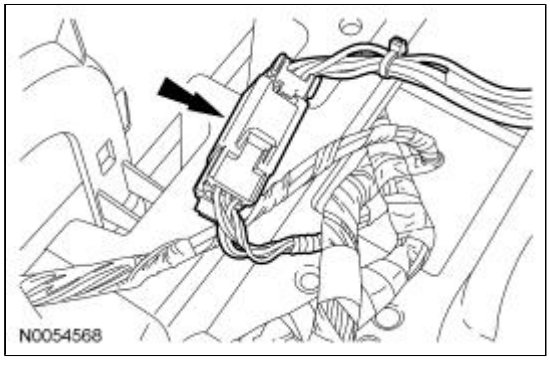
9. Remove the center console LH kick panel.



10. Disconnect the selector lever cable from the selector lever housing.

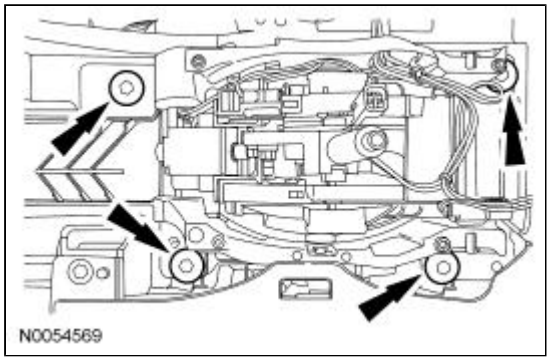


11. Disconnect the selector lever electrical connector.



12. **NOTE:** Selector lever bezel removed for clarity.

    Remove the bolts and lift the selector lever out of the console.

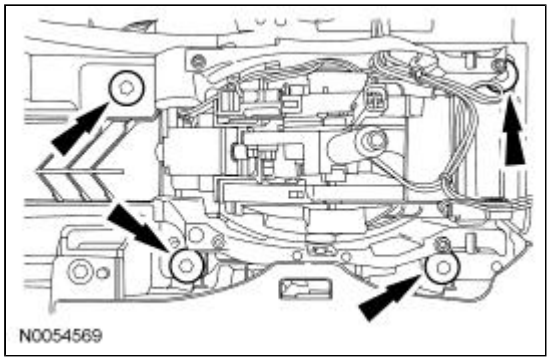


Installation

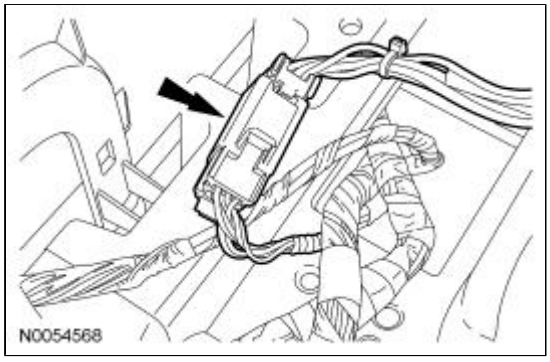
Vehicles equipped with a 6R75 transmission

1. **NOTE:** Selector lever bezel removed for clarity.

   Install the sector lever into the console.
   - Tighten to 8 Nm (71 lb-in).



2. Connect the selector lever electrical connector.

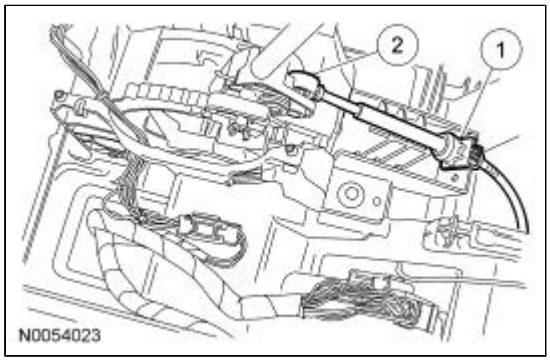


3. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

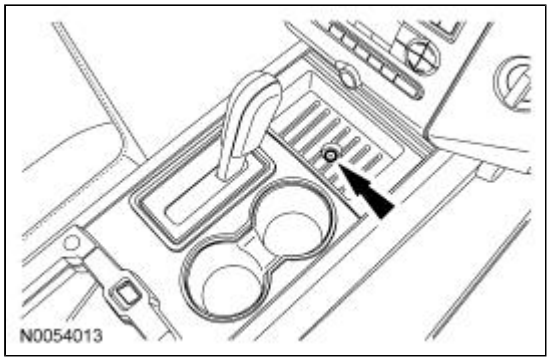
   NOTE: Selector lever bezel removed for clarity.

   Connect the selector lever cable onto the selector lever.
   1. Connect the selector lever cable onto the selector lever housing.
   2. Connect the selector lever cable onto the selector lever arm ball stud.

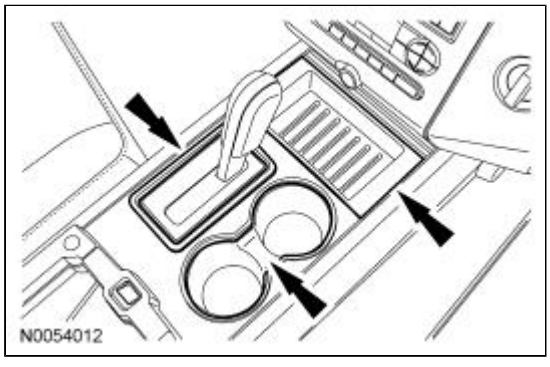
- Listen for the audible click.
- Pull back on the selector lever cable to make sure that it is correctly installed.



4. Install the console upper trim and the screw.



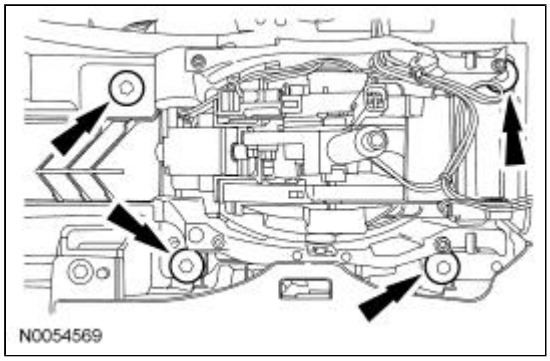
5. Install the PRNDL trim, console tray and cup holder insert.



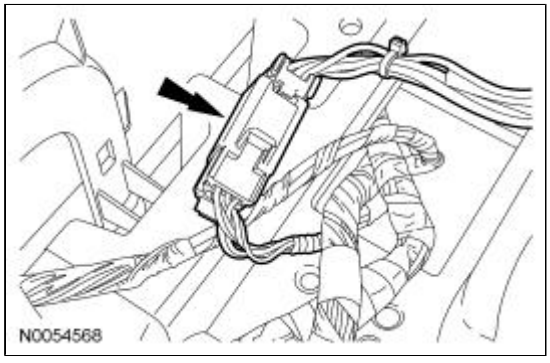
Vehicles equipped with a 6HP26 transmission

6. **NOTE:** Selector lever bezel removed for clarity.

   Install the selector lever into the console.
   - Tighten to 8 Nm (71 lb-in).

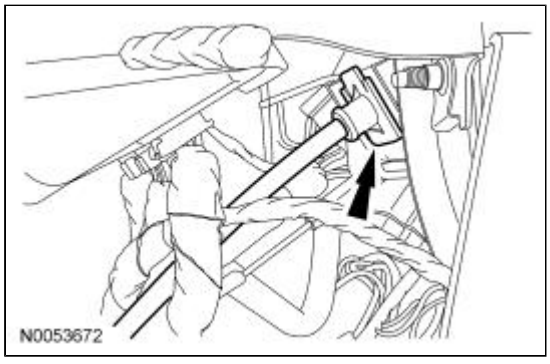


7. Connect the selector lever electrical connector.

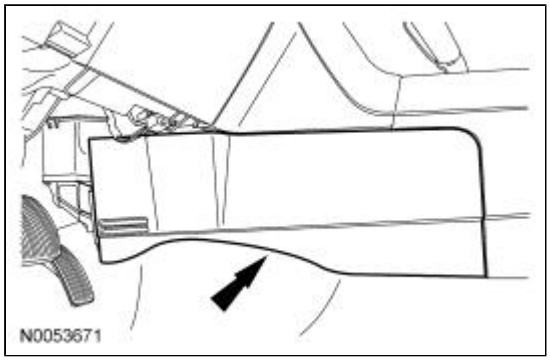


8. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

   Connect the selector lever cable onto the selector lever housing.



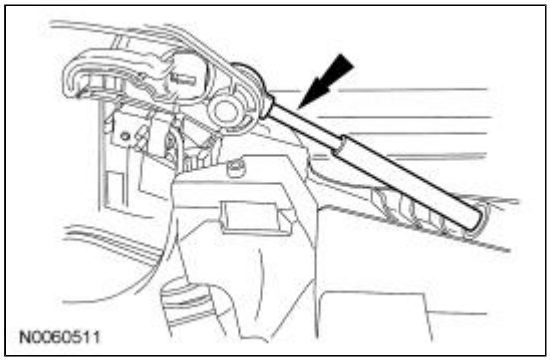
9. Install the center console LH kick panel.



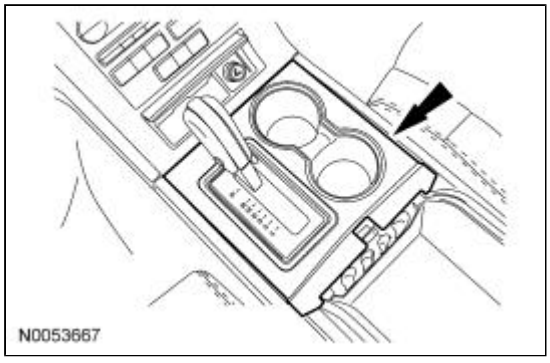
10. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the cable to click into place. Pull back on the selector lever cable to make sure that it is locked into the bracket. Also, make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable to make sure that the cable end is correctly installed.

    NOTE: Selector lever bezel removed for clarity.

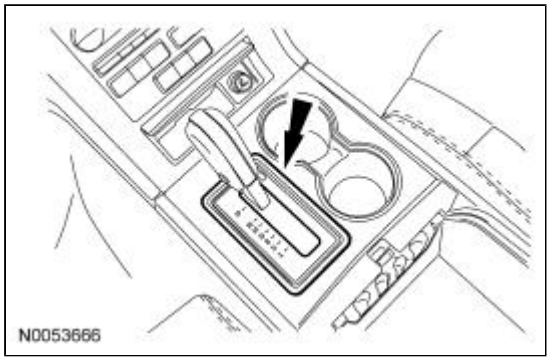
    Connect the selector lever cable onto the selector lever arm ball stud.
    - Listen for the audible click.
    - Pull back on the selector lever cable to make sure that it is correctly installed.



11. Install the floor console upper panel.



12. Install the selector lever trim plate.



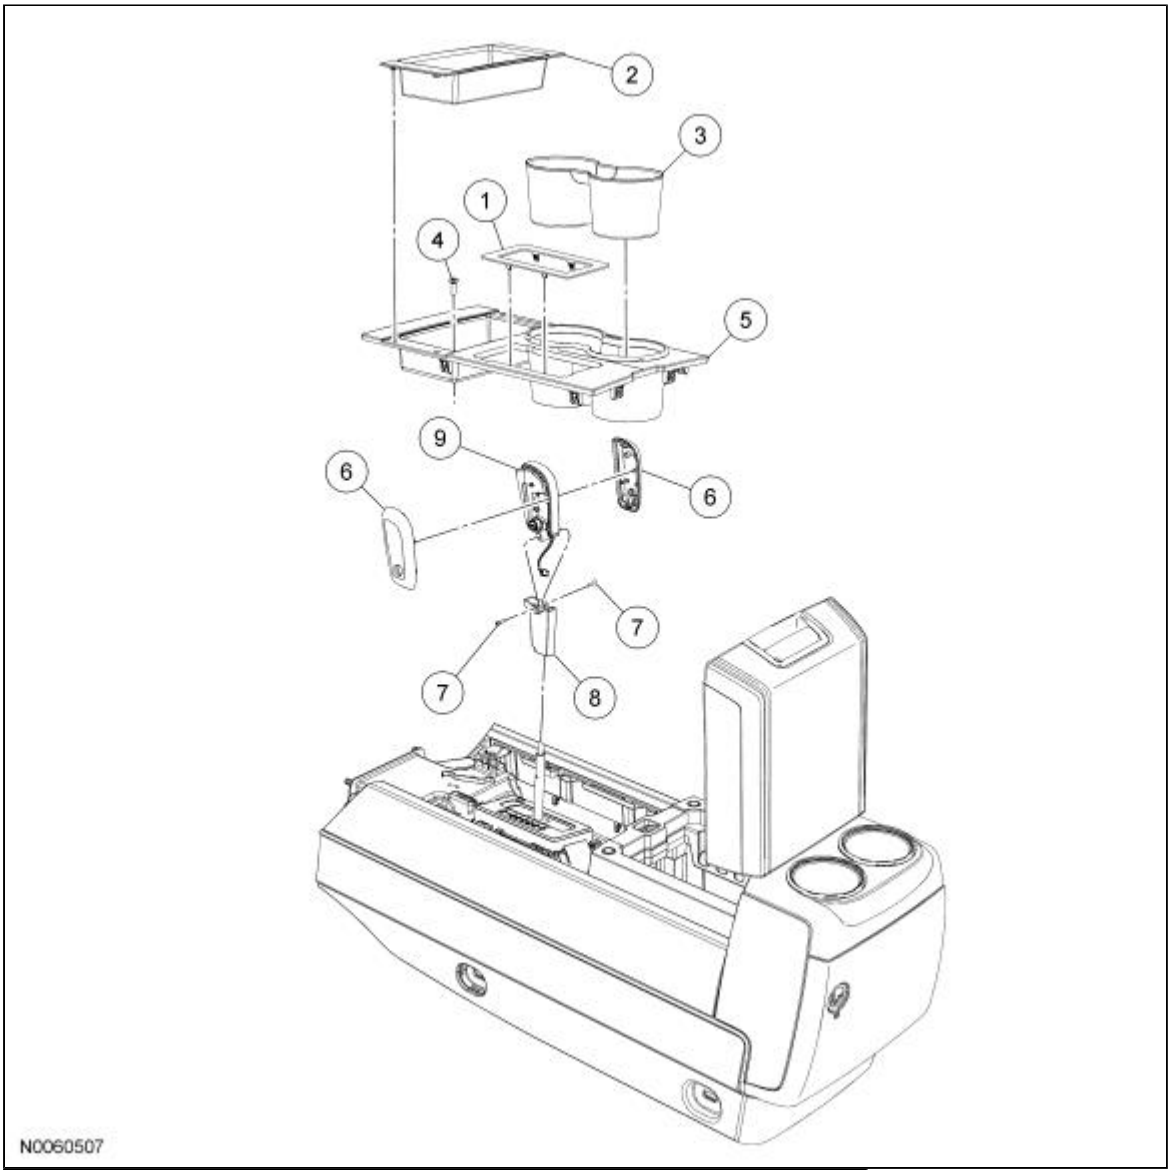
All vehicles

13. Adjust the selector lever cable. Refer to Selector Lever Cable Adjustment in this section.

Selector Lever Knob

Printable View (576 KB)

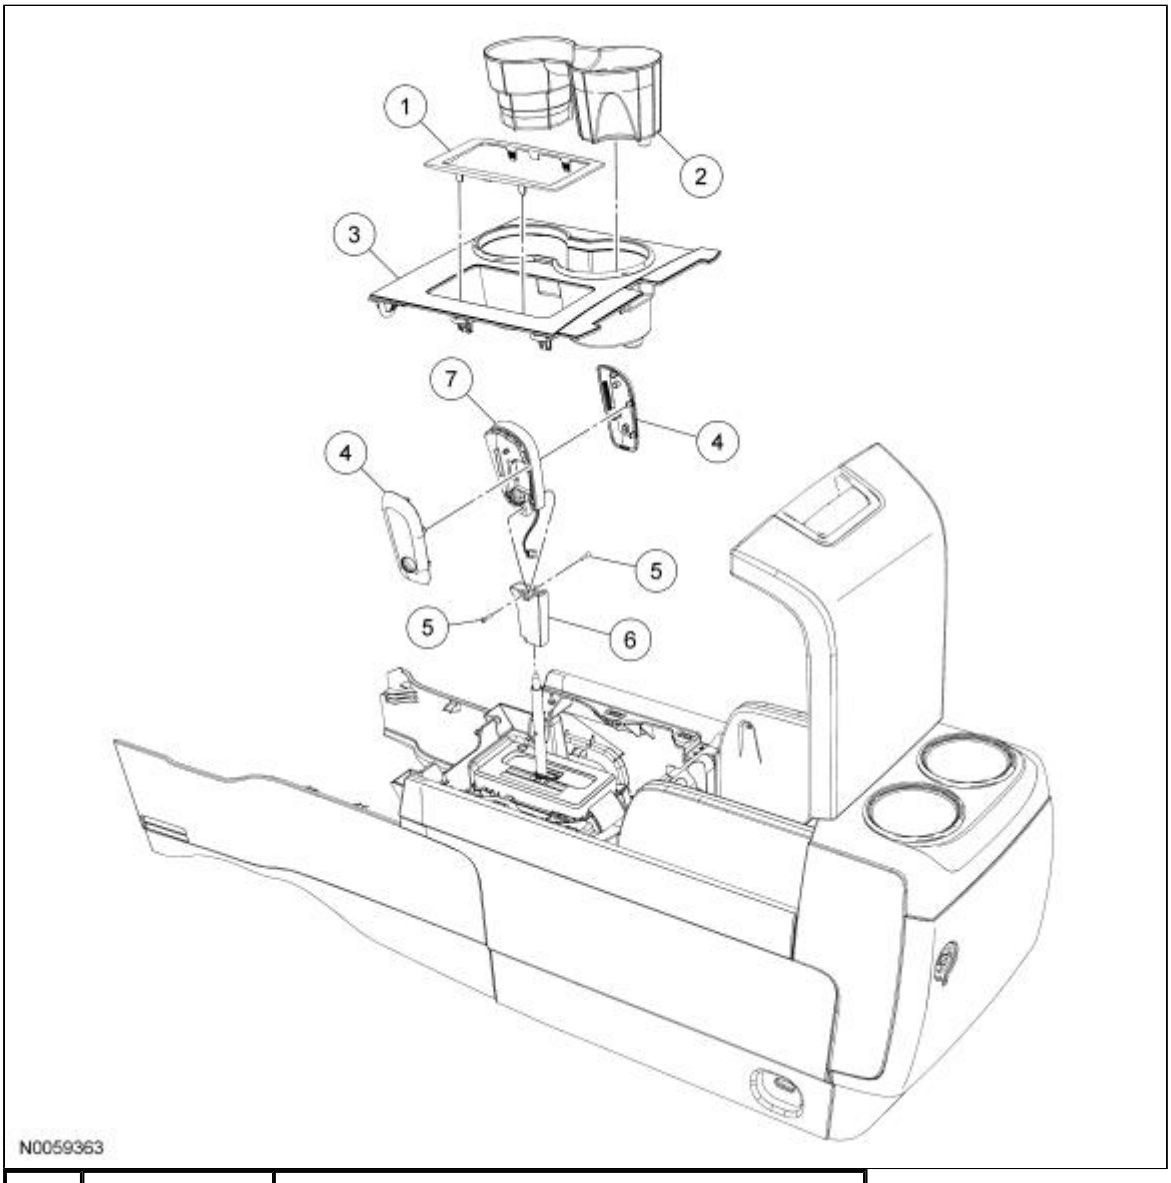
Vehicles Equipped With a 6R75 Transmission



Item	Part Number	Description
1	—	PRNDL trim plate
2	78045G34-B	Console tray
3	78046B94-B	Console cup holder insert
4	—	Console upper trim panel screw
5	78045A76-A	Console upper trim panel
6	7L468-A/B	Selector lever knob cover
7	W701894	Selector lever knob screws
8	7E026-A/B	Selector lever shroud

9	7L010-A/B	Selector lever knob

Vehicles Equipped With a 6HP26 Transmission

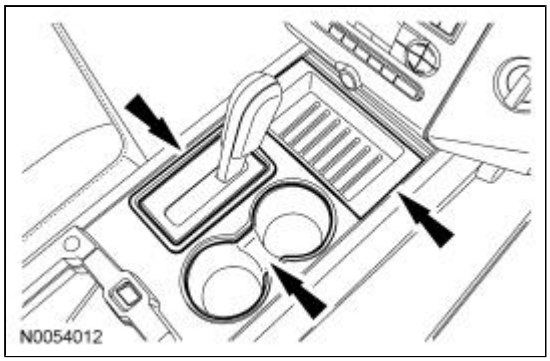


Item	Part Number	Description
1	—	PRNDL trim plate
2	78046B94-B	Console cup holder insert
3	78044J76-A	Console upper trim panel
4	7L468-A	Selector lever knob cover
5	W701894	Selector lever knob screws (part of 7L010-A)
6	7E026-B	Selector lever shroud
7	7L010-A	Selector lever knob

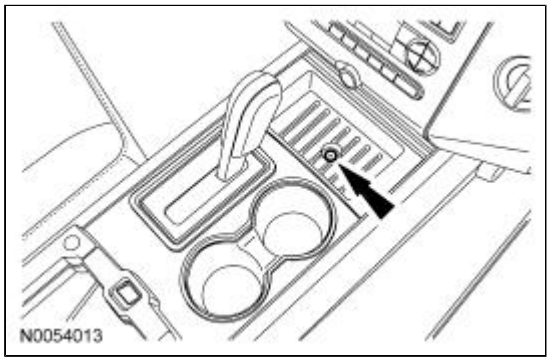
Removal

1. **NOTE:** 6R75 transmission selector lever shown, 6HP26 similar.

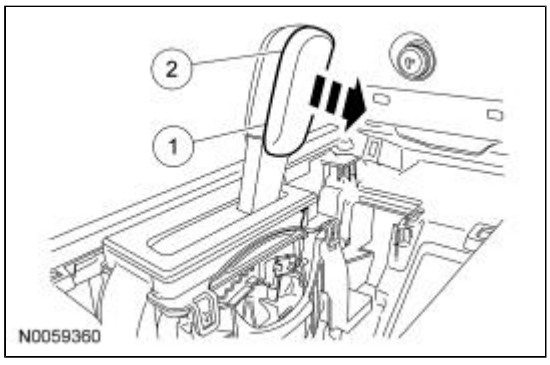
Remove the PRNDL trim, console tray and cup holder insert.



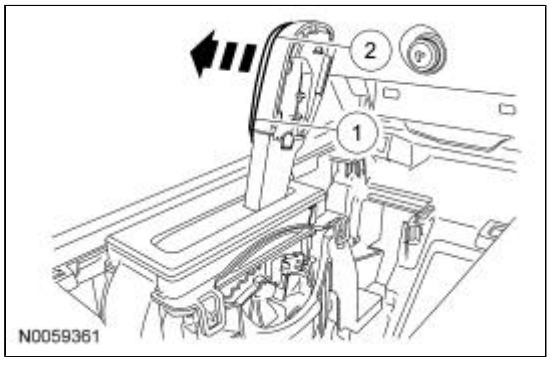
2. Remove the screw and the console upper trim.



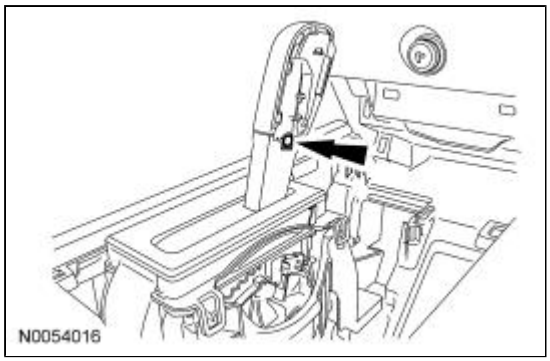
3. Remove and discard the RH selector lever knob cover.
    1. Start at the bottom rear only.
    2. Work towards the top.



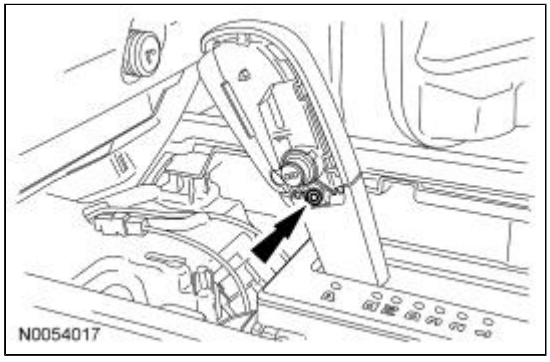
4. Remove and discard the LH selector lever knob cover.
    1. Start at the bottom rear only.
    2. Work towards the top.



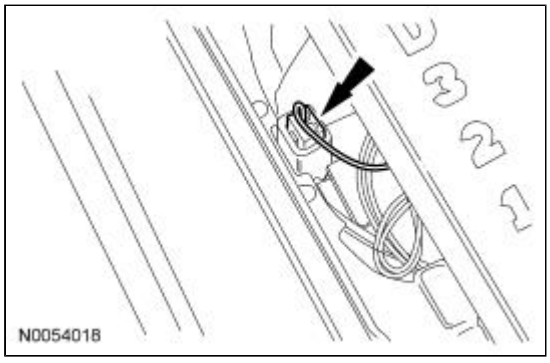
5. Remove and discard the RH selector lever knob screw.



6. Remove and discard the LH selector lever knob screw.

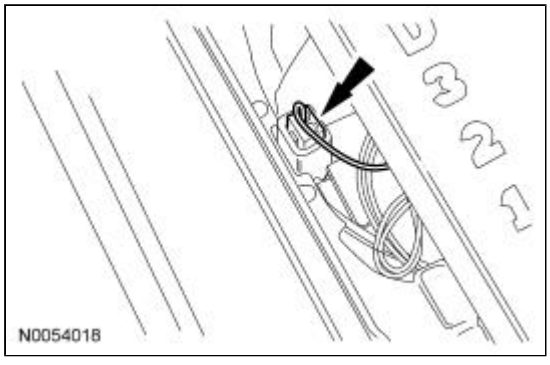


7. Disconnect the transmission control (TC) switch electrical connector and remove the selector lever knob.

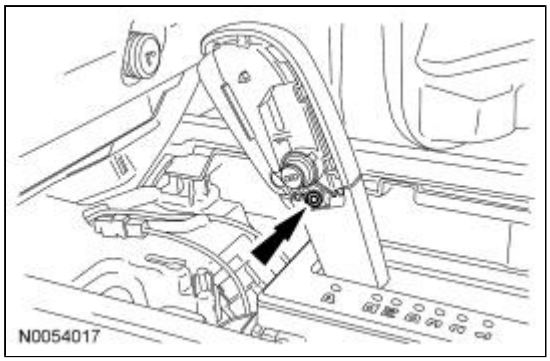


Installation

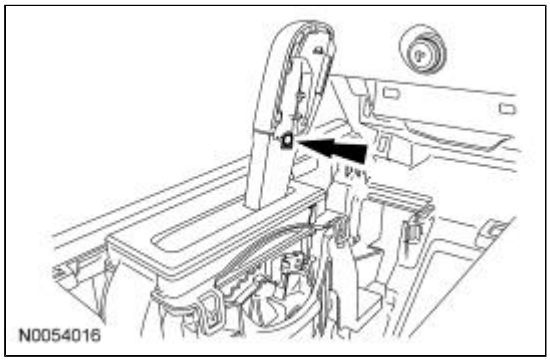
1. Connect the transmission control (TC) switch electrical connector and install the selector lever knob.



2. Install a new LH selector lever knob screw.

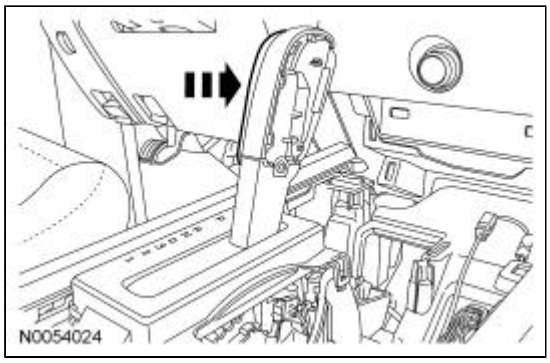


3. Install a new RH selector lever knob screw.



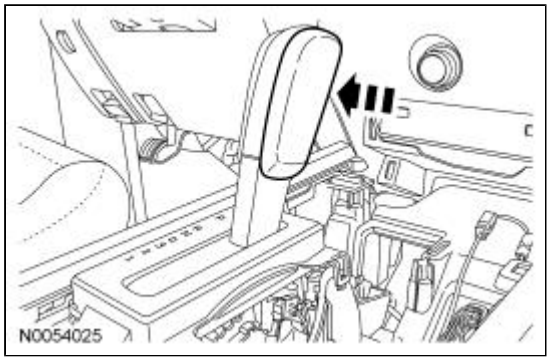
4. **NOTE:** Wood trimmed vehicles have a rubber damper not found on other trim levels.

   Install a new LH selector lever knob cover.

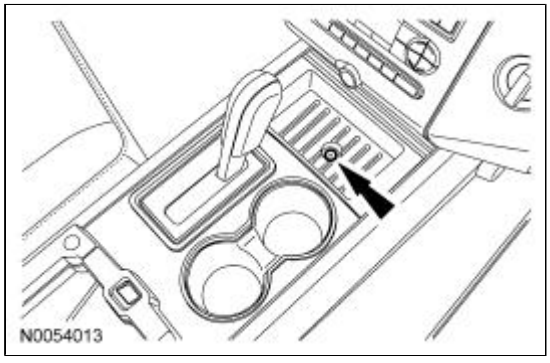


5. **NOTE:** Wood trimmed vehicles have a rubber damper not found on other trim levels.

   Install a new RH selector lever knob cover.



6. Install the console upper trim and the screw.



7. Install the PRNDL trim, console tray and cup holder insert.

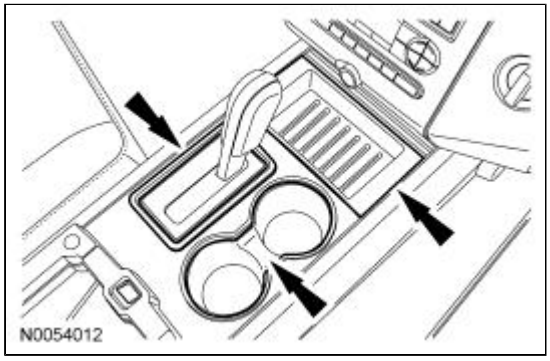
Removal

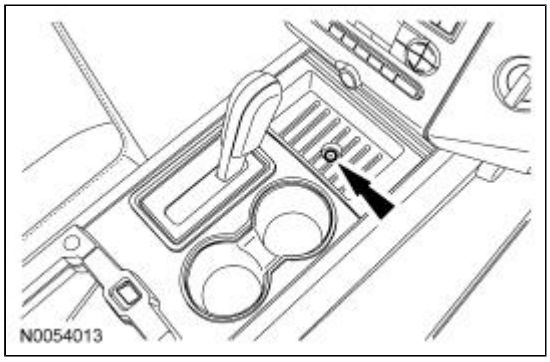
All vehicles

1. **NOTE:** 6R75 transmission selector lever shown, 6HP26 similar.

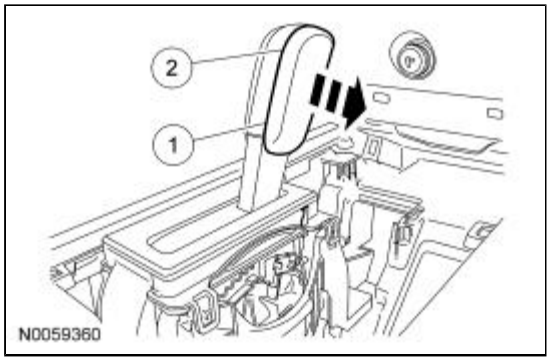
   Remove the PRNDL trim, console tray and cup holder insert.



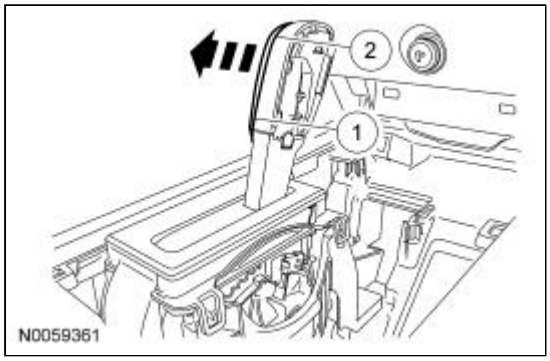
2. Remove the screw and the console upper trim.



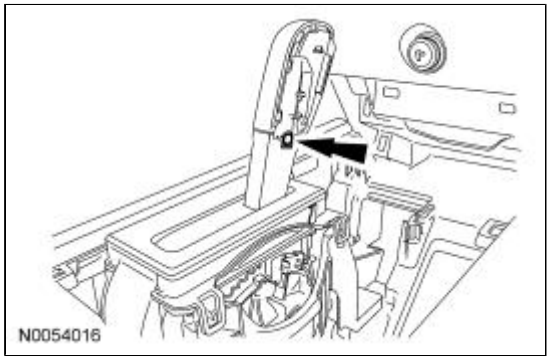
3. Remove and discard the RH selector lever knob cover.
   1. Start at the bottom rear only.
   2. Work towards the top.



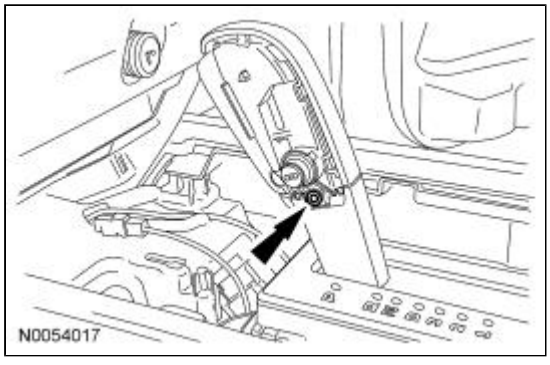
4. Remove and discard the LH selector lever knob cover.
   1. Start at the bottom rear only.
   2. Work towards the top.



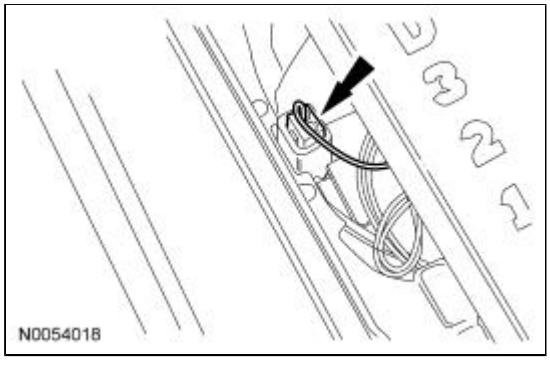
5. Remove and discard the RH selector lever knob screw.



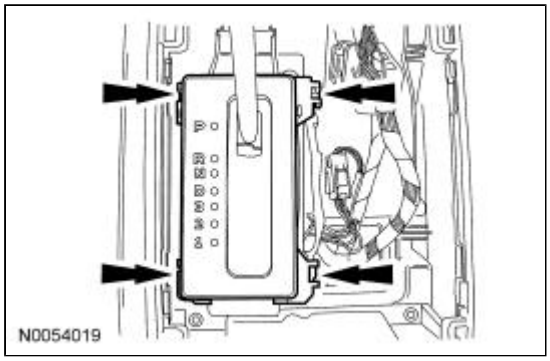
6. Remove and discard the LH selector lever knob screw.



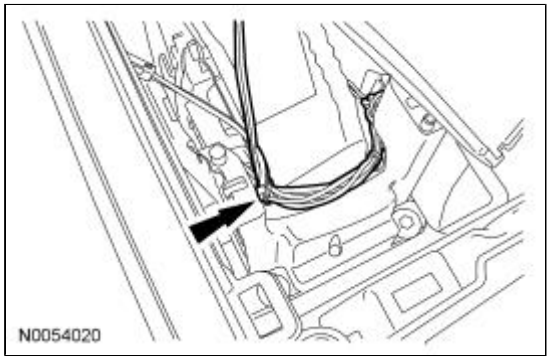
7. Disconnect the transmission control (TC) switch electrical connector and remove the selector lever knob.



8. Lift the tabs on the selector lever bezel and lift the bezel for access to the electrical harness.

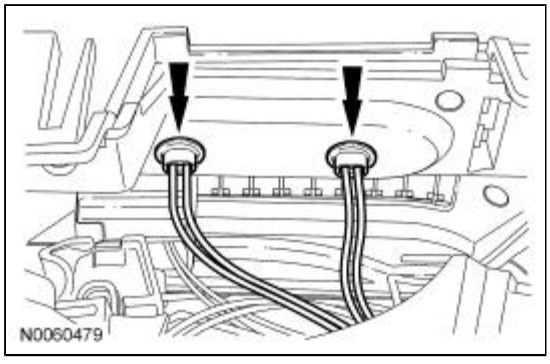


9. Disconnect the electrical harness from the selector lever housing.



Vehicles equipped with a 6R75 transmission

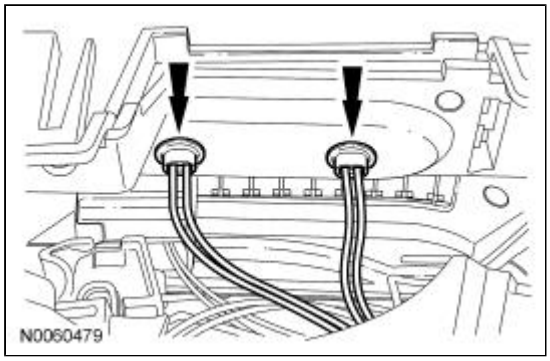
10. Disconnect the electrical harness from the bezel.



Installation

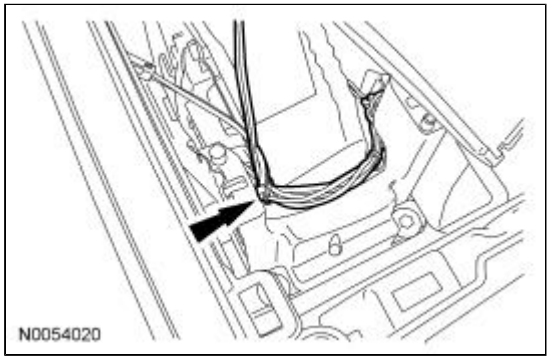
Vehicles equipped with a 6R75 transmission

1. Connect the electrical harness onto the bezel.

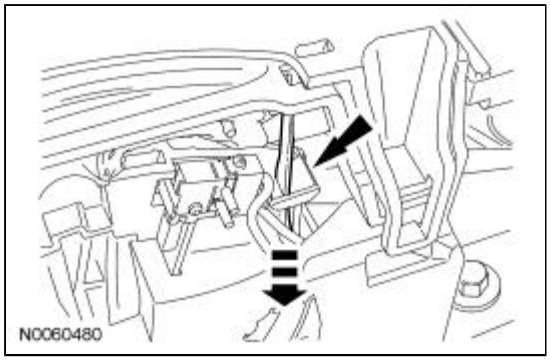


All vehicles

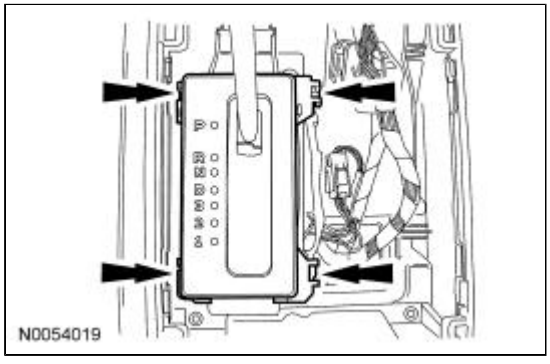
2. Connect the electrical harness onto the selector lever housing.



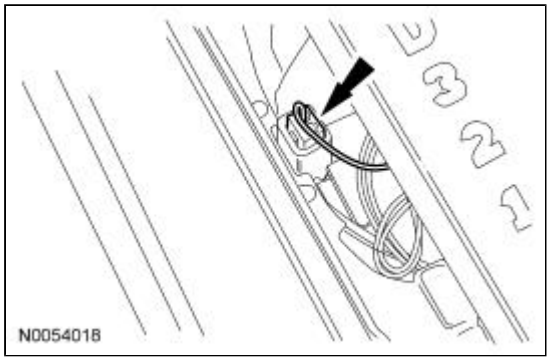
3. Align the brake shift interlock override tab into its guide.



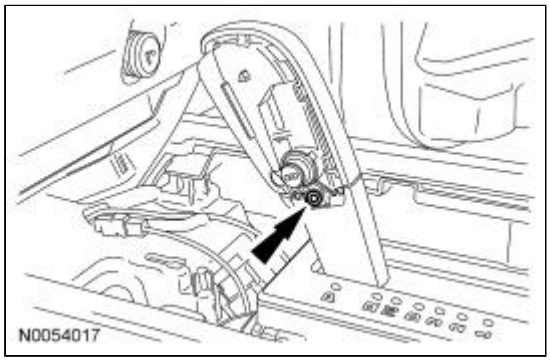
4. Install the selector lever bezel onto the selector lever housing.



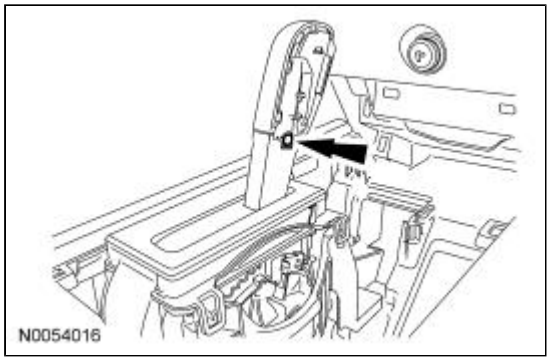
5. Connect the transmission control (TC) switch electrical connector and install the selector lever knob.



6. Install a new LH selector lever knob screw.
    - tighten to 2 Nm (18 lb-in).

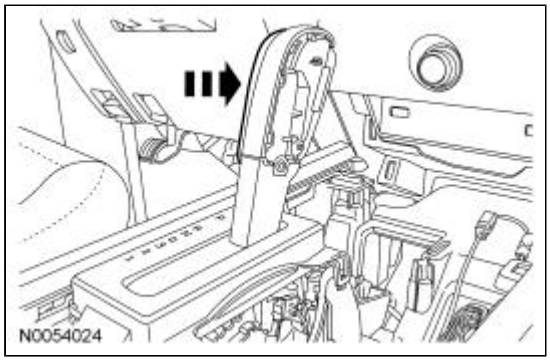


7. Install a new RH selector lever knob screw.
    - Tighten to 2 Nm (18 lb-in).



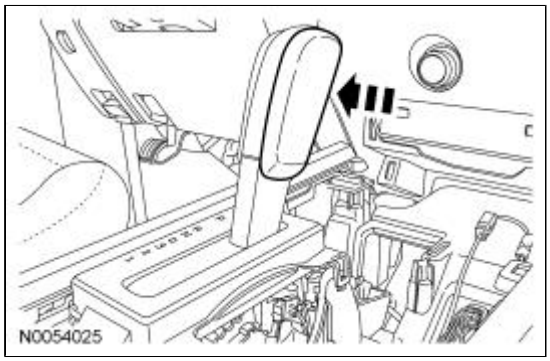
8. **NOTE:** Wood trimmed vehicles have a rubber damper not found on other trim levels.

   Install a new LH selector lever knob cover.

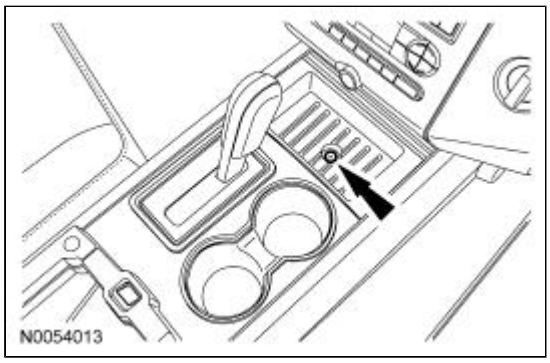


9. **NOTE:** Wood trimmed vehicles have a rubber damper not found on other trim levels.

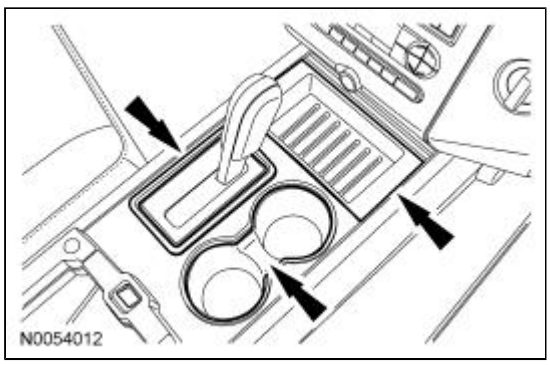
   Install a new RH selector lever knob cover.



10. Install the console upper trim and the screw.



11. Install the PRNDL trim, console tray and cup holder insert.



12. Verify brake shift interlock function.

Transmission Control (TC) Switch — Column Shift

Printable View (78 KB)

Removal and Installation

NOTE: The transmission control (TC) switch is not replaceable. If a new TC switch is required, install a new transmission selector lever assembly.

For additional information, refer to Selector Lever — Column Shift in this section.

Transmission Control (TC) Switch — Floor Shift

Printable View (78 KB)

Removal and Installation

NOTE: The transmission control (+/-) switch is not serviced. If a new switch is required, install a new selector lever assembly.

For additional information, refer to Selector Lever — Floor Shift in this section.

Four Wheel Drive (4WD) Systems

Printable View (63 KB)

The 1-speed torque on demand (TOD) (Navigator) and 2-speed torque on demand (TOD) (Expedition) 4 wheel drive (4WD) systems consist of the following:

- 4WD mode select switch (MSS)
- 4WD control module
- Integrated wheel ends (IWE) solenoid
- IWEs
- 4WD mode indicators and messages in the instrument cluster message center
- Transfer case assembly
- Transfer case shift motor
- Steering wheel angle (SWA) signal from anti-lock brake system (ABS) module
- Accelerator pedal position output from the powertrain control module (PCM)
- Wheel speed signals from the anti-lock brake system (ABS)

Integrated Wheel End (IWE) System

The IWE system contains the following:

- Vacuum reservoir
- IWE solenoid
- IWEs (spring loaded vacuum hubs)
- Vacuum hoses
- Check valve

The IWE system uses vacuum hubs that engage the front wheel hubs to the front halfshafts or disengage the front wheel hubs from the front halfshafts.

The IWE solenoid receives engine vacuum from the vacuum reservoir.

When the 4WD system is in 2 wheel drive (2WD) mode, the 4WD module supplies a ground path to the IWE solenoid to apply vacuum to the integrated wheel ends (disengaging the front hubs from the front halfshafts). In 4WD mode, the 4WD module does not supply the ground path to the IWE solenoid, vacuum is not applied to the integrated wheel ends and an internal spring keeps the front hubs engaged to the front halfshafts.

Four Wheel Drive (4WD) Systems — 1-Speed Torque-On-Demand

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST1137-A	73III Automotive Meter 105-R00057 or equivalent
ST1177-A	88 Digital Multimeter or equivalent 105-R0053
ST2574-A	Flex Probe Kit 105-R025B

Principles of Operation

The Navigator is equipped with an automatic, electronic-shift system that allows the operator to choose (by pressing the mode select buttons) between 3 different modes: 4x2, 4x4 AUTO and 4x4. The operator can switch between 4x2 and 4x4 AUTO mode or 4x4 mode at any speed below 88 kph (55 mph). The operator can switch between 4x4 AUTO mode and 4x4 mode at any speed.

Wheel slip is sensed by monitoring the average front and rear wheel speeds. Based on steering wheel angle (SWA), accelerator pedal position and wheel slip, a pulse width modulated (PWM) signal is transmitted to the transfer case as torque is required. The 4 wheel drive (4WD) control module will provide the anti-lock brake system (ABS) with current clutch duty cycle and whether or not ABS may command the clutch duty cycle.

The brake subsystem sends the following information signals to the 4WD system:

- Occurrences of brake events and failures. Refer to Section 206-09 .
- Steering wheel angle status. Refer to Section 206-09 .
- Wheel speeds. Refer to Section 206-09 .

A concern with any of the above listed brake system signals will affect operation of the 4WD system.

The accelerator pedal position output signal is provided to the 4WD control module from the powertrain control module (PCM). This signal is used by the 4WD control module in controlling the transfer case clutch.

The 4WD control module sends a duty cycle command to the clutch coil which activates the clutch within the transfer case.

The 4WD control module varies the torque sent to the front driveline by controlling the transfer case clutch. At rest and under cruising conditions, the 4WD control module activates the transfer case clutch a minimum duty cycle (percentage of time the clutch is turned on), which allows for the slight difference between the front and rear driveshafts which normally occurs when negotiating a corner on dry pavement. Under any of the following conditions, the 4WD control module will increase the duty cycle in order to prevent or control slip:

- Slip is detected
- Heavy acceleration (accelerator pedal position)
- Straight-ahead steering wheel angle (SWA)

Feature inputs:

- Mode select switch (MSS)
- Accelerator pedal position (from the PCM)
- SWA (from the ABS module)
- Transmission range position (from the transmission control module [TCM])
- Transmission output torque (from the PCM)
- Wheel speed signal (transmitted from the ABS module)
- Accelerator pedal position information (transmitted from the PCM)

Feature outputs:

- Solid state PWM signal
- Message center 4WD mode indicators

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Halfshafts
• Integrated wheel ends (IWEs)
• Driveshaft and universal joints
• Vacuum leaks
• Fluid leaks
• Matching tire sizes
• Transfer case
	• Battery junction box (BJB) fuses:
	  ▪ 35 (20A)
	  ▪ 75 (5A)
	• Smart junction box (SJB) fuse 35 (10A)
	• 4WD control module
	• Mode select switch (MSS)
	• Integrated wheel end (IWE) solenoid
	• Wiring harness
	• Connector(s)

	• Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the DTCs and carry out the self-test diagnostics for the 4WD control module.

9. **NOTE:** Before carrying out the on-demand self test, make sure that:
   - the ignition is in RUN.
   - 4x2 mode is selected.

   If the DTCs retrieved are related to the concern, go to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart

DTC	Description	Source	Action
B1317	Battery Voltage High	Four Wheel Drive (4WD) Control Module	CHECK the battery and charging system for faults. REFER to Section 414-00 . CLEAR the DTC. REPEAT the self-test.
B1318	Battery Voltage Low	4WD Control Module	CHECK the battery and charging system for faults. REFER to Section 414-00 . CLEAR the DTC. REPEAT the self-test.
B1342	ECU is Defective	4WD Control Module	CLEAR the DTC. REPEAT the self-test. If DTC B1342 is retrieved, INSTALL a 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. REPEAT the

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the four wheel drive (4WD) control module	• Scan tool • Battery junction box (BJB) fuse 35 (20A) • Power supply: ▪ SBB35 (BU/RD) hot at all	• REFER to Section 418-00 .

	times ■ CBB75 (YE/GY) run/start • Smart junction box (SJB) fuses: ■ 20 (15A) (OBD II) ■ 35 (10A) • Ground circuit GD133 (BK) • 4WD control module • Charging system	
• The vehicle does not shift between two wheel drive (2WD) and 4WD modes correctly	• 4WD indicator (s) • 4WD control module • BJB fuse 35 (20A) • SJB fuse 35 (10A) • Circuit CBB75 (YE/GY) • Transfer case clutch • Mode select switch (MSS)	• Go To Pinpoint Test B .
• The 4WD indicators do not operate correctly/do not operate	• Instrument cluster • 4WD system fault • CAN communication network • 4WD control module • Ignition switch and/or circuitry • SJB fuse 35 (10A) • Circuit CBP35 (YE/GY)	• Go To Pinpoint Test G .
• Four wheel drive (4WD) does not engage at speed correctly	• Transfer case clutch coil • 4WD control module • Integrated wheel ends (IWEs)	• Go To Pinpoint Test C .
• The front axle does not engage/disengage correctly/makes noise in 4x2 mode under heavy throttle	• Mode select switch • IWEs • IWE solenoid • Vacuum leaks • 4WD control module • Front halfshaft • Vacuum check	• Go To Pinpoint Test A .

	valve(s)	
• The four wheel drive (4WD) system jumps out of gear	• Transfer case • IWE vent • MSS	• Go To Pinpoint Test D .
• Straightline driveline wind-up	• Unmatched tire sizes • Unequal amounts of tire wear • Unequal tire inflation pressures • Unmatched front and rear axle ratios	• Go To Pinpoint Test E .
• Grinding noise during 4WD system engagement, especially at high speeds	• Front halfshaft speeds not turning at the same speed	• INSTALL the S-spring in the front differential. REFER to Section 205-03 for S-spring installation.
• The transfer case makes noise	• Tire inflation pressure • Tire and wheel size	• MAKE SURE that all tires and wheels are the same size and that the inflation pressures are correct.
	• Tire tread wear	• CHECK tire tread wear to see if there is more than 0.15 mm (0.06 in) difference in tread wear between front and rear. INTERCHANGE one front wheel and one rear wheel. ROAD TEST again.
	• Internal components	• OPERATE the vehicle in all transmission gears. If there is noise in the transmission in NEUTRAL, or in some gears and not in others, REMOVE and REPAIR the transmission. REFER to Section 307-01A . If there is noise in all gears, DISASSEMBLE the transfer case. REFER to Section 308-07B . CHECK the planetary gears, the bearings, the upper and lower drive sprockets and drive chain for damage. INSTALL new parts as necessary.
	• Fluid level	• FILL with automatic transmission fluid. REFER to Section 308-07B .
• The vehicle binds in turns/resists turning/pulsates/shudders in a straight line	• Unmatched tire sizes • Unequal amounts of tire	• Go To Pinpoint Test H .

	wear • Unequal tire inflation pressures • Unmatched front and rear axle ratios	
• The vehicle does not shift between 4x4 AUTO mode and 4x4 mode correctly	• MSS • Transfer case • Circuitry • 4WD control module	• Go To Pinpoint Test C .
• The vehicle has no torque or inadequate torque at rear wheels in 4x4 AUTO mode	• Transfer case • Circuitry • 4WD control module	• Go To Pinpoint Test F .
• Unable to duplicate customer concern	• 4WD indicator • 4WD control module • Transfer case and related components • Wheel/tire assemblies	• CARRY OUT the 4WD System Functional Test. Go To Pinpoint Test F .

Pinpoint Tests

Pinpoint Test A: The Front Axle Does Not Engage/Disengage Correctly/Makes Noise in 4x2 Mode Under Heavy Throttle

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

In 4x2 mode, the 4 wheel drive (4WD) control module supplies a ground path to the integrated wheel end (IWE) solenoid to apply vacuum to the IWEs (disengaging the front hubs from the front axle). In 4x4 mode and 4x4 AUTO modes, the 4WD control module does not supply the ground path to the IWE solenoid, vacuum is not applied to the IWEs and an internal spring keeps the hubs engaged. Systematically check the necessary inputs and outputs at the 4WD control module, internal components of the transfer case, mode select switch, IWE components and drive axles.

Possible Causes

- Mode select switch (MSS)
- IWE
- IWE solenoid
- Transfer case
- Vacuum leaks
- Front axle assembly
- 4WD control module
- Circuit CCF05 (BN/BU)
- Circuit CBB75A (YE/GY)

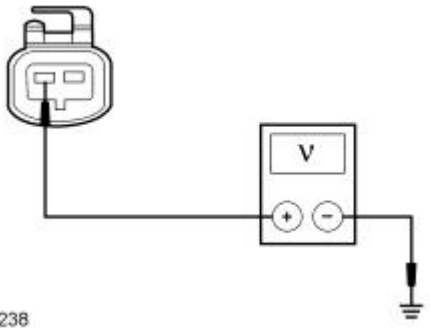
PINPOINT TEST A: THE FRONT AXLE DOES NOT ENGAGE/DISENGAGE CORRECTLY/MAKES

NOISE IN 4x2 MODE UNDER HEAVY THROTTLE

Test Step	Result / Action to Take
A1 CHECK FOR DTCs • Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Carry out the on-demand self test. • **Are DTCs C1979 or C1980 present?**	**Yes** If DTC C1979 is retrieved, GO to A13 . If DTC C1980 is retrieved, GO to A15 . **No** GO to A2 .
A2 CHECK FOR GRINDING NOISES AT HIGH SPEEDS • Select 4x2 mode then select 4x4 mode while at rest. Drive the vehicle. • Select 4x2 mode then select 4x4 mode while driving the vehicle at low speed. • Select 4x2 mode then select 4x4 mode while driving the vehicle at high speed. • **Is the axle system fully functional at rest, but there is a grinding noise during engagement, especially at high speed?**	**Yes** If the concern is excessive front axle noise during 4x4 mode engagement (especially at high speeds), INSTALL the S-spring in the front differential. REFER to Section 205-03 . **No** GO to A3 .
A3 CHECK THE TRANSFER CASE SHIFT TO 4x2 MODE • Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Select 4x2 mode. • **Does the message center still indicate 4x4 auto mode or 4x4 mode?**	**Yes** GO to A4 . **No** Go To Pinpoint Test B .
A4 CHECK THE IWE DISENGAGEMENT • Raise and support the vehicle off the ground until the front wheels can be spun freely. Refer to Section 100-02 . • **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid. • Start the engine and allow to idle. • Select 4x2 mode. • Rotate the left front tire one revolution forward and one revolution backward while observing the left front halfshaft. • Rotate the right front tire one revolution forward and one revolution backward while observing the right front halfshaft. • **Did either front halfshaft rotate?**	**Yes** GO to A10 . **No** GO to A5 .
A5 CHECK THE TRANSFER CASE SHIFT INTO 4x4 MODE • Select 4x4 mode. • **Does the instrument cluster indicator lamp indicate that the MSS is in 4x4 mode?**	**Yes** GO to A6 . **No** Go To Pinpoint Test C .
A6 CHECK THE IWE ENGAGEMENT • Raise and support the vehicle off the ground until the front wheels can be spun freely. Refer to Section 100-02 . • **NOTE:** The engine must be idling during the following	**Yes** CHECK that all driveline fasteners are present and tightened to specification.

steps to supply vacuum to the IWE solenoid. • Start the engine and allow to idle. • Select 4x4 mode. • Rotate the left front tire one revolution forward and one revolution backward while observing the left front halfshaft. • Rotate the right front tire one revolution forward and one revolution backward while observing the right front halfshaft. • **Did both front halfshafts rotate?**	REFER to Section 205-00 for further diagnosis of the front axle. **No** GO to A7 .
A7 CHECK THE IWE SOLENOID OUTPUT IN 4x4 MODE	
• **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid. • Start the engine. • Disconnect the output vacuum line at the IWE solenoid. • Select 4x4 mode. • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum less than 25 mm (1 in) Hg?**	**Yes** Key in OFF position. GO to A24 . **No** GO to A8 .
A8 CHECK THE IWE SOLENOID OUTPUT IN 4x4 WITH THE SCAN TOOL	
• Key in OFF position. • Connect the diagnostic tool. • **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid. • Start the engine. • Disconnect: Active Commands. • Using the scan tool, command the IWE solenoid to engage the IWEs (solenoid OFF). • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum less than 25 mm (1 in) Hg?**	**Yes** END active command. GO to A18 . **No** GO to A9 .
A9 CHECK THE IWE SOLENOID	
• Disconnect: IWE Solenoid C1157. • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum less than 25 mm (1 in) Hg?**	**Yes** END active command. GO to A17 . **No** END active command. INSTALL a new IWE solenoid. REPEAT the self-test.
A10 CHECK THE IWE SOLENOID OUTPUT VACUUM IN 4x2 MODE	
• **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid. • Start the engine. • Disconnect the output vacuum line at the IWE solenoid. • Select 4x2 mode. • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to A19 . **No** GO to A11 .
A11 CHECK THE IWE SOLENOID INPUT VACUUM	
• Measure the vacuum at the input port of the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to A12 . **No** REPAIR the vacuum leak. CLEAR the DTCs. REPEAT the

	self test.
A12 CHECK THE IWE SOLENOID OUTPUT IN 4x2 MODE WITH THE SCAN TOOL	
• Key in OFF position. • Connect the diagnostic tool. • **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid. • Start the engine. • Enter the following diagnostic mode on the scan tool: Active Command. • Using the scan tool, command the IWE solenoid to disengage the IWEs (IWE solenoid ON). • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** END active command. GO to A18 . **No** END active command. GO to A13 .
A13 CHECK CIRCUIT CBB75A (YE/GY) FOR VOLTAGE	
• Key in OFF position. • Disconnect: IWE Solenoid C1157. • Measure the voltage between IWE solenoid C1157-1, circuit CBB75A (YE/GY) and ground.  A0069239 • **Is the voltage greater than 9 volts?**	**Yes** GO to A14 . **No** CHECK CJB fuse 75 (5A) for an open. CLEAR the DTCs. REPEAT the self-test.
A14 CHECK THE IWE SOLENOID OPERATION	
• Connect: IWE Solenoid C1157. • **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • Start the engine. • Connect a 10 amp fused jumper wire between IWE solenoid C1157-1, circuit CCF05 (BN/BU), component side and ground. • Measure the vacuum at the IWE solenoid output vacuum port. • **Is the IWE solenoid output port vacuum greater than 254 mm (10 in) Hg?**	**Yes** DISCONNECT the fused jumper. GO to A15 . **No** INSTALL a new IWE solenoid. CLEAR the DTCs. REPEAT the self-test.
A15 CHECK CIRCUIT CCF05 (BN/BU) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: IWE Solenoid C1157. • Disconnect: 4WD Control Module C281a. • Key in ON position. • Measure the voltage between IWE solenoid C1157-2, circuit CCF05 (BN/BU), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to A16 .



A0069238

- **Is voltage present?**

A16 CHECK CIRCUIT CCF05 (BN/BU) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between IWE solenoid C1157-2 harness side and 4WD control module C281a-17 harness side, circuit CCF05 (BN/BU).  N0057985 • **Is the resistance less than 5 ohms?**	**Yes** GO to A17 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A17 CHECK CIRCUIT CCF05 (BN/BU) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between IWE solenoid C1157-2, circuit CCF05 (BN/BU), harness side and ground.  A0079780 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A18 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A18 CHECK THE 4WD CONTROL MODULE	

• Disconnect all 4WD control module connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all 4WD control module connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. REPEAT the self-test. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have

	been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
A19 CHECK THE IWE VACUUM SYSTEM • Key in OFF position. • Disconnect both vacuum lines from the IWE solenoid. • Using a vacuum pump, apply 508 mm (20 in) Hg of vacuum to the IWE system through the apply vacuum circuit. • Observe the vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** GO to A20 . **No** CONNECT the vacuum lines to the IWE solenoid. GO to A23 .
A20 CHECK THE RH IWE LEAK RATE • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Disconnect the vacuum line from the larger port on the RH IWE. • Apply 508 mm (20 in) Hg of vacuum to the RH IWE port and observe vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** INSTALL a new IWE. REFER to Section 204-00 . GO to A19 . **No** GO to A21 .
A21 CHECK THE LH IWE LEAK RATE • Disconnect the vacuum line from the larger port at the LH IWE. • Apply 205 mm (20 in) Hg of vacuum to the LH IWE port and observe vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** INSTALL a new IWE. REFER to Section 204-00 . GO to A19 . **No** GO to A22 .
A22 CHECK THE IWE VACUUM SUPPLY TUBE • Disconnect both vacuum lines from the IWE solenoid. • Plug both LH and RH IWE vacuum lines. Apply 508 mm (20 in) Hg of vacuum to the IWE vacuum circuit and observe the vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** INSTALL new vacuum lines as necessary. GO to A19 . **No** GO to A23 .
A23 CHECK THE IWE VACUUM SUPPLY AT EACH IWE IN 4x2 MODE • Connect a hand-held vacuum gauge to the LH IWE vacuum supply tube. • **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • Start the engine. • Select 4x2 mode while observing the vacuum gauge. • Repeat these steps for the RH IWE. • **Are the vacuum readings greater than 254 mm (10 in) Hg?**	**Yes** GO to A26 . **No** INSTALL new vacuum lines as necessary. GO to A19 .
A24 CHECK THE LH IWE VACUUM LINE FOR AN OBSTRUCTION • Disconnect both vacuum lines from the IWE solenoid. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Disconnect the vacuum line at the LH IWE. • Connect a hand vacuum pump to the LH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the vacuum pump draw a vacuum on the LH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. CLEAR the DTCs. REPEAT the self-test. **No** CONNECT the vacuum line to the LH IWE. GO to A25 .

A25 CHECK THE RH IWE VACUUM LINE FOR AN OBSTRUCTION	
• Disconnect the larger vacuum line at the RH IWE. • Connect a vacuum pump to the RH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the vacuum pump draw a vacuum on the RH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. CLEAR the DTCs. REPEAT the self-test. **No** CONNECT the vacuum line to the RH IWE. GO to A26 .
A26 CHECK THE LH IWE OPERATION	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to section Section 100-02 . • Connect a vacuum pump to the larger IWE vacuum port. • Observe the LH halfshaft while rotating the LH front tire. Apply and release vacuum to manually engage and disengage the LH IWE. • **Did the LH IWE disengage between 152 and 203 mm (6 to 8 in) Hg?**	**Yes** GO to A27 . **No** INSTALL a new LH IWE. CLEAR the DTCs. REPEAT the self-test.
A27 CHECK THE RH IWE OPERATION	
• Connect a vacuum pump to the larger RH IWE vacuum port. • Observe the RH halfshaft while rotating the RH front tire. Apply and release vacuum to manually engage and disengage the LH IWE. • **Did the RH IWE disengage between 152 and 203 mm (6 to 8 in) Hg?**	**Yes** CLEAR the DTC(s). REPEAT the self-test. Go To Pinpoint Test H . **No** INSTALL a new RH IWE. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: The Vehicle Does Not Shift Between Two Wheel Drive (2WD) and Four Wheel Drive (4WD) Modes Correctly

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

The mode select switch (MSS) communicates the operator's choice to the four wheel drive (4WD) control module. The 4WD control module then controls the transfer case clutch, transfer case motor and integrated wheel ends (IWEs) as necessary. If the vehicle is not responding to the operator's intentions, systematically check the necessary inputs and outputs of the 4WD control module, components of the transfer case, IWE components and halfshafts. Check all circuits for opens and shorts to power or ground.

Possible Causes

- 4WD indicator
- Ignition switch and/or circuity
- Transfer case clutch
- Transfer case
- Circuit CCF03 (GY/BN)
- Powertrain control module (PCM)
- Instrument cluster (IC)
- 4WD control module
- Controller area network (CAN) communication network

PINPOINT TEST B: THE VEHICLE DOES NOT SHIFT BETWEEN TWO WHEEL DRIVE (2WD) AND

FOUR WHEEL DRIVE (4WD) MODES CORRECTLY

Test Step	Result / Action to Take
B1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs) • Connect the diagnostic tool. • Carry out the 4WD control module on-demand self test. • **Are DTCs retrieved?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module DTC Chart for diagnosis. **No** GO to B2 .
B2 CHECK THE 4x4 MODE INDICATOR • Select 4x4 mode and observe the instrument cluster. • **Does the instrument cluster indicator lamp indicate 4x4 mode?**	**Yes** GO to B8 . **No** GO to B3 .
B3 CHECK THE IGNITION SWITCH STATUS PID • Key in ON position. • Monitor the ignition switch status PID. • **Do the ignition switch PIDs match the ignition switch positions?**	**Yes** GO to B4 . **No** CHECK the ignition switch and the CAN communication network for faults. REFER to Section 413-00 and Section 418-00 . After the fault is repaired, CLEAR the DTC. REPEAT the self-test.
B4 CHECK THE MODE SELECT SWITCH (MSS) POSITION PID • Monitor each MSS PID while cycling through each MSS position. • **Does each MSS PID agree with each switch position?**	**Yes** GO to B7 . **No** GO to B5 .
B5 CHECK THE MSS RESISTANCE VALUES • Key in OFF position. • Disconnect: MSS C284. • Measure the resistance between MSS C284, terminals 2 and 3, while rotating the switch through all positions. Refer to the following chart. **Mode Select Switch (MSS) Position** / **Resistance** 4x2 / 39 ohms 4x4 AUTO / 237 ohms 4x4 / 536 ohms	**Yes** GO to B6 . **No** INSTALL a new MSS. CLEAR the DTCs. REPEAT the self-test.

 A0049121 • **Are the resistance values within specification?**	
B6 CHECK CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR AN OPEN • Measure the resistance between MSS C284-2, harness side and 4WD control module C281a-11, harness side, circuit CCF13 (WH/BU).  N0057986 • Measure the resistance between MSS C284-3, harness side and 4WD control module C281a-20, harness side, circuit RCF13 (WH/BN). • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
B7 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID • Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle (pulse width modulated [PWM]) PID. • **Does the clutch duty cycle PID read 0% at closed throttle?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. REPEAT the self-test. TEST the system for normal operation.
B8 CHECK FOR 4x4 MODE WIND-UP • Switch 4x4 mode. • Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to B13 . **No** GO to B9 .
B9 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID AT WIDE OPEN THROTTLE (WOT) • Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle PWM PID at wide open throttle (WOT), engine off, key on. • **Does the clutch duty cycle PID read 98% at WOT?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No**

	GO to B10 .
B10 CHECK THE ACCELERATOR PEDAL POSITION OUTPUT PID • Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Slowly move the accelerator pedal from closed throttle to WOT and observe the output PID. • **Does the throttle output PID vary between 0% at closed throttle and 100% at WOT?**	**Yes** GO to B11 . **No** Diagnose the powertrain control module (PCM). REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual and the CAN communication network, REFER to Section 418-00 .
B11 CHECK FOR TRANSFER CASE CLUTCH ENGAGEMENT WITH ACTIVE COMMANDS • Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Using the active commands, engage the transfer case clutch to 100% while monitoring the transfer case clutch duty cycle PWM PID. • **Does the clutch duty cycle PID read 100%?**	**Yes** CHECK transfer case. REFER to Section 308-07B . **No** GO to B12 .
B12 CHECK CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR AN OPEN • Measure the resistance between MSS B284-2, harness side and 4WD control module C281a-11, harness side, circuit CCF13 (WH/BU).  N0057986 • Measure the resistance between MSS B284-3, harness side and 4WD control module C281a-20, harness side, circuit RCF13 (WH/BN). • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
B13 CHECK 4WD INDICATOR IN 4x4 AUTO MODE • Select 4x4 AUTO mode and observe the instrument cluster. • **Does the instrument cluster indicator lamp indicate 4x4 AUTO mode?**	**Yes** GO to B14 . **No** Go To Pinpoint Test C .
B14 CHECK FOR WIND-UP IN 4x4 AUTO MODE • Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to B15 . **No** The system is operating correctly.
B15 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID • Enter the following diagnostic mode on the diagnostic	**Yes**

tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle PWM PID at closed throttle, engine off, key on. • **Does the PID indicate 2 to 4% clutch application at closed throttle?**	GO to B16 . **No** GO to B18 .
B16 CHECK VOLTAGE ON THE CLUTCH POWER CIRCUIT CCF03 (GY/BN)	
• Use the scan tool active commands to energize the transfer case clutch to 4%. • Back-probe transfer case C350-16 circuit CCF03 (GY/BN), harness side. • Measure the voltage on circuit CCF03 (GY/BN) using a digital multimeter. • **Is the voltage approximately 0.2 to 0.4 volt?**	**Yes** END the active command. CHECK the transfer case. REFER to Section 308-07B . **No** GO to B17 .
B17 CHECK CIRCUITS CCF03 (GY/BN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Transfer Case C350. • Disconnect: 4WD Control Module C281b. • Measure the resistance between 4WD control module C281b-1, harness side and transfer case C350-16, harness side circuit CCF03 (GY/BN).  N0057987 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL as new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B18 CHECK THE WHEEL SPEED PIDs	
• While driving the vehicle at 30 km/h (18 mph), monitor the wheel speed PIDs. • Compare the speedometer reading to the wheel speed PIDs. • **Do the wheel speed PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	**Yes** GO to B19 . **No** CHECK the anti-lock brake system (ABS). REFER to Section 206-09 .
B19 CHECK THE THROTTLE POSITION OUTPUT PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Slowly move the accelerator pedal from closed throttle to WOT and observe the throttle position output PID. • **Does the throttle output PID vary between 0% at closed throttle and 100% at WOT?**	**Yes** INSTALL as new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. TEST the system for normal operation. **No** DIAGNOSE the powertrain control module (PCM). REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual and the CAN communication network, REFER to Section 418-00 .

Pinpoint Test C: Four Wheel Drive (4WD) Does Not Engage at Speed Correctly

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

When the operator selects a transfer case mode from 4x2 mode, the 4 wheel drive (4WD) control module engages a clutch for approximately 5 seconds to synchronize the front and rear driveshafts allowing a mechanical engagement of the transfer case. The 4WD control module also removes the ground path from the integrated wheel end (IWE) solenoid, which removes vacuum from the IWEs, allowing them to engage the front axle shaft. Systematically check the necessary inputs and outputs at the 4WD control module, internal components of the transfer case, IWE components and drive axles.

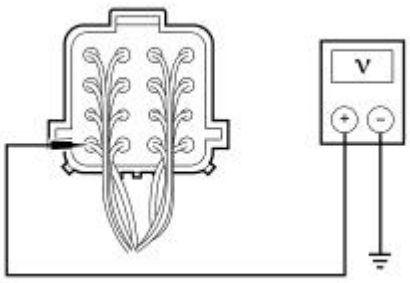
Possible Causes

- Transfer case clutch coil
- Transfer case
- 4WD control module
- Front axle assembly
- Circuit CCF03 (GY/BN)
- Circuit 92 (LB/YE)

PINPOINT TEST C: FOUR WHEEL DRIVE (4WD) DOES NOT ENGAGE AT SPEED CORRECTLY

Test Step	Result / Action to Take
C1 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCs)	
• Connect the diagnostic tool. • Carry out the 4WD control module self-test. • **Are any DTCs retrieved?**	**Yes** If DTC P1825, GO to C11 . If DTC P1826, GO to C13 . If DTC P1824 and/or P1827, GO to C10 . For all other DTCs, GO to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart. **No** GO to C2 .
C2 CHECK 4x4 MODE ENGAGEMENT AT REST	
• Switch the mode select switch (MSS) from 4x2 mode to 4x4 mode. • While on the road, drive the vehicle in turns and check for wind-up. • **Does 4x4 mode engage at rest correctly?**	**Yes** GO to C3 . **No** Go To Pinpoint Test I .
C3 CHECK 4x2 MODE TO 4x4 MODE SHIFT AT SPEED	
• Switch the MSS to 4x2 mode. • Key in ON position. • Drive the vehicle and carry out a 4x2 mode to 4x4 mode shift while driving approximately at 16 km/h (10 mph). • Stop the vehicle, shift to 4x2 mode , drive the vehicle and carry out a 4x2 mode to 4x4 mode shift while driving at approximately 64 km/h (40 mph). • **Does 4x4 mode engage correctly (or much better) at 16 km/h (10 mph) than at 64 km/h (40 mph)?**	**Yes** Go To Pinpoint Test H . **No** GO to C4 .
C4 CHECK THE TRANSFER CASE CLUTCH COIL LOCKUP	
• Connect the diagnostic tool. • Key in ON position.	**Yes** GO to C5 .

• Switch the MSS to 4x4 AUTO mode. • Using the scan tool, command the transfer case clutch to 98%. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate when the rear driveshaft is rotated?**	**No** GO to C8 .
C5 CHECK THE TRANSFER CASE CLUTCH COIL RELEASE	
• Using the scan tool, command the transfer case clutch to 0%. • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate when the rear driveshaft is rotated?**	**Yes** GO to C14 . **No** GO to C6 .
C6 CHECK THE TRANSFER CASE SYNCHRONIZATION (ON A HOIST)	
• Start the engine, shift the MSS to 4x2 mode. • Place the transmission in DRIVE and increase speed to between 16 km/h (10 mph) and 24 km/h (15 mph). • While observing the front driveshaft, switch the MSS to 4x4 mode. • **Did the front driveshaft start to spin?**	**Yes** GO to C7 . **No** GO to C14 .
C7 CHECK THE TRANSFER CASE DISENGAGEMENT	
• Switch the MSS to 4x2 mode. • Rotate the rear driveshaft while observing the front driveshaft. • **Did the front driveshaft rotate?**	**Yes** GO to C14 . **No** Go To Pinpoint Test H .
C8 CHECK CIRCUIT CCF03 (GY/BN) FOR VOLTAGE	
• Carefully back-probe transfer case C350-16, circuit CCF03 (GY/BN).  N0037381 • While active commanding 98%, measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and the transfer case housing. • **Is the voltage greater than 9 volts?**	**Yes** END the active command. INSTALL a new transfer case synchronization clutch. REFER to Section 308-07B . CLEAR the DTCs. REPEAT the self-test. **No** GO to C9 .
C9 CHECK THE TRANSFER CASE-TO-CHASSIS GROUND	
• Carefully back-probe transfer case C350-16, circuit CCF03 (GY/BN).	**Yes** END the active command. REPAIR the transfer case ground connection between the transfer case and the chassis. CLEAR the DTCs. REPEAT the self-test.



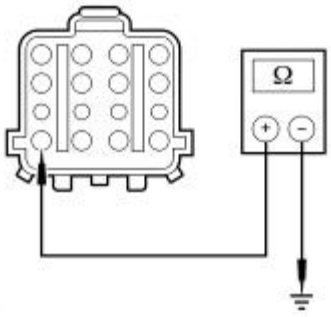
N0037381

- While still in active command 98%, measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and chassis ground.
- **Is the voltage greater than 9 volts?**

No
END the active command. GO to C10 .

C10 CHECK CIRCUIT CCF03 (GY/BN) FOR A SHORT TO GROUND

- Disconnect: Transfer Case C350.
- Disconnect: 4WD Control Module C281b.
- Measure the resistance between transfer case C350-16, circuit CCF03 (GY/BN) and ground.



N0057998

- **Is the resistance greater than 10,000 ohms?**

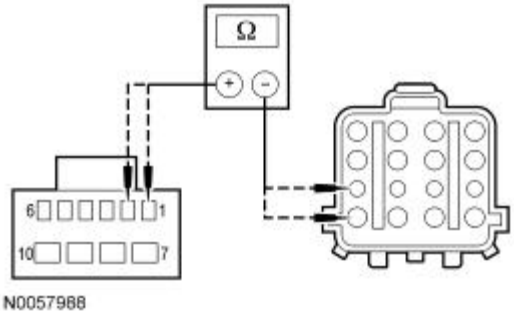
Yes
GO to C11 .

No
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

C11 CHECK CIRCUITS CCF03 (GY/BN) AND CCF04 (VT/OG) FOR AN OPEN

- Key in OFF position.
- Measure the resistance of the following circuits between 4WD control module C281b, harness side and transfer case C350, harness side:

Circuit	C281b	C350
CCF03 (GY/BN)	1	16
CCF04 (VT/OG)	2	12



N0057988

- **Are the resistances less than 5 ohms?**

Yes
GO to C12 .

No
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

C12 CHECK CIRCUIT CCF03 (GY/BN) FOR VOLTAGE	
• Connect: Transfer Case C350. • Connect: 4WD Control Module C281b. • Carefully back-probe transfer case C350-16, circuit CCF03 (GY/BN).  N0037381 • While in active command greater than 10%, measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground. • **Is voltage present?**	**Yes** END active command. GO to C13 . **No** END active command. INSTALL a new transfer case synchronization clutch. REFER to Section 308-07B . CLEAR the DTCs. REPEAT the self-test.
C13 CHECK CIRCUIT CCF03 (GY/BN) FOR A SHORT TO POWER	
• Carefully back-probe transfer case C350-16, circuit CCF03 (GY/BN).  N0037381 • While in active command 0%, measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground. • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to C14 .
C14 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION	

• Disconnect the 4WD control module connectors C281a and C281b.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect the 4WD control module connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Four Wheel Drive (4WD) System Jumps Out Of Gear

Normal Operation

Once the 4 wheel drive (4WD) system engages the user selected mode, that mode should be maintained. If the 4WD system does not stay in the selected position systematically check the 4WD system components.

Possible Causes

- Integrated wheel end (IWE) vent line(s)
- Mode select switch (MSS)
- Transfer case

PINPOINT TEST D: THE FOUR WHEEL DRIVE (4WD) SYSTEM JUMPS OUT OF GEAR

Test Step	Result / Action to Take
D1 CHECK FOR OBSTRUCTED IWE VENT LINES • With the vehicle in NEUTRAL, position in on a hoist. Refer to Section 100-02 . • **NOTE:** The integrated wheel end (IWE) vent port is the smaller of the 2 vacuum ports. • Disconnect the LH IWE line from the vent port. • Attach a vacuum pump to the IWE vent line. • Attempt to draw and hold a vacuum. Repeat Steps 1, 2 and 3 for the RH side of the vehicle. • **Can a vacuum be held on either IWE vent line?**	**Yes** INSTALL new IWE vent lines as necessary. **No** GO to D2 .
D2 VERIFY THE CONCERN • Drive the vehicle and attempt to duplicate the concern. • **Is the concern an uncommanded range shift (in or out of low range)?**	**Yes** GO to D5 . **No** GO to D3 .
D3 CHECK THE MODE SELECT SWITCH (MSS) POSITION PIDS • Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Drive the vehicle. • Dynamically monitor the MSS PID while driving the vehicle in each shift position. • **Does the MSS PID always agree with the switch position?**	**Yes** GO to D4 . **No** Go To Pinpoint Test C .
D4 CHECK FOR DTCs • Carry out the on-demand self test. • **Are DTCs present?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** Go To Pinpoint Test H .
D5 CHECK THE 4WD INDICATORS	

• Stop the vehicle. • Transmission in NEUTRAL. • Depress the brake pedal. • Observe the 4WD indicators in the instrument cluster while cycling through each MSS position. • **Do the 4WD indicators match MSS switch positions?**	**Yes** GO to D3 . **No** GO to D6 .
D6 CHECK FOR DTCs	
• Transmission in PARK. • Release the brake pedal. • Carry out the on-demand self test. • **Are DTCs present?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** CHECK the transfer case fluid level. REFER to Section 308-07B . If the fluid level is okay, CHECK for internal transfer case faults. REFER to Section 308-07B .

Pinpoint Test E: Straightline Driveline Wind-up

Normal Operation

In order for the 4 wheel drive (4WD) system to function correctly, tires and wheels must be the same size, be in good condition and the front and rear axle ratios must match.

Possible Causes

- Unmatched tire sizes
- Unequal amounts of tire wear
- Unequal tire inflation pressures
- Unmatched front and rear axle ratios

PINPOINT TEST E: STRAIGHTLINE DRIVELINE WIND-UP

NOTE: 4x4 mode is not intended for driving on hard/dry surfaces; using 4x4 mode while driving on these surfaces may produce noise like intermittent clunking, but will not damage driveline components.

Test Step	Result / Action to Take
E1 VERIFY THE CONCERN	
• Drive the vehicle and switch from 4x4 AUTO mode to 4x4 mode. There should be minimal wind-up in 4x4 mode during straight line maneuvers (wind-up in turns is normal; 4x4 mode is not intended for driving on hard/dry surfaces). • **Is excessive wind-up present?**	**Yes** GO to E2 . **No** RETURN the vehicle to the customer. ADVISE about correct 4WD system operation and normal vehicle behavior.
E2 CHECK FOR MATCHING WHEEL AND TIRE SIZES	
• Check the wheel and tire sizes. • **Do the 4 wheel and tire sizes match?**	**Yes** GO to E3 . **No** ADVISE the customer that 4WD systems

	require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
E3 CHECK TIRE WEAR	
• Check each of the 4 tires for wear. • **Are the 4 tires worn evenly?**	**Yes** GO to E4 . **No** ADVISE the customer that AWD systems require 4 matched, correctly inflated, correctly rotated tires to operate correctly.
E4 CHECK TIRE INFLATION PRESSURE	
• Check the inflation pressure in each tire. Refer to vehicle certification label. • **Are the tire inflation pressures correct?**	**Yes** GO to E5 . **No** ADJUST the tire pressure as necessary. TEST the vehicle for normal operation. ADVISE the customer that AWD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
E5 CHECK THE FRONT AND REAR AXLE RATIOS	
• Check that front and rear axle ratios match. Refer to Section 205-00 . • **Do the front and rear axle ratios match?**	**Yes** RETURN the vehicle to the customer and ADVISE about correct 4WD usage and normal vehicle behavior. **No** CHECK the vehicle identification label. INSTALL the correct axle(s). REFER to Section 205-02 and Section 205-03 .

Pinpoint Test F: Four Wheel Drive (4WD) System Functional Test

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

When the 4 wheel drive (4WD) system is in 4x4 mode, all 4 wheels rotate at the same speed. The amount of traction the vehicle can achieve depends on the amount of traction each tire can establish with the road surface. In order for the 4WD system to operate correctly, each wheel/tire assembly must have matching sizes, and the front and rear axle ratios must match.

Possible Causes

- 4x4 indicator
- 4WD control module
- Transfer case and related components
- Wheel/tire assemblies

PINPOINT TEST F: FOUR WHEEL DRIVE (4WD) SYSTEM FUNCTIONAL TEST

NOTE: 4x4 mode is not intended for driving on hard/dry surfaces; using 4x4 mode while driving on these

surfaces may produce noise like intermittent clunking, but will not damage driveline components.

Test Step	Result / Action to Take
F1 CHECK 4x4 AUTO MODE OPERATION • Transmission in NEUTRAL. • Select 4x4 AUTO mode. • **Do the 4WD indicators turn off?**	**Yes** GO to F4 . **No** GO to F2 .
F2 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs) • Connect the diagnostic tool. • Carry out the 4WD control module on-demand self test. • **Are DTCs present?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to F3 .
F3 CHECK FOR WIND-UP IN 4x2 MODE • Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** Go To Pinpoint Test B . **No** Go To Pinpoint Test C .
F4 CHECK FOR WIND-UP IN 4x2 MODE • Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** REPAIR the transfer case. REFER to Section 308-07B . **No** GO to F5 .
F5 CHECK 4x4 AUTO MODE OPERATION • Select 4x4 AUTO mode. • **Does the 4x4 AUTO indicator illuminate correctly?**	**Yes** GO to F8 . **No** GO to F6 .
F6 CHECK FOR DTCs • Connect the diagnostic tool. • Carry out the 4WD control module on-demand self test. • **Are DTCs present?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to F7 .
F7 CHECK FOR WIND-UP IN 4x4 AUTO MODE • Drive the vehicle on a dry, hard surface, executing turns while applying the throttle. • **Is wind-up present?**	**Yes** GO to F8 . **No** GO to F9 .
F8 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID • Enter the following diagnostic mode on the	**Yes**

diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle (pulse width modulated [PWM]) PID. • **Does the PID indicate 2 to 10% clutch application at closed throttle?**	GO to F9 . **No** GO to F10 .
F9 CHECK FOR WIND-UP IN 4x4 AUTO MODE WITH 100% CLUTCH	
• Using the scan tool, command the clutch duty cycle to 100%. • Drive the vehicle on a dry, hard surface, executing turns. • **Is wind-up present?**	**Yes** GO to F10 . **No** CHECK the transfer case. REFER to Section 308-07B .
F10 CHECK SHAFT SPEED PIDs	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case front and rear shaft speeds. • Drive the vehicle 30 km/h (18 mph). • Record and compare the front wheel speed and the rear wheel speed. • **Do the front shaft speed and rear shaft speed values match within 1.5 km/h (1 mph)?**	**Yes** GO to F11 . **No** CHECK the anti-lock brake system (ABS) . REFER to Section 206-09 and VERIFY that the 4 road tire sizes match.
F11 CHECK THE THROTTLE POSITION PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the throttle position PID from the 4WD control module. • Ignition ON, engine OFF. • Slowly move throttle from closed throttle to WOT and observe the 4WD control module throttle sensor PID. • **Does the PID value vary between 0% at closed throttle and 100% at WOT?**	**Yes** GO to F12 . **No** CHECK the throttle position sensor and/or powertrain control module (PCM). REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
F12 CHECK 4x4 MODE OPERATION	
• Select 4x4 mode. • **Does the 4x4 mode indicator illuminate correctly?**	**Yes** GO to F15 . **No** GO to F13 .
F13 CHECK FOR DTCs	
• Transmission in PARK. • Connect the diagnostic tool. • Carry out the 4WD control module on-demand self test. • **Are DTCs retreived?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to F14 .
F14 CHECK FOR WIND-UP IN 4x4 MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** Go To Pinpoint Test C . **No**

	Go To Pinpoint Test B .
F15 CHECK FOR STRAIGHTLINE WIND-UP IN 4x4 MODE	
• Drive the vehicle on a dry, hard surface. • **Is straightline wind-up present?**	**Yes** Go To Pinpoint Test E . **No** GO to F16 .
F16 CHECK FOR 4x4 MODE WIND-UP IN TURNS	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** GO to F17 . **No** Go To Pinpoint Test B .
F17 CHECK 4x4 MODE TO 4X2 MODE SHIFT	
• With the vehicle at rest, brake applied and transmission in NEUTRAL, switch the mode select switch (MSS) from 4x4 mode to 4x2 mode. • **Do the 4WD indicators turn off?**	**Yes** GO to F20 . **No** GO to F18 .
F18 CHECK FOR DTCs	
• Transmission in PARK. • Connect the diagnostic tool. • Carry out the 4WD control module on-demand self test. • **Are DTCs retrieved?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to F19 .
F19 CHECK FOR WIND-UP IN 4x2 MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** Go To Pinpoint Test B . **No** Go To Pinpoint Test C .
F20 CHECK FOR TRANSFER CASE DISENGAGEMENT	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate?**	**Yes** CHECK the transfer case. REFER to Section 308-07B . **No** GO to F21 .
F21 CHECK FOR LH AND RH IWE DISENGAGEMENT	
• **NOTE:** The engine must be at idle during the following steps. • Start the engine and allow it to idle. • Rotate the LH front tire one revolution forward and one revolution backward while observing the LH front halfshaft and universal joint. • Rotate the RH front tire one revolution forward and one revolution backward while observing the RH front halfshaft and universal joint.	**Yes** Go To Pinpoint Test D . **No** GO to F22 .

• **Did either front axle shaft and universal joint rotate?**	
F22 CHECK FOR IWE VACUUM LEAKS	
• Key in OFF position. • Disconnect both vacuum lines from the IWE solenoid. • Using a vacuum pump, apply 508 mm (20 in) Hg of vacuum to the IWE apply vacuum circuit. • Observe the vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** CHECK the IWE and related components for leaks. Go To Pinpoint Test D . **No** GO to F23 .
F23 CHECK 4x2 MODE TO 4x4 MODE SHIFT AT SPEED ABOVE 32 KM/H (20 MPH)	
• Select 4x2 mode. • Drive the vehicle on the road and shift from 4x2 mode to 4x4 mode while driving above 32 km/h (20 mph). • **Does the transfer case shift to 4x4 mode satisfactorily?**	**Yes** The 4WD system is functioning correctly. **No** Go To Pinpoint Test E .

Pinpoint Test G: The Four Wheel Drive (4WD) Indicators Do Not Operate Correctly/Do Not Operate

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

The 4 wheel drive (4WD) system status is transmitted to the instrument cluster from the 4WD control module through the controller area network (CAN) to the powertrain malfunction indicator. A steady indicator displays if the vehicle is in 4x4 AUTO or 4x4 (HIGH) mode, according to the driver selection. A 4WD system fault condition will illuminate the powertrain malfunction indicator. The powertrain malfunction indicator includes other general powertrain system failures. For information about CAN, refer to Section 418-00 .

Possible Causes

- Instrument cluster (IC)
- 4WD system fault
- CAN circuits
- 4WD control module

PINPOINT TEST G: THE FOUR WHEEL DRIVE (4WD) INDICATORS DO NOT OPERATE CORRECTLY/DO NOT OPERATE

Test Step	Result / Action to Take
G1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs)	
• Connect the diagnostic tool. • Carry out the on-demand self test. • **Are DTCs present?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to G2 .

G2 CHECK FOR INCORRECT 4WD INDICATOR ILLUMINATION	
• Select 4x2 mode. • Observe the instrument cluster. • **Do any 4WD indicators illuminate?**	**Yes** GO to G3 . **No** GO to G4 .
G3 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle (pulse width modulated [PWM]) PID. • **Does the clutch duty cycle PID read 0% at closed throttle?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No** Go To Pinpoint Test B .
G4 CHECK THE 4x4 AUTO INDICATOR	
• Select 4x4 AUTO mode with the engine running and the vehicle at rest. • Observe the instrument cluster. • **Does the 4x4 AUTO indicator illuminate?**	**Yes** GO to G6 . **No** GO to G5 .
G5 CHECK THE 4x4 MODE INDICATOR	
• Select 4x4 HIGH mode with the engine running and the vehicle at rest. • Observe the instrument cluster. • **Does the 4x4 AUTO indicator illuminate?**	**Yes** GO to G8 . **No** GO to G7 .
G6 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE AND TRANSFER CASE SHIFT MOTOR POSITION PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle PWM PID and the transfer case shift motor position PID. • **Does the clutch duty cycle PID read 2% at closed throttle and the transfer case shift motor position PID indicate 4x4 AUTO?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No** Go To Pinpoint Test B .
G7 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE AND TRANSFER CASE SHIFT MOTOR POSITION PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle PWM PID and the transfer case shift motor position PID. • **Does the clutch duty cycle PID read 2% at closed throttle and the transfer case shift motor position PID indicate 4x4 AUTO?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No** Go To Pinpoint Test A .
G8 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE AND TRANSFER CASE SHIFT MOTOR POSITION PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle PWM PID and the transfer case shift motor position PID.	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No**

• **Does the clutch duty cycle PID read 12% at closed throttle and the transfer case shift motor position PID indicate 4x4 mode?**	Go To Pinpoint Test B .

Pinpoint Test H: The Vehicle Binds in Turns/Resists Turning/Pulsates/Shudders in a Straight Line

Normal Operation

When the vehicle is operating in 4x4 AUTO mode, all 4 wheels receive the same amount of torque and rotate at the same speed. The amount of traction the vehicle can achieve depends on the amount of traction each tire can establish with the road surface. In order for the 4 wheel drive (4WD) system to operate correctly, each wheel/tire assembly must have matching sizes and the front and rear axle ratios must match.

Possible Causes

- Unmatched tire sizes
- Unequal amounts of tire wear
- Unequal tire inflation pressures
- Unmatched front and rear axle ratios

PINPOINT TEST H: THE VEHICLE BINDS IN TURNS/RESISTS TURNING/PULSATES/SHUDDERS IN A STRAIGHT LINE

NOTE: 4x4 mode is not intended for driving on hard/dry surfaces; using 4x4 mode while driving on these surfaces may produce noise like intermittent clunking, but will not damage driveline components.

Test Step	Result / Action to Take
H1 VERIFY THE CONCERN	
• Test drive the vehicle on a straight stretch of road in 4x4 AUTO mode. • Drive the vehicle through turns and parking lot maneuvers. • **Does the vehicle bind, pulsate or shudder?**	**Yes** If the problem occurs in 4x4 AUTO mode, GO to H2 ; in 4x4 mode, binding is a normal condition. **No** Go To Pinpoint Test E .
H2 CHECK THE 4x4 INDICATOR	
• Review the test drive notes. • **Did the 4x4 indicator or the powertrain malfunction indicator illuminate?**	**Yes** If the powertrain malfunction indicator is illuminated, GO to H4 . If the 4x4 indicator stayed illuminated, GO to H3 . **No** GO to H5 .
H3 VERIFY THE FAULT	
• Review the test drive notes. • **Was 4x4 mode selected when the indicators were illuminated?**	**Yes** The system is functioning correctly. **No** The fault may have been caused by an intermittent, uncommanded or autolock shift. TEST the system for normal operation. Go To Pinpoint Test E .
H4 CHECK FOR DIAGNOSTIC TROUBLE	

CODES (DTCs)	
• Connect the diagnostic tool. • Carry out the on-demand self test. • **Are DTCs retrieved?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to H5 .
H5 VERIFY THE CONCERN	
• Test drive the vehicle on a straight stretch of road and in turns, and shift the transfer case through each mode. Record any fault conditions. • **Is the concern present?**	**Yes** **Vehicles with limited slip rear differential:** The condition may be normal and no repair action is necessary. CHECK the rear axle to verify. REFER to Section 205-02 . **Vehicles without limited slip rear differential:** INSPECT the driveline components for damage or wear. REFER to Inspection and Verification in this section. **No** GO to H6 .
H6 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID	
• Clear the DTCs. • Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle (pulse width modulated [PWM]) PID at closed throttle, engine OFF, ignition ON. • **Is the clutch duty cycle greater than 10%?**	**Yes** GO to H7 . **No** CHECK the transfer case. REFER to Section 308-07B .
H7 CHECK THE SHAFT SPEED PIDs	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • While driving the vehicle at 30 km/h (18 mph), monitor the shaft speed PIDs. • Compare the speedometer reading to the shaft speed PIDs. • **Do the wheel speed PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	**Yes** GO to H8 . **No** VERIFY that the 4 road wheels are the same size and have similar tread depth. CHECK the anti-lock brake system (ABS) for faults. REFER to Section 206-09 .
H8 CHECK THE THROTTLE POSITION PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Slowly move throttle from closed throttle to wide open throttle (WOT) and observe the throttle position PID. • **Does the value vary between 0% at closed throttle and 100% at WOT?**	**Yes** GO to H9 . **No** CHECK the throttle position sensor and/or PCM for faults. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
H9 CHECK THE TRANSFER CASE FRONT DRIVESHAFT OUTPUT	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .	**Yes** INSTALL a new 4WD control module. REFER to

• Rotate the front driveshaft by hand. • **Does the front driveshaft rotate freely (does it require less than 45 Nm [33 lb-ft] to rotate)?**	Four Wheel Drive (4WD) Control Module in this section. REPEAT the self-test. TEST the system for normal operation. **No** CHECK the transfer case. REFER to Section 308-07B . TEST the system for normal operation.

Four Wheel Drive (4WD) Systems — 2-Speed Torque-On-Demand

Printable
View (433 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST1177-A	88 Digital Multimeter or equivalent 105-R0053
ST2574-A	Flex Probe Kit 105-R025B

Principles of Operation

The Expedition is equipped with an automatic electronic-shift system that allows the operator to choose between 2 wheel drive (2WD) and 3 different 4 wheel drive (4WD) modes. The operator can switch between two-wheel drive (2H) mode and 4x4 AUTO (4A) mode or 4x4 (4H) mode at any speed below 88 kph (55 mph). The operator can switch between 4x4 AUTO (4A) mode and 4x4 (4H) mode at any speed. To engage or disengage 4L mode, the vehicle speed must be less than 3 km/h (2 mph), the brake pedal must be pressed and the transmission must be in NEUTRAL.

Wheel slip is sensed by monitoring the average front and rear wheel speeds. Based on steering wheel angle (SWA), accelerator pedal position and wheel slip, a pulse width modulated (PWM) signal is transmitted to the transfer case as torque is required.

The 4WD control module will provide the anti-lock brake system (ABS) with current clutch duty cycle and whether or not ABS may command the clutch duty cycle.

The brake subsystem sends the following information signals to the 4WD system:

- Occurrences of brake events and failures. Refer to Section 206-09 .

- Steering wheel angle status. Refer to Section 206-09 .
- Wheel speeds. Refer to Section 206-09 .

A concern with any of the above listed brake system signals will affect operation of the 4WD system.

The accelerator pedal position output signal is provided to the 4WD control module from the powertrain control module (PCM). This signal is used by the 4WD control module in controlling the transfer case clutch.

The shift motor sense plate, an integral part of the shift motor assembly, informs the 4WD control module of the transfer case position.

The electric shift motor is mounted externally to the transfer case. It drives a rotary cam which moves the range fork within the transfer case between the HIGH range (2H, 4A and 4H) and LOW range (4L mode) positions.

The 4WD control module sends a duty cycle command to the clutch coil which activates the clutch within the transfer case.

The 4WD control module varies the torque sent to the front driveline by controlling the transfer case clutch. At rest and under cruising conditions, the 4WD control module activates the transfer case clutch a minimum duty cycle (percentage of time the clutch is turned on), which allows for the slight difference between the front and rear driveshafts which normally occurs when negotiating a corner on dry pavement. Under any of the following conditions, the 4WD control module will increase the duty cycle in order to prevent or control slip:

- Slip is detected
- Heavy acceleration (accelerator pedal position)
- Straight-ahead steering wheel angle (SWA)

Feature inputs:

- Mode select switch (MSS)
- Accelerator pedal position (from the PCM)
- Steering wheel angle (from the anti-lock brake system [ABS] module)
- Transmission range (TR) position (from the transmission control module [TCM])
- Transmission output torque (from the PCM)
- Wheel speed signal (transmitted from the ABS module)
- Accelerator pedal position (from the PCM)
- Transfer case shift motor contact plate position inputs A, B, C, D

Feature outputs:

- PWM signal to the transfer case clutch
- 4WD message center indicators
- Transfer case shift motor outputs

Shifts between 4A and 4H modes can be made at any speed. Listed below are the inputs and outputs needed by the 4WD control module to execute a change between any of these modes.

Feature inputs:

- Wheel speed signal
- Accelerator pedal position (from the PCM)
- MSS

Feature outputs:

- Transfer case shift motor outputs
- PWM signal to the transfer case clutch
- 4WD message center indicators

When shifting into or out of 4L mode, the 4WD control module requires that the vehicle speed is less than 3 km/h (2 mph) and the transmission is in NEUTRAL.

Feature inputs:

- Accelerator pedal position (from the PCM)
- MSS
- Transfer case shift motor encoder contact plate position inputs A, B, C, D
- Wheel speed signal (transmitted from ABS module)

Feature outputs:

- Transfer case shift motor outputs
- 4WD message center indicators
- PWM signal to the transfer case clutch

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
● Halfshafts ● Integrated wheel ends (IWEs) ● Shift motor ● Driveshaft and universal joints ● Vacuum leaks ● Fluid leaks ● Matching tire sizes ● Transfer case	● Power distribution box (PDB) fuses: ■ 35 (20A) ■ 43 (20A) ■ 75 (5A) ● Smart junction box (SJB) mini fuse 35 (10A) ● Wiring harness ● Mode select switch (MSS) ● Synchronization clutch ● Connector(s) ● IWE vacuum solenoid ● Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM:

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM.
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. **NOTE:** Before carrying out the self-test, make sure that:
   - ignition is in RUN.
   - 4A mode is selected (or the last mode selected before starting the self-test).

   If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

8. Clear the DTCs and carry out the self-test diagnostics for the 4WD control module.

9. If the DTCs retrieved are related to the concern, go to the Four Wheel Drive (4WD) Control Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart

DTC	Description	Source	Action
B1317	Battery Voltage High	Four Wheel Drive (4WD) Control Module	CHECK the battery and charging system for faults. REFER to Section 414-00 . CLEAR the DTC. REPEAT the self-test.
B1318	Battery Voltage Low	4WD Control Module	CHECK the battery and charging system for faults. REFER to Section 414-00 . CLEAR the DTC. REPEAT the self-test.
B1342	ECU is Defective	4WD Control Module	CLEAR the DTC. REPEAT the self-test. If DTC B1342 is retrieved, INSTALL a 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. REPEAT the self-test.

U0121	Lost Communication with ABS Module	4WD Control Module	DIAGNOSE the module communication network. REFER to Section 418-00 .
U2023	External Node Fault	4WD Control Module	DIAGNOSE the module communication network. REFER to Section 418-00 .
U2050	Application Not Programmed	4WD Control Module	Method 3 programming fault. REFER to Section 418-00 for 4WD control module (PCM) programming information.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the four wheel drive (4WD) control module	• Scan tool • Data link connector (DLC) • Four wheel	• REFER to Section 418-00 .

	drive (4WD) control module • Circuitry	
• The 4WD indicators do not operate correctly/do not operate	• Instrument cluster • 4WD system fault • Controller area network (CAN) communication network • 4WD control module • Ignition switch and/or circuitry	• Go To Pinpoint Test P .
• The vehicle does not shift between two wheel drive (2WD) and 4WD modes correctly	• Mode select switch (MSS) • Transfer case • Transfer case clutch • Integrated wheel ends (IWEs) • 4WD control module • Circuitry	• Go To Pinpoint Test J .
• The vehicle does not shift between AWD mode and 4H mode correctly	• MSS • Transfer case • Circuitry • 4WD control module	• Go To Pinpoint Test L .
• Vehicle has no torque or inadequate torque at rear wheels in AWD mode	• Transfer case • Circuitry • 4WD control module	• Go To Pinpoint Test O .
• The vehicle does not shift between 4H and 4L modes correctly	• Transfer case • MSS • 4WD control module • Transmission drag torque	• Go To Pinpoint Test K .
• Four wheel drive (4WD) does not engage at speed correctly	• Transfer case clutch coil • 4WD control module • IWEs	• Go To Pinpoint Test L .
• The front axle does not engage/disengage correctly/makes noise in 2H under heavy throttle	• MSS • IWEs • IWE solenoid • Vacuum leaks • 4WD control module • Front halfshaft • Vacuum check valve(s)	• Go To Pinpoint Test I .
• The four wheel drive (4WD) system jumps out of gear	• Transfer case • IWE vent • MSS	• Go To Pinpoint Test M .
• Straightline driveline	• Tire inflation	• Go To Pinpoint Test N .

wind-up	pressure • Tire and wheel size • Tire wear • Axle ratio	
• Grinding noise during four wheel drive (4WD) system engagement, especially at high speeds	• Front halfshaft speeds not turning at the same speed	• INSTALL the S-spring in the front differential. REFER to Section 205-03 for S-spring installation.
• The transfer case makes noise	• Tire inflation pressure • Tire and wheel size	• MAKE SURE that all tires and wheels are the same size and that the inflation pressures are correct.
	• Tire tread wear	• CHECK tire tread wear to see if there is more than 0.15 mm (0.06 in) difference in tread wear between front and rear. INTERCHANGE one front wheel and one rear wheel. ROAD TEST again.
	• Internal components	• OPERATE the vehicle in all transmission gears. If there is noise in the transmission in NEUTRAL, or in some gears and not in others, REMOVE and REPAIR the transmission. REFER to Section 307-01B . If there is noise in all gears, DISASSEMBLE the transfer case. REFER to Section 308-07B . CHECK the planetary gears, the bearings, the upper and lower drive sprockets and drive chain for damage. INSTALL new parts as necessary.
	• Fluid level	• FILL with automatic transmission fluid. REFER to Section 308-07B .
• Unable to duplicate customer concern	• 4WD system and/or related components	• CARRY OUT the torque-on demand Functional Test. Go To Pinpoint Test O .
• Vehicle binds in a turn/resists turning/pulsates in a straightline in 4WD mode	• Unmatched tire sizes • Unequal amounts of tire wear • Unequal tire inflation pressures • Accelerator pedal position failure • Transfer case clutch • Circuitry • 4WD control module	• Go To Pinpoint Test Q .

Pinpoint Tests

Pinpoint Test I: The Front Axle Does Not Engage/Disengage Correctly/Makes Noise in 2H Mode Under Heavy Throttle

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

In 2H mode, the 4 wheel drive (4WD) control module supplies a ground path to the integrated wheel end (IWE) solenoid to apply vacuum to the IWEs (disengaging the front hubs from the front axle). In 4A, 4H and 4L modes, the 4WD control module does not supply the ground path to the IWE solenoid, vacuum is not applied to the IWEs and an internal spring keeps the hubs engaged. Systematically check the necessary inputs and outputs at the 4WD control module, internal components of the transfer case, mode select switch (MSS), IWE components and drive axles.

Possible Causes

- MSS
- IWE
- IWE solenoid
- Transfer case

- Circuit CBB75A (YE/GY)
- Battery junction box (BJB) fuse 75 (5A)

PINPOINT TEST I: THE FRONT AXLE DOES NOT ENGAGE/DISENGAGE CORRECTLY/MAKES NOISE IN 2H MODE UNDER HEAVY THROTTLE

Test Step	Result / Action to Take
I1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs)	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Carry out the on-demand self-test. • **Are DTCs C1979 or C1980 present?**	**Yes** If DTC C1979 is retrieved, GO to I13 . If DTC C1980 is retrieved, GO to I15 . **No** GO to I2 .
I2 CHECK FOR GRINDING NOISES AT HIGH SPEEDS	
• Turn the MSS from 2H mode to 4H mode at rest. Drive the vehicle. • Turn the MSS from 2H mode to 4H mode while driving the vehicle at low speed. • Turn the MSS from 2H mode to 4H mode while driving the vehicle at high speed. • **Is the axle system fully functional at rest, but there is a grinding noise during engagement, especially at high**	**Yes** If the concern is excessive front axle noise during 4WD mode engagement (especially at high speeds), INSTALL the S-spring in the front differential. REFER to

speed?

Section 205-03 .

No
GO to I3 .

I3 CHECK THE TRANSFER CASE SHIFT TO 2H

- Key in OFF position.
- Connect the diagnostic tool.
- Key in ON position.
- **NOTE:** If it is difficult to read the motor position, use the active command to energize the transfer case motor contact plate position return circuit.
- Monitor the 4WD control module PID for the contact plate position while switching the MSS to 2H.

Mode Select Switch (MSS) Position	Contact Plate Position			
	1 (A)	2 (B)	3 (C)	4 (D)
2H/AWD/4H Mode	CLOSED	OPEN	CLOSED	CLOSED
4L Mode	OPEN	CLOSED	OPEN	CLOSED

- **Does the 4WD control module PID and instrument cluster indicator lamp indicate that vehicle shifted into 2H?**

Yes
GO to I4 .

No
Go To Pinpoint Test J .

I4 CHECK THE IWE DISENGAGEMENT

- Raise and support the vehicle off the ground until the front wheels can be spun freely. Refer to Section 100-02 .
- **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid.
- Start the engine and allow to idle.
- Switch the MSS to 2H.
- Rotate the left front tire one revolution forward and one revolution backward while observing the left front halfshaft.
- Rotate the right front tire one revolution forward and one revolution backward while observing the right front halfshaft.
- **Did either front halfshaft rotate?**

Yes
GO to I10 .

No
GO to I5 .

I5 CHECK THE TRANSFER CASE SHIFT INTO 4H

- **NOTE:** If it is difficult to read the motor position, use the active command to energize the transfer case motor contact plate position return circuit.
- Monitor the 4WD control module PID for the contact plate position while switching the MSS to 4H.

Mode Select Switch (MSS) Position	Contact Plate Position			
	1 (A)	2 (B)	3 (C)	4 (D)
2H/AWD/4H Mode	CLOSED	OPEN	CLOSED	CLOSED
4L Mode	OPEN	CLOSED	OPEN	CLOSED

- **Does the 4WD control module PID and instrument cluster indicator lamp indicate that the MSS in 4H?**

Yes
GO to I6 .

No
Go To Pinpoint Test C .

I6 CHECK THE IWE ENGAGEMENT

- Raise and support the vehicle off the ground until the front wheels can be spun freely. Refer to Section 100-02 .
- **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid.
- Start the engine and allow to idle.
- Switch the MSS to 4H.

Yes
CHECK that all driveline fasteners are present and tightened to specification. REFER to Section 205-00 for further diagnosis of the

• Rotate the left front tire one revolution forward and one revolution backward while observing the left front halfshaft. • Rotate the right front tire one revolution forward and one revolution backward while observing the right front halfshaft. • **Did both front halfshafts rotate?**	front axle. **No** GO to I7 .
I7 CHECK THE IWE SOLENOID OUTPUT IN 4H	
• **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid. • Start the engine. • Disconnect the output vacuum line at the IWE solenoid. • Switch the MSS to 4H. • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum less than 25 mm (1 in) Hg?**	**Yes** Key in OFF position. GO to I24 . **No** GO to I8 .
I8 CHECK THE IWE SOLENOID OUTPUT IN 4H WITH THE SCAN TOOL	
• Key in OFF position. • Connect the diagnostic tool. • **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid. • Start the engine. • Enter the following diagnostic mode on the scan tool: Active Commands. • Using the scan tool, command the IWE solenoid to engage the IWEs (solenoid OFF). • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum less than 25 mm (1 in) Hg?**	**Yes** END active command. GO to I18 . **No** GO to I9 .
I9 CHECK THE IWE SOLENOID	
• Disconnect: IWE Solenoid C1157. • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum less than 25 mm (1 in) Hg?**	**Yes** END active command. GO to I17 . **No** END active command. INSTALL a new IWE solenoid. REPEAT the self-test.
I10 CHECK THE IWE SOLENOID OUTPUT VACUUM IN 2H MODE	
• **NOTE:** The engine must be idling during the following steps to supply vacuum to the IWE solenoid. • Start the engine. • Disconnect the output vacuum line at the IWE solenoid. • Switch the MSS to 2H mode. • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to I19 . **No** GO to I11 .
I11 CHECK THE IWE SOLENOID INPUT VACUUM	
• Measure the vacuum at the input port of the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**Yes** GO to I12 . **No** REPAIR the vacuum leak. CLEAR the DTCs. REPEAT the self-test.
I12 CHECK THE IWE SOLENOID OUTPUT IN 2H MODE WITH THE SCAN TOOL	
• Key in OFF position. • Connect the diagnostic tool. • **NOTE:** The engine must be idling during the following steps to	**Yes** END active command. GO to I18 .

supply vacuum to the IWE solenoid. • Start the engine. • Enter the following diagnostic mode on the scan tool: Active Commands. • Using the scan tool, command the IWE solenoid to disengage the IWEs (IWE solenoid ON). • Measure the vacuum at the output port of the IWE solenoid. • **Is the vacuum greater than 254 mm (10 in) Hg?**	**No** END active command. GO to I13 .
I13 CHECK CIRCUIT CBB75A (YE/GY) FOR VOLTAGE	
• Key in OFF position. • Disconnect: IWE Solenoid C1157. • Measure the voltage between IWE solenoid C1157-1, circuit CBB75A (YE/GY) and ground.  A0069239 • **Is the voltage greater than 9 volts?**	**Yes** GO to I14 . **No** CHECK CJB fuse 75 (5A) for an open. REPAIR the circuit as necessary. CLEAR the DTCs. REPEAT the self-test.
I14 CHECK THE IWE SOLENOID OPERATION	
• Connect: IWE Solenoid C1157. • **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • Start the engine. • Connect a 10 amp fused jumper wire between IWE solenoid C1157-1, circuit CCF05 (BN/BU), component side and ground. • Measure the vacuum at the IWE solenoid output vacuum port. • **Is the IWE solenoid output port vacuum greater than 254 mm (10 in) Hg?**	**Yes** DISCONNECT the fused jumper. GO to I15 . **No** INSTALL a new IWE solenoid. CLEAR the DTCs. REPEAT the self-test.
I15 CHECK CIRCUIT CCF05 (BN/BU) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: IWE Solenoid C1157. • Disconnect: 4WD Control Module C281a. • Key in ON position. • Measure the voltage between IWE solenoid C1157-2, circuit CCF05 (BN/BU), harness side and ground.  A0069238 • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to I16 .
I16 CHECK CIRCUIT CCF05 (BN/BU) FOR AN OPEN	
• Key in OFF position.	**Yes**

• Measure the resistance between IWE solenoid C1157-2 harness side and 4WD control module C281a-17 harness side, circuit CCF05 (BN/BU).  • **Is the resistance less than 5 ohms?**	GO to I17 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
I17 CHECK CIRCUIT CCF05 (BN/BU) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: 4WD Control Module C281a. • Measure the resistance between IWE solenoid C1157-2, circuit CCF05 (BN/BU), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I18 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
I18 CHECK THE 4WD control module	

• Disconnect all 4WD control module connectors C281a and C281b.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect the 4WD control module connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

I19 CHECK THE IWE VACUUM SYSTEM	
• Key in OFF position. • Disconnect both vacuum lines from the IWE solenoid. • Using a vacuum pump, apply 508 mm (20 in) Hg of vacuum to the IWE system through the apply vacuum circuit. • Observe the vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** GO to I20 . **No** CONNECT the vacuum lines to the IWE solenoid. GO to I23 .

I20 CHECK THE RH IWE LEAK RATE	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Disconnect the vacuum line from the larger port on the RH IWE. • Apply 508 mm (20 in) Hg of vacuum to the RH IWE port and observe vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** INSTALL a new IWE. GO to I19 . **No** GO to I21 .
I21 CHECK THE LH IWE LEAK RATE	
• Disconnect the vacuum line from the larger port at the LH IWE. • Apply 205 mm (20 in) Hg of vacuum to the LH IWE port and observe vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** INSTALL a new IWE. GO to I19 . **No** GO to I22 .
I22 CHECK THE IWE VACUUM SUPPLY TUBE	
• Disconnect both vacuum lines from the IWE solenoid. • Plug both LH and RH IWE vacuum lines. Apply 508 mm (20 in) Hg of vacuum to the IWE vacuum circuit and observe the vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** INSTALL new vacuum lines as necessary. GO to I19 . **No** GO to I23 .
I23 CHECK THE IWE VACUUM SUPPLY AT EACH IWE IN 2H	
• Connect a hand-held vacuum gauge to the LH IWE vacuum supply tube. • **NOTE:** The engine must be idling during the following steps to supply the vacuum required for the IWEs to engage and disengage. • Start the engine. • Switch the MSS to 2H while observing the vacuum gauge. • Repeat these steps for the RH IWE. • **Are the vacuum readings greater than 254 mm (10 in) Hg?**	**Yes** GO to I26 . **No** INSTALL new vacuum lines as necessary. GO to I19 .
I24 CHECK THE LH IWE VACUUM LINE FOR AN OBSTRUCTION	
• Disconnect both vacuum lines from the IWE solenoid. • Raise and support the vehicle on a hoist. Refer to Section 100-02 . • Disconnect the vacuum line at the LH IWE. • Connect a hand vacuum pump to the LH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the vacuum pump draw a vacuum on the LH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. CLEAR the DTCs. REPEAT the self-test. **No** CONNECT the vacuum line to the LH IWE. GO to I25 .
I25 CHECK THE RH IWE VACUUM LINE FOR AN OBSTRUCTION	
• Disconnect the larger vacuum line at the RH IWE. • Connect a vacuum pump to the RH IWE vacuum line and attempt to draw a vacuum on the line. • **Did the vacuum pump draw a vacuum on the RH IWE vacuum line?**	**Yes** INSTALL a new vacuum line. CLEAR the DTCs. REPEAT the self-test. **No** CONNECT the vacuum line to the RH IWE. GO to I26 .
I26 CHECK THE LH IWE OPERATION	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .	**Yes** GO to I27 .

• Connect a vacuum pump to the larger IWE vacuum port. • Observe the LH halfshaft while rotating the LH front tire. Apply and release vacuum to manually engage and disengage the LH IWE. • **Did the LH IWE disengage between 152 and 203 mm (6 to 8 in) Hg?**	**No** INSTALL a new LH IWE. CLEAR the DTCs. REPEAT the self-test.
I27 CHECK THE RH IWE OPERATION	
• Connect a vacuum pump to the larger RH IWE vacuum port. • Observe the RH halfshaft while rotating the RH front tire. Apply and release vacuum to manually engage and disengage the LH IWE. • **Did the RH IWE disengage between 152 and 203 mm (6 to 8 in) Hg?**	**Yes** CLEAR the DTC(s). REPEAT the self-test. Go To Pinpoint Test N . **No** INSTALL a new RH IWE. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: The Vehicle Does Not Shift Between Two Wheel Drive (2WD) and Four Wheel Drive (4WD) Modes Correctly

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

In 2H mode, the 4 wheel drive (4WD) control module supplies a ground path to the integrated wheel end (IWE) solenoid to apply vacuum to the IWEs (disengaging the front hubs from the front axle). In 4A, 4H and 4L modes, the 4WD control module does not supply the ground path to the IWE solenoid, vacuum is not applied to the IWEs and an internal spring keeps the hubs engaged. Systematically check the necessary inputs and outputs at the 4WD control module, internal components of the transfer case, mode select switch (MSS), IWE components and drive axles.

Possible Causes

- MSS
- IWE
- IWE solenoid
- Transfer case
- Vacuum leaks
- Front axle assembly
- 4WD control module
- Circuit CCF05 (BN/BU)
- Circuit CBB75A (YE/GY)
- Smart junction box (SJB) mini-fuse 35 (10A)

PINPOINT TEST J: THE VEHICLE DOES NOT SHIFT BETWEEN TWO WHEEL DRIVE (2WD) AND FOUR WHEEL DRIVE (4WD) MODES CORRECTLY

Test Step	Result / Action to Take
J1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs)	
• Connect the diagnostic tool. • Carry out the 4WD control module on-demand self test. • **Are DTCs retrieved?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis.

	No GO to J2 .
J2 CHECK THE 4H INDICATOR • Select 4H mode and observe the instrument cluster. • **Does the instrument cluster indicator lamp indicate 4H mode?**	**Yes** GO to J8 . **No** GO to J3 .
J3 CHECK THE IGNITION SWITCH STATUS PID • Key in ON position. • Monitor the ignition switch status PID. • **Do the ignition switch PIDs match the ignition switch positions?**	**Yes** GO to J4 . **No** CHECK the ignition switch and the controller area network (CAN) communication network for faults. REFER to Section 413-00 . After the fault is repaired, CLEAR the DTC. REPEAT the self-test.
J4 CHECK THE MSS POSITION PID • Monitor each MSS PID while cycling through each MSS position. • **Does each MSS PID agree with each switch position?**	**Yes** GO to J7 . **No** GO to J5 .
J5 CHECK THE MSS RESISTANCE VALUES • Key in OFF position. • Disconnect: MSS C284. • Measure the resistance between MSS C284, terminals 2 and 3, while rotating the switch through all positions. Refer to the following chart. **Mode Select Switch (MSS) Position** / **Resistance** 2H — 619 ohms 4A — 270 ohms 4H — 130 ohms  A0049121 • **Are the resistance values within specification?**	**Yes** GO to J6 . **No** INSTALL a new MSS. CLEAR the DTCs. REPEAT the self-test.
J6 CHECK CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR AN OPEN • Measure the resistance between MSS C284-2, harness side and 4WD control module C281a-11, harness side, circuit RCF13 (WH/BN).	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this

 • Measure the resistance between MSS C284-3, harness side and 4WD control module C281a-20, harness side, circuit CCF13 (WH/BU). • **Is the resistance less than 5 ohms?**	section. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
J7 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle (pulse width modulated [PWM]) PID. • **Does the clutch duty cycle PID read 0% at closed throttle?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. REPEAT the self-test. TEST the system for normal operation.
J8 CHECK FOR WIND-UP IN 4H MODE	
• Switch the MSS to 4H mode. • Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to J13 . **No** GO to J9 .
J9 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID AT WIDE OPEN THROTTLE (WOT)	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle PWM PID at wide open throttle (WOT), engine OFF, key ON. • **Does the clutch duty cycle PID read 98% at WOT?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No** GO to J10 .
J10 CHECK THE ACCELERATOR PEDAL POSITION OUTPUT PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Slowly move the accelerator pedal from closed throttle to WOT and observe the output PID. • **Does the output PID vary between 0% at closed throttle and 100%t at WOT?**	**Yes** GO to J11 . **No** Diagnose the powertrain control module (PCM), REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual and the CAN communication network, REFER to Section 418-00 .
J11 CHECK FOR TRANSFER CASE CLUTCH ENGAGEMENT WITH ACTIVE COMMANDS	
• Enter the following diagnostic mode on the diagnostic	**Yes** CHECK the transfer case. REFER

tool: PID/DATA Monitor and Record. • Using the active commands, engage the transfer case clutch to 100% while monitoring the transfer case clutch duty cycle PWM PID. • **Does the clutch duty cycle PID read 100%?**	to Section 308-07B . **No** GO to J12 .
J12 CHECK CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR AN OPEN	
• Measure the resistance between MSS C284-2, harness side and 4WD control module C281a-11, harness side, circuit RCF13 (WH/BN).  • Measure the resistance between MSS C284-3, harness side and 4WD control module C281a-20, harness side, circuit CCF13 (WH/BU). • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
J13 CHECK THE INSTRUMENT CLUSTER INDICATOR IN AWD MODE	
• Select AWD mode and observe the instrument cluster. • **Does the instrument cluster indicator lamp indicate AWD mode?**	**Yes** GO to J14 . **No** Go To Pinpoint Test C .
J14 CHECK FOR WIND-UP IN AWD MODE	
• Drive the vehicle on a dry, hard surface in turns while applying the throttle. • **Is wind-up present in turns?**	**Yes** GO to J15 . **No** The system is operating correctly.
J15 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle PWM PID at closed throttle, engine OFF, key ON. • **Does the PID indicate 2 to 4% clutch application at closed throttle?**	**Yes** GO to J16 . **No** GO to J18 .
J16 CHECK VOLTAGE ON THE CLUTCH POWER CIRCUIT CCF03 (GY/BN)	
• Use the scan tool active commands to energize the transfer case clutch to 4%. • Back-probe transfer case C350-16 circuit CCF03 (GY/BN), harness side. • Measure the voltage on circuit CCF03 (GY/BN) using a digital multimeter. • **Is the voltage approximately 0.2 to 0.4 volt?**	**Yes** END the active command. CHECK the transfer case. REFER to Section 308-07B . **No** GO to J17 .
J17 CHECK CIRCUIT CCF03 (GY/BN) FOR AN OPEN	

• Key in OFF position. • Disconnect: Transfer Case C350. • Disconnect: 4WD Control Module C281b. • Measure the resistance between 4WD control module C281b-1, harness side and transfer case C350-16, harness side circuit CCF03 (GY/BN).  N0057987 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
J18 CHECK THE WHEEL SPEED PIDs	
• While driving the vehicle at 30 km/h (18 mph), monitor the wheel speed PIDs. • Compare the speedometer reading to the wheel speed PIDs. • **Do the wheel speed PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	**Yes** GO to J19. **No** CHECK the anti-lock brake system (ABS). REFER to Section 206-09.
J19 CHECK THE THROTTLE POSITION OUTPUT PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Slowly move the accelerator pedal from closed throttle to WOT and observe the throttle position output PID. • **Does the throttle output PID vary between 0% at closed throttle and 100% at WOT?**	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. TEST the system for normal operation. **No** Diagnose the powertrain control module (PCM), REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual and the CAN communication network, REFER to Section 418-00.

Pinpoint Test K: The Vehicle Does Not Shift Between 4H and 4L Modes Correctly

Refer to Wiring Diagrams Cell 34, Four-Wheel Drive System for schematic and connector information.

Normal Operation

With the key in the ON position, the four wheel drive (4WD) control module receives the operator's choice of 4WD selection from the mode select switch (MSS). The 4WD control module then controls the electric clutch and transfer case shift motor. If the transfer case is not responding to the operator's intentions, systematically check all inputs and outputs to the 4WD control module.

Possible Causes

- MSS
- 4WD control module
- Circuitry
- Anti-lock brake system (ABS) module

- Controller area network (CAN)
- Transfer case shift motor
- Transfer case

PINPOINT TEST K: THE VEHICLE DOES NOT SHIFT BETWEEN 4H AND 4L MODES CORRECTLY

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>K1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs)</td><td></td></tr>
<tr><td>• Key in ON position.
• Connect the diagnostic tool.
• Carry out the on-demand self test.
• Are DTCs retrieved?</td><td>Yes
If DTC C1729, GO to K23 . If DTCs P1812, P1815, P1867 or P1891, GO to K24 .

No
GO to K2 .</td></tr>
<tr><td>K2 CHECK THE MESSAGE CENTER</td><td></td></tr>
<tr><td>• If the MSS is not in 4L mode: Switch the MSS to 4L mode.
  ▪ Press the brake pedal.
  ▪ Vehicle at rest.
  ▪ Transmission in NEUTRAL .
• Monitor the message center.
• If the MSS is in 4L mode: Switch the MSS to 4H mode.
• Monitor the message center.
• Does the message center read SHIFT IN PROGRESS?</td><td>Yes
GO to K3 .

No
GO to K4 .</td></tr>
<tr><td>K3 CHECK THE 4H/4L INDICATOR</td><td></td></tr>
<tr><td>• Observe the instrument cluster.
• Is the correct 4WD indicator illuminated (4H or 4L) for the MSS mode selected in step K2?</td><td>Yes
GO to K5 .

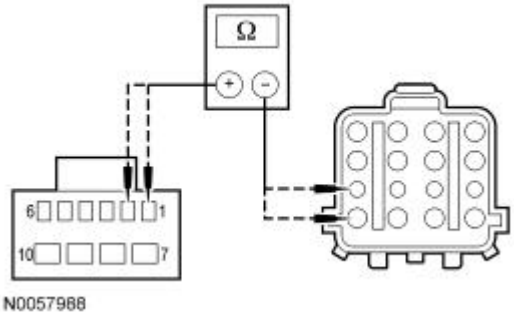
No
GO to K4 .</td></tr>
<tr><td>K4 CHECK THE CONTACT PLATE ENCODER PIDs IN THE SELECTED MODE</td><td></td></tr>
<tr><td>• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record.
• Monitor the contact plate position PIDs. Refer to the following chart:
<table><tr><th>Contact Plate Position PID</th><th>MSS PID 4A/4H MODE</th><th>MSS PID 4L MODE</th></tr><tr><td>PLATE_A</td><td>CLOSED</td><td>OPEN</td></tr><tr><td>PLATE_B</td><td>OPEN</td><td>CLOSED</td></tr><tr><td>PLATE_C</td><td>CLOSED</td><td>OPEN</td></tr><tr><td>PLATE_D</td><td>CLOSED</td><td>CLOSED</td></tr></table>• Do the contact plate position PIDs indicate that the transfer case shift motor is in the selected mode from step K2?</td><td>Yes
CHECK the instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.

No
GO to K24 .</td></tr>
<tr><td>K5 CHECK FOR DRIVELINE WIND-UP</td><td></td></tr>
<tr><td>• Drive the vehicle on a dry, hard surface in turns while applying the throttle.
• Is wind-up present in turns?</td><td>Yes
GO to K6 .

No</td></tr>
</table>

	GO to K10 .
K6 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle (pulse width modulated [PWM]) PID at wide open throttle (WOT), with the transfer case in 4L mode, engine OFF, key ON. • **Does the clutch duty cycle PID indicate 98% clutch application at WOT?**	**Yes** GO to K7 . **No** GO to K8 .
K7 CHECK FOR VOLTAGE ON THE CLUTCH POWER CIRCUIT CCF03 (GY/BN)	
• Carefully back-probe the transfer case connector C350-16, circuit CCF03 (GY/BN).  N0037381 • Measure the voltage on circuit CCF03 (GY/BN) using a digital multimeter. • Use the scan tool active commands to cycle the transfer case clutch to 98%. • **Is the voltage greater than 9 volts?**	**Yes** END the active command. Go To Pinpoint Test O . **No** END the active command. GO to K9 .
K8 CHECK THE THROTTLE POSITION PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the throttle position PID from the 4WD control module. • Key ON, engine OFF. • Slowly move throttle from closed throttle to WOT and observe the 4WD control module throttle sensor PID. • **Does the PID value vary between 0% at closed throttle and 100% at WOT?**	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. TEST the system for normal operation. **No** CHECK the throttle position sensor and/or the powertrain control module (PCM). REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
K9 CHECK CIRCUITS CCF03 (GY/BN) AND CCF04 (VT/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: Transfer Case C350. • Disconnect: 4WD Control Module C281b. • Measure the resistance of the following circuits between 4WD control module C281b, harness side and transfer case C350, harness side: 	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. TEST the system for normal

Circuit	C281b	C350
CCF03 (GY/BN)	1	16
CCF04 (VT/OG)	2	12



- **Are the resistances less than 5 ohms?**

operation.

No
REPAIR the circuit. CLEAR the DTC(s). REPEAT the self-test.

K10 CHECK FOR PRESENCE OR ABSENCE OF TRANSFER CASE GEAR REDUCTION

- While driving the vehicle, monitor the engine rpm and vehicle speed.
- **Does the engine rpm and vehicle speed indicate that the vehicle is in the designated mode (4H or 4L mode)?**

Yes
The system is functioning correctly.

No
GO to K11 .

K11 CHECK THE CONTACT PLATE ENCODER PIDs IN 4H OR 4L MODE

- Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record.
- With the MSS in the designated mode (4H or 4L mode), monitor the contact plate position PIDs. Refer to the following chart:

Contact Plate Position PID	MSS PID 4A/4H MODE	MSS PID 4L MODE
PLATE_A	CLOSED	OPEN
PLATE_B	OPEN	CLOSED
PLATE_C	CLOSED	OPEN
PLATE_D	CLOSED	CLOSED

- **Do the contact plate position PIDs indicate that the transfer case shift motor is in 4H or 4L mode?**

Yes
GO to K12 .

No
GO to K13 .

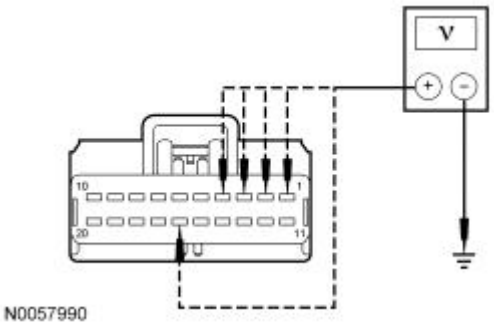
K12 CHECK THE TRANSFER CASE SHIFT MOTOR

- Remove the transfer case shift motor from the transfer case.
- Rotate the shift cam through all positions.
- **Does the transfer case shift cam rotate with difficulty (is the force required to rotate the cam greater than 45 Nm [33 lb-ft])?**

Yes
REPAIR the transfer case. REFER to Section 308-07B . CLEAR the DTC(s). REPEAT the self-test.

No
INSTALL a new transfer case shift motor. CLEAR the DTC(s). REPEAT the self-test.

K13 CHECK CIRCUITS RCF09 (BN/WH), CCF17 (WH/OG), CCF16 (VT/GN), CCF15 (BN/YE) AND CCF14 (GN/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: Transfer Case C350. • Disconnect: 4WD Control Module C281a. • Measure the resistance of the following circuits between 4WD control module C281a, harness side and transfer case C350, harness side: **Circuit** / **C281a** / **C350** RCF09 (BN/WH) / 16 / 10 CCF17 (WH/OG) / 4 / 13 CCF16 (VT/GN) / 3 / 9 CCF15 (BN/YE) / 2 / 1 CCF14 (GN/OG) / 1 / 5  • **Are the resistances less than 5 ohms?**	**Yes** GO to K14 . **No** REPAIR the circuit. CLEAR the DTC(s). REPEAT the self-test.
K14 CHECK CIRCUITS RCF09 (BN/WH), CCF17 (WH/OG), CCF16 (VT/GN), CCF15 (BN/YE) AND CCF14 (GN/OG) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between the following circuits at the 4WD control module C281a, harness side and ground: **Circuit** / **C281a** RCF09 (BN/WH) / 16 CCF17 (WH/OG) / 4 CCF16 (VT/GN) / 3 CCF15 (BN/YE) / 2 CCF14 (GN/OG) / 1	**Yes** REPAIR the circuit. CLEAR the DTC(s). REPEAT the self-test. **No** GO to K15 .



- **Is voltage present?**

K15 CHECK CIRCUITS RCF09 (BN/WH), CCF17 (WH/OG), CCF16 (VT/GN), CCF15 (BN/YE) AND CCF14 (GN/OG) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the following circuits at 4WD control module C281a, harness side and ground: **Circuit** / **C281a** RCF09 (BN/WH) / 16 CCF17 (WH/OG) / 4 CCF16 (VT/GN) / 3 CCF15 (BN/YE) / 2 CCF14 (GN/OG) / 1  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to K16 . **No** REPAIR the circuit. CLEAR the DTC(s). REPEAT the self-test.
K16 CHECK THE TRANSMISSION RANGE (TR) AND WHEEL SPEED PIDS DURING THE 4H/4L MODE SHIFT	
• Connect: 4WD Control Module C281a. • Connect: 4WD Control Module C281b. • Connect: Transfer Case C350. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • A. Monitor the 4WD control module transmission range (TR) sensor status PID while shifting the transmission to NEUTRAL. • B. Monitor the ABS wheel speed PID. • **A. Does the 4WD control module TR sensor PID indicate NEUTRAL when the transmission is shifted to NEUTRAL?** **B. Does the ABS wheel speed PID indicate 0 km/h (0 mph)?**	**Yes** If all 3 PIDs are accurate, GO to K17 . **No** **A.** REFER to Section 307-01B for further diagnosis of the TR sensor and the CAN communication network. **B.** REFER to Section 206-09 for further diagnosis of the ABS system and the CAN

	communication network.
K17 CHECK THE IGNITION STATUS PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Key in ON position. • Monitor the ignition status PID. • **Does the ignition switch position correspond with the ignition status PID?**	**Yes** GO to K18 . **No** CHECK the ignition switch circuit(s) and CAN communication network. REFER to Section 418-00 .
K18 CHECK THE MODE SELECT SWITCH (MSS) POSITION PIDS	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Drive the vehicle. • Dynamically monitor the MSS PID while driving the vehicle in each shift position. • **Does the MSS PID always agree with the switch position?**	**Yes** GO to K13 . **No** GO to K19 .
K19 CHECK THE MSS	
• Key in OFF position. • Disconnect: MSS C284. • Measure the resistance between MSS C284-2, component side and C284-3, component side. Refer to the following chart: **MSS Position** / **Resistance (± 1%)** 4A — 270 ohms 4H — 130 ohms 4L — 62 ohms 2H — 619 ohms  N0038956 • **Are the resistances within the specified values?**	**Yes** GO to K20 . **No** INSTALL a new MSS. CLEAR the DTC(s). REPEAT the self-test.
K20 CHECK THE MSS CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR AN OPEN	
• Measure the resistance between MSS C284-2 and 4WD control module C281a-11, circuit CCF13 (WH/BU); measure the resistance between MSS C284-3 and 4WD control module C281a-20, circuit RCF13 (WH/BN).	**Yes** GO to K21 . **No** REPAIR the circuit(s). CLEAR the DTC(s). REPEAT the self-test.

 N0057986 • **Are the resistances less than 5 ohms?**	
K21 CHECK THE MSS CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between MSS C284-2, circuit CCF13 (WH/BU) and ground; measure the voltage between MSS C284-3, circuit RCF13 (WH/BN) and ground.  N0037380 • **Is voltage present?**	**Yes** REPAIR the circuit(s). CLEAR the DTC(s). REPEAT the self-test. **No** GO to K22 .
K22 CHECK THE MSS CIRCUITS RCF13 (WH/BN) AND CCF13 (WH/BU) FOR A SHORT TO GROUND	
• Measure the resistance between MSS C284-2, circuit CCF13 (WH/BU) and ground; measure the resistance between MSS C284-3, circuit RCF13 (WH/BN) and ground.  N0037379 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. TEST the system for normal operation. **No** REPAIR the circuit(s). CLEAR the DTC(s). REPEAT the self-test.
K23 CHECK CIRCUITS CCF08 (GY/OG) AND CCF07 (BN/GN) FOR POWER DURING ACTIVE COMMANDS	
• Connect: 4WD Control Module C281a. • Enter the following diagnostic mode on the diagnostic tool: Access Active Commands. • Enter the clockwise transfer case shift motor active command ON and OFF and measure the voltage between transfer case C350-15, circuit CCF07 (GN/RD) harness side and ground. Enter the counterclockwise transfer case shift motor active command ON and OFF and measure the voltage between transfer case C350-14, circuit CCF08 (GY/OG) harness side	**Yes** CHECK the transfer case. REFER to Section 308-07B and REPAIR the transfer case as necessary. REPEAT the self-test. Go To Pinpoint Test O .

and ground.  A0069234 • **Are the voltages 10 volts or greater while the corresponding active commands are on?**	**No** GO to K24 .
K24 CHECK CIRCUITS CCF08 (GY/OG) AND CCF07 (BN/GN) FOR AN OPEN	
• Measure the resistance between transfer case C350-14, circuit and 4WD control module C281b-4, harness side, circuit CCF08 (GY/OG).  N0058002 • Measure the resistance between transfer case C350-15, circuit and 4WD control module C281b-5, harness side, circuit CCF07 (BN/GN). • **Are the resistances less than 5 ohms?**	**Yes** GO to K25 . **No** REPAIR the circuit. CLEAR the DTC(s). REPEAT the self-test. Go To Pinpoint Test O .
K25 CHECK CIRCUITS CCF08 (GY/OG) AND CCF07 (BN/GN) FOR A SHORT TO VOLTAGE	
• Measure the voltage between 4WD control module C281b-4, circuit CCF08 (GY/OG), harness side and ground.  N0057993 • Measure the voltage between 4WD control module C281b-5, circuit CCF07 (BN/GN), harness side and ground. • **Is voltage present?**	**Yes** GO to K26 . **No** REPAIR the circuit. CLEAR the DTC(s). REPEAT the self-test. Go To Pinpoint Test O .
K26 CHECK CIRCUITS CCF08 (GY/OG) AND CCF07 (BN/GN) FOR A SHORT TO GROUND	
• Measure the resistance between 4WD control module C281b-4, circuit CCF08 (GY/OG) harness side and ground.	**Yes** GO to K27 . **No**

 N0057994 • Measure the resistance between 4WD control module C281b-5, circuit CCF07 (BN/GN) harness side and ground. • **Are the resistances greater than 10,000 ohms?**	REPAIR the circuit. CLEAR the DTC(s). REPEAT the self-test. Go To Pinpoint Test O .
K27 CHECK THE HOT AT ALL TIMES-2 (HAT2) BJB FUSE 43 (20A)	
• Check battery junction box (BJB) fuse 43 (20A). • **Is the fuse OK?**	**Yes** GO to K28 . **No** REPAIR the circuit. REPEAT the self-test.
K28 CHECK FOR BATTERY VOLTAGE FROM THE FUSE CAVITY	
• Measure the voltage between PDB input side fuse cavity 43 and ground. • **Is the voltage greater than 9 volts?**	**Yes** GO to K29 . **No** REPAIR or INSTALL new components as necessary. REPEAT the self-test.
K29 CHECK FOR HAT VOLTAGE INPUT TO THE 4WD CONTROL MODULE	
• Disconnect: 4WD Control Module C281b. • Measure the voltage between 4WD control module C281b-6, circuit SBB34 (BU/RD) harness side and ground.  N0057995 • **Is the voltage greater than 9 volts?**	**Yes** GO to K30 . **No** REPAIR the affected circuit(s). REPEAT the self-test.
K30 CHECK THE GROUND CIRCUIT FOR AN OPEN	
• Key in OFF position. • Measure the resistance between 4WD control module C281b-10 circuit GD123 (BK/GY), harness side and ground.	**Yes** GO to K31 . **No** REPAIR the circuit. REPEAT the self-test.

 N0057996 • **Is the resistance less than 5 ohms?**	
K31 CHECK THE 4WD CONTROL MODULE CONNECTOR	
• Check 4WD control module connectors C281a and C281b for corrosion and bent or broken pins. • Connect: C281a. • Connect: C281b. • Test the 4WD system operation. • Carry out the 4WD control module on-demand self test. • **Is the concern still present?**	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. Go To Pinpoint Test O . **No** Go To Pinpoint Test O .

Pinpoint Test L: Four Wheel Drive (4WD) Does Not Engage at Speed Correctly

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

When the operator selects a transfer case mode from 2H mode, the four wheel drive (4WD) control module engages a clutch for approximately 5 seconds to synchronize the front and rear driveshafts allowing a mechanical engagement of the transfer case. The 4WD control module also removes the ground path from the integrate wheel end (IWE) solenoid, which removes vacuum from the IWEs, allowing them to engage the front axle shaft. Systematically check the necessary inputs and outputs at the 4WD control module, internal components of the transfer case, IWE components and drive axles.

Possible Causes

- Transfer case clutch coil
- Transfer case
- 4WD control module
- Front axle assembly
- Circuit CCF03 (GY/BN)
- Circuit 92 (LB/YE)

PINPOINT TEST L: 4WD DOES NOT ENGAGE AT SPEED CORRECTLY

Test Step	Result / Action to Take
L1 RETRIEVE DIAGNOSTIC TROUBLE CODES (DTCs)	
• Connect the diagnostic tool. • Carry out the 4WD control module self-test. • **Are any DTCs retrieved?**	**Yes** If DTC P1824, DTC P1827 or DTC P183B, GO to L10 . If DTC P1825, GO to L11 . If DTC P1826

	GO to L13 . For all other DTCs, GO to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart. **No** GO to L2 .
L2 CHECK 4H ENGAGEMENT AT REST	
• Switch the MSS from 2H mode to 4H mode. • While on the road, drive the vehicle in turns and check for wind-up. • **Does 4H mode engage at rest correctly?**	**Yes** GO to L3 . **No** Go To Pinpoint Test I .
L3 CHECK 2H MODE TO 4H MODE SHIFT AT SPEED	
• Switch the mode select switch (MSS) to 2H mode. • Key in ON position. • Drive the vehicle and carry out a 2H mode to 4H mode shift while driving approximately at 16 km/h (10 mph). • Stop the vehicle, shift to 2H mode , drive the vehicle and carry out a 2H mode to 4H mode shift while driving at approximately 64 km/h (40 mph). • **Does 4H mode engage correctly (or much better) at 16 km/h (10 mph) than at 64 km/h (40 mph)?**	**Yes** Go To Pinpoint Test H . **No** GO to L4 .
L4 CHECK THE TRANSFER CASE CLUTCH COIL LOCKUP	
• Connect the diagnostic tool. • Key in ON position. • Switch the MSS to AWD mode. • Using the scan tool, command the transfer case clutch to 98%. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate when the rear driveshaft is rotated?**	**Yes** GO to L5 . **No** GO to L8 .
L5 CHECK THE TRANSFER CASE CLUTCH COIL RELEASE	
• Using the scan tool, command the transfer case clutch to 0%. • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate when the rear driveshaft is rotated?**	**Yes** GO to L14 . **No** GO to L6 .
L6 CHECK THE TRANSFER CASE SYNCHRONIZATION (ON A HOIST)	
• Start the engine, shift the MSS to 2H mode. • Place the transmission in DRIVE and increase speed to between 16 km/h (10 mph) and 24 km/h (15 mph). • While observing the front driveshaft, switch the MSS to 4H mode. • **Did the front driveshaft start to spin?**	**Yes** GO to L7 . **No** GO to L14 .
L7 CHECK THE TRANSFER CASE DISENGAGEMENT	
• Switch the MSS to 2H mode. • Rotate the rear driveshaft while observing the front driveshaft. • **Did the front driveshaft rotate?**	**Yes** GO to L14 . **No**

	Go To Pinpoint Test H .
L8 CHECK CIRCUIT CCF03 (GY/BN) FOR VOLTAGE • Disconnect: Transfer Case C350. • Carefully back-probe transfer case C350-16, circuit CCF03 (GY/BN).  N0037381 • While active commanding 98%, measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and the transfer case housing. • **Is the voltage greater than 9 volts?**	**Yes** END the active command. INSTALL a new transfer case synchronization clutch. REFER to Section 308-07B . CLEAR the DTCs. REPEAT the self-test. **No** GO to L9 .
L9 CHECK THE TRANSFER CASE CHASSIS GROUND • Carefully back-probe transfer case C350-16, circuit CCF03 (GY/BN).  N0037381 • While active commanding 98%, measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and chassis ground. • **Is the voltage greater than 9 volts?**	**Yes** END the active command. REPAIR the transfer case ground connection between the transfer case and the chassis. CLEAR the DTCs. REPEAT the self-test. **No** END the active command. GO to L10 .
L10 CHECK CIRCUIT CCF03 (GY/BN) FOR A SHORT TO GROUND • Disconnect: 4WD Control Module C281b. • Measure the resistance between transfer case C350-16, circuit CCF03 (GY/BN) and ground.  N0057992 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L11 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
L11 CHECK CIRCUIT CCF03 (GY/BN) FOR AN OPEN • Measure the resistance between transfer case C350-16,	**Yes**

circuit CCF03 (GY/BN), harness side and the 4WD control module C281b-1, circuit CCF03 (GY/BN), harness side.  N0057987 • **Is the resistance less than 5 ohms?**	GO to L12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
L12 CHECK CIRCUIT CCF03 (GY/BN) FOR VOLTAGE	
• Active command the transfer case clutch greater than 10% and measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground.  N0058003 • **Is voltage present?**	**Yes** END active command. GO to L13 . **No** END active command. INSTALL a new transfer case synchronization clutch. REFER to Section 308-07B . CLEAR the DTCs. REPEAT the self-test.
L13 CHECK CIRCUIT CCF03 (GY/BN) FOR A SHORT TO VOLTAGE	
• While in active command 0%, measure the voltage between transfer case C350-16, circuit CCF03 (GY/BN), harness side and ground.  N0058003 • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to L14 .
L14 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION	

• Disconnect all 4WD control module connectors C281a and C281b.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect the 4WD control module connectors and make sure they are seated correctly.
	Yes
	INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. REPEAT the self-test.

• Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test M: The Four Wheel Drive (4WD) System Jumps Out of Gear

Normal Operation

When the 4 wheel drive (4WD) system engages the user selected mode, that mode should be maintained. If the 4WD system does not stay in the selected mode, systematically check the 4WD system components.

Possible Causes

- Integrated wheel end (IWE) vent line(s)
- Mode select switch (MSS)
- Transfer case

PINPOINT TEST M: THE FOUR WHEEL DRIVE (4WD) SYSTEM JUMPS OUT OF GEAR

Test Step	Result / Action to Take
M1 CHECK FOR OBSTRUCTED IWE VENT LINES	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • **NOTE:** The IWE vent port is the smaller of the 2 vacuum ports. • Disconnect the LH IWE line from the vent port. • Attach a vacuum pump to the IWE vent line. • Attempt to draw and hold a vacuum. Repeat Steps 1, 2 and 3 for the RH side of the vehicle. • **Can a vacuum be held on either IWE vent line?**	**Yes** INSTALL new IWE vent lines as necessary. **No** GO to M2 .
M2 VERIFY THE CONCERN	
• Drive the vehicle and attempt to duplicate the concern. • **Is the concern an uncommanded range shift (in or out of 4L mode)?**	**Yes** GO to M5 . **No** GO to M3 .
M3 CHECK THE MSS POSITION PIDS	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Drive the vehicle. • Dynamically monitor the MSS PID while driving the vehicle in each shift position. • **Does the MSS PID always agree**	**Yes** GO to M4 . **No** Go To Pinpoint Test B .

with the switch position?	
M4 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs)	
• Carry out the on-demand self test. • **Are DTCs present?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart. **No** Go To Pinpoint Test H .
M5 CHECK THE 4WD INDICATORS	
• Stop the vehicle. • Transmission in NEUTRAL. • Depress the brake pedal. • Observe the 4WD indicators in the instrument cluster while cycling through each MSS position. • **Do the 4WD indicators match MSS switch positions?**	**Yes** GO to M3 . **No** GO to M6 .
M6 CHECK FOR DTCs	
• Transmission in PARK. • Release the brake pedal. • Carry out the on-demand self test. • **Are DTCs present?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart. **No** CHECK the transfer case fluid level. REFER to Section 308-07B . If the fluid level is OK, CHECK for internal transfer case faults. REFER to Section 308-07B .

Pinpoint Test N: Straightline Driveline Wind-up

Normal Operation

In order for the 4 wheel drive (4WD) system to function correctly, tires and wheels must be the same size, be in good condition and the front and rear axle ratios must match.

Possible Causes

- Unmatched tire sizes
- Unequal amounts of tire wear
- Unequal tire inflation pressures
- Unmatched front and rear axle ratios

PINPOINT TEST N: STRAIGHTLINE DRIVELINE WIND-UP

NOTE: Four high/low mode (4H/4L mode) is not intended for driving on hard/dry surfaces; using 4H/4L mode while driving on these surfaces may produce noises like intermittent clunking, but will not damage driveline components.

Test Step	Result / Action to Take
N1 VERIFY THE CONCERN	
• Drive the vehicle and shift from 2H mode to 4H mode. There should be minimal wind-up in 4H mode during straightline maneuvers,	**Yes** GO to N2 .

(wind-up in turns is normal; 4H/4L is not intended for driving on hard/dry surfaces). • **Is excessive wind-up present?**	**No** RETURN the vehicle to the customer. ADVISE about correct 4WD system operation and normal vehicle behavior.
N2 CHECK FOR MATCHING WHEEL AND TIRE SIZES	
• Check the wheel and tire sizes. • **Do the 4 wheel and tire sizes match?**	**Yes** GO to N3 . **No** ADVISE the customer that 4WD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
N3 CHECK TIRE WEAR	
• Check each of the 4 tires for wear. • **Are the 4 tires worn evenly?**	**Yes** GO to N4 . **No** ADVISE the customer that 4WD systems require 4 matched, correctly inflated, correctly rotated tires to operate correctly.
N4 CHECK TIRE INFLATION PRESSURE	
• Check the inflation pressure in each tire. Refer to vehicle certification label. • **Are the tire inflation pressures correct?**	**Yes** GO to N5 . **No** ADJUST the tire pressure as necessary. TEST the vehicle for normal operation. ADVISE the customer that 4WD systems require 4 matched, correctly inflated, correctly maintained tires to operate correctly.
N5 CHECK THE FRONT AND REAR AXLE RATIOS	
• Check that front and rear axle ratios match. Refer to Section 205-03 . • **Do the front and rear axle ratios match?**	**Yes** RETURN the vehicle to the customer and ADVISE about correct 4WD system usage and normal vehicle behavior. **No** CHECK the vehicle identification label. INSTALL the correct axle(s). REFER to Section 205-00 .

Pinpoint Test O: Torque On-Demand Functional Test

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

When operating in 4 wheel drive (4WD), the transfer case and both integrated wheel ends (IWEs) are locked. When in 4L mode, the transfer case low range gear set provides an additional 2.64 gear reduction. When operating in 2H mode, the transfer case and both IWEs are unlocked.

Possible Causes

- Transfer case and related components

- IWE and related components
- Wheel/tire assemblies

PINPOINT TEST O: TORQUE ON-DEMAND FUNCTIONAL TEST

NOTE: Four high/low mode (4H/4L mode) is not intended for driving on hard/dry surfaces; using 4H/4L mode while driving on these surfaces may produce noises like intermittent clunking, but will not damage driveline components.

Test Step	Result / Action to Take
O1 CHECK FOR 4WD INDICATOR PROVE OUT	
• Key in OFF position. • Key in ON position. • **Do the 4WD indicators illuminate at prove out?**	**Yes** GO to O2 . **No** CHECK the instrument cluster for faults. REFER to Section 413-01 .
O2 CHECK 2H MODE OPERATION	
• Stop the vehicle. • Transmission in NEUTRAL. • Depress the brake pedal. • Switch the mode select switch (MSS) to 2H mode. • **Do the 4WD indicators turn off?**	**Yes** GO to O5 . **No** GO to O3 .
O3 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs)	
• Transmission in PARK. • Release the brake pedal. • Connect the diagnostic tool. • Carry out the on-demand self test. • **Are DTCs retrieved?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to O4 .
O4 CHECK FOR WIND-UP IN 2H MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** Go To Pinpoint Test D . **No** Go To Pinpoint Test I .
O5 CHECK FOR WIND-UP IN 2H MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** REPAIR the transfer case. REFER to Section 308-07B . **No** GO to O6 .
O6 CHECK AWD MODE OPERATION	
• Switch the MSS to AWD mode. • **Are the 4WD indicators off?**	**Yes** GO to O9 . **No** GO to O7 .
O7 CHECK FOR DTCs	

• Connect the diagnostic tool. • Carry out the on-demand self test. • **Are DTCs present?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to O8 .
O8 CHECK FOR WIND-UP IN AWD MODE	
• Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** GO to O9 . **No** GO to O10 .
O9 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle (pulse width modulated [PWM]) PID. • **Does the PID indicate 2 to 4% clutch application at closed throttle?**	**Yes** GO to O10 . **No** GO to O11 .
O10 CHECK FOR WIND-UP IN AWD WITH 100% CLUTCH	
• Using the scan tool, command the clutch duty cycle to 100%. • Drive the vehicle on a dry, hard surface in turns. • **Is wind-up present in turns?**	**Yes** GO to O11 . **No** CHECK the transfer case. REFER to Section 308-07B .
O11 CHECK SHAFT SPEED PIDs	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case front and rear shaft speeds. • Drive the vehicle 30 km/h (18 mph). • Record and compare the front wheel speed and rear wheel speed. • **Do the front shaft speed and rear shaft speed values match within 1.5 km/h (1 mph)?**	**Yes** GO to O12 . **No** CHECK anti-lock brake system (ABS). REFER to Section 206-09 and VERIFY the 4 road tire sizes match.
O12 CHECK THE THROTTLE POSITION PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the throttle position PID from the 4WD control module. • Key ON, engine OFF. • Slowly move throttle from closed throttle to WOT and observe the 4WD control module throttle sensor PID. • **Does the PID value vary between 0% at closed throttle and 100% at WOT?**	**Yes** GO to O13 . **No** CHECK the throttle position sensor and/or the powertrain control module (PCM). REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
O13 CHECK 4H MODE OPERATION	
• Switch the MSS to 4H mode. • **Does the 4H indicator illuminate correctly?**	**Yes** GO to O16 . **No** GO to O14 .

O14 CHECK FOR DTCs	
• Transmission in PARK. • Release the brake pedal. • Connect the diagnostic tool. • Carry out the on-demand self test. • **Are DTCs retrieved?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to O15 .
O15 CHECK FOR WIND-UP IN 4H MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** Go To Pinpoint Test I . **No** Go To Pinpoint Test C .
O16 CHECK FOR WIND-UP IN 4H MODE	
• Drive the vehicle on a dry, hard surface. • **Is straightline wind-up present?**	**Yes** Go To Pinpoint Test G . **No** GO to O17 .
O17 CHECK WIND-UP IN TURNS IN 4H MODE	
• Drive the vehicle in 4H mode while turning. • **Is wind-up present in turns?**	**Yes** GO to O18 . **No** Go To Pinpoint Test I .
O18 CHECK 4L MODE OPERATION	
• Bring the vehicle to a stop with the brake applied, transmission in NEUTRAL, switch the MSS to 4L mode. • **Does the 4WD low indicator illuminate correctly?**	**Yes** GO to O21 . **No** GO to O19 .
O19 CHECK FOR DTCs	
• Transmission in PARK. • Release the brake pedal. • Connect the diagnostic tool. • Carry out the on-demand self test. • **Are DTCs retrieved?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to O20 .
O20 CHECK FOR WIND-UP IN 4L MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** Go To Pinpoint Test I . **No** Go To Pinpoint Test D .
O21 CHECK FOR WIND-UP IN TURNS IN 4L MODE	
• Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present and 4L mode functioning?**	**Yes** GO to O22 . **No** CHECK for 4WD control module DTCs. REFER to the Inspection and Verification procedure in this section. If no DTCs are present, Go To Pinpoint Test D .

O22 CHECK 4L MODE TO 2H MODE SHIFT • With the vehicle at a stop, brake applied and transmission in NEUTRAL, switch the MSS from 4L mode to 2H mode. • **Does the 4WD indicator turn OFF?**	**Yes** GO to O25 . **No** GO to O23 .
O23 CHECK FOR DTCs • Transmission in PARK. • Release the brake pedal. • Connect the diagnostic tool. • Carry out the on-demand self test. • **Are DTCs retrieved?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to O24 .
O24 CHECK FOR WIND-UP IN 2H MODE • Drive the vehicle on a dry, hard surface while executing turns. • **Is wind-up present in turns?**	**Yes** Go To Pinpoint Test D . **No** Go To Pinpoint Test I .
O25 CHECK FOR TRANSFER CASE DISENGAGEMENT • With the vehicle in NEUTRAL, position it on a hoist. Refer to section Section 100-02 . • Rotate the rear driveshaft while observing the front driveshaft. • **Does the front driveshaft rotate?**	**Yes** REFER to Section 308-07B . **No** GO to O26 .
O26 CHECK FOR LH AND RH IWE DISENGAGEMENT **NOTE:** The engine must be at idle during the following steps to supply vacuum for IWE engagement/disengagement. • Start the engine and allow to idle. • Rotate the left front tire one revolution forward and one revolution backward while observing the left front halfshaft and universal joint. • Rotate the right front tire one revolution forward and one revolution backward while observing the right front halfshaft and universal joint. • **Does the LH or RH front halfshaft rotate?**	**Yes** Go To Pinpoint Test B . **No** GO to O27 .
O27 CHECK FOR IWE VACUUM LEAKS • Key in OFF position. • Disconnect both vacuum lines from the IWE solenoid. • Using a vacuum pump, apply 508 mm (20 in) Hg of vacuum to the IWE apply vacuum circuit. • Observe the vacuum reading. • **Did the vacuum drop more than 25 mm (1 in) Hg per minute?**	**Yes** CHECK the IWE and related components for leaks. Go To Pinpoint Test B . **No** GO to O28 .
O28 CHECK 2H MODE TO 4H MODE SHIFT AT SPEED ABOVE 32 KM/H (20 MPH) • Switch the MSS to 2H mode. • Drive the vehicle on the road and shift from 2H mode to 4H mode while driving above 32 km/h (20 mph). • **Does the transfer case shift to 4H mode satisfactorily?**	**Yes** The 4WD system is functioning correctly. **No** Go To Pinpoint Test E .

Pinpoint Test P: The 4WD Indicators Do Not Operate Correctly/Do Not Operate

Refer to Wiring Diagrams Cell 34 , Four-Wheel Drive System for schematic and connector information.

Normal Operation

The 4 wheel drive (4WD) system status is transmitted to the instrument cluster from the 4WD control module through the controller area network (CAN) to the powertrain malfunction indicator. A steady indicator displays if the vehicle is in 4x4 auto (4A), 4x4 high (4H) or 4x4 low (4L) (no indicator is provided for 2WD [2H] mode), according to the driver selection. A system fault condition will illuminate the powertrain malfunction indicator. The powertrain malfunction indicator includes other general powertrain system failures. For information about CAN, refer to Section 418-00 .

Possible Causes

- Instrument cluster (IC)
- 4WD system fault
- CAN circuits
- 4WD control module

PINPOINT TEST P: THE 4WD INDICATORS DO NOT OPERATE CORRECTLY/DO NOT OPERATE

Test Step	Result / Action to Take
P1 CHECK FOR DIAGNOSTIC TROUBLE CODES (DTCs)	
• Connect the diagnostic tool. • Carry out the on-demand self test. • **Are DTCs present?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to P2 .
P2 CHECK FOR INCORRECT 4WD INDICATOR ILLUMINATION	
• Switch the mode select switch (MSS) to 2H mode. • Observe the instrument cluster. • **Do any 4WD indicators illuminate?**	**Yes** GO to P3 . **No** GO to P4 .
P3 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle (pulse width modulated [PWM]) PID. • **Does the clutch duty cycle PID read 0% at closed throttle?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No** Go To Pinpoint Test B .
P4 CHECK THE AWD MODE INDICATOR	
• Switch the MSS to 4A mode with the engine running and the vehicle at rest: • Observe the instrument cluster. • **Does the 4WD mode indicator illuminate?**	**Yes** GO to P6 . **No** GO to P5 .

P5 CHECK THE 4H MODE INDICATOR	
• Switch the MSS to 4H mode with the engine running and the vehicle at rest: • Observe the instrument cluster. • **Does the 4WD mode indicator illuminate?**	**Yes** GO to P8 . **No** GO to P7 .
P6 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE AND TRANSFER CASE SHIFT MOTOR POSITION PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle PWM PID and the transfer case shift motor position PID. • **Does the clutch duty cycle PID read 2% at closed throttle and the transfer case shift motor position PID indicate AWD?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No** Go To Pinpoint Test B .
P7 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE AND TRANSFER CASE SHIFT MOTOR POSITION PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle PWM PID and the transfer case shift motor position PID. • **Does the clutch duty cycle PID read 2% at closed throttle and the transfer case shift motor position PID indicate AWD mode?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No** Go To Pinpoint Test A .
P8 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE AND TRANSFER CASE SHIFT MOTOR POSITION PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle PWM PID and the transfer case shift motor position PID. • **Does the clutch duty cycle PID read 12% at closed throttle and the transfer case shift motor position PID indicate 4H mode?**	**Yes** CHECK the instrument cluster. REFER to Section 413-01 . **No** Go To Pinpoint Test B .

Pinpoint Test Q: The Vehicle Binds in Turns/Resists Turning/Pulsates/Shudders in a Straightline in 4WD Mode

Normal Operation

When the vehicle is operating in 4WD (4H/4L modes), all 4 wheels receive the same amount of torque and rotate at the same speed. The amount of traction the vehicle can achieve depends on the amount of traction each tire can establish with the road surface. In order for the 4 wheel drive (4WD) system to function correctly, each tire must be in good condition and the front and rear axle ratios must match.

Possible Causes

- Unmatched tire sizes
- Unequal amounts of tire wear
- Unequal tire inflation pressures
- Unmatched front and rear axle ratios

PINPOINT TEST Q: THE VEHICLE BINDS IN TURNS/RESISTS TURNING/PULSATES/SHUDDERS IN A STRAIGHTLINE IN 4WD MODE

NOTE: Four high/low mode (4H/4L mode) is not intended for driving on hard/dry surfaces; using 4H/4L mode while driving on these surfaces may produce noises like intermittent clunking, but will not damage driveline components.

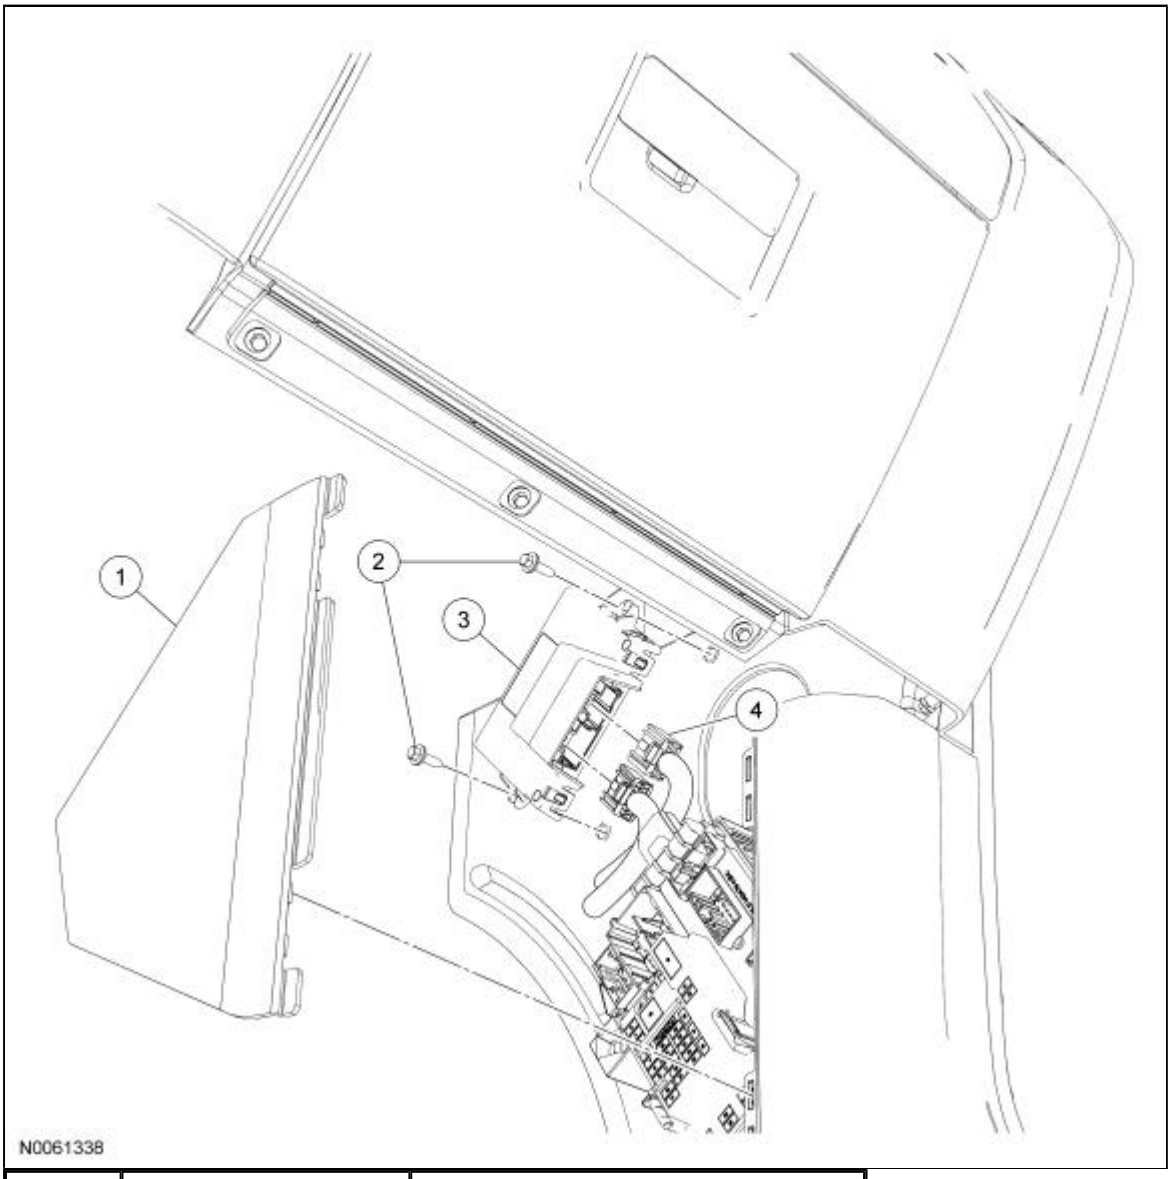
Test Step	Result / Action to Take
Q1 VERIFY THE CONCERN • Test drive the vehicle on a straight stretch of road in AWD mode. • Drive the vehicle through turns and parking lot maneuvers. • **Does the vehicle bind, pulsate or shudder?**	**Yes** If the problem occurs in 4A mode, GO to Q2 ; If 4H mode or 4L mode, binding is a normal condition. **No** Go To Pinpoint Test N .
Q2 CHECK THE 4WD INDICATORS • Review the test drive notes. • **Did any of the instrument cluster 4WD indicators illuminate or flash?**	**Yes** If the 4H mode indicator or 4L mode indicator illuminated, GO to Q4 . If the 4H mode or 4L mode indicators stayed illuminated, GO to Q3 . **No** GO to Q5 .
Q3 VERIFY THE FAULT • Review the test drive notes. • **Was 4H mode or 4L mode selected when the 4WD indicators were illuminated?**	**Yes** The system is functioning correctly. **No** The fault may have been caused by an intermittent, uncommanded or autolock shift. TEST the system for normal operation. Go To Pinpoint Test N .
Q4 CHECK FOR DTCs • Connect the diagnostic tool. • Carry out the on-demand self test. • **Are DTCs retrieved?**	**Yes** REFER to the Four Wheel Drive (4WD) Control Module Diagnostic Trouble Code (DTC) Chart for diagnosis. **No** GO to Q5 .
Q5 VERIFY THE CONCERN • Disconnect: Transfer Case C350. • Test drive the vehicle on a straight stretch of road and in turns, and shift the transfer case through each mode. Record any fault conditions. • **Is the concern present?**	**Yes** **Vehicles with limited slip rear differential:** The condition may be normal and no repair action is necessary. CHECK the rear axle to verify. REFER to Section 205-00 . **Vehicles without limited slip rear differential:** INSPECT the driveline components for damage or wear. REFER to Inspection and Verification. **No** GO to Q6 .
Q6 CHECK THE TRANSFER CASE CLUTCH DUTY CYCLE PID • Connect: Transfer Case C350. • CLEAR the DTCs. • Enter the following diagnostic mode on the diagnostic tool:	**Yes** GO to Q7 . **No**

PID/DATA Monitor and Record. • Monitor the transfer case clutch duty cycle (pulse width modulated [PWM]) PID at closed throttle, engine OFF, key ON. • **Is the clutch duty cycle greater than 10%?**	CHECK the transfer case. REFER to Section 308-07B .
Q7 CHECK THE 4WD SHAFT SPEED PIDs	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • While driving the vehicle at 30 km/h (18 mph), monitor the shaft speed PIDs. • Compare the speedometer reading to the wheel speed PIDs. • **Do the wheel speed PIDs and speedometer speeds match within 1.5 km/h (1 mph)?**	**Yes** GO to Q8 . **No** VERIFY that the 4 road wheels are the same size and have similar tread depth. CHECK the anti-lock brake system (ABS) system for faults. REFER to Section 206-09 .
Q8 CHECK THE ACCELERATOR PEDAL POSITION OUTPUT PID	
• Enter the following diagnostic mode on the diagnostic tool: PID/DATA Monitor and Record. • Slowly move accelerator pedal from closed throttle to WOT and observe the output PID. • **Does the value vary between 0% at closed throttle and 100% at WOT?**	**Yes** GO to Q9 . **No** Diagnose the powertrain control module (PCM). REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
Q9 CHECK THE TRANSFER CASE FRONT DRIVESHAFT OUTPUT	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate the front driveshaft by hand. • **Does the front driveshaft rotate freely (does it require less than 45 Nm [33 lb-ft] to rotate)?**	**Yes** INSTALL a new 4WD control module. REFER to Four Wheel Drive (4WD) Control Module in this section. TEST the system for normal operation. **No** CHECK the transfer case. REFER to Section 308-07B . TEST the system for normal operation.

Four Wheel Drive (4WD) Control Module

Printable View (180 KB)

Removal and Installation



Item	Part Number	Description
1	020A78	Cowl side panel cover
2	W705314	Screws
3	—	Connectors
4	7E453	4WD control module

1. Remove the RH-side cowl side panel cover to gain access.
2. Remove the 2 screws.
3. Disconnect the electrical connectors.

4. Remove the 4WD control module.
5. To install, reverse the removal procedure.

Features and Operation

Expedition

The automatic four wheel drive (A4WD) transfer case uses an electronic shift four wheel drive (4WD) system that allows the operator to choose between 4 different operational modes. The operator can switch between 2H, all wheel drive (AWD) and 4H modes at any speed. However, to engage or disengage 4L mode, the 4WD control module requires that the vehicle speed is less than 5 km/h (3 mph), the brake is applied and the transmission is in NEUTRAL.

In AWD mode, the 4WD control module varies the torque split between front and rear drivelines by controlling the transfer case clutch. Under most conditions, the 4WD control module activates the transfer case clutch at a minimum duty cycle (percentage of time the clutch is turned on) which allows for a slight speed difference between the front and rear drivelines which normally occurs when negotiating a corner on dry pavement. When the rear wheels are overpowered, the 4WD control module detects this slip condition and the duty cycle to the transfer case clutch is increased until the speed difference between front and rear drivelines is reduced. In this manner, the 4WD control module can redirect engine torque to the front wheels when the rear wheels lose traction yet still allow operation in the AWD mode on dry pavement.

Navigator

The A4WD transfer case uses an electronic shift 4WD system that allows the operator to choose between 3 different operational modes. The operator can switch between 4x2, 4x4 AUTO and 4x4 modes at any speed. 4L mode is not available.

In 4x4 AUTO mode, the 4WD control module varies the torque split between front and rear drivelines by controlling the transfer case clutch. Under most conditions, the 4WD control module activates the transfer case clutch at a minimum duty cycle (percentage of time the clutch is turned on) which allows for a slight speed difference between the front and rear drivelines which normally occurs when negotiating a corner on dry pavement. When the rear wheels are overpowered, the 4WD control module detects this slip condition and the duty cycle to the transfer case clutch is increased until the speed difference between front and rear drivelines is reduced. In this manner, the 4WD control module can redirect engine torque to the front wheels when the rear wheels lose traction yet still allow operation in the AWD mode on dry pavement.

Expedition and Navigator

When the anti-lock brake (ABS) system is active, the 4WD control module will default to a minimum duty cycle for the transfer case clutch.

Feature inputs:

- Mode select switch (MSS)
- ABS active input (battery voltage when ABS is active, grounded when inactive)
- Contact plate position inputs A, B, C, D grounded when closed, open circuit when open

Feature outputs:

- Solid state clutch relay (pulse width modulated signal: grounded when relay is on, battery potential when relay is off)

Transfer Case

Refer to Section 308-07A .

Transfer Case Draining and Filling

Printable View (92 KB)

Special Tool(s)

ST2323-A	Oil Suction Gun 303-D104 (D94T-9000-A)

Material

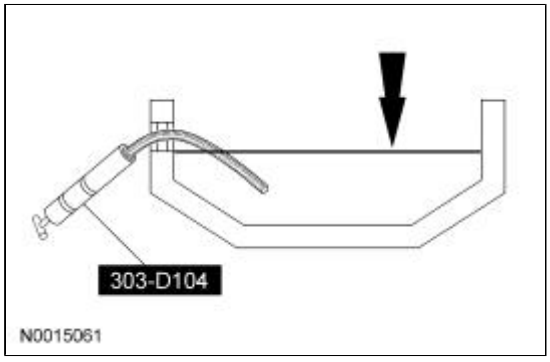
Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V
Thread Sealant with PTFE TA-24	WSK-M2G350-A2

1. Remove the drain plug and drain the fluid. Clean the drain plug and the drain plug area. Apply thread sealant to the drain plug threads. Reinstall the drain plug.
   - To install, tighten to 15 Nm (11 lb-ft).

2. Clean the area around the fill plug. Remove the fill plug.

3. **CAUTION: Incorrect fluid fill can result in transfer case failure.**

   Using the special tool, fill the transfer case to specification.
   - The fluid must be just below the fill plug hole. Fill the case until the fluid slowly flows over the fill plug threads. Clean the fluid from the fill plug area.



4. Apply thread sealant to the fill plug threads, then install the fill plug.
   - Tighten to 15 Nm (11 lb-ft).

Transfer Case Rear Output Shaft Seal

Printable View (108 KB)

Special Tool(s)

ST2261-A	Installer, Input Shaft Oil Seal 308-249 (T96T-7127-A)

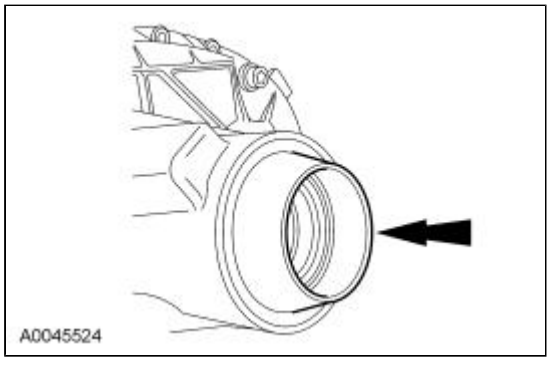
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Index-mark the rear driveshaft yoke and pinion flange to maintain initial driveshaft balance during installation.

   Remove the rear driveshaft. For additional information, refer to Section 205-01 .

3. Using a suitable tool, remove the oil seal.



Installation

1. To install, reverse the removal procedure.
   - Using the special tool, install the oil seal.

MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Disassembly

1. **WARNING: Make sure protective eyewear is in place.**

   WARNING: Use a petroleum-based solvent to clean the transfer case. Refer to the solvent manufacturer's safety precautions to prevent personal injury or transfer case damage.

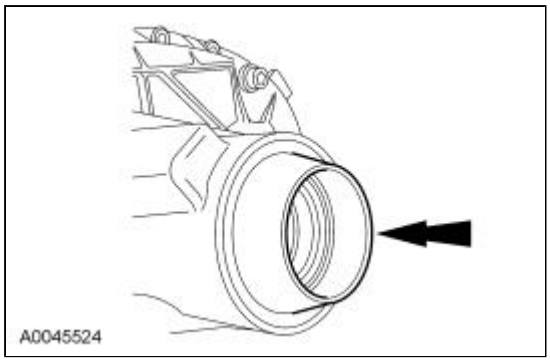
   CAUTION: Seal all openings before cleaning the transfer case exterior. This will prevent entry of dirt and water, which can cause damage to internal components.

   Clean the transfer case exterior with solvent and dry with compressed air.

2. Using special tool 307-003, secure the transfer case to a work bench. Rotate the transfer case so that the output shaft is pointing upward.

3. Drain the fluid from the transfer case, if not done previously.

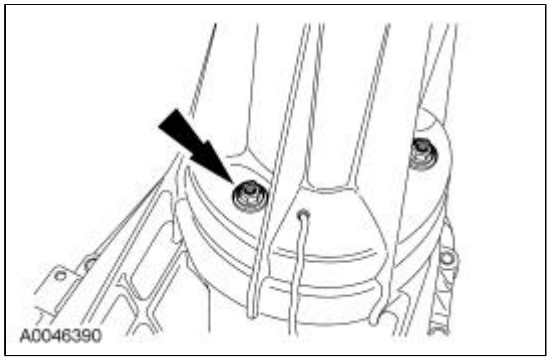
4. Using a suitable tool, remove and discard the oil seal.



5. Remove the coil wire pin from the electrical connector.
    - Remove the wire connector spacer.
    - Remove the coil wire pin (tan wire).
        - Use an electrical connector pin extractor tool.

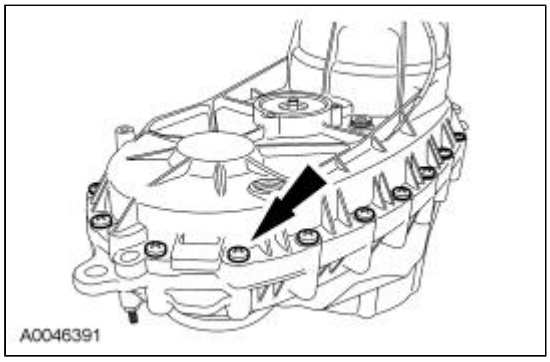
6. Remove the bolts and transfer case shift motor.

7. Remove the 3 coil nuts and washers.

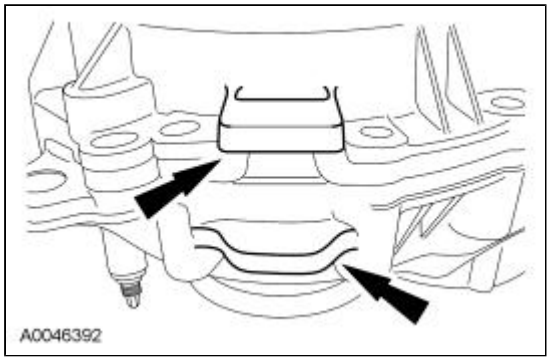


8. **NOTE:** It is normal to find metal shavings after removing the self-tapping transfer case bolts.

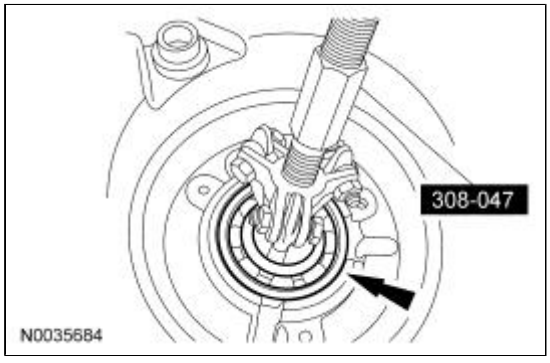
    Remove the 20 bolts.



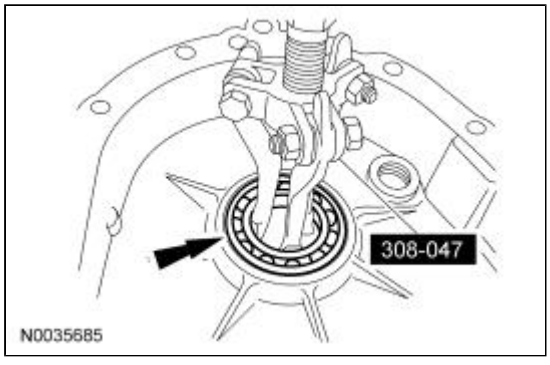
9. Separate the transfer case halves.
    - Use the pry bosses to separate the case halves.



10. Using the special tool, remove the rear output shaft support bearing.



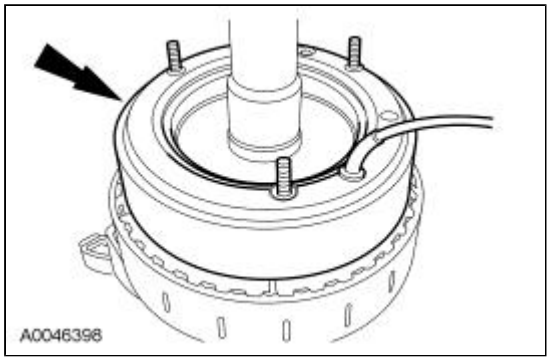
11. Using the special tool, remove the front output shaft rear bearing.



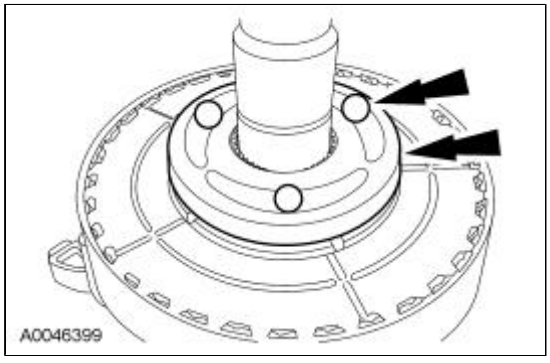
12. Remove the snap ring.
    - Inspect the snap ring for wear or damage. Install a new snap ring as necessary.

13. Remove the caged thrust bearing assembly.
    - Inspect the bearing for wear or damage. Install a new bearing as necessary.

14. Remove the cam/coil housing.

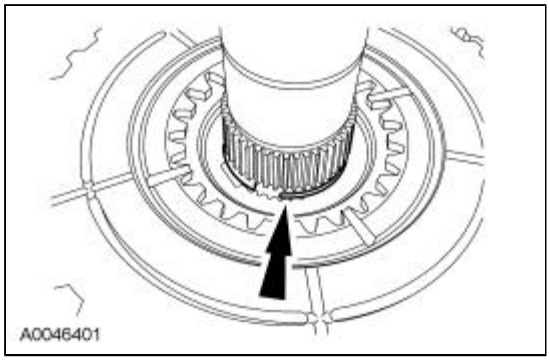


15. Remove the steel balls and the cam.



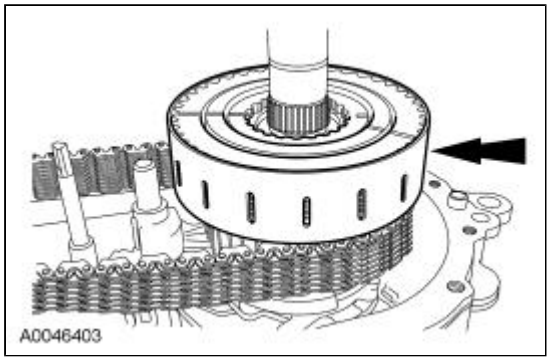
16. Remove the wave spring.

17. Remove and discard the snap ring.

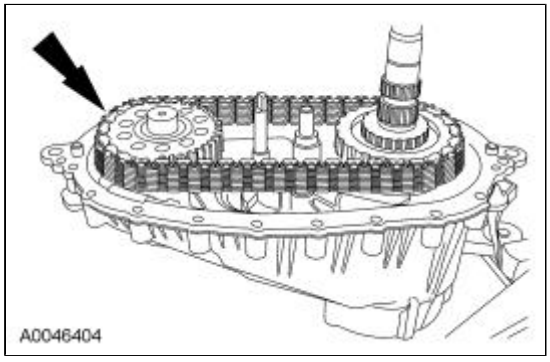


18. **CAUTION: When removing the clutch pack assembly, do not separate the clutch pack assembly. Keep tension on the clutch pack upon removal. Set the clutch pack assembly on the bench in the same position as located in the transfer case. The thrust washer in the lower clutch pack uses tabs to hold it in place. If the thrust washer is not in place, a transfer case clearance problem can occur.**

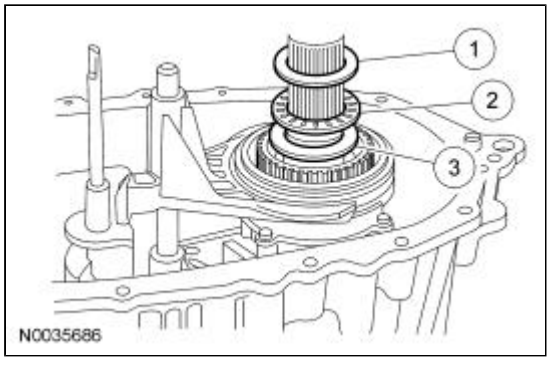
    Remove the clutch pack assembly.



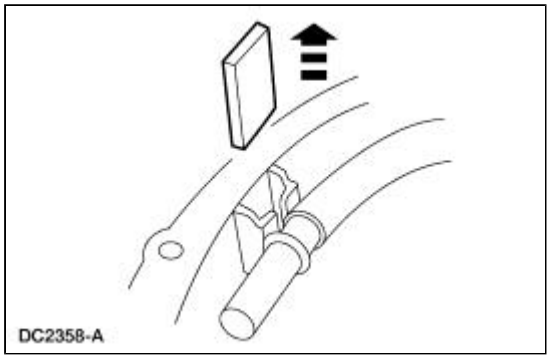
19. Remove the drive chain and the sprockets as an assembly.
    - Inspect the drive chain for wear or damage. Inspect the sprockets for broken or cracked teeth. Install new components as necessary.



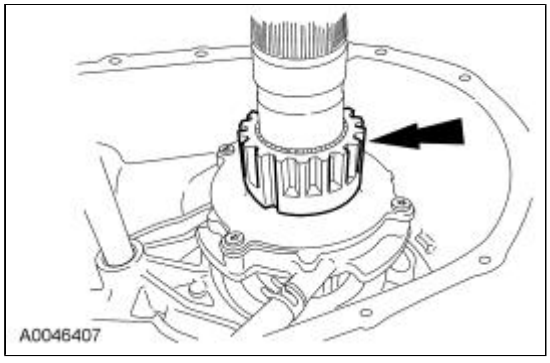
20. Remove the thrust bearing assembly.
    1. Remove the thrust washer.
        - The upper thrust washer may be attached to the sprocket.
    2. Remove the thrust bearing.
    3. Remove the thrust washer.
    - Inspect the washers and bearing for wear or damage. Install new components as necessary.



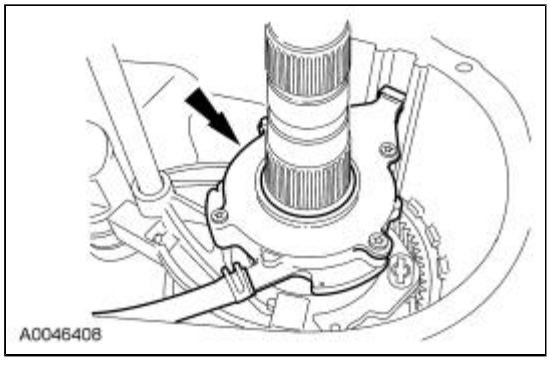
21. Remove and clean the oil pan magnet.



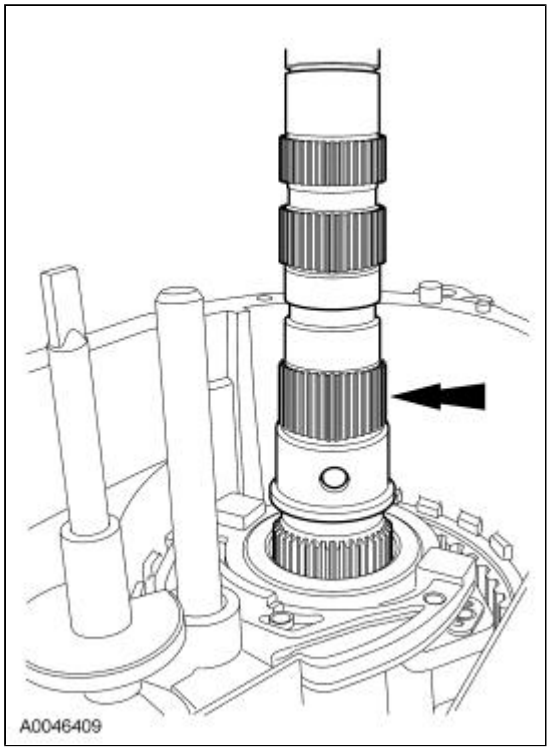
22. Remove the output shaft sprocket.



23. Remove the oil pump assembly.



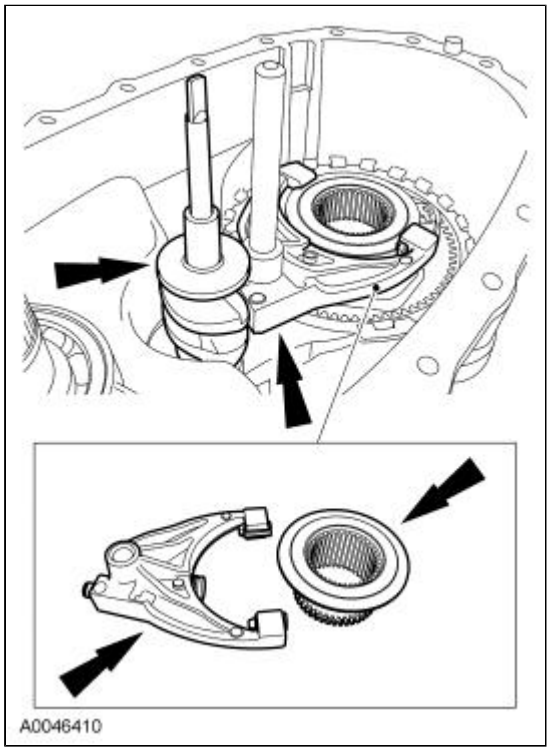
24. Remove the output shaft.



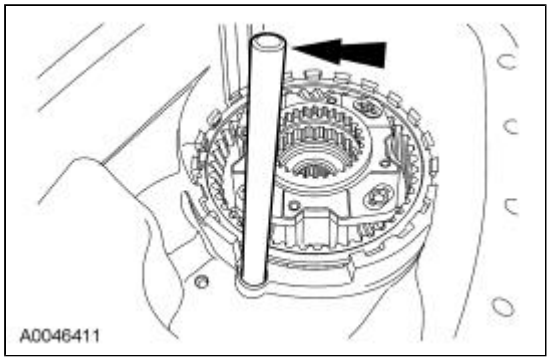
25. **WARNING: Do not disassemble the shift cam assembly.**

Remove the reduction shift fork, the reduction hub and the shift cam as an assembly.

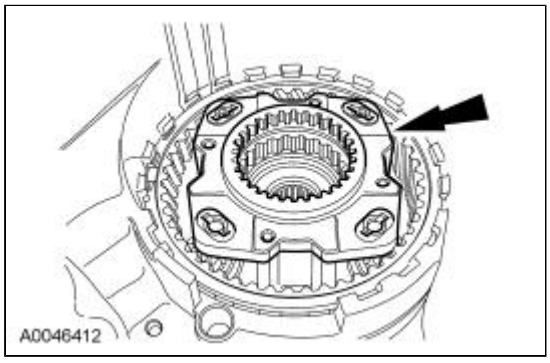
- Separate and inspect the reduction hub and the reduction shift fork for wear or damage.



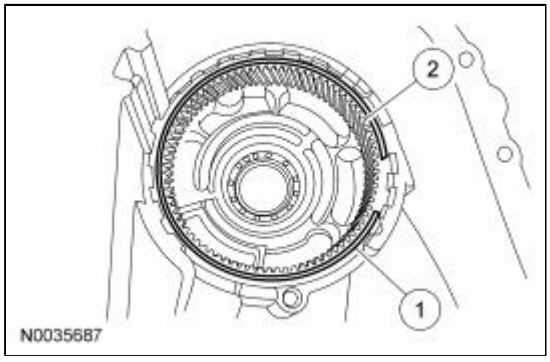
26. Remove the shift fork shaft.



27. Remove the front planet.
    - Using a drift and a hammer, remove the front planet needle bearing, if necessary.



28. Remove the ring gear.
    1. Remove the snap ring.
        - Inspect the snap ring for wear or damage. Install a new snap ring as necessary.
    2. Remove the ring gear.

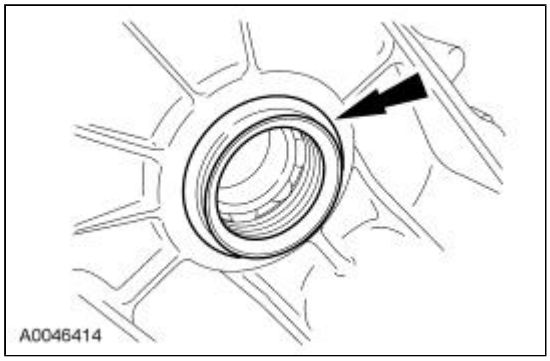


29. **CAUTION: Do not let the front output shaft fall when removing the snap ring.**

    Remove the snap ring and the front output shaft.
    - Inspect the snap ring for wear or damage. Install a new snap ring as necessary.

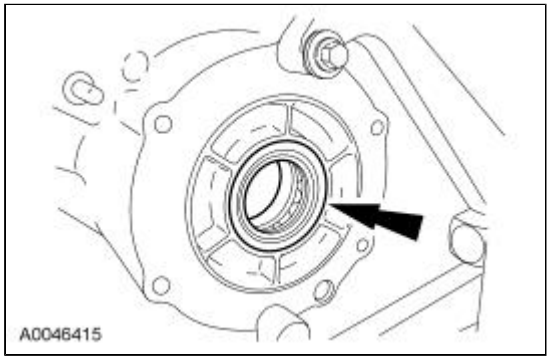
30. **NOTE:** Carefully remove the seal, do not damage the seal bore.

    Remove and discard the front output shaft oil seal.

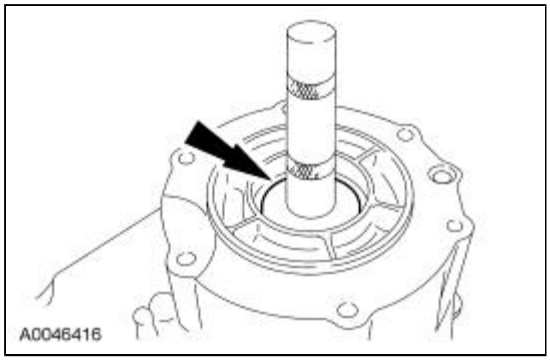


31. **NOTE:** Carefully remove the seal, do not damage the seal bore.

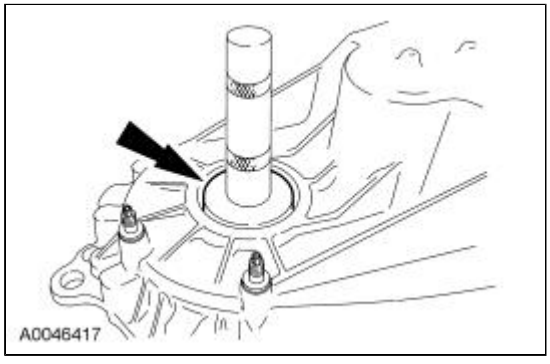
    Remove and discard the front input shaft oil seal.



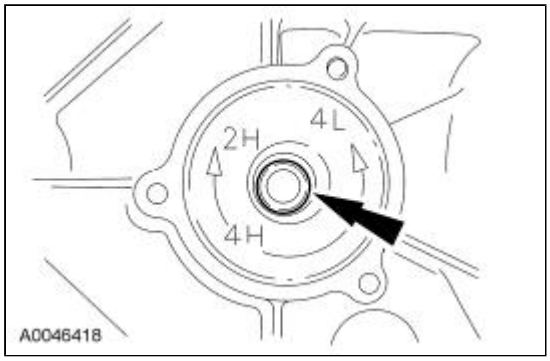
32. Using a suitable driver, remove the front planet support bearing.



33. Using a suitable driver, remove the front output shaft support bearing.



34. Using a suitable tool, remove and discard the shifter shaft seal.

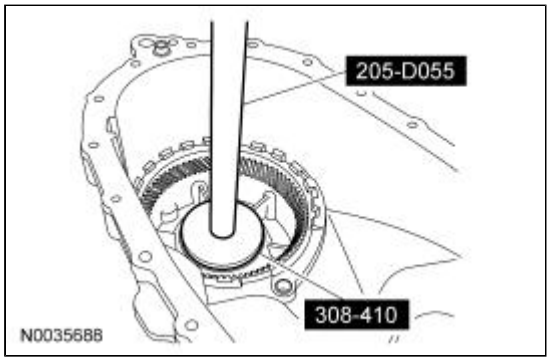


Assembly

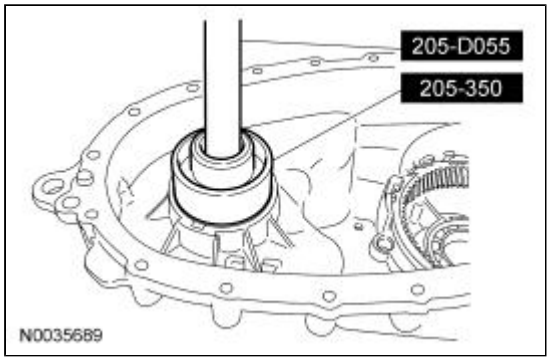
1. Lubricate all internal components with the recommended transfer case lubricant during reassembly.

2. Clean the mating surfaces of the cases.

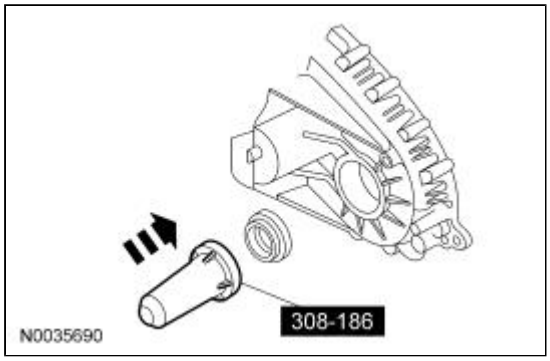
3. Using a suitable press and the special tools, install the front planet support bearing.



4. Using a suitable press and the special tools, install the front output shaft support bearing.

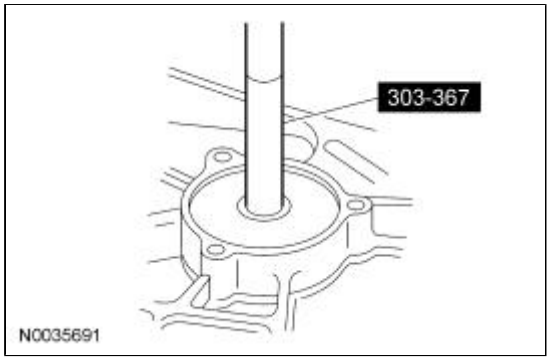


5. Using the special tool, install a new oil seal.



6. **CAUTION: Be careful not to crush the seal.**

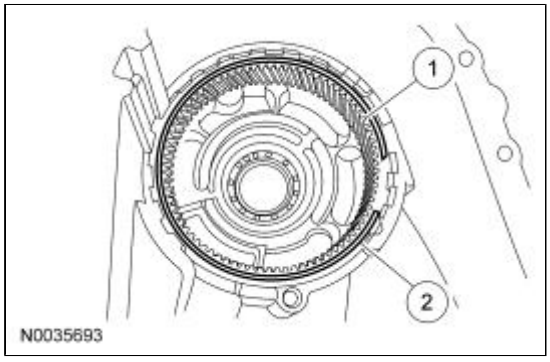
   Using the special tool, install a new shifter shaft seal.



7. Install the case to the transmission holding fixture. Secure the case to the work bench.

8. Using special tool 308-249, install a new oil seal.

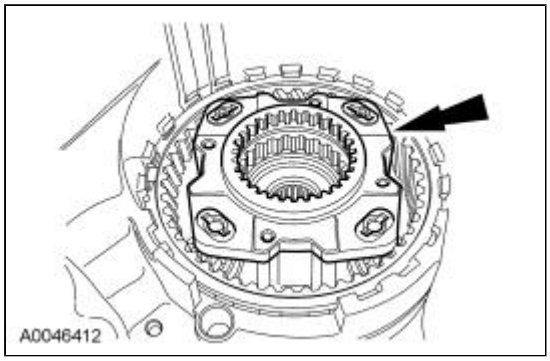
9. Install the ring gear.
   1. Position the ring gear in the case.
   2. Install the snap ring.



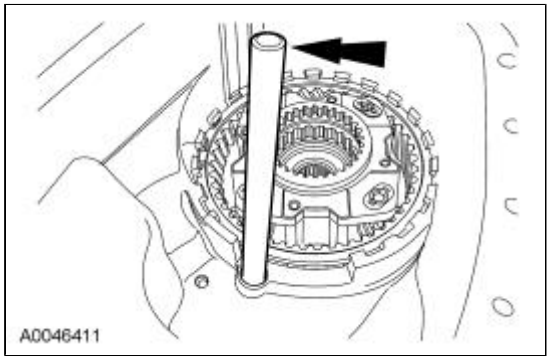
10. Install the front output shaft and the snap ring.

11. **NOTE:** If removed, using a suitable press and the special tool 308-085, install the needle bearing into the front planet. Be careful not to crush the bearing cage.

    Install the front planet.

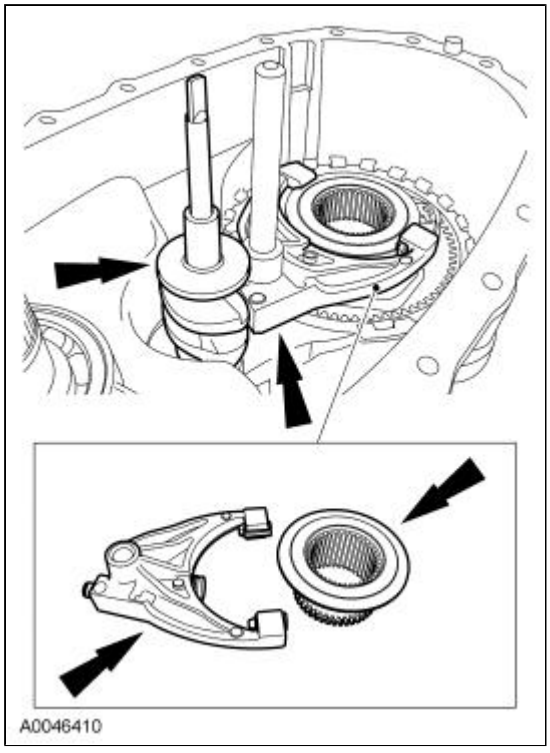


12. Install the shift fork shaft.

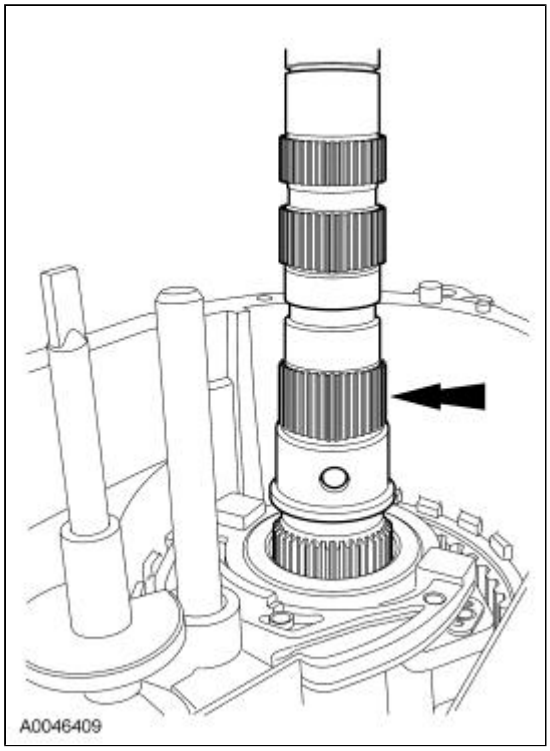


13. **NOTE:** Assemble the reduction hub and the reduction shift fork.

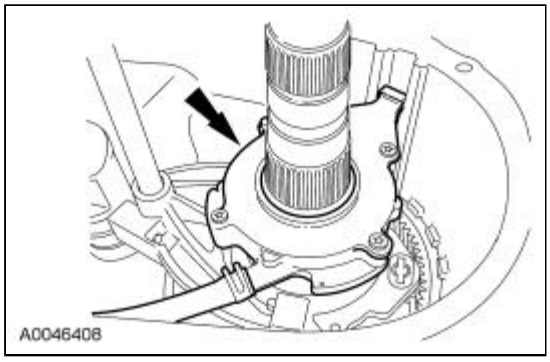
    Install the reduction shift fork, the reduction hub and the shift cam as an assembly.



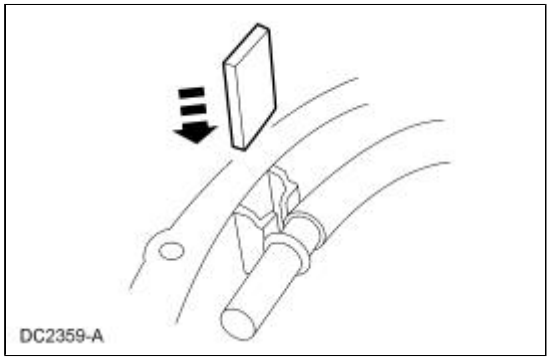
14. Install the output shaft.



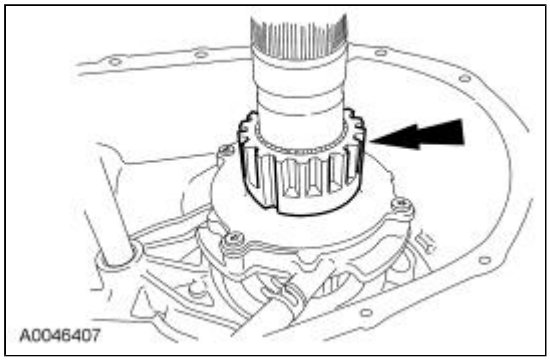
15. Install the oil pump assembly.
    - Make sure the oil pump finger is in the slot in the case.



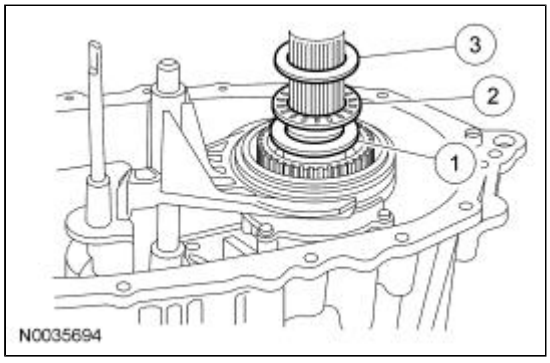
16. Install the oil pan magnet into its slot in the case.



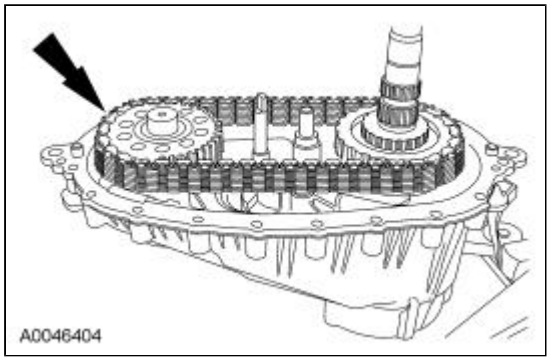
17. Install the output shaft sprocket.



18. Install the 3-piece thrust bearing assembly.
    1. Install the thrust washer.
    2. Install the thrust bearing.
    3. Install the thrust washer.

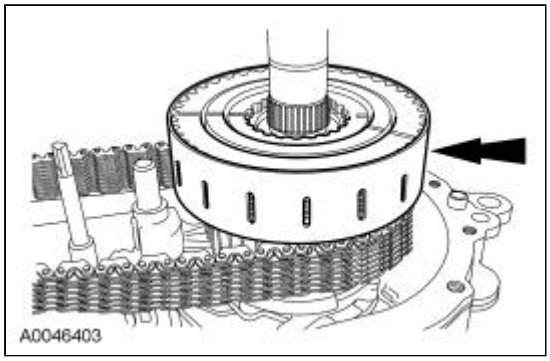


19. Install the drive chain and the sprockets as an assembly.

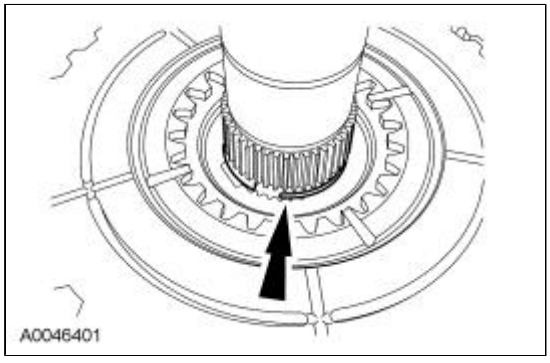


20. **CAUTION: When installing the clutch assembly, do not separate the clutch pack assembly. The thrust washer in the lower clutch pack uses tabs to hold it in place. If the thrust washer is not in place, a transfer case clearance problem can occur.**

    Install the clutch pack assembly.

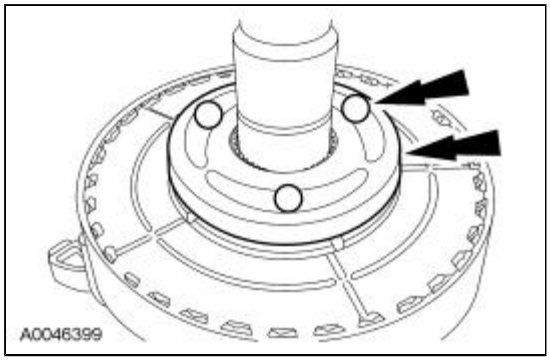


21. Install a new snap ring.

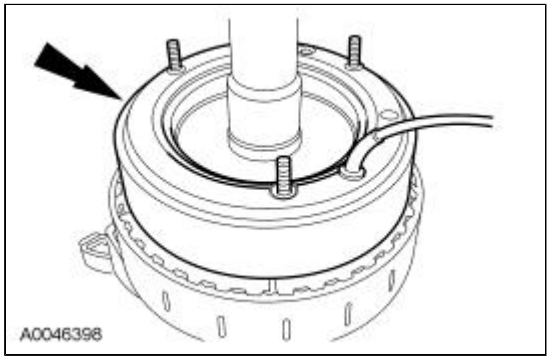


22. Install the wave spring.

23. Install the cam and the steel balls.



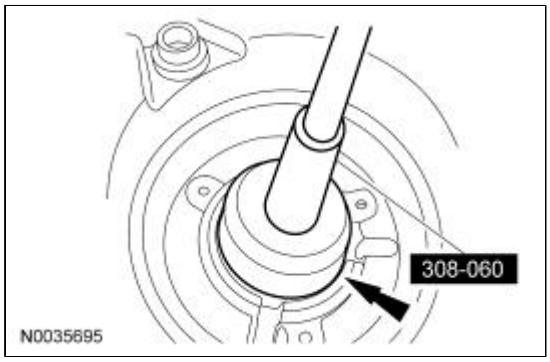
24. Install the cam/coil housing.



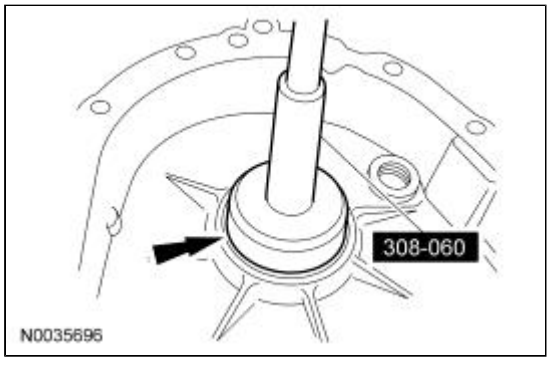
25. Install the thrust bearing assembly.

26. Install the snap ring.

27. Using a suitable press and the special tool, install the rear output shaft support bearing.

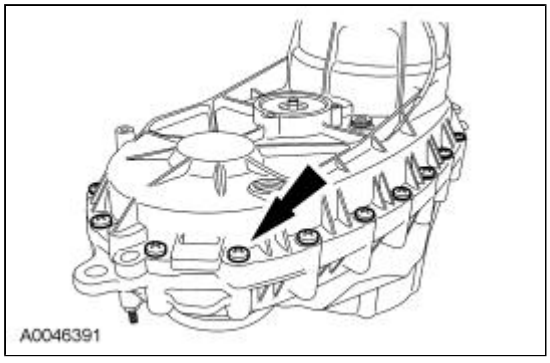


28. Using a suitable press and the special tool, install the front output shaft rear bearing.



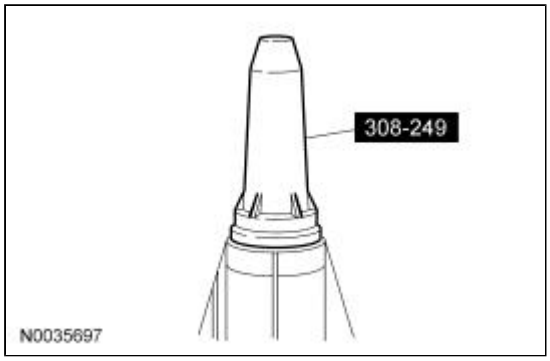
29. **CAUTION: Applying too much silicone sealant can plug the fluid filter and cause transfer case failure.**

    Apply a bead of silicone sealant to the transfer case mating surfaces, then position the 2 transfer case halves together. Tighten the transfer case bolts evenly in a star pattern.
    - Position the coil studs through the case holes, make sure the shift cam shaft is aligned with its case bore, and the lockup shift fork spring is in position.
    - Tighten to 24 Nm (18 lb-ft).



30. Install the 3 coil washers and nuts.
    - Tighten to 10 Nm (89 lb-in).

31. Using the special tool, install the oil seal.



32. Install the transfer case shift motor.
    - Tighten the shift motor bolts to 10 Nm (89 lb-in).

33. Install the coil wire pin in the electrical connector.
    - Remove the wire connector spacer.
    - Install the coil wire pin. Reinstall the wire connector spacer.

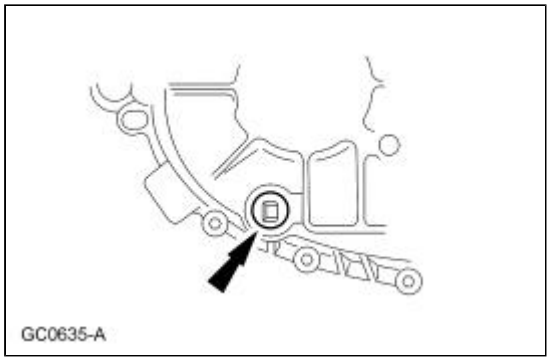
34. Remove the transfer case from the special tool.

Transfer Case — Navigator

Printable View (252 KB)

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the fluid if the transfer case is to be disassembled.
   - Install the drain plug when finished draining.



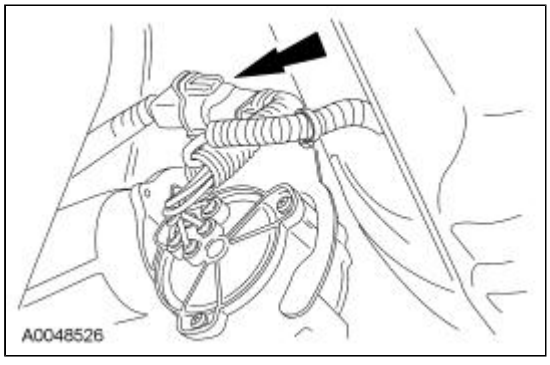
3. **NOTE:** Index-mark the driveshaft to maintain initial driveshaft balance during installation.

   Remove the front driveshaft. For additional information, refer to Section 205-01 .

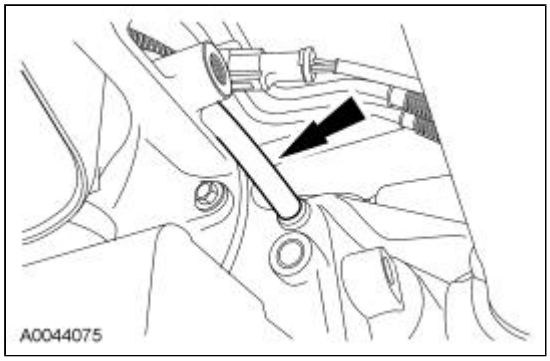
4. **NOTE:** Index-mark the driveshaft to maintain initial driveshaft balance during installation.

   Remove the rear driveshaft. For additional information, refer to Section 205-01 .

5. Disconnect the electrical connector.

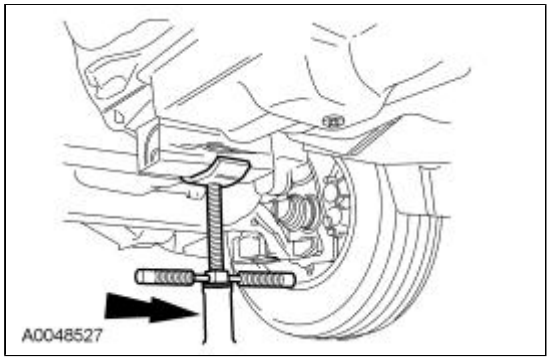


6. Disconnect the vent hose.



7. **CAUTION: Never support the transmission from the bottom of the transmission pan.**

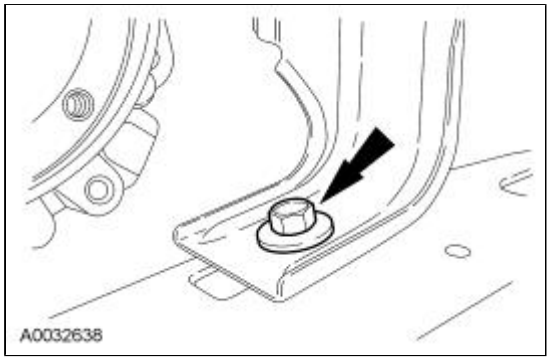
   Using a suitable jack stand, support the transmission.



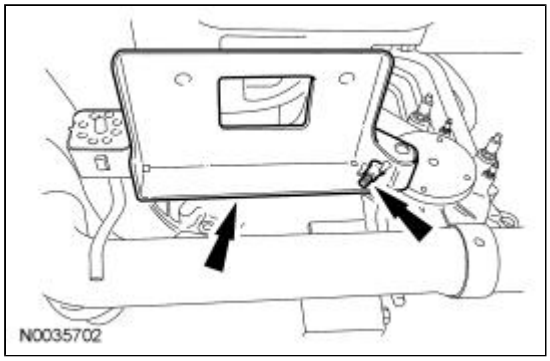
8. **CAUTION: Secure the transfer case to the jack with a safety strap.**

   Using a suitable transmission jack, support the transfer case.

9. Remove the 2 exhaust heat shield-to-crossmember bolts.

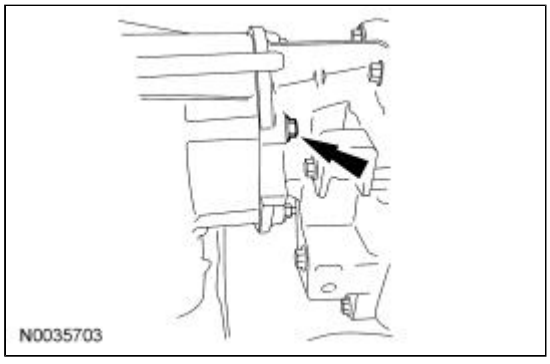


10. Remove the bolt and the exhaust hanger bracket.
    - To install, tighten to 40 Nm (30 lb-ft).



11. **NOTE:** Position a suitable drain pan below the transmission extension housing.

    Remove the 6 transfer case-to-transmission extension housing bolts.
    - To install, tighten to 41 Nm (30 lb-ft).



12. **NOTE:** Watch for obstructions.

    Separate the transfer case from the transmission extension housing, move the transfer case rearward off the output shaft, then lower the transfer case from the vehicle.

13. **CAUTION: Carefully clean the gasket surfaces. Nicks and gouges cause fluid leaks.**

    Remove the transfer case-to-transmission gasket and clean the mating surfaces.

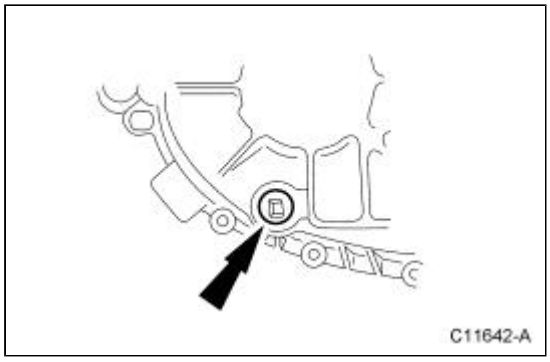
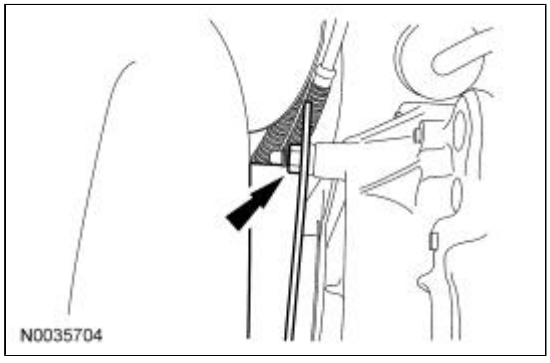
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the fluid if the transfer case is to be disassembled.
   - Install the drain plug when finished draining.



3. Remove the 2 nuts and the front driveshaft shield.
   - To install, tighten to 18 Nm (13 lb-ft).



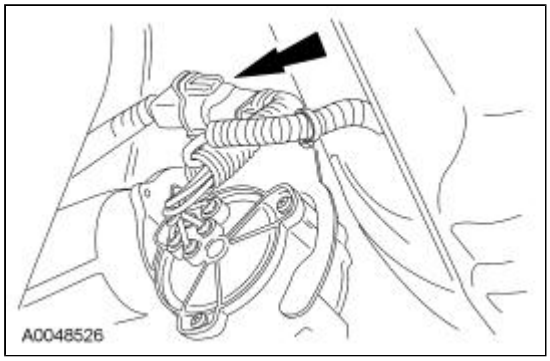
4. **NOTE:** Index-mark the driveshaft to maintain initial driveshaft balance during installation.

   Remove the front driveshaft. For additional information, refer to Section 205-01 .

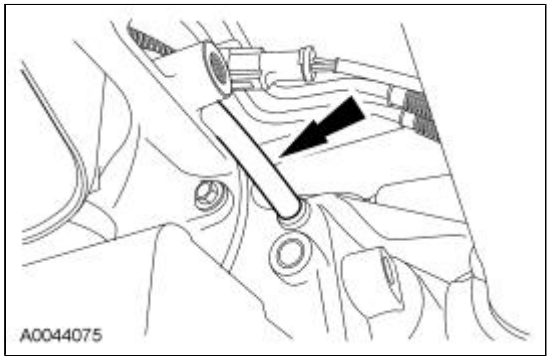
5. **NOTE:** Index-mark the driveshaft to maintain initial driveshaft balance during installation.

   Remove the rear driveshaft. For additional information, refer to Section 205-01 .

6. Disconnect the electrical connector.

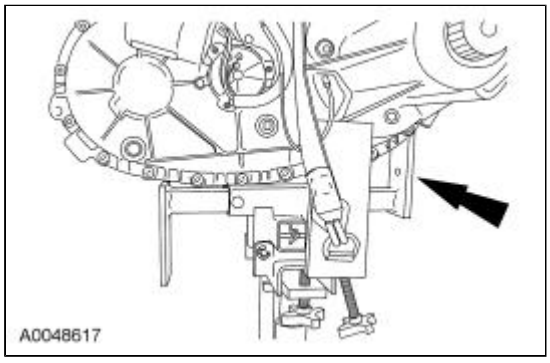


7. Disconnect the vent hose.



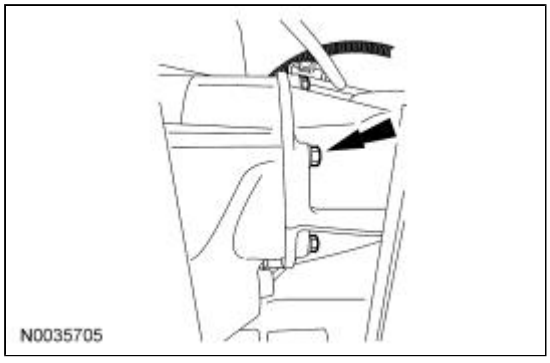
8. **CAUTION: Secure the transfer case to the jack with a safety strap.**

   Using a suitable transmission jack, support the transfer case.



9. **NOTE:** Position a suitable drain pan below the transmission extension housing.

   Remove the 6 transfer case-to-transmission extension housing bolts.
   - To install, tighten to 47 Nm (35 lb-ft).

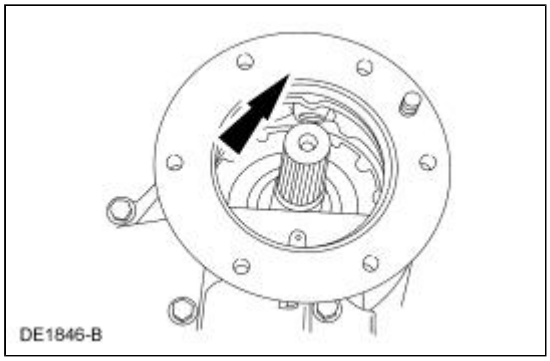


10. **NOTE:** Watch for obstructions.

    Separate the transfer case from the transmission extension housing, move the transfer case rearward off the output shaft, then lower the transfer case from the vehicle.

11. **CAUTION: Carefully clean the gasket surfaces. Nicks and gouges cause fluid leaks.**

    Remove the transfer case-to-transmission gasket and clean the mating surfaces.



Transfer Case

Printable View (105 KB)

NOTE: Installation is for both Navigator and Expedition.

1. To install, reverse the removal procedure.
   - Install a new transfer case-to-transmission gasket.
   - Fill the transfer case. For additional information, refer to Transfer Case Draining and Filling in the General Procedures portion of this section when refilling the transfer case. Refer to Specifications in this section for the correct type and quantity of fluid.
   - Tighten the transfer case-to-transmission bolts evenly in a star pattern.
   - Adjust the transmission selector lever cable. For additional information, refer to Section 307-05 .

Exhaust System

Printable View (84 KB)

Exhaust System

The exhaust system provides an exit for exhaust gases and reduces engine noise by passing exhaust gases through the catalytic converter and a muffler assembly. Rubber exhaust hanger insulators attach the exhaust system to the mounting hooks.

Catalytic Converter

The catalytic converter plays a major role in the emission control system. The catalytic converter operates as a gas reactor. Its catalytic function is to speed the heat-producing chemical reaction of components in the exhaust gases in order to reduce air pollutants. The catalyst material inside the catalytic converter consists of a ceramic substrate.

The catalytic converter is designed to provide a long life. No maintenance is necessary for the catalytic converter.

Sound Insulators and Shields

Sound insulators and shields attached to the underbody protect the vehicle from exhaust system heat and should be inspected at regular intervals to make sure they are not dented or out of position. If a sound insulator or shield is damaged or shows evidence of deterioration, a new sound insulator or shield should be installed. The sound insulators and shields for the muffler, exhaust downpipe, inlet pipe and catalytic converter pipe are installed separately.

Precautions

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to repair any part of the exhaust system until it has cooled. Use special care when working around the catalytic converter. The catalytic converter heats to a high temperature after only a short period of engine operation. Failure to follow these instructions may result in personal injury.

WARNING: Exhaust gases contain carbon monoxide which can be harmful to health and are potentially lethal. Exhaust system leaks should be repaired immediately. Never operate the engine in enclosed areas. Failure to follow these instructions may result in personal injury.

CAUTION: Do not use leaded fuel in a vehicle equipped with catalytic converter.

CAUTION: In a vehicle that is continually misfueled, the lead in the fuel will be deposited in the catalytic converter and completely blanket the catalyst. Lead reacts with platinum to "poison" the catalyst. Continuous use of leaded fuel can destroy the catalyst and render the catalytic converter useless.

CAUTION: The addition of lead to the catalytic converter can also solidify the catalyst, causing excessive back pressure in the exhaust system and possibly causing engine damage.

CAUTION: Extremely high temperatures of 1,100°C (2,012°F) or above due to misfiring or

over-rich fuel/air mixture will cause the ceramic substrate to sinter or burn, destroying the catalytic converter. Do not continue to operate the vehicle if the engine is misfiring, there is a power loss or other unusual operating conditions, such as engine overheating and backfiring

CAUTION: Do not use oil or grease-based lubricants on the isolators. These lubricants may cause deterioration of the rubber. This can lead to separation of the isolator from the exhaust hanger bracket during vehicle operation.

NOTE: Exhaust fasteners are of a prevailing torque design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

Apply anti-seize lubricant to the threads of the heated oxygen sensors (HO2S) and catalyst monitor sensor before installation.

Exhaust System

Printable View (89 KB)

Principles of Operation

The exhaust system provides an exit for exhaust gases and reduces engine noise by passing exhaust gases through the catalytic converters and a muffler assembly. The catalytic converters also play a major role in reducing air pollutants.

Inspection and Verification

1. Verify the concern by running the engine (with the vehicle on the ground) or road testing the vehicle to duplicate the condition.
2. Visually inspect the components of the exhaust system and related controls that may affect exhaust gas quality or loss of power.
3. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
• Exhaust pipe pinched or crushed • Damaged muffler • Broken or damaged exhaust hanger brackets • Damaged catalytic converter • Cracked exhaust manifold • Dirty engine air cleaner • Loose or damaged heat shields

4. Verify that the exhaust system is installed correctly, with clamps correctly located and tightened to specification.
5. If the fault is not visually evident, determine the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Rattle, squeaks or buzz type noise — from the bottom of vehicle	• Loose or damaged heat shield	• INSPECT the exhaust system for loose or missing heat shields or foreign material trapped between the heat shields and the exhaust system

		components. If any heat shields are loose, INSTALL worm gear clamp 7L5Z-5A231-AA and TIGHTEN to 7 Nm (62 lb-in). If the heat shields are missing, INSTALL new heat shields or exhaust system components as necessary. If a rattle, noise or buzz condition persists, INSTALL a new heat shield or component as necessary.
	• Loose or damaged exhaust isolators	• CHECK exhaust isolators are correctly installed. INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	• Damaged exhaust isolator hanger bracket	• INSPECT the exhaust system components for damage or broken hangers. INSTALL new components as necessary. CHECK for loose or damaged exhaust hanger brackets or fasteners. TIGHTEN bolts to specification or INSTALL new components as necessary.
	• Loose or damaged catalytic converter or muffler	• MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler, then the catalytic converter. Determine if there are loose or broken baffles in the muffler or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
	• Exhaust grounded to chassis	• INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the Exhaust System Alignment in this section.
• Drone or clunk type noise — from bottom of vehicle	• Loose or damaged exhaust isolators	• INSPECT exhaust isolators for wear or damage. INSTALL new isolators as necessary.
	• Exhaust grounded to chassis	• INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the Exhaust System Alignment in this section.
• Whistles, boom, hum or ticking type noise — noise tends to change as	• Punctures in the muffler • Broken, loose or missing exhaust manifold fasteners	• REPAIR as necessary.

engine warms. Noises are often accompanied by exhaust fumes	or gaskets • Loose heated oxygen or catalyst monitor sensor	
	• Exhaust system leak	• INSPECT the entire exhaust system for leaks. CHECK for punctures, loose or damaged clamps/fasteners, or broken welds. EXAMINE the chassis for grayish-white or black exhaust soot, which would indicate exhaust leakage at that point. To magnify a small leak, have an assistant hold a rag over the tailpipe outlet, while listening for a leak. REPAIR or INSTALL new components as necessary.
	• Catalytic converter	• MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly tap on the muffler, then the catalytic converter. Determine if there are loose or broken baffles in the muffler or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
	• Exhaust muffler/resonator drain hole enlarged due to corrosion	• **NOTE:** Check with vehicle on the ground, not on a hoist. CONFIRM drain holes are noise source. INSTALL new components as necessary.
• Hissing or rushing noise — high frequency sound. Vehicle performance is unaffected	• Exhaust system. Exhaust flow through pipes	• CHECK the exhaust system for leaks. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly tap on the muffler, then the catalytic converter. Determine if there are loose or broken baffles in the muffler or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary.
• Pinging noise — occurs when exhaust system is hot, engine turned OFF	• Catalytic converter/exhaust system	• Cool down pinging is the exhaust system expanding and contracting during heating and cooling. Condition is normal.
• Vibration — occurs at idle and at low speeds. Also	• Loose or damage exhaust isolator	• INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary.

accompanied by clunk or buzz type noise	• Loose or damaged exhaust isolator hanger brackets	• INSPECT the exhaust isolator hanger brackets for wear or damage. INSTALL or REPAIR as necessary.
	• Exhaust system grounded to chassis	• CARRY OUT the Exhaust System Alignment in this section.
• Vehicle has low or no power — vehicle performance complaint	• Exhaust pipe pinched or crushed • Damaged catalytic converter • Loose obstruction in exhaust	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to test for restricted exhaust.
	• Restricted exhaust (possible frozen condensate in muffler)	• CHECK drain holes for foreign material. PARK the vehicle inside to thaw. TEST vehicle for normal operation. If concern is still present, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Burning smell — usually occurs at idle, with possible traces of smoke	• Foreign material caught in exhaust system • Missing heat shields	• INSPECT the exhaust system for foreign material or missing heat shields. REPAIR or INSTALL new components as necessary.
• Odor — described as a sulfur or rotten egg smell	• Catalytic converter	• At times, a slight sulfur smell is normal for catalytic converters. The cause is the sulfur content in the gasoline being used. ADVISE customer, no repair required.
	• Rich fuel conditions • Misfire conditions • Excessive sulfur content in fuel	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
• Visible rust on surface of exhaust pipes	• Catalytic converter/exhaust system	• Surface rust is a characteristic of materials used on exhaust system. Exposure to heat or road salt may result in surface rust. INSPECT for perforations. If there are no perforations, condition is normal.

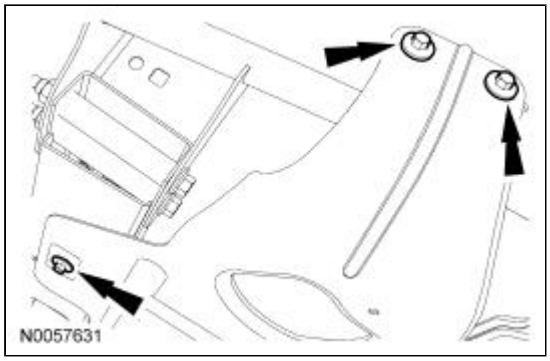
Exhaust System Alignment

Printable View (258 KB)

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** LH side shown, RH side similar.

   If equipped, remove the transfer case skid plate.



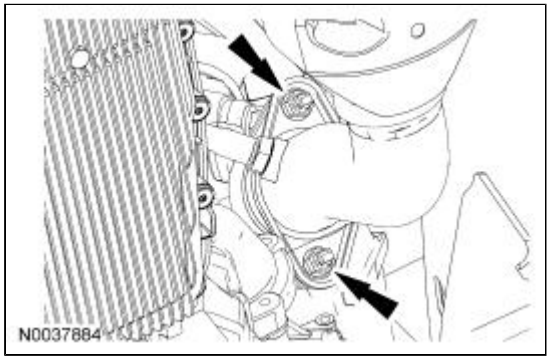
3. Loosen all exhaust component fasteners from the exhaust manifolds to the muffler inlet pipe except the RH catalytic converter-to-LH catalytic converter clamp.

4. Verify that the RH catalytic converter-to-LH catalytic converter and tailpipe clamps are secure and pipes are fully inserted.

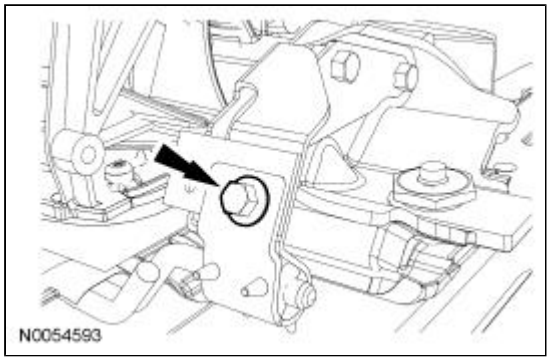
5. **NOTE:** Make sure the exhaust isolators are not torn, damaged or binding.

   Beginning at the front of the vehicle, align the exhaust system to establish the maximum clearance to surrounding components. Make sure that all slip fit pipes are pushed all the way into the preceding pipe and the notches are correctly lined up with the tabs.

6. Tighten the RH catalytic converter-to-exhaust manifold nuts in the following sequence:
   1. Tighten the RH upper catalytic converter-to-exhaust manifold nut.
      - Tighten to 40 Nm (30 lb-ft).
   2. Tighten the RH lower catalytic converter-to-exhaust manifold nut.
      - Tighten to 40 Nm (30 lb-ft).



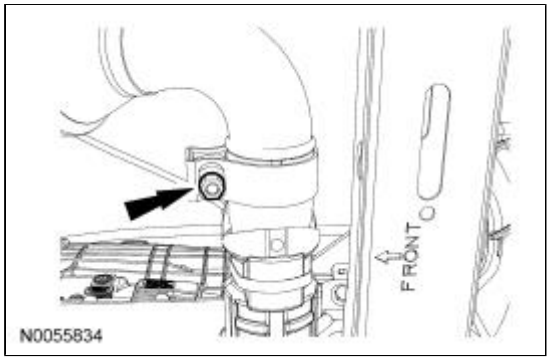
7. Tighten the exhaust and transmission mounting bracket cap bolt.
   - Tighten to 35 Nm (26 lb-ft).



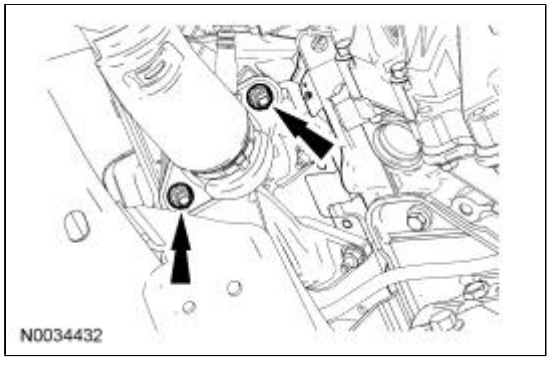
8. **NOTE:** A new RH catalytic converter-to-LH catalytic converter clamp must be installed whenever the clamp is loosened.

   NOTE: Make sure the new RH catalytic converter-to-LH catalytic converter clamp is positioned with the clamp bolt facing the front of the vehicle.

   If loosened, tighten the RH catalytic converter-to-LH catalytic converter clamp.
   - Tighten to 55 Nm (41 lb-ft).



9. Tighten the LH catalytic converter-to-exhaust manifold nuts in the following sequence:
   1. Snug the LH inner catalytic converter-to-exhaust manifold nut.
   2. Tighten the LH outer catalytic converter-to-exhaust manifold nut.
      - Tighten to 40 Nm (30 lb-ft).
   3. Tighten the LH inner catalytic converter-to-exhaust manifold nut.
      - Tighten to 40 Nm (30 lb-ft).



10. Tighten the exhaust Y-pipe dual catalytic converter-to-muffler assembly bolts in the following sequence:
    1. Snug the outer exhaust Y-pipe dual catalytic converter-to-muffler assembly bolt.
    2. Tighten the inner exhaust Y-pipe dual catalytic converter-to-muffler assembly bolt.
       - Tighten to 48 Nm (35 lb-ft).
    3. Tighten the outer exhaust Y-pipe dual catalytic converter-to-muffler assembly bolt.
       - Tighten to 48 Nm (35 lb-ft).

11. Start the engine and check the exhaust system for leaks.

12. **NOTE:** LH side shown, RH side similar.

    If equipped, install the transfer case skid plate.
    - Tighten to 25 Nm (18 lb-ft).

Exhaust Y-Pipe — Dual Catalytic Converter

Printable View (420 KB)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A

Removal

CAUTION: Do not use oil or grease-based lubricants on isolators as they deteriorate the rubber.

NOTE: The exhaust Y-pipe dual catalytic converter is a 2-piece assembly. The RH and LH converters can be serviced separately as needed.

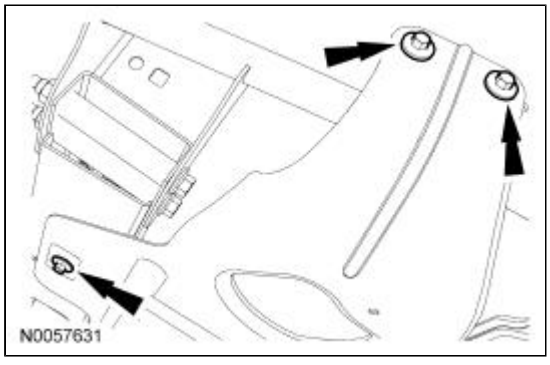
All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

Four wheel drive (4WD) vehicles

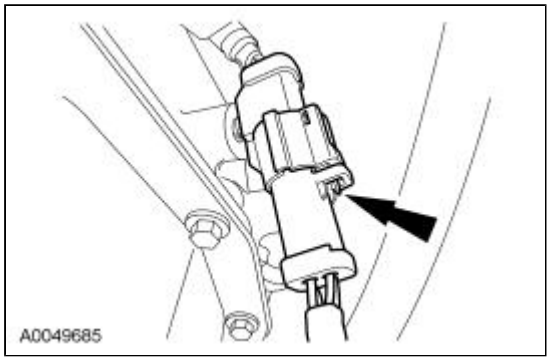
2. **NOTE:** LH side shown, RH side similar.

   If equipped, remove the transfer case skid plate.



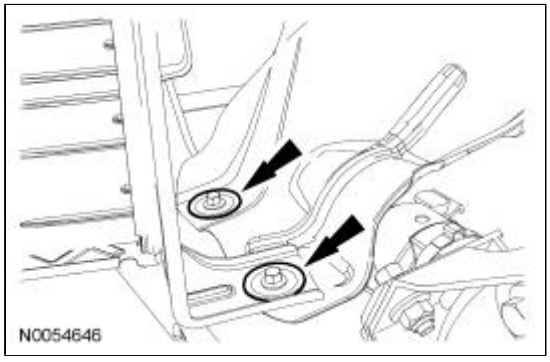
All vehicles

3. Disconnect the heated oxygen and catalyst monitor sensors electrical connectors.

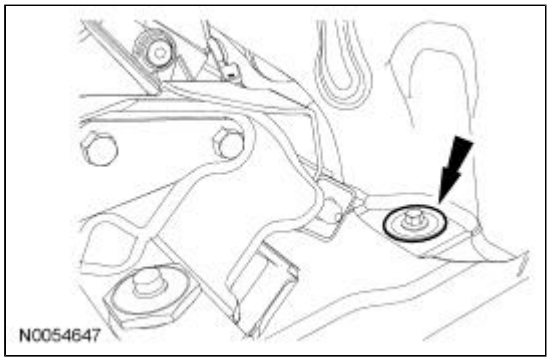


4. Using a suitable jack, support the transmission.

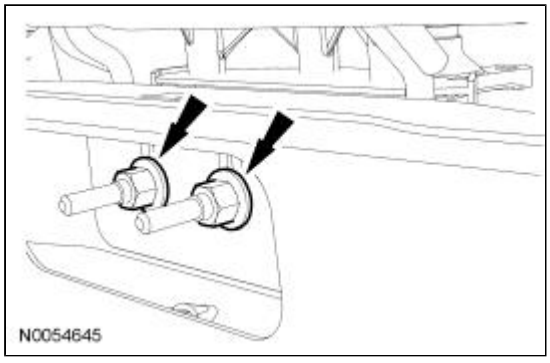
5. Remove the LH heat shield bolt and LH heat shield and evaporative emissions (EVAP) canister assembly bolt.



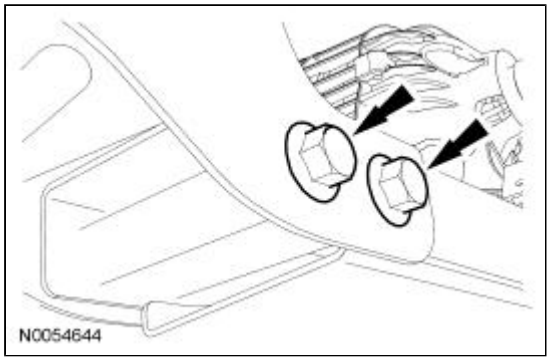
6. Remove the RH heat shield bolt.



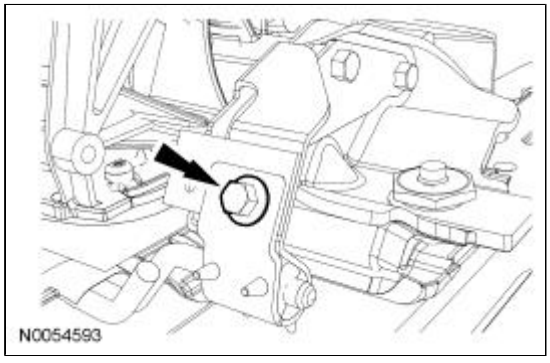
7. Remove the transmission mount nuts.



8. Remove the 4 crossmember bolts and the crossmember.

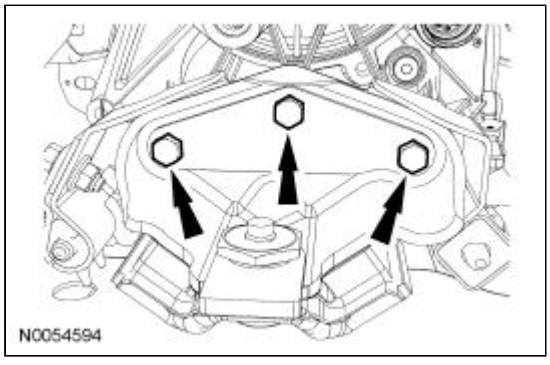


9. Loosen the exhaust and transmission mounting bracket cap bolt.



Rear wheel drive (RWD) vehicles

10. Remove the 3 bolts and then slide off the exhaust and transmission mounting bracket from the exhaust Y-pipe dual catalytic converter.

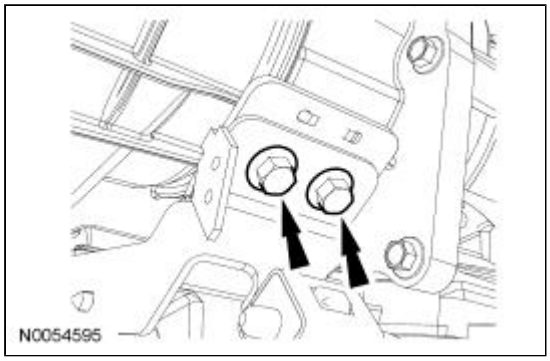


4WD vehicles

11. **NOTE:** On 4WD vehicles, the exhaust and transmission mounting bracket will not slide off the exhaust Y-pipe dual catalytic converter until the exhaust Y-pipe dual catalytic converter is removed from the vehicle.

    NOTE: RH side shown, LH side similar.

    Remove the 4 bolts from the exhaust and transmission mounting bracket.

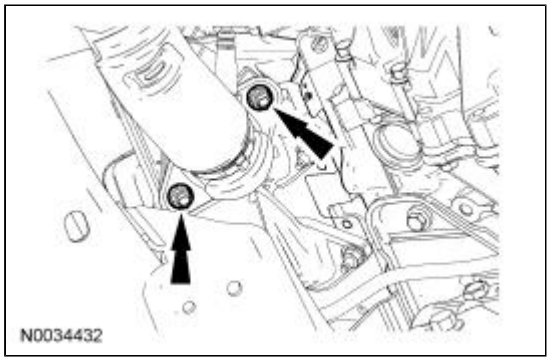


All vehicles

12. Remove the exhaust Y-pipe dual catalytic converter-to-muffler assembly bolts.

13. **NOTE:** LH catalytic converter-to-exhaust manifold nuts shown, RH similar.

    Remove and discard the exhaust Y-pipe dual catalytic converter-to-exhaust manifold nuts.



14. **NOTE:** Use caution removing the exhaust Y-pipe dual catalytic converter. Make sure not to damage the manifold outlet flare, the converter inlet flare or the studs.

    Remove the exhaust Y-pipe dual catalytic converter from the vehicle.

4WD vehicles

15. If necessary, remove the exhaust and transmission mounting bracket from the exhaust Y-pipe dual catalytic converter.

All vehicles

16. **NOTE:** A new RH catalytic converter-to-LH catalytic converter clamp must be installed whenever the clamp is loosened.

    If necessary, loosen the RH catalytic converter-to-LH catalytic converter clamp.

17. If necessary, separate the RH catalytic converter from the LH catalytic converter.

18. If the RH catalytic converter-to-LH catalytic converter clamp is loosened, grind the spot weld and remove the RH catalytic converter-to-LH catalytic converter clamp. Clean the uneven surface area.

Installation

All vehicles

CAUTION: Do not tighten the fasteners until all components are assembled and aligned, making sure to tighten all fasteners beginning at the front of the vehicle. For additional information, refer to Exhaust System Alignment in this section.

NOTE: Clean the mating surfaces of the exhaust manifold outlet flare and the exhaust Y-pipe dual catalytic converter inlet flares.

Also clean the mating surfaces of the exhaust Y-pipe dual catalytic converter-to-muffler assembly.

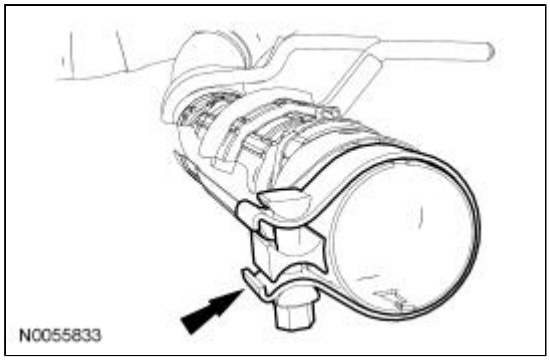
Make sure not to damage the exhaust manifold outlet flares, the exhaust Y-pipe-dual catalytic converter inlet flares or the studs.

NOTE: Always install new fasteners and RH catalytic converter-to-LH catalytic converter clamp.

1. **NOTE:** Make sure to apply anti-seize lubricant to the threads of the sensors before installation.

   If removed, install the heated oxygen and the catalyst monitor sensors.
   - Tighten to 40 Nm (30 lb-ft).

2. If necessary, position a new RH catalytic converter-to-LH catalytic converter clamp with the clamp bolt facing the front of the vehicle.



3. If separated, install RH catalytic converter to the LH catalytic converter.

4WD vehicles

4. If removed, install the exhaust and transmission mounting bracket to the exhaust Y-pipe dual catalytic converter.

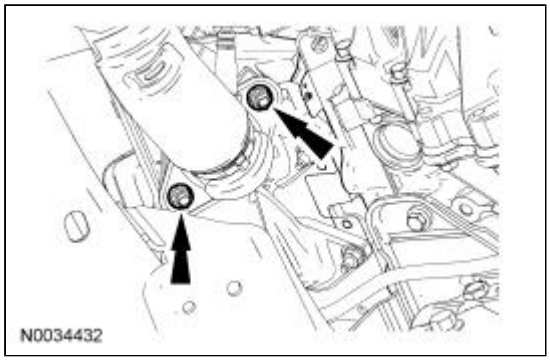
All vehicles

5. **NOTE:** Use caution installing the Y-pipe dual catalytic converter. Make sure not to damage the manifold outlet flare, the converter inlet flare or the studs.

   Position the exhaust Y-pipe dual catalytic converter into the vehicle.

6. **NOTE:** LH catalytic converter-to-exhaust manifold nuts shown, RH similar.

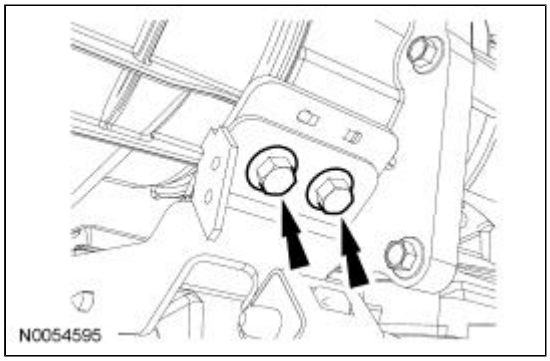
   Loosely install the exhaust Y-pipe dual catalytic converter-to-exhaust manifold nuts.



4WD vehicles

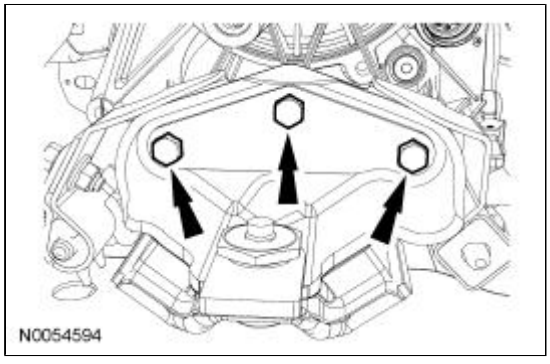
7. **NOTE:** RH side shown, LH side similar.

   Install the 4 exhaust and transmission mounting bracket-to-transmission bolts.
   - Tighten to 90 Nm (66 lb-ft).



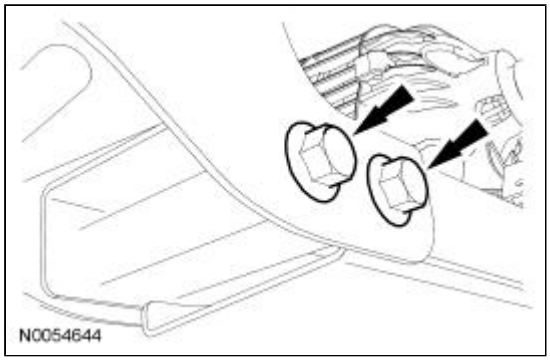
RWD vehicles

8. Slide on the exhaust and transmission mounting bracket to the exhaust Y-pipe dual catalytic converter and install the 3 exhaust and transmission mounting bracket-to-transmission bolts.
   - Tighten to 90 Nm (66 lb-ft).

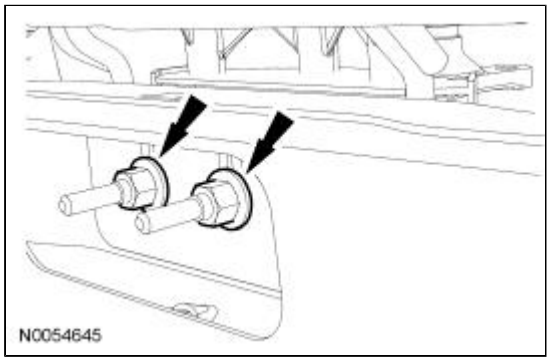


All vehicles

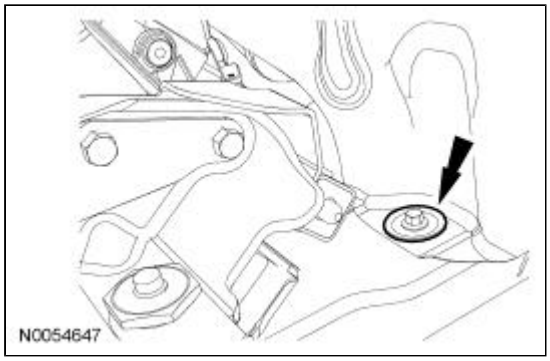
9. Install the 4 crossmember bolts and the crossmember.
   - Tighten to 90 Nm (66 lb-ft).



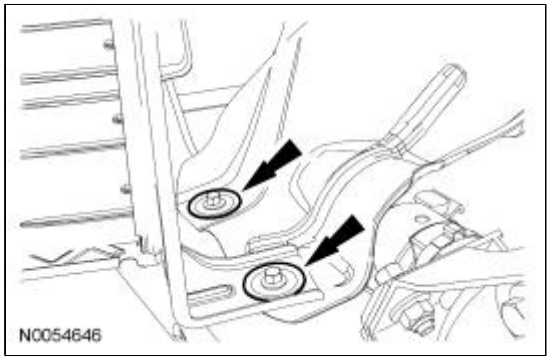
10. Install the exhaust and transmission mounting bracket nuts.
    - Tighten to 103 Nm (76 lb-ft)



11. Install the RH heat shield bolt.
    - Tighten to 20 Nm (15 lb-ft).

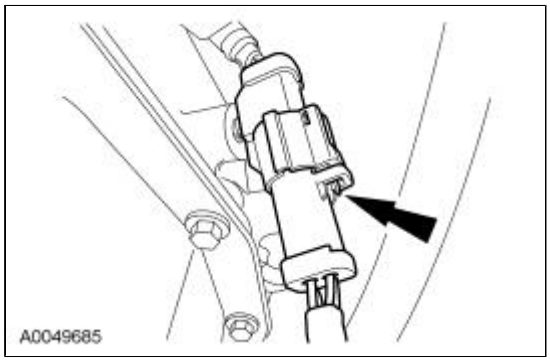


12. Install the LH heat shield bolt and LH heat shield and evaporative emissions (EVAP) canister assembly bolt.
    - Tighten to 20 Nm (15 lb-ft).



13. Loosely install the exhaust Y-pipe dual catalytic converter-to-muffler assembly bolts.

14. Connect the heated oxygen and catalyst monitor sensor electrical connectors.

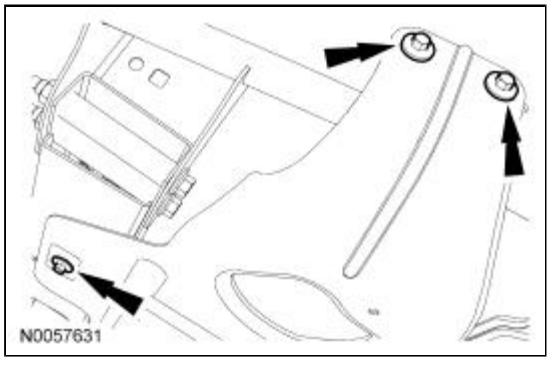


15. Align the exhaust system. For additional information, refer to Exhaust System Alignment in this section.

4WD vehicles

16. **NOTE:** LH side shown, RH side similar.

    If equipped, install the transfer case skid plate.
    - Tighten to 25 Nm (18 lb-ft).



Muffler and Tailpipe

Printable View (153 KB)

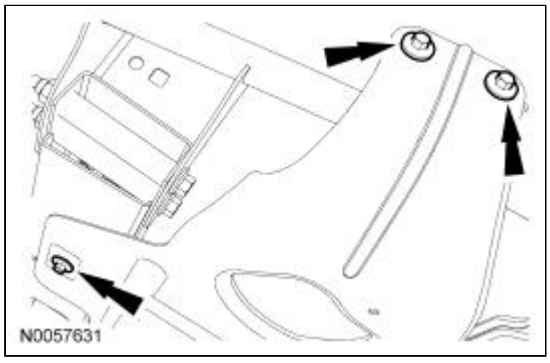
Removal

CAUTION: Do not use oil or grease-based lubricants on isolators as they deteriorate the rubber.

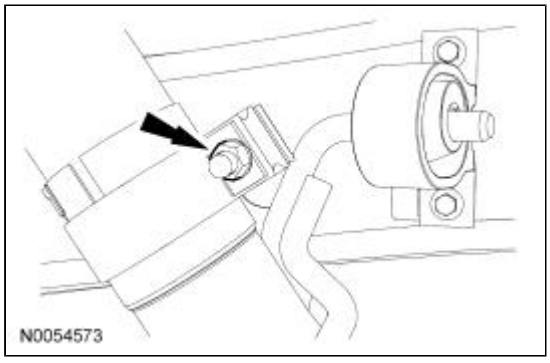
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** LH side shown, RH side similar.

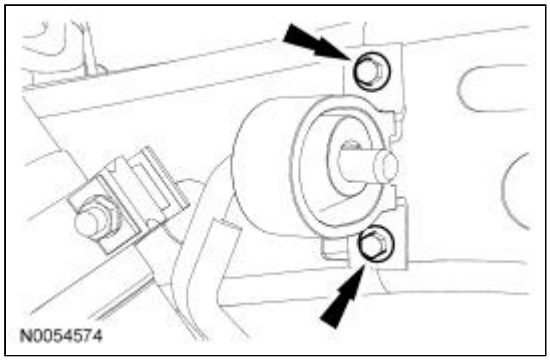
   If equipped, remove the transfer case skid plate.



3. Loosen the tailpipe or resonator-to-muffler assembly clamp.



4. Remove the isolator and bracket assembly bolts and remove:
   - the tailpipe for Expedition models.
   - the resonator for Navigator models.



5. Using a suitable jack stand, support the muffler.

6. Remove and discard the exhaust Y-pipe dual catalytic converter-to-muffler assembly bolts and flag nuts.

7. **CAUTION: Make sure not to make contact with the axle boots while routing the muffler assembly outlet over the rear axle or damage to the boots may result.**

   Detach the isolators from the muffler assembly and remove from the vehicle

Installation

1. **NOTE:** Clean the mating surfaces of the exhaust Y-pipe dual catalytic converter-to-muffler assembly.

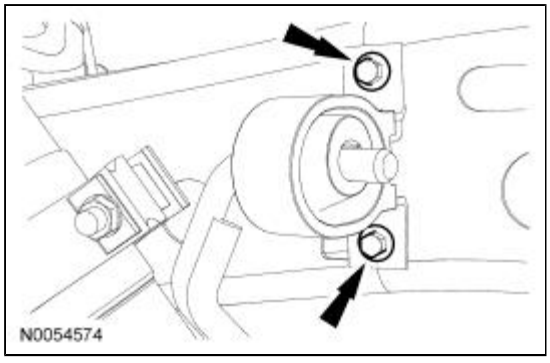
   NOTE: Check the exhaust hanger isolators for wear or damage, install new isolators, if necessary.

   Install the muffler assembly into the vehicle and attach the isolators.

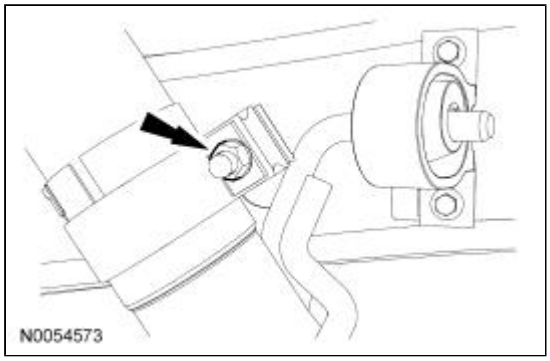
2. **NOTE:** Always install new fasteners.

   Loosely install the exhaust Y-pipe dual catalytic converter-to-muffler assembly bolts and flag nuts.

3. Install the tailpipe for Expedition models or the resonator for Navigator models and install the isolator and bracket assembly bolts.
   - Tighten to 25 Nm (18 lb-ft).



4. Tighten the tailpipe or resonator-to-muffler assembly clamp.
   - Tighten to 48 Nm (35 lb-ft).



5. Align the exhaust system. For additional information, refer to Exhaust System Alignment in this section.

6. **NOTE:** LH side shown, RH side similar.

   If equipped, install the transfer case skid plate.
   - Tighten to 25 Nm (18 lb-ft).

Special Tool(s)

ST1371-A	Fuel Pressure Gauge 310-012 (T80L-9974-B)

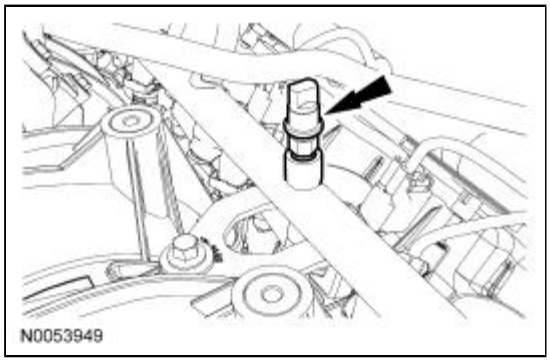
WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing a fire hazard. Failure to follow these instructions may result in personal injury.

WARNING: This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Remove the Schrader valve cap and attach the pressure gauge.



3. **NOTE:** Open manual valve slowly to relieve the system pressure. This may drain fuel from the fuel system. Place fuel in a suitable container.

   Open the manual valve on the pressure gauge and relieve the fuel pressure.

WARNING: This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard. Failure to follow these instructions may result in personal injury.

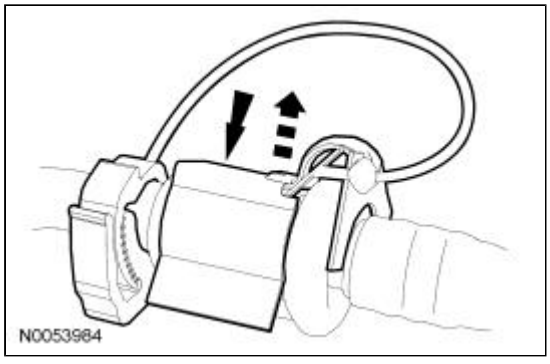
CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air

to remove any foreign material from the connector retaining clip area before separating from the tube. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

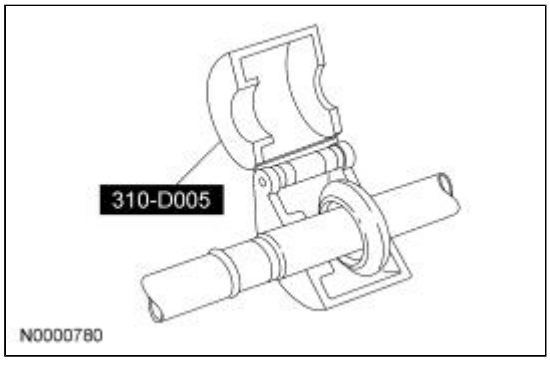
CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

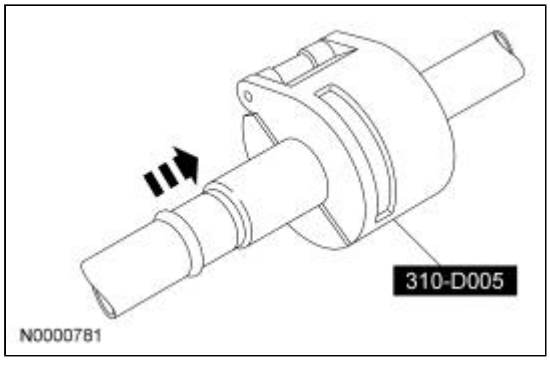
2. Remove the fuel tube safety clip.



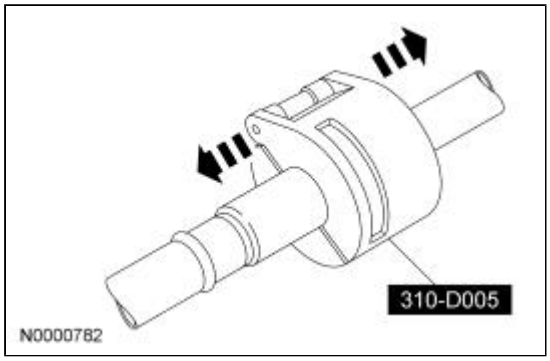
3. Install the special tool.



4. Close and push the special tool into the open side of the cage.



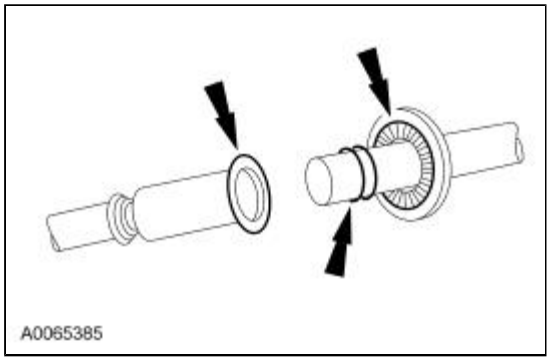
5. Separate the spring lock coupling.



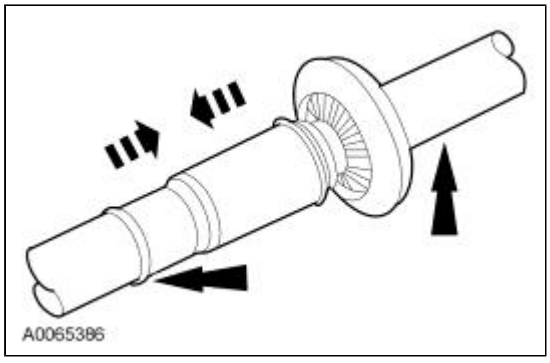
Connect

CAUTION: Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

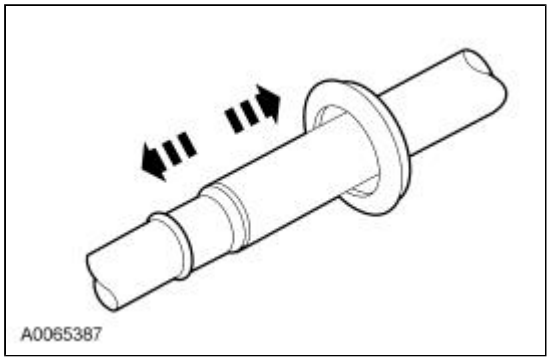
1. Inspect and clean both spring lock coupling ends. Install new O-ring seals and garter springs if necessary.
    - Lubricate the O-ring seals with clean engine oil.



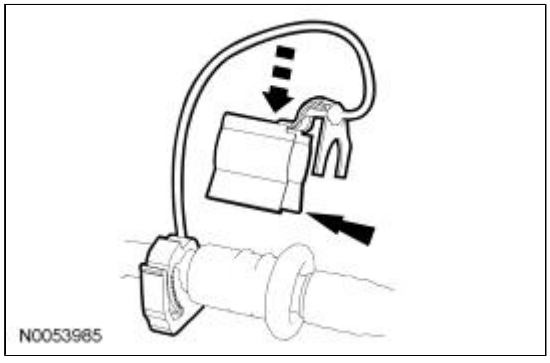
2. Fit the male fitting into the female end and push until the garter spring snaps over the flared end of the female end.



3. Make sure the spring lock coupling is engaged by pulling on the lines.



4. Install the fuel tube safety clip.



Disconnect — Type II

WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before repairing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, which can cause a fire hazard. Failure to follow these instructions may result in personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

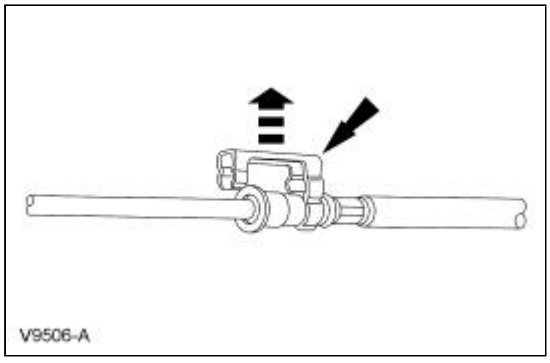
WARNING: This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always cap off any open orifices or tubes.

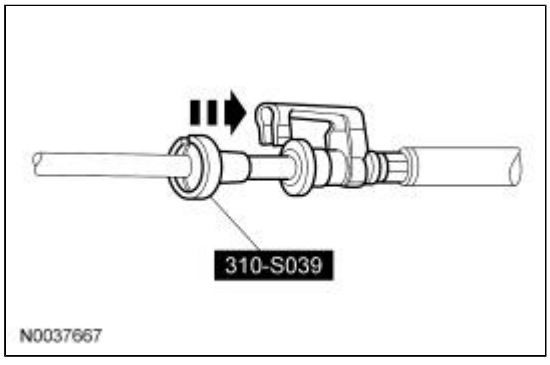
CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

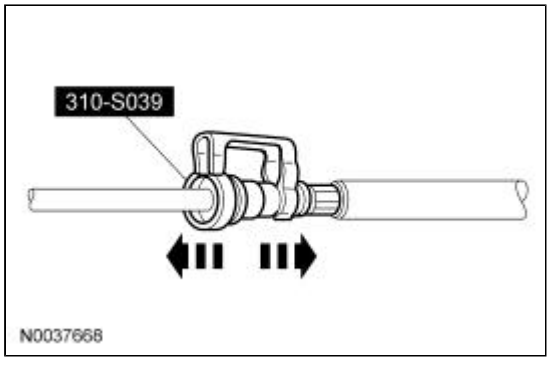
2. Disconnect the safety clip from the male hose.



3. Install the special tool and press it into the spring lock coupling.



4. Separate the spring lock coupling.



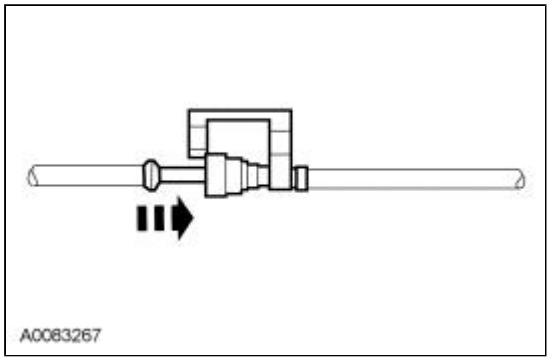
Connect — Type II

1. Inspect and clean both spring lock coupling ends.

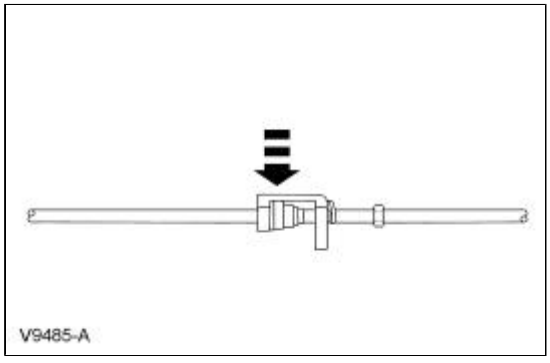
2. **CAUTION: Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.**

   NOTE: Lubricate the tube end with clean engine oil to ease assembly.

   Align the fuel tubes spring lock coupling and push together until a click is heard.



3. Pull on the spring lock coupling to make sure it is fully engaged, then install the safety clip.



Quick Connect Coupling

Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Disconnect — Type I

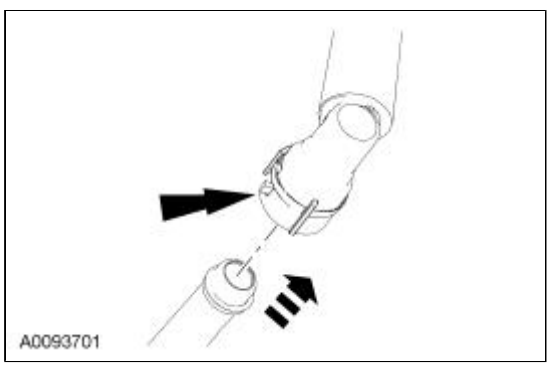
WARNING: Do not smoke, carry lighted tobacco or have open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.

1. Disconnect the quick connect coupling.
   - Push the connector toward the tube to release pressure.
   - Push the release tab clockwise.
   - Disconnect the quick connect coupling.

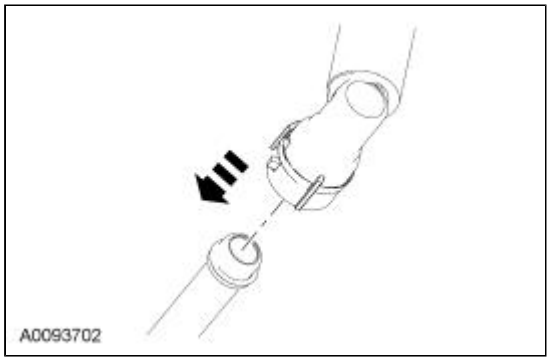


Connect — Type I

CAUTION: Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

1. **NOTE:** Apply clean engine oil to the end of the tube or fitting before connecting.

   Connect the quick connect coupling.



Disconnect — Type II

WARNING: The evaporative emissions system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions may result in personal injury.

WARNING: Do not smoke, carry lighted tobacco or have open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

WARNING: This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard. Failure to follow these instructions may result in personal injury.

CAUTION: If the liquid or vapor tube is damaged (torn, holes or delaminated), a new tube assembly must be installed. Do not use aftermarket sleeving. Do not re-adhere loose sleeving material.

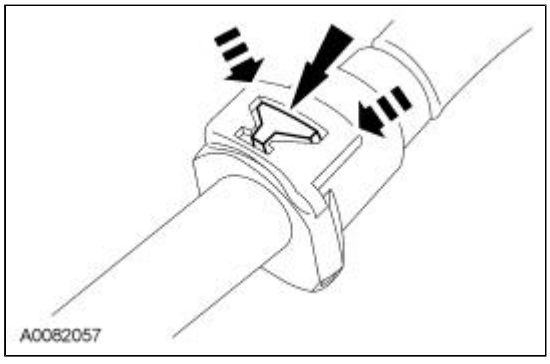
CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.

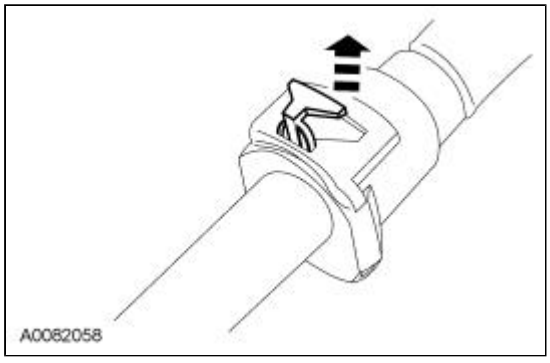
CAUTION: Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

1. If servicing a liquid fuel tube, release the fuel system pressure. For additional information refer to Fuel System Pressure Release in this section.

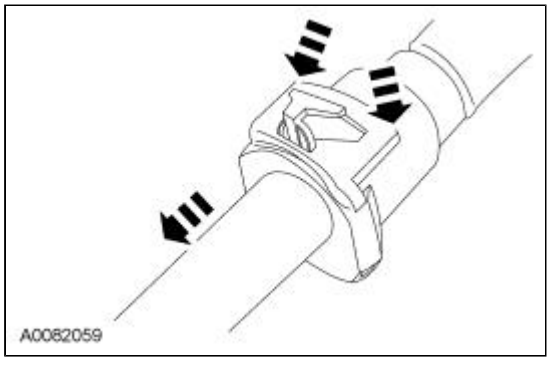
2. Press the tab corners to release the locking tab.



3. Pull the locking tab to the release position.



4. Disconnect the quick connect coupling.
   - Push the fitting toward the tube to release pressure.
   - Press the tab corners to release the fitting.
   - Disconnect the quick connect fitting.

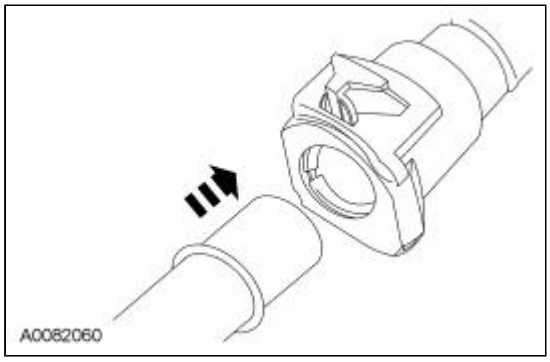


Connect — Type II

CAUTION: Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.

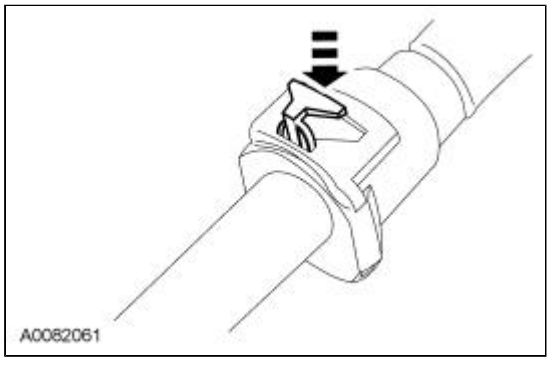
1. **NOTE:** Apply clean engine oil to the end of the tube or fitting before connecting.

   Connect the tube into the quick connect coupling.



2. **CAUTION: Make sure the quick connect fitting clicks into place when installing the tube. To make sure that the quick connect fitting is fully seated, pull on the fitting.**

   Press the locking tab down into the locked position.



Disconnect — Type III

WARNING: The evaporative emissions system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions may result in personal injury.

WARNING: Do not smoke or carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Do not carry personal electronic devices such as a cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is

not running. Before repairing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard. Failure to follow these instructions may result in personal injury.

WARNING: This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

CAUTION: If the liquid or vapor tube is damaged (torn, holes or delaminated), a new tube assembly must be installed. Do not use aftermarket sleeving. Do not re-adhere loose sleeving material.

CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

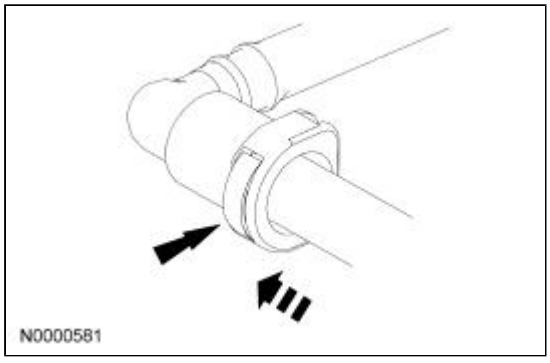
CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is, therefore, essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.

CAUTION: Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

1. If servicing a liquid fuel tube, release the fuel system pressure. For additional information refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Disconnect the fuel tube quick connect coupling.
   - Press the fuel tube quick connect coupling button and pull the fuel tube to disconnect.

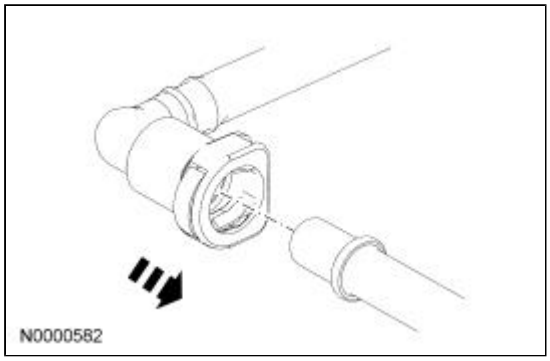


Connect — Type III

1. **CAUTION: Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.**

   NOTE: Apply clean engine oil to O-ring seals.

   Install the quick connect coupling onto the tube until it is fully seated.



Disconnect — Type IV

WARNING: The evaporative emissions system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions may result in personal injury.

WARNING: Do not smoke, or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before repairing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard. Failure to follow these instructions may result in personal injury.

WARNING: This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

CAUTION: If the liquid or vapor tube is damaged (torn, holes or delaminated), a new tube assembly must be installed. Do not use aftermarket sleeving. Do not re-adhere loose sleeving material.

CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

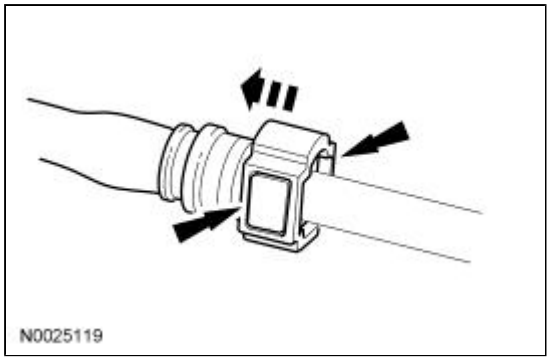
CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.

CAUTION: Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.

1. If servicing a liquid fuel tube, release the fuel system pressure. For additional information refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Disconnect the fuel tube quick connect coupling.
   - Press the 2 fuel tube quick connect coupling buttons and pull the fuel tube to disconnect.



Connect — Type IV

1. **CAUTION: Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.**

   NOTE: Apply clean engine oil to O-ring seals.

   Install the quick connect coupling onto the tube until it is fully seated.

Fuel Tank and Lines

Printable View (63 KB)

The fuel system consists of:

- the fuel tank assembly.
- the fuel tank filler pipe, which contains a restrictor plate to permit only unleaded fuel to be pumped into the fuel tank.
- a 1/4 turn type fuel tank filler cap.
- a fuel filter to protect the fuel injectors located on the fuel tank assembly.
- fuel tube.
- fuel rail pressure and temperature sensor, located on the fuel rail.
- a fuel pump containing:
  - the electric fuel pump, which provides pressurized fuel to the engine.
  - the fuel level sensor.
  - an inlet filter.
  - a check valve which maintains system pressure after the pump is shut off.
  - a pressure relief valve for overpressure protection in the event of restricted flow.

The fuel pump is controlled by the powertrain control module (PCM). Electrical power to the pump is provided through the inertia fuel shutoff (IFS) switch.

Removal and Installation

All fuel tanks

WARNING: Do not smoke, carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel tubes or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel which can cause a fire hazard. Failure to follow these instructions may result in personal injury.

CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.

CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the fuel system pressure. For additional information, refer to Section 310-00 .

3. Drain the fuel tank. For additional information, refer to Section 310-00 .

106L (28 gal) fuel tank

4. If equipped, remove the 4 nuts and the fuel tank skid plate.
   - To install, tighten to 20 Nm (15 lb-ft).

127L (33.5 gal) fuel tank

5. If equipped, remove the 5 nuts and the fuel tank skid plate.
   - To install, tighten to 20 Nm (15 lb-ft).

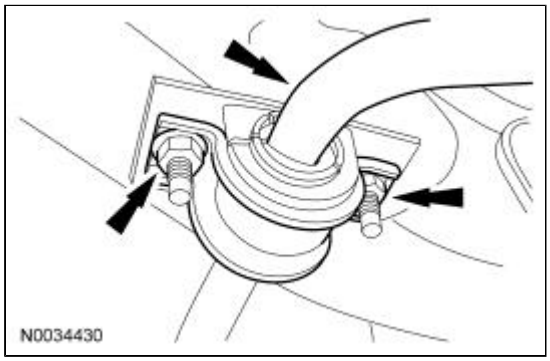
All fuel tanks

6. Disconnect the fuel tank filler pipe vapor tube from the evaporative emissions (EVAP) canister fresh air tube, and the fuel tank filler pipe vent tube-to-fuel tank pressure sensor and vapor tube assembly quick connect coupling in the rear of the fuel tank. For additional information, refer to Section 310-00 .

7. Disconnect the fuel filter outlet tube-to-fuel tube spring lock coupling, EVAP canister fresh air tube-to-dust separator quick connect coupling and the fuel tank pressure sensor and vapor tube assembly-to-EVAP canister quick connect coupling in the front of the fuel tank. For additional

information, refer to Section 310-00 .

8. Remove the sway bar bracket nuts and let the sway bar hang down.
    - To install, tighten to 48 Nm (35 lb-ft).



9. **CAUTION: Do not support the fuel tank directly beneath the fuel pump mounting area. Damage to the fuel pump assembly can occur.**

    Position a suitable jack under the fuel tank.

127L (33.5 gal) fuel tank

10. Remove the center fuel tank support strap bolt.
    - To install, tighten to 40 Nm (30 lb-ft).

All fuel tanks

11. Remove the 2 bolts from the front and rear fuel tank support straps.
    - To install, tighten to 40 Nm (30 lb-ft).

12. Remove the front fuel tank support strap.

127L (33.5 gal) fuel tanks

13. **NOTE:** To assist in removing the center fuel tank support strap, you may have to push up slightly on the front of the tank to get the center fuel tank support strap to clear the fuel tank.

    Lower the fuel tank slightly and rotate the center fuel tank support strap aside.

All fuel tanks

14. Rotate the rear fuel tank support strap aside.

15. Lower the fuel tank slightly. Disconnect the fuel pump module and fuel tank pressure sensor electrical connectors.

16. Remove the fuel tank from the vehicle.

127L (33.5 gal) fuel tanks

17. If installing a new center fuel tank support strap, remove the center fuel tank support strap from the vehicle.

All fuel tanks

18. If installing a new rear fuel tank support strap, remove the rear fuel tank support strap from the vehicle.

19. To install, reverse the removal procedure.

Fuel Tank Filler Pipe

Printable View (110 KB)

Removal and Installation

Failure to follow these instructions may result in personal injury.

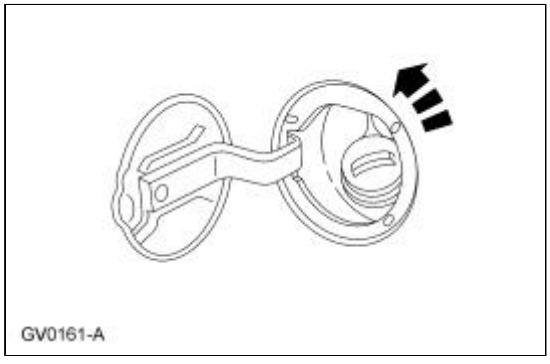
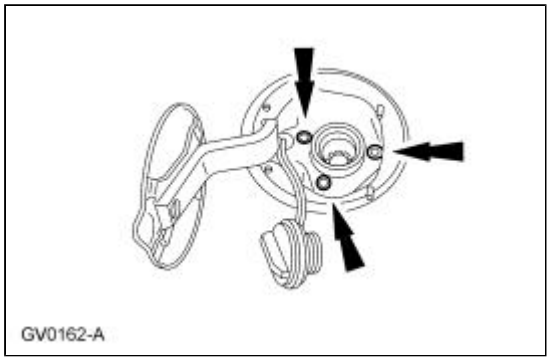
CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.

CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the fuel tank filler cap.



4. Remove the 3 fuel tank filler pipe-to-body screws.



5. Disconnect the fuel tank filler pipe vent tube-to-fuel tank pressure sensor and vapor tube assembly quick connect coupling.

6. Disconnect the fuel tank filler pipe vapor tube from the evaporative emissions (EVAP) canister fresh air tube.

7. Loosen the hose clamp and disconnect the fuel tank filler pipe hose-to-fuel tank.

8. Remove the 2 fuel tank filler pipe support brackets-to-frame bolts.
    - To install, tighten to 15 Nm (11 lb-ft).

9. Remove the fuel tank filler pipe assembly.

10. To install, reverse the removal procedure.

Fuel Pump Module

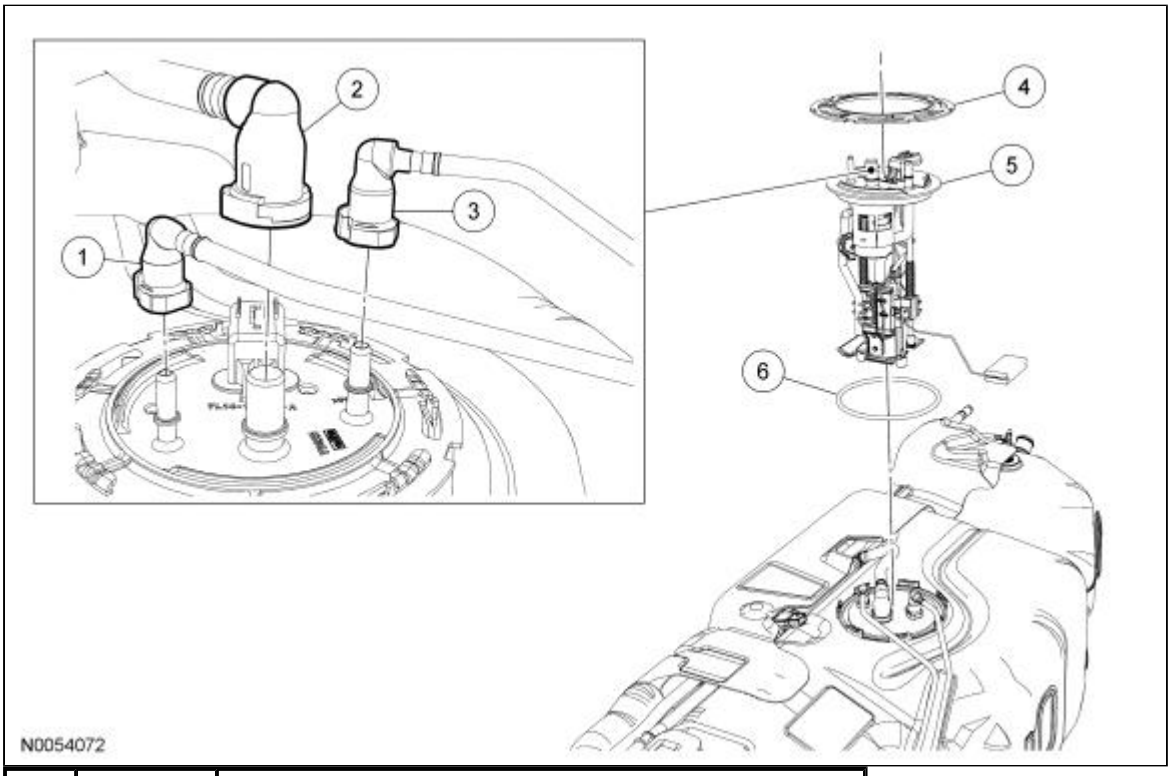
ST2803-A	Wrench, Fuel Tank Sender Unit 310-123

NOTE: 106L (28 gal) fuel tank shown, 127L (33.5 gal) fuel tank similar.



Item	Part Number	Description
1	—	Return fuel tube-to-fuel pump module quick connect coupling (part of 9J337)
2	—	Fuel tank pressure sensor and vapor tube assembly-to-fuel pump module quick connect coupling (part of 9G271)
3	—	Supply fuel tube-to-fuel pump module quick connect coupling (part of 9J337)
4	9C385	Fuel pump module locking ring
5	9H307	Fuel pump module
6	9276	Fuel pump module O-ring seal

Removal and Installation

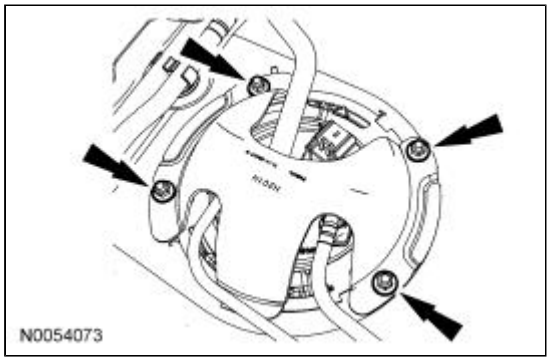
WARNING: Do not smoke, carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

All fuel tanks

1. Remove the fuel tank. For additional information, refer to Fuel Tank in this section.

127L (33.5 gal) fuel tank

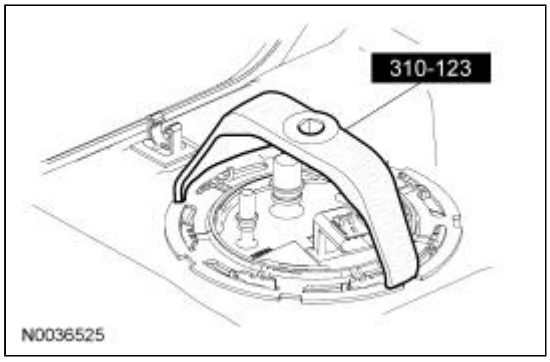
2. Remove the nuts and the fuel pump module cover.



All fuel tanks

3. Disconnect the return fuel tube-to-fuel pump module quick connect coupling, the fuel tank pressure sensor and vapor tube assembly-to-fuel pump module quick connect coupling and the supply fuel tube-to-fuel pump module quick connect coupling.

4. Using the special tool, remove the fuel pump lock ring.



5. **CAUTION: Note the location of the fuel pump alignment tabs.**

   CAUTION: Carefully remove the fuel pump assembly to avoid damaging the fuel level sensor.

   Remove the fuel pump module assembly.
   - Remove and discard the O-ring seal.

6. To install, reverse the removal procedure.

Failure to follow these instructions may result in personal injury.

CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.

CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Disconnect the fuel filter outlet tube spring lock coupling. For additional information, refer to Section 310-00 .
4. Disconnect the return fuel tube-to-fuel filter inlet tube quick connect coupling and supply fuel tube-to-fuel filter inlet tube quick connect coupling. For additional information, refer to Section 310-00 .

106L (28 gal) fuel tank

5. Loosen the worm gear clamp and remove the fuel filter.

127L (33.5 gal) fuel tank

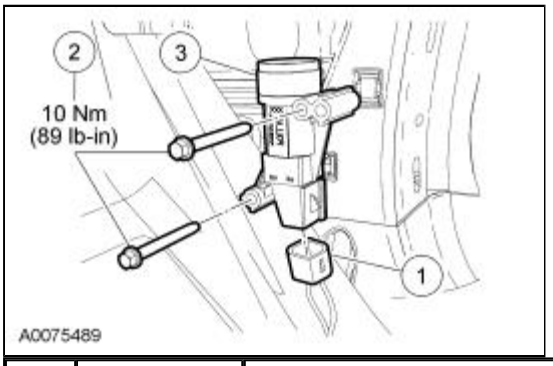
6. Remove the fuel filter from the fuel filter bracket.

All fuel tanks

7. To install, reverse the removal procedure.

Inertia Fuel Shutoff (IFS) Switch

Printable View (92 KB)



Item	Part Number	Description
1	—	Inertia fuel shutoff (IFS) switch electrical connector (part of 14405)
2	W5041483	IFS bolts (2 required)
3	9341	IFS switch

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the LH rear interior quarter trim panel. For additional information, refer to Section 501-05 .
3. Disconnect the inertia fuel shutoff (IFS) switch electrical connector.
4. Remove the 2 bolts and the IFS switch.
   - To install, tighten to 10 Nm (89 lb-in).
5. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft
Fixed accelerator pedal bolts	25	18
Adjustable accelerator pedal bolts	12	9

Acceleration Control

Printable View (63 KB)

The throttle is controlled by an accelerator pedal position sensor on the accelerator pedal assembly. The accelerator pedal should travel smoothly from the idle position to the wide open throttle position. Hesitation or binding should not be experienced at any portion of the accelerator pedal travel. Surrounding components such as wiring, sound insulator and floor carpet must not contact or interfere with the accelerator pedal.

Some vehicles are equipped with adjustable pedals. This allows both the accelerator and brake pedals to be adjusted simultaneously forward or rearward. A rocker switch on the instrument panel provides adjustment on the pedal's assembly when it is activated. On vehicles with the memory seat option, the pedal's position can be controlled by the memory selection, as well as the rocker switch. The adjustable accelerator pedal can be serviced separately from the adjuster. The components in the acceleration control system are not adjustable and new components must be installed if damaged or worn.

Acceleration Control

Printable View (62 KB)

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Description	Nm	lb-in
Speed control switch screws	7	62

Speed Control

Printable View (62 KB)

The vehicle speed control system consists of the following components:

- Speed control switches
- Speed control deactivator switch (part of the stoplamp switch)
- Stoplamp switch
- Speed control indicator
- Powertrain control module (PCM)
- Electronic controlled throttle body (ECT)
- Clockspring

Speed Control

Printable View (220 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2574-A	Flex Probe Kit 105-R025C or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The speed control system is controlled by the powertrain control module (PCM). The speed control system is designed to maintain a selected vehicle speed between 48 and 200 km/h (30 and 124 mph). The speed control system is controlled by the steering wheel mounted switch(es) (ON, OFF, SET+ [ACCEL], SET- [COAST], RESUME), the stoplamp switch and the speed control deactivator switch (part of the stoplamp switch). The steering wheel mounted switch(es) are hardwired to the PCM through the clockspring.

The speed control functions include:

- Turning on the speed control system
- Setting and maintaining the desired vehicle speed
- Accelerating the vehicle speed
- Decelerating the vehicle speed
- Turning the vehicle speed control system off
- Canceling the speed control

Pressing and releasing the ON switch turns the speed control system on. Pressing and releasing the SET+ or SET- switch while the vehicle is traveling at the desired speed activates the speed control system.

Tapping the SET+ or the SET- switch while in the set mode respectively, increases or decreases the maintained vehicle speed by 1.6 km/h (1 mph) per tap. If the respective button is pressed and held, the vehicle speed continues to accelerate or decelerate until the button is released.

Pressing and releasing the OFF switch, or switching the ignition switch to the OFF position, turns the

speed control system off. Applying the brake pedal puts the speed control system into the STANDBY mode. Pressing the RESUME button, when the speed control system is in the STANDBY mode causes the vehicle to accelerate to the last set speed. Resume does not function if the OFF button is pressed, the ignition switch is in the OFF position, or if the current vehicle speed is below the minimum operational speed.

The clockspring provides the electrical interface between the steering column wiring and the speed control switches in the steering wheel.

The speed control deactivator switch (part of the stoplamp switch) is provided as an additional safety feature. When the brake pedal is applied, the speed control deactivator switch opens and removes the voltage signal from the PCM input circuit, deactivating the speed control system.

Whenever the speed control system is engaged and active, a speed control icon on the instrument cluster is illuminated.

The inputs to the PCM are:

- Transmission output shaft speed (OSS) sensor
- Digital transmission range (TR) sensor
- Speed control switch(es)
- Stoplamp switch
- Speed control deactivator switch (part of stoplamp switch)
- Accelerator pedal position (APP) sensor

The outputs of the PCM for the speed control system are:

- Speed control indicator lamp
- Throttle command

The speed control system throttle position is completely controlled by the PCM through the electronically controlled throttle body. Speed control electronics are contained entirely within the PCM.

When the speed control system is active, the PCM corrects for deviations in the actual vehicle speed by proportionally moving the throttle plate. The PCM modulates the throttle to minimize error between the actual vehicle speed and the desired speed.

The PCM strategy uses the throttle control for smooth accelerations.

The PCM sends a message over the controller area network (CAN) to the instrument cluster whenever the speed control telltale should be turned on or off.

In the event of an off command or a deactivation request from any source, the speed control system carries out a deactivation and immediately returns the throttle to the idle position.

The speed control system provides self-diagnostics. Speed control is disabled anytime an error is detected in the system. No cluster telltale or message center messages are displayed when faults occur. DTCs are logged by the PCM.

An electronically controlled throttle system fault also causes the speed control system to be disabled and the malfunction indicator lamp (MIL) illuminates, or a message center message is displayed.

Additionally, the following conditions cause the speed control system to deactivate:

- Transmission gear selector in a position other than D or OD.
- Speed control set speed is over-ridden with the accelerator pedal for a period longer than 5 minutes.

- Vehicle speed loss from set speed of greater than 16 km/h (10 mph) occurs.
- Vehicle speed falls below the minimum allowable limit of 48 km/h (30 mph).
- Speed control is pressed or stuck longer than 2 minutes.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Throttle body	• Battery junction box (BJB) fuse 74 (20A) • Circuitry • Stoplamp switch • Speed control deactivator switch (integral to the stoplamp switch) • Powertrain control module (PCM) • Speed control switches

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. Verify the speedometer operates correctly without speed control by test driving the vehicle. If the speedometer does not operate correctly, refer to Section 413-01 .

5. Verify the parking brake warning indicator operates correctly. If the parking brake warning indicator does not operate correctly, refer to Section 413-01 .

6. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

7. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

8. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

9. Carry out the network test:
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

10. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.

11. If the DTCs retrieved are related to the concern, go to the Powertrain Control Module (PCM) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

12. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Powertrain Control Module (PCM) Diagnostic Trouble Code (DTC) Chart

DTCs	Description	Action
P0500	Vehicle Speed Sensor	REFER to Section 307-01A or Section 307-01B .
P0579	Cruise Control Multi-function Input A Circuit Range/Performance	Go To Pinpoint Test C .
P0581	Cruise Control Multi-function Circuit High	Go To Pinpoint Test C .
P1572	Brake Pedal Switch Circuit	Go To Pinpoint Test B .
P1703	Brake Switch Out of Self Test Range	Go To Pinpoint Test B .
All other DTCs	—	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The speed control is inoperative	• Stoplamp switch • Speed control switch • Digital transmission range (TR) sensor • Vehicle speed signal • Powertrain control module (PCM)	• Go To Pinpoint Test A .
• The speed control indicator lamp is always on	• Circuitry • Instrument cluster • PCM	• REFER to Section 413-01 .

Pinpoint Tests

Pinpoint Test A: The Speed Control Is Inoperative

Normal Operation

The powertrain control module (PCM) sends a signal through circuit VES10 (WH) to the speed control switches, which passes through the clockspring. The return signal is sent to the PCM through circuit RES08 (GN/BN) and the clockspring. When the brake pedal is applied, voltage is routed to the PCM to deactivate the speed control, if engaged.

The speed control deactivator switch interrupts circuit CES09 (VT/OG), removing the voltage signal to the PCM when the brake pedal is applied. This is a redundant signal to the PCM.

Possible Causes

- Stoplamp switch
- Speed control switch
- Digital transmission range (TR) sensor
- Vehicle speed signal
- PCM

PINPOINT TEST A: THE SPEED CONTROL IS INOPERATIVE

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>A1 RETRIEVE THE RECORDED PCM DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS</td><td rowspan="2">Yes

</table>
</td></tr>
</table>

 N0002245 • **Are the speed control switch resistance values OK?**	
A4 CHECK THE DIGITAL TR SENSOR	
• Connect: PCM C175b. • Apply the parking brake. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: TCM Digital TR Sensor PID. • Monitor the TCM TR PID. • Select DRIVE. • **Does the PID value agree with the transmission range selector lever position?**	**Yes** GO to A5 . **No** REFER to Section 307-01A or Section 307-01B to continue diagnosis of the digital TR sensor.
A5 CHECK THE DIGITAL TR SENSOR FOR CORRECT ALIGNMENT	
• Check the digital TR sensor alignment. REFER to Section 307-01A or Section 307-01B . • **Is the digital TR sensor aligned correctly?**	**Yes** GO to A6 . **No** ADJUST the digital TR sensor. REFER to Section 307-01A or Section 307-01B . TEST the system for normal operation.
A6 CHECK THE VEHICLE SPEED	
NOTE: This step may require an assistant. • Enter the following diagnostic mode on the diagnostic tool: Anti-lock Brake System (ABS) Wheel Speed PID. • Monitor and record the ABS LF_WSPD PID while driving the vehicle at 48 km/h (30 mph) as indicated on the speedometer. • Enter the following diagnostic mode on the diagnostic tool: PCM Vehicle Speed PID. • Monitor and record the PCM VSS PID while driving the vehicle at 48 km/h (30 mph). • **Does the speed indicated by the ABS LF_WSPD PID match the PCM VSS PID?**	**Yes** GO to A7 . **No** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the output shaft speed (OSS) sensor signal.
A7 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC P1703 or DTC P1572 — Brake On/Off Circuit Failure

Refer to Wiring Diagrams Cell 31 , Speed Control for schematic and connector information.

Normal Operation

When the brake pedal is applied, voltage is routed through circuit CLS17 (YE/GY) to the powertrain control module (PCM) to deactivate the speed control, if engaged.

The speed control deactivator switch interrupts circuit CES09 (VT/OG), removing the voltage signal to the PCM when the brake pedal is applied. This is a redundant signal to the PCM.

DTC P1572 — sets when the PCM does not sense the proper sequence of the brake pedal input signal from both the stoplamp and deactivator switches when the brake pedal is pressed and released.

DTC P1703 — sets when there is an open or short in the deactivator switch circuits or when there is an open or short in the stoplamp circuits.

Possible Causes

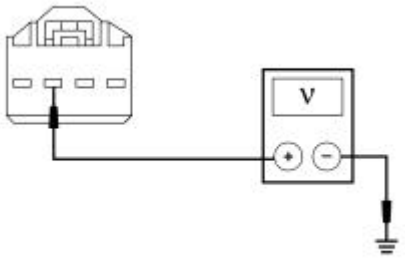
- Fuse
- Circuit CBB74 (VT/BN) open
- Circuit CES09 (VT/OG) open or short to voltage
- Circuit CLS17 (YE/GY) open
- PCM
- Speed control deactivator switch (integral to the stoplamp switch)

PINPOINT TEST B: DTC P1703 OR DTC P1572 — BRAKE ON/OFF CIRCUIT FAILURE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
B1 CHECK THE OPERATION OF THE STOPLAMPS	
• Key in ON position. • Operate the stoplamps. • **Do the stoplamps operate correctly?**	**Yes** GO to B2 . **No** REFER to Section 417-01 .
B2 CHECK CIRCUIT CLS17 (YE/GY) FOR VOLTAGE	
• Key in OFF position. • Disconnect: PCM C175b. • Key in ON position. • Apply the brake pedal. • Measure the voltage between the PCM C175b-46, circuit CLS17 (YE/GY), harness side and ground.	**Yes** GO to B3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0002246 • **Is the voltage greater than 10 volts with the brake pedal applied?**	
B3 CHECK THE SPEED CONTROL DEACTIVATOR SWITCH FOR CORRECT OPERATION	
• While firmly applying and releasing the brake pedal, measure the voltage between the PCM C175b-47, circuit CES09 (VT/OG), harness side and ground.  N0038828 • **Is the voltage greater than 10 volts with the brake pedal released and 0 volts with the brake pedal firmly applied?**	**Yes** GO to B8 . **No** GO to B4 .
B4 CHECK CIRCUIT CBB74 (VT/BN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Stoplamp Switch C278. • Key in ON position. • Measure the voltage between the stoplamp switch C278-2, circuit CBB74 (VT/BN), harness side and ground.  N0038829 • **Is the voltage greater than 10 volts?**	**Yes** GO to B5 . **No** VERIFY the battery junction box (BJB) fuse 74 (20A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B5 CHECK CIRCUIT CES09 (VT/OG) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Connect: PCM C175b. • Key in ON position. • Measure the voltage between the stoplamp switch C278-3, circuit CES09 (VT/OG), harness side and ground.	**Yes** GO to B6 . **No** GO to B7 .



N0038830

- **Is any voltage present?**

B6 CHECK THE PCM FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: PCM C175b. • Key in ON position. • Measure the voltage between the PCM C175b-47, circuit CES09 (VT/OG), harness side and ground.  N0002246 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B8 .
B7 CHECK CIRCUIT CES09 (VT/OG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the stoplamp switch C278-3, circuit CES09 (VT/OG), harness side and the PCM C175b-47, circuit CES09 (VT/OG), harness side.  N0038831 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new stoplamp switch. REFER to Section 417-01 . CLEAR the DTCs. REPEAT the self-test. **No** GO to B8 .
B8 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR

	the DTCs. REPEAT the self-test.

Pinpoint Test C: DTC P0579 or DTC P0581 — Speed Control Switch Circuit Failure

Refer to Wiring Diagrams Cell 31 , Speed Control for schematic and connector information.

Normal Operation

The powertrain control module (PCM) sends a signal through circuit VES10 (WH) to the speed control switches, which passes through the clockspring. The return signal is sent to the PCM through circuit RES08 (GN/BN) and the clockspring.

DTC P0579 — may set when the speed control switch circuits are open, shorted to voltage or shorted to ground.

DTC P0581 — sets when the speed control switch circuits are open or shorted to voltage.

Possible Causes

- Circuit RES08 (GN/BN) open, short to voltage or ground
- Circuit VES10 (WH) open, short to voltage or ground
- Clockspring
- Speed control switch
- PCM

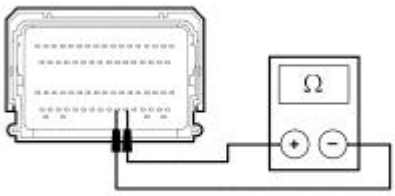
PINPOINT TEST C: DTC P0579 OR DTC P0581 — SPEED CONTROL SWITCH CIRCUIT FAILURE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
C1 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: PCM C175b. • Key in ON position. • Turn the parking lamps on. • Measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.  N0038832 • **Is any voltage present?**	**Yes** TURN the parking lamps off. GO to C2 . **No** TURN the parking lamps off. GO to C4 .

C2 CHECK CIRCUITS VES10 (WH) AND RES08 (GN/BN) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Clockspring C218. • Key in ON position. • Turn the parking lamps on. • Measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.  N0038832 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** TURN the parking lamps off. GO to C3 .
C3 CHECK THE CLOCKSPRING FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Connect: Clockspring C218. • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring. • **WARNING: Make sure there is no one inside the vehicle and that there is nothing blocking or set in front of any air bag module when the battery is connected. Failure to follow these instructions may result in personal injury.** • Connect the battery. • Key in ON position. • Turn the parking lamps on. • Measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.  N0038832 • **Is any voltage present?**	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new speed control switch. REFER to Speed Control Switch in this section. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
C4 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.	**Yes** GO to C7 . **No** GO to C5 .

 N0038833 • **Are the resistances greater than 10,000 ohms?**	
C5 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND	
• Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring. • Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.  N0038833 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new speed control switch. REFER to Speed Control Switch in this section. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** GO to C6 .
C6 CHECK CIRCUITS VES10 (WH) AND RES08 (GN/BN) FOR A SHORT TO GROUND	
• Disconnect: Clockspring C218. • Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.  N0038833 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit in question. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
C7 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR AN OPEN	
• Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and the PCM C175b-57, circuit RES08 (GN/BN), harness side.	**Yes** GO to C10 . **No** GO to C8 .



N0038826

- **Is the resistance between 4,279 and 4,363 ohms?**

C8 CHECK CIRCUITS VES10 (GN/BK) AND RES08 (GN/BN) FOR AN OPEN	
• Disconnect: Clockspring C218. • Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and the clockspring C218-15, circuit VES10 (WH), harness side; and between the PCM C175b-57, RES08 (GN/BN), harness side and the clockspring C218-14, circuit RES08 (GN/BN), harness side.  N0038834 • **Are the resistances less than 5 ohms?**	**Yes** GO to C9 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
C9 CHECK THE CLOCKSPRING	
• Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring. • Measure the resistance between the upper clockspring connector pin 15, component side and the clockspring C218 pin 8, component side; and between the upper clockspring connector pin 14, component side and the clockspring C218 pin 9, component side.  N0038835 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new speed control switch. REFER to Speed Control Switch in this section. TEST the system for normal operation. **No** INSTALL a new clockspring. REFER to Section 501-20B . INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
C10 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins	**Yes** INSTALL a new PCM. REFER to Section 303-14 .

• Connect all the PCM connectors and make sure they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Removal and Installation

Expedition

NOTE: It is not necessary to remove the driver air bag module during this procedure.

NOTE: Be careful not to allow the speed control switch electrical connector to fall back into the steering wheel.

1. Remove the speed control switch by pulling the switch toward the rear of the vehicle.
    - Disconnect the electrical connector.

General Specifications

Item	Specification
A/C Compressor	
Type	FS20
Displacement	213 cc (13 cu in)
A/C Pressure Relief Valve [a]	
Open pressures	3,792-4,137 kPa (550-600 psi)
Magnetic Clutch	
Air gap clearance	0.35-0.65 mm (0.014-0.026 in)
Evaporator Discharge Air Temperature Sensor	
On temperatures	2.2-3.3°C (36-38°F)
Off temperatures	2.2-3.3°C (36-38°F)
Refrigerant Lubricant and Capacity	
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B
Capacity without auxiliary climate control	266 ml (9 oz)
Capacity with auxiliary climate control	414 ml (14 oz)
Refrigerant and Capacity	
R-134a Refrigerant YN-19 (US); CYN-16-P or CYN-16-R (Canada)	WSH-M17B19-A
Capacity without auxiliary climate control	1.13 kg (40 oz)
Capacity with auxiliary climate control	1.64 kg (58 oz)
Refrigerant System Cleaner	
A/C Systems Flushing YN-23	—
Refrigerant System Coating	
A/C Cooling Coil Coating YN-29	—
Refrigerant System Dye	
R-134a Leak Detection Dye 164-R6060 or 164-R6081	—

[a] Manifold gauge set pressures may vary slightly depending on the distance between the service gauge port valve and the A/C pressure relief valve, low charge protection and pressure cutoff switch locations.

Climate Control System

WARNING: Carbon monoxide is colorless, odorless and dangerous. If it is necessary to operate the engine with vehicle in a closed area such as a garage, always use an exhaust collector to vent the exhaust gases outside the closed area.

WARNING: R-134a is classified as a safe refrigerant, but misuse can make it dangerous. The following precautions must be observed.

- **Always wear safety goggles when repairing an air conditioning system.**
- **Avoid contact with liquid refrigerant R-134a. R-134a vaporizes at approximately -25°C (-13° F) under atmospheric pressure and it will freeze skin tissue.**
- **Never allow refrigerant R-134a gas to escape in quantity in an occupied space. R-134a is non-toxic, but it will displace the oxygen needed to support life.**
- **Never use a torch in an atmosphere containing R-134a gas. R-134a is non-toxic at all normal conditions, but when it is exposed to high temperatures, such as a torch flame, it decomposes. During decomposition it releases irritating and toxic gases (as described in the MSDS sheet from the manufacturer). Decomposition products are hydrofluoric acid, carbon dioxide and water.**
- **Do not allow any portion of the charged air conditioning system to become too hot. The pressure in an air conditioning system rises as the temperature rises and temperatures of approximately 85°C (185°F) can be dangerous.**
- **Allow the engine to cool sufficiently prior to carrying out maintenance or serious burns and injury can occur.**

WARNING: It is dangerous to charge the system with the engine running at the high side service port.

CAUTION: To avoid damaging the vehicle or A/C components, the following precautions must be observed.

- **The A/C refrigerant of all vehicles must be identified and analyzed prior to refrigerant charging. Failure to do so can contaminate the shop bulk refrigerant and other vehicles.**
- **Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. These two types of refrigerant must never be mixed. Doing so can damage the A/C system.**
- **Charge the A/C system with R-134a refrigerant gas while the engine is running only at the low-pressure side to prevent refrigerant slugging from damaging the A/C compressor.**
- **Use only R-134a refrigerant. Due to environmental concerns, when the A/C system is drained, the refrigerant must be collected using refrigerant recovery/recycling equipment. Federal, State/Provincial and/or local laws REQUIRE that R-134a be recovered into appropriate recovery equipment and the process be conducted by qualified technicians who have been certified by an approved organization, such as ASE, MACS, HRAI, etc. Use of a recovery machine dedicated to R-134a is necessary to reduce the possibility of oil and refrigerant incompatibility concerns. Refer to the instructions provided by the equipment manufacturer when removing refrigerant from or charging the A/C system.**
- **Refrigerant R-134a must not be mixed with air for leak testing or used with air for any other**

purpose above atmospheric pressure. R-134a is combustible when mixed with high concentrations of air and higher pressures.

- **A number of manufacturers are producing refrigerant products that are described as direct substitutes for refrigerant R-134a. The use of any unauthorized substitute refrigerant can severely damage the A/C components. If repair is required, use only new or recycled refrigerant R-134a.**

CAUTION: To avoid contamination of the A/C system, the following precautions must be observed.

- **Never open or loosen a connection before recovering the refrigerant.**
- **When loosening a connection, if any residual pressure is evident, allow it to leak out before opening the fitting.**
- **Evacuate a system that has been opened to install a new component or one that has discharged through leakage before charging.**
- **Seal open fittings with a cap or plug immediately after disconnecting a component from the system.**
- **Clean the outside of the fittings thoroughly before disconnecting a component from the system.**
- **Do not remove the sealing caps from a new component until ready to install.**
- **Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open an oil container until ready to use and install the cap immediately after using. Store the oil in a clean, moisture-free container.**
- **Install a new O-ring seal before connecting an open fitting. Coat the fitting and O-ring seal with mineral oil before connecting.**
- **When installing a refrigerant line, avoid sharp bends. Position the line away from the exhaust or any sharp edges that can chafe the line.**
- **Tighten threaded fittings only to specifications. The steel and aluminum fittings used in the refrigerant system will not tolerate overtightening.**
- **When disconnecting a fitting, use a wrench on both halves of the fitting to prevent twisting of the refrigerant lines or tubes.**
- **Do not open a refrigerant system or uncap a new component unless it is as close as possible to room temperature. This will prevent condensation from forming inside a component that is cooler than the surrounding air.**

The electronic manual temperature control (EMTC) system heats or cools the vehicle depending on the EMTC control panel selection.

- The EMTC control panel selections determine heating or cooling, air distribution and enables blower motor operation.
- The temperature control setting determines the air temperature.
- The blower motor switch varies the blower motor speed.
- During A/C operation the system also reduces the relative humidity of the air.
- The driver side and passenger side temperature settings can be individually controlled. (Dual-zone EMTC only.)

The dual-zone electronic automatic temperature control (EATC) system maintains the selected vehicle interior temperature by heating and/or cooling the air.

- During A/C operation the system also reduces the relative humidity of the air.
- The driver may override the automatic mode of operation.
- The temperature control setting determines the air temperature.
- The blower motor control override buttons vary the blower motor speed.
- The driver side and passenger side temperature settings can be individually controlled.

Principles of Operation

There are 4 main principles involved with the basic theory of operation:

- Heat transfer
- Latent heat of vaporization
- Relative humidity
- Effects of pressure

Heat Transfer

If 2 substances of different temperature are placed near each other, the heat in the warmer substance will transfer to the colder substance.

Latent Heat of Vaporization

When a liquid boils (converts to gas) it absorbs heat without raising the temperature of the resulting gas. When the gas condenses (converts back to a liquid), it gives off heat without lowering the temperature of the resulting liquid.

Relative Humidity

The amount of moisture (water vapor content) that the air can hold is directly related to the air temperature. The more heat there is in the air, the more moisture the air can hold. The lower the moisture content in the air, the more comfortable you feel. Removing the moisture from the air lowers its relative humidity and improves personal comfort.

Effects of Pressure on Boiling or Condensation

As the pressure is increased on a liquid, the temperature at which the liquid boils (converts to gas) also increases. Conversely, when the pressure on a liquid is reduced, its boiling point is also reduced. When in the gas state, an increase in pressure causes an increase in temperature, while a decrease in pressure will decrease the temperature of the gas.

Compressor Anti-Slugging Strategy

Liquid refrigerant may accumulate in the A/C compressor under certain conditions. To alleviate damage to the A/C compressor, compressor anti-slugging strategy (CASS) is utilized.

CASS is initiated only under specific conditions:

- Ignition is off for more than 8 hours
- Ambient temperature is above -4°C (25°F)
- Battery voltage is above 8.5 volts during engine cranking

When these conditions are present, the powertrain control module (PCM) will activate the A/C control relay prior to cranking of the engine. The A/C control relay engages the A/C compressor for approximately 4-15 A/C compressor revolutions or a maximum of 2 seconds (depending upon vehicle application), allowing the liquid refrigerant to be pushed from the A/C compressor. CASS is initiated by the PCM regardless of the EMTC or the EATC system settings.

The Refrigerant Cycle

During stabilized conditions (air conditioning system shutdown), the refrigerant pressures are equal throughout the system. When the A/C compressor is in operation it increases pressure on the refrigerant vapor, raising its temperature. The high-pressure and high-temperature vapor is then released into the top of the A/C condenser core.

The A/C condenser, being close to ambient temperature, causes the refrigerant vapor to condense into a liquid when heat is removed from the refrigerant by ambient air passing over the fins and tubing. The

now liquid refrigerant, still at high pressure, exits from the bottom of the A/C condenser and enters the inlet side of the A/C receiver/drier. The receiver/drier is designed to remove moisture from the refrigerant.

The outlet of the receiver/drier is connected to the thermostatic expansion valve (TXV). The TXV provides the orifice which is the restriction in the refrigerant system and separates the high and low pressure sides of the A/C system. As the liquid refrigerant passes across this restriction, its pressure and boiling point are reduced.

The liquid refrigerant is now at its lowest pressure and temperature. As it passes through the A/C evaporator, it absorbs heat from the airflow passing over the plate/fin sections of the A/C evaporator. This addition of heat causes the refrigerant to boil (convert to gas). The now cooler air can no longer support the same humidity level of the warmer air and this excess moisture condenses on the exterior of the evaporator coils and fins and drains outside the vehicle.

The refrigerant cycle is now repeated with the A/C compressor again increasing the pressure and temperature of the refrigerant.

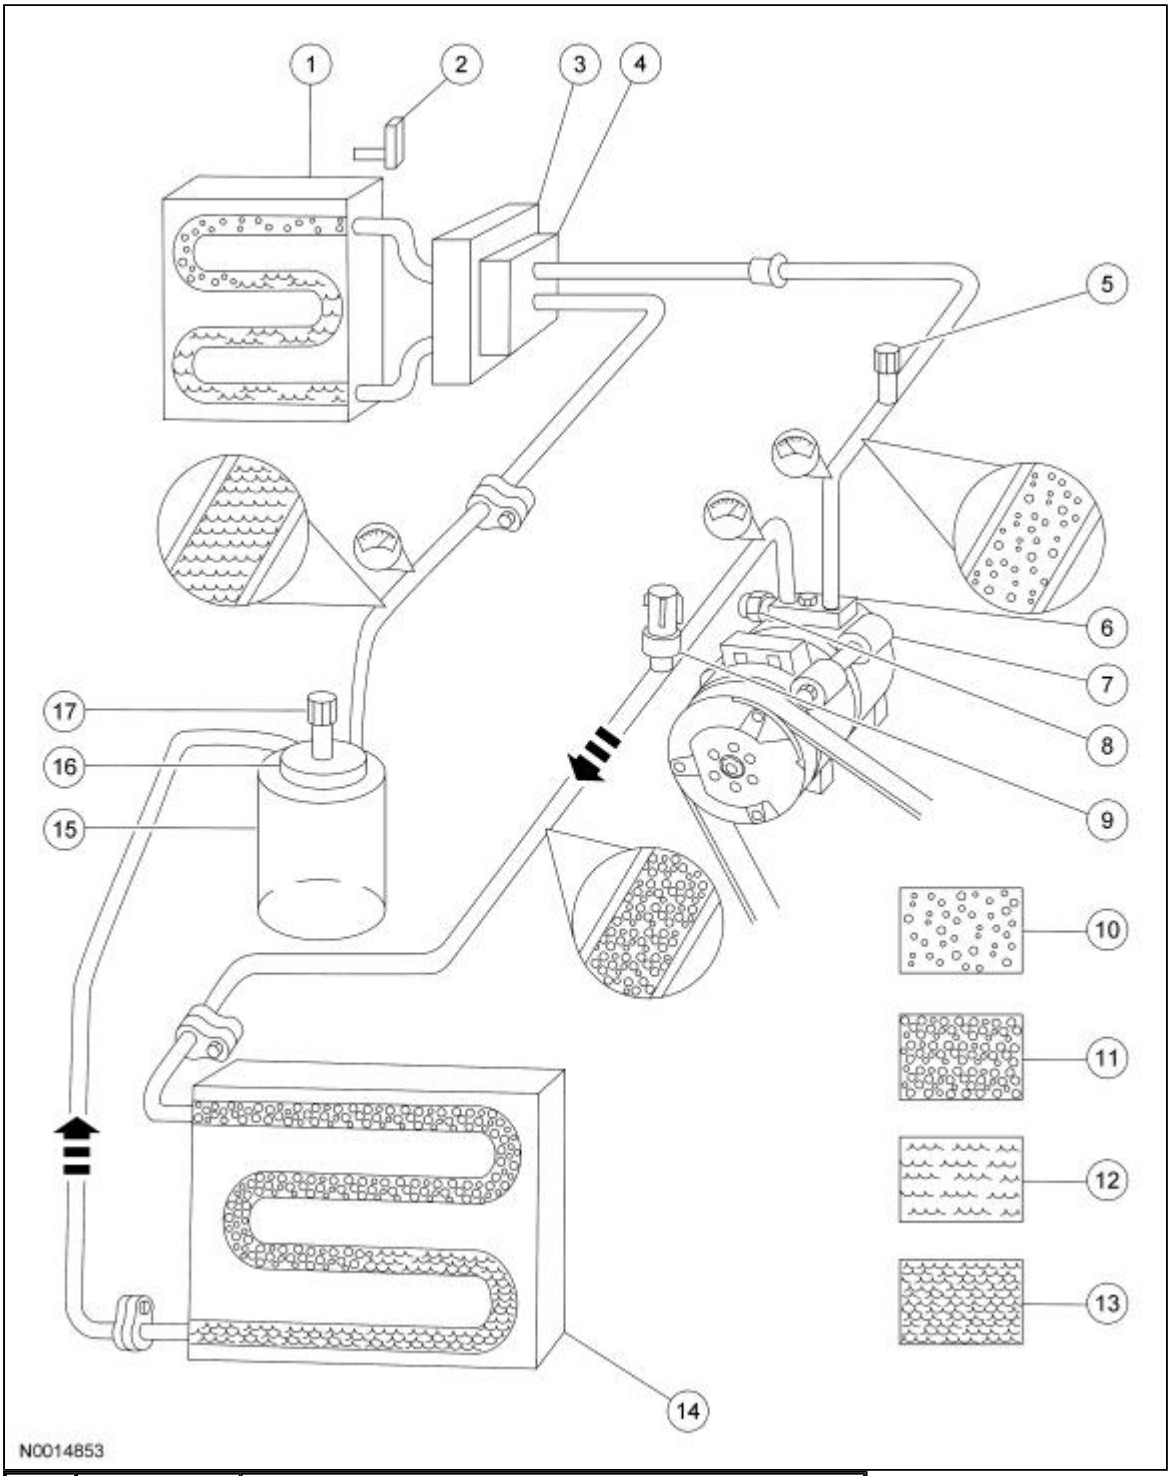
A thermistor which monitors the temperature of the air that has passed through the evaporator core controls A/C clutch cycling. If the temperature of the evaporator core discharge air is low enough to cause the condensed water vapor to freeze, the A/C clutch is disengaged by the vehicle powertrain control module (PCM).

The high-side line pressure is also monitored so that A/C compressor operation will be interrupted if the system pressure becomes too high or is determined to be too low (low charge condition).

The A/C compressor thermal protection switch will interrupt compressor operation if the compressor housing exceeds temperature limits.

The A/C compressor relief valve will open and vent refrigerant to relieve unusually high system pressure.

Thermostatic Expansion Valve Type Refrigerant System



Item	Part Number	Description
1	19860	A/C evaporator core
2	19C734	A/C evaporator core outlet temperature thermistor
3	19849	Thermostatic expansion valve
4	19835	Manifold and tube assembly — thermostatic expansion valve
5	19D701	A/C charge valve port (low side)
6	19D734	Manifold and tube assembly — A/C compressor
7	19703	A/C compressor

8	19D644	A/C pressure relief valve
9	19D594	A/C pressure transducer
10	—	Low pressure vapor
11	—	High pressure vapor
12	—	Low pressure liquid
13	—	High pressure liquid
14	19712	A/C condenser core
15	19959	A/C receiver/drier
16	19835	Manifold and tube assembly — receiver/drier
17	19D701	A/C charge valve port (high side)

Climate Control System Operation

Electronic Manual Temperature Control System

The electronic manual temperature control (EMTC) system operation is determined by the settings on the climate control assembly. The EMTC system is composed of the EMTC module, blower motor resistor, mode door actuator, air inlet door actuator and temperature blend door actuator to control the various functions.

The blower motor switch:

- sets the blower motor speed.
- directs the blower motor path to ground through the blower motor resistor to allow blower motor operation in LO, MED LO and MED HI.
- directs the blower motor path directly to ground, bypassing the blower motor resistor, to allow blower motor operation in HI.

The A/C request switch:

- can command the A/C compressor ON when the function selector switch is in PANEL, FLOOR/PANEL, FLOOR/DEFROST and FLOOR when the A/C request switch is pressed. Indicator illuminates when A/C request switch is toggled ON.
- is inoperative in MAX A/C, OFF and DEFROST.
- indicator illuminates when the function selector switch is in MAX A/C and cannot be toggled.
- indicator does not illuminate in OFF and cannot be toggled.
- indicator does not illuminate in DEFROST but can be toggled ON or OFF. The A/C compressor will operate regardless of indicator status if the outside air temperature is above 6°C (43°F).
- is serviced only with the climate control assembly.

The function selector switch:

- selects airflow direction.
- is serviced only with the climate control assembly.

The air recirculation button:

- selects either recirculated or outside air source.
- recirculates air in any mode except DEFROST, if requested.
- is disabled in MAX A/C or OFF mode where recirculated air only is used.
- is disabled in DEFROST mode where outside air only is used.

- is serviced only with the climate control assembly.

The auxiliary climate controls:

- select the auxiliary blower motor speed.
- select the auxiliary airflow mode/temperature.

The EMTC module also includes:

- a rear window defrost button, refer to Section 501-11 .
- heated/cooled seat controls, refer to Section 501-10 .

Electronic Automatic Temperature Control System

The electronic automatic temperature control (EATC) system operation is determined by the settings on the EATC module. The EATC system automatically maintains a selected temperature for vehicle interior comfort. The EATC system is composed of the EATC module, blower motor speed control, mode door actuator, air inlet door actuator, temperature blend door actuator, in-vehicle temperature sensor and solar radiation sensor to control the various functions.

When the EATC module is set to AUTO:

- the air distribution direction, blower motor speed and A/C compressor operation are automatically controlled based on the temperature(s) selected.

The EATC module manual override settings:

- allow the air distribution direction to be manually selected.
- allow the blower motor speed to be manually selected.
- allow RECIRCULATION mode to be manually selected in all modes except DEFROST. The A/C request can be cancelled by pressing the A/C request switch, turning the indicator OFF.
- allow A/C compressor operation to be manually selected except in DEFROST.

The auxiliary climate controls:

- select the auxiliary blower motor speed.
- select the auxiliary airflow mode/temperature.

The EATC module also includes:

- a rear window DEFROST button, refer to Section 501-11 .
- heated/cooled seat controls, refer to Section 501-10 .

Auxiliary Climate Control System

An auxiliary climate control system is available as optional equipment. The auxiliary climate control system operation is determined by the settings on the front or rear auxiliary climate control assembly. The auxiliary climate control assemblies include a blower motor switch and temperature control/air distribution mode knob, neither of which can be individually serviced.

Auxiliary blower motor operation is enabled when the EMTC or EATC is in any mode except OFF. The auxiliary system air can be cooled below interior air temperature only when A/C compressor operation has been requested by the settings of the climate control assembly of the base (front) system. The auxiliary system air can be heated at any time.

The front auxiliary climate controls:

- are built into the dual-zone EMTC or EATC module. The blower motor speed can be set to OFF, LO, MED LO, MED HI or HI by pressing the auxiliary blower FAN button either right (higher) or left (lower). The temperature/airflow mode can be adjusted by pressing the rear button either right (warm/floor) or left (cool/panel). If the front (main) driver side temperature is set to full COOL or full HEAT, the auxiliary temperature will be set to the same as the driver and cannot be changed. When the front auxiliary REAR button is depressed, all control of the auxiliary climate control system functions are then transferred to the rear auxiliary climate control assembly and the auxiliary temperature can be fully independently controlled.

The rear auxiliary climate control assembly:

- blower motor switch controls the auxiliary blower motor speed only when the front auxiliary climate control assembly blower motor switch is set to REAR. The blower motor speed can be set to OFF, LO, MED LO, MED HI or HI.
- temperature/airflow mode control switch is a potentiometer that outputs a variable voltage to the auxiliary temperature blend door actuator and auxiliary mode door actuator to set the position of the auxiliary temperature blend and mode doors only when the front auxiliary climate control assembly blower motor switch is set to REAR. When A/C compressor operation has not been initiated (A/C compressor commanded on) by the EMTC or EATC module (as equipped), the auxiliary climate control system cannot cool the air below that of the interior air temperature.

System Airflow Description — EMTC

Max A/C

When MAX A/C is selected:

- the air inlet door actuator closes off outside air and admits only recirculated air.
- the recirc button is disabled and the indicator is illuminated.
- the floor/defrost/panel door directs airflow to the instrument panel A/C registers.
- blended air temperature is available.
- the A/C request button is illuminated and will be disabled.
- the A/C compressor will operate if the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

PANEL

When PANEL is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the instrument panel A/C registers.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air

inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the side window demisters and defrost duct will be present.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

OFF

When OFF is selected:

- the recirc request button is disabled.
- the air inlet door actuator closes off outside air and admits only recirculated air.
- the A/C request button is disabled.
- the blower motor is OFF.

FLOOR

When FLOOR is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters will be present.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

FLOOR/DEFROST

When the FLOOR/DEFROST is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the floor duct, the defroster duct and the side window demisters.
- blended air temperature is available.
- the A/C request button will indicate the last status and the indicator can be toggled. To reduce fogging, the A/C compressor will operate automatically, regardless of indicator status, if the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

DEFROST

When DEFROST is selected:

- the air inlet door actuator opens, admitting only outside air into the passenger compartment.

- the floor/defrost/panel door directs airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct will be present.
- blended air temperature is available.
- the A/C request button will indicate the last status and the indicator can be toggled. To reduce fogging, the A/C compressor will operate automatically, regardless of indicator status, if the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

System Airflow Description — EATC

AUTO

When AUTO is selected:

- the temperature control setting is manually set to the desired setting.
- the air inlet door actuator is automatically controlled by the EATC module, based on the temperature setting.
- the mode door actuators are automatically controlled by the EATC module based on the temperature setting.
- the A/C compressor is automatically controlled by the EATC module based on the temperature setting. The A/C compressor will not operate if the outside temperature is below approximately 6° C (43°F).
- the A/C request button or the RECIRC request button, if pressed, will transfer the system to semi-auto operation.
- the blower motor is ON. The blower motor speed is automatically controlled by the EATC module based on the temperature setting, but can be manually overridden.

OFF

When OFF is selected:

- the RECIRC request button is disabled.
- the air inlet door actuator closes off outside air and admits only recirculated air.
- the floor/defrost/panel door actuator is in the DEFROST position.
- the A/C request button is disabled.
- the blower motor is OFF.

PANEL

When PANEL is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the instrument panel A/C registers.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator ON), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the side window demisters and defrost duct will be present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator ON), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

FLOOR

When FLOOR is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters will be present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator ON), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor will operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

FLOOR/DEFROST

When the FLOOR/DEFROST is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the floor duct, the defroster duct and the side window demisters.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor will operate automatically and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

DEFROST

When DEFROST is selected:

- the recirc request button and indicator is disabled. Regardless of button and indicator status, the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct will be present.
- blended air temperature is available.
- the A/C request button will indicate the last status and the indicator can be toggled. To reduce

fogging, the A/C compressor will operate automatically, regardless of indicator status, if the outside temperature is above approximately 6°C (43°F).

- the blower motor is ON.

ST2351-A	Refrigerant Leak Detector 216-00001 or equivalent
ST1474-A	Pressure Test Kit 014-R1072 or equivalent

Inspection and Verification

1. Verify the customer's concern by operating the climate control system to duplicate the condition.

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

   Visual Inspection Chart

Mechanical	Electrical

• Loose, missing or damaged A/C compressor drive belt
• Loose or disconnected A/C clutch
• Broken or binding door/actuator
• Broken or leaking refrigerant lines
• Obstructed in-vehicle temperature sensor
• Disconnected in-vehicle temperature aspirator hose
	• Battery junction box (BJB) fuse:
	  ▪ 11 (30A)
	  ▪ 24 (40A)
	  ▪ 30 (10A)
	  ▪ 67 (10A)
	  ▪ 70 (20A)
	• Smart junction box (SJB) fuse:
	  ▪ 15 (10A)
	  ▪ 37 (10A)
	  ▪ 46 (7.5A)
	• Blower motor inoperative
	• A/C compressor inoperative
	• Circuitry open/shorted
	• Disconnected electrical connectors
	• Cooling fan inoperative

3. As pinpoint tests and measurements are being carried out, be sure to inspect for any disconnected, loose-fitting or incorrectly installed component, module and in-line electrical connectors and pins.

4. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

6. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power to The Scan Tool, to diagnose no communication with the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the powertrain control module (PCM), electronic manual temperature control (EMTC) or electronic automatic temperature control (EATC) module.

8. Carry out the network test.
   - If the scan tool responds with no communication from one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory diagnostic trouble codes (DTCs).

9. Clear the continuous DTCs and carry out the self-test diagnostics from the PCM, EMTC or EATC.

10. **NOTE:** Some PCM DTCs may inhibit air conditioning (A/C) operation. If any PCM DTCs are retrieved, diagnose those first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

    If the EATC DTCs retrieved are related to the concern, go to the EATC Diagnostic Trouble Code (DTC) Chart. If the EMTC DTCs retrieved are related to the concern, go to the EMTC Diagnostic Trouble Code (DTC) Chart. If the PCM DTCs retrieved are related to the concern, go to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. For all other DTCs, refer to Section 419-10 .

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Electronic Automatic Temperature Control (EATC) Module — Diagnostic Methods

The EATC system must be diagnosed by first retrieving any DTCs, if present.

- An on-demand (hard fault) DTC indicates that the fault is currently present. An on-demand DTC suggests a wiring fault, disconnected connector or component failure.
- A continuous (intermittent) DTC alone (corresponding on-demand DTC is not present) indicates that the fault is an intermittent condition and may not be currently present. A continuous only DTC suggests a poor wiring connection, loose pin or terminal or intermittent component failure.

On-demand (hard fault) or continuous (intermittent fault) DTCs can be retrieved using a scan tool. If using a scan tool, refer to the scan tool operating manual.

On-demand DTCs can also be retrieved by carrying out the Electronic Automatic Temperature Control (EATC) Module On-Demand Self Test. To retrieve and/or clear continuous DTCs, carry out the Electronic Automatic Temperature Control (EATC) Module — Retrieve Continuous DTCs procedure. Always carry out the Electronic Automatic Temperature Control (EATC) Module On-Demand Self Test before retrieving continuous DTCs.

If no DTCs are present, GO to Symptom Chart for the appropriate diagnostic action.

Electronic Automatic Temperature Control (EATC) Module On-Demand Self Test

The Electronic Automatic Temperature Control (EATC) Module On-Demand Self Test will retrieve on-demand (hard fault) DTCs only, it will not retrieve continuous DTCs. Continuous DTCs can be cleared when exiting the Electronic Automatic Temperature Control (EATC) Module On-Demand Self Test. Make sure to retrieve continuous DTCs by carrying out the Electronic Automatic Temperature Control (EATC) Module — Retrieve Continuous DTCs procedure before clearing any continuous DTCs.

- The Electronic Automatic Temperature Control (EATC) Module On-Demand Self Test will not detect concerns associated with data link messages like engine coolant temperature or vehicle speed signals. A scan tool must be used to retrieve these concerns.
- The Electronic Automatic Temperature Control (EATC) Module On-Demand Self Test will detect concerns in the system control functions and will display on-demand (hard fault) DTCs for concerns that are present during the self-test. The vehicle interior temperature should be between 4°C-38°C (40°F-100°F) when carrying out the self-test. If the temperatures are not within the specified ranges, false DTCs may be displayed.
- The self-test can be initiated after cycling the ignition switch from OFF to ON. Normal operation of the climate control system stops when the self-test is activated.
- To enter the self-test, press the OFF and DEFROST buttons simultaneously and release, then press the AUTO button within 2 seconds. The display will show a flashing blower icon for 20 seconds, after which all vacuum fluorescent segments will be displayed if there are no on-demand DTCs present. If DTCs are present, the EATC module will display "00 00" and then on-demand DTCs. Record all DTCs displayed.
- If any DTCs appear during the self-test, carry out the diagnostic procedure. Refer to the

Electronic Automatic Temperature Control (EATC) Module Diagnostic Trouble Code Chart and follow the ACTION for each DTC given.

- If a condition exists, but no DTCs appear during the self-test, GO to Symptom Chart Condition: The EATC System Is Inoperative, Intermittent or Incorrect Operation.
- To exit the self-test and **retain** all DTCs, press any button **except** DEFROST. The EATC module will exit the self-test and retain all DTCs.
- To exit the self-test and **clear** all DTCs, press the DEFROST button. The EATC module will exit the self-test and all DTCs will be cleared.
- Always exit the self-test before powering the system down (system turned OFF). Once the self-test is exited, the ignition switch must remain ON for at least 30 seconds to allow the door actuators to automatically recalibrate.
- Continuous DTCs will be deleted after 80 ignition switch ON cycles after the intermittent fault occurs.

Electronic Automatic Temperature Control (EATC) Module — Retrieve Continuous DTCs

The EATC module will retrieve only continuous (intermittent) DTCs when carrying out this procedure.

- Retrieval of continuous DTCs can be initiated after cycling the ignition switch from OFF to ON. Normal operation of the climate control system stops when retrieving continuous DTCs.
- To retrieve continuous DTCs, press the OFF and DEFROST buttons simultaneously and release, then press the RECIRC button within 2 seconds. All vacuum fluorescent segments will be displayed if there are no continuous DTCs present. Continuous DTCs are indicated by the presence of the Celsius symbol (°C) on the EATC module display. Record all DTCs displayed.
- If any DTCs appear, carry out the diagnostic procedure. Refer to the Electronic Automatic Temperature Control (EATC) Module Diagnostic Trouble Code Chart and follow the ACTION for each DTC given.
- If a condition exists but no DTCs appear, GO to Symptom Chart Condition: The EATC System Is Inoperative, Intermittent or Incorrect Operation.
- To exit and **retain** all continuous DTCs, press any button **except** DEFROST. The EATC module will exit the retrieved continuous DTCs mode and retain all continuous DTCs.
- To exit and **clear** all continuous DTCs, press the DEFROST button. The EATC module will exit the retrieve continuous DTCs mode and all continuous DTCs will be cleared.
- Always exit the procedure before powering the system down (system turned OFF). Once the procedure is exited, the ignition switch must remain ON for at least 30 seconds to allow the door actuators to automatically recalibrate.
- Continuous DTCs will be deleted after 80 ignition switch ON cycles after the intermittent fault occurs.

Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process

The purpose of the cold boot process is to allow the EATC or EMTC module to reinitialize and calibrate the actuators. To carry out the cold boot process, follow the steps below.

1. Turn the ignition switch to the OFF position.
2. Disconnect the EATC or EMTC module electrical connectors.
3. Wait one minute.
4. Connect the EATC or EMTC module electrical connectors.
5. Turn the ignition switch to the ON position.
6. Select any position except OFF on the EATC or EMTC module.

The EATC or EMTC module will not initialize and calibrate the actuators. Calibration of the actuators will

take approximately 30 seconds.

Diagnostic Trouble Code Chart

Electronic Automatic Temperature Control (EATC) Module Diagnostic Trouble Code (DTC) Chart

NOTE: Some PCM DTCs may inhibit air conditioning (A/C) operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

DTC	Description	Action to Take
B1342	EMTC Module Faulted	INSTALL a new EMTC module. REFER to Section 412-01 .
B1676	Battery Voltage Out Of Range	Go To Pinpoint Test W .
B2266	(LH) Blend Door Failure or Short	Go To Pinpoint Test M .
B2826	Evaporator Temperature Sensor Circurt Failure	Go To Pinpoint Test E .
B2827	Evaporator Temperature Sensor Circuit Short to Ground	Go To Pinpoint Test E .
B2916	Auxiliary Blend Door Failure	Go To Pinpoint Test T .
B2917	Auxiliary Mode Door Failure	Go To Pinpoint Test U .
B2918	Auxiliary Temperature Input Circuit Open/Short to Ground	If the vehicle is not equipped with a center console and rear auxiliary climate controls, ignore the DTC and continue diagnostics. If the vehicle is equipped with a center console and rear auxiliary climate controls, Go To Pinpoint Test V .
B2919	Auxiliary Blower Motor Speed Input Circuit Open/Short to Ground	If the vehicle is not equipped with a center console and rear auxiliary climate controls, ignore the DTC and continue diagnostics. If the vehicle is equipped with a center console and rear auxiliary climate controls, Go To Pinpoint Test V .
U2050	No Application Present	INSTALL a new EMTC module. REFER to Section 412-01 .

Electronic Automatic Temperature Control (EATC) Module Diagnostic Trouble Code (DTC) Chart

NOTE: Some PCM DTCs may inhibit air conditioning (A/C) operation. If any PCM DTCs are retreived, diagnose those first. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

DTC	Description	Action to Take
B1200	Stuck Button	Button held too long may set DTC. ATTEMPT to clean buttons. If code returns, INSTALL a new EATC module. REFER to Section 412-01 .
B1251	In-Vehicle Temperature Sensor Open Circuit	Go To Pinpoint Test A .
B1253	In-Vehicle Temperature Sensor Circuit Short to Ground	Go To Pinpoint Test A .
B1255	Ambient Temperature Sensor	Go To Pinpoint Test B .

	Open Circuit	
B1257	Ambient Temperature Sensor Circuit Short to Ground	Go To Pinpoint Test B .

B2426	RH A/C Solar Radiation Sensor Open Circuit	Go To Pinpoint Test C .
B2427	RH A/C Solar Radiation Sensor Circuit Short to Ground	Go To Pinpoint Test C .
B2411	A/C Humidity Sensor Circuit Open	Go To Pinpoint Test D .
B2412	A/C Humidity Sensor Circuit Short to Ground	Go To Pinpoint Test D .
B2826	Evaporator Temperature Sensor Circuit Failure	Go To Pinpoint Test E .
B2827	Evaporator Temperature Sensor Circuit Short to Ground	Go To Pinpoint Test E .
B2268	Steering Wheel Control Switch Circuit Open	Go To Pinpoint Test F .
B2269	Steering Wheel Control Switch Circuit Short to Ground	Go To Pinpoint Test F .
B2266	LH Blend Door Failure or Short	Go To Pinpoint Test M .
B2267	RH Blend Door Failure or Short	Go To Pinpoint Test M .
B1003	Mode Door Short/Failure	Go To Pinpoint Test H .
B2916	Auxiliary Blend Door Failure	Go To Pinpoint Test T .
B2917	Auxiliary Mode Door Failure	Go To Pinpoint Test U .
B2918	Auxiliary Temperature Input Circuit Open/Short to Ground	If the vehicle is not equipped with a center console and rear auxiliary climate controls, ignore the DTC and continue diagnostics. If the vehicle is equipped with a center console and rear auxiliary climate controls, Go To Pinpoint Test V .
B2919	Auxiliary Blower Motor Speed Input Circuit Open/Short to Ground	If the vehicle is not equipped with a center console and rear auxiliary climate controls, ignore the DTC and continue diagnostics. If the vehicle is equipped with a center console and rear auxiliary climate controls, Go To Pinpoint Test V .
B1676	Battery Voltage Out of Range	Go To Pinpoint Test W .
B1342	EATC Module Faulted	INSTALL a new EATC module. REFER to Section 412-01 .
U2050	No Application Present	INSTALL a new EATC module. REFER to Section 412-01 .

Symptom Chart

SYMPTOM CHART

NOTE: Some PCM DTCs may inhibit air conditioning (A/C) operation. If any PCM DTCs are retrieved, diagnose those first. Refer to Powertrain Control/Emissions Diagnosis

(PC/ED) manual.

Condition	Possible Sources	Action
• The air inlet door is inoperative	• Circuitry open/shorted • Door actuator • Air inlet door binding or stuck • Electronic module temperature control (EMTC) module or electronic automatic temperature control (EATC) module	• Go To Pinpoint Test G .
• Incorrect/erratic direction of airflow from outlets	• Circuitry open/shorted • Door actuator • Mode door binding or stuck • EMTC module or EATC module	• Go To Pinpoint Test H .
• The EATC system is inoperative, intermittent or incorrect operation	• Fuse(s) • Circuitry open	• Go To Pinpoint Test I .
• Insufficient, erratic or no heat	• Low engine coolant level • Engine overheating • Plugged or partially plugged heater core • Temperature blend door is binding or stuck • Temperature blend door actuator • Heater hose is kinked or binding	• Go To Pinpoint Test J .
• The air conditioning (A/C) is inoperative/does not operate correctly	• Fuse(s) • Circuitry open • A/C system discharged/low charge • PCM • EATC module • EMTC module • A/C clutch relay • A/C compressor clutch air gap • A/C pressure transducer • Evaporator discharge temperature sensor • A/C clutch field coil • Battery junction	• Go To Pinpoint Test K .

	box (BJB)	
• The A/C is always on	• Circuitry shorted • PCM • EATC module • EMTC module • A/C clutch relay • A/C compressor clutch air gap • A/C pressure transducer • Evaporator discharge temperature sensor • A/C clutch field coil	• Go To Pinpoint Test L .
• Temperature control is inoperative/does not operate correctly	• Circuitry open/shorted • EMTC module • EATC module • Temperature blend door is binding or stuck • Temperature blend door actuator	• Go To Pinpoint Test M .
• The blower motor is inoperative — EMTC	• Fuse(s) • Circuitry open • A/C blower motor switch • Blower motor relay • A/C blower motor • EMTC module • BJB	• Go To Pinpoint Test N .
• The blower motor does not operate correctly — EMTC	• Circuitry open/shorted • A/C blower motor resistor • A/C blower motor switch	• Go To Pinpoint Test O .
• The blower motor is inoperative — EATC	• Fuse(s) • Circuitry short/open • Blower motor relay • A/C blower motor • EATC module • A/C blower motor speed control • BJB	• Go To Pinpoint Test P .
• The blower motor does not operate correctly — EATC	• Circuitry open/shorted • A/C blower motor speed control • EATC module	• Go To Pinpoint Test Q .
• The auxiliary blower motor is inoperative	• Fuse(s) • Circuitry open • Auxiliary blower motor relay 1 • Auxiliary blower motor resistor • Auxiliary blower motor	• Go To Pinpoint Test R .

	• EMTC module • EATC module	
• The auxiliary blower motor does not operate correctly	• Fuse(s) • Circuitry open/shorted • Auxiliary blower motor relay 1 • Auxiliary blower motor relay 2 • Auxiliary blower motor relay 3 • Auxiliary blower motor resistor • Rear auxiliary control • EMTC module • EATC module	• Go To Pinpoint Test S .
• The temperature control is inoperative/does not operate correctly using the front/rear auxiliary climate controls	• Circuitry open/shorted • Auxiliary blend door actuator • EMTC module • EATC module	• Go To Pinpoint Test T .
• The panel/floor control is inoperative/does not operate correctly using the front/rear auxiliary climate controls	• Circuitry open/shorted • Auxiliary mode door actuator • EMTC module • EATC module	• Go To Pinpoint Test U .
• The temperature, panel/floor and blower motor controls are inoperative/do not operate correctly using the front/rear auxiliary climate controls	• Circuitry open/shorted • Rear auxiliary control • EMTC module • EATC module	• Go To Pinpoint Test V .
• The dual temperature control is inoperative/does not operate correctly	• Temperature blend door/actuator broken/binding • EATC module • Low A/C refrigerant charge	• CHECK that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42 psi), REFER to Fluorescent Dye Leak Detection in this section. CHECK the temperature blend doors/actuators for a binding or broken condition. If no condition is found, INSTALL a new EMTC/EATC module.
• The temperature set point does not repeat after turning the ignition switch OFF	• Fuse • Circuitry short/open • EATC module	• VERIFY smart junction box (SJB) fuse 15 (10A) is OK. If OK, CHECK circuit SBP15 (WH/RD) for a short or open and repair as necessary. If OK, INSTALL a new EATC module.
• The temperature	• EATC module	• If the instrument cluster

display will not switch between Celsius and Fahrenheit	• Instrument cluster (IC) module	does not switch between English and Metric, refer to Section 413-00 and diagnose. • If only the EATC module does not switch between English and Metric, INSTALL a new EATC module.

Pinpoint Tests

Pinpoint Test A: DTC B1251 or DTC B1253 — In-Vehicle Temperature Sensor Open Circuit or Short to Ground

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

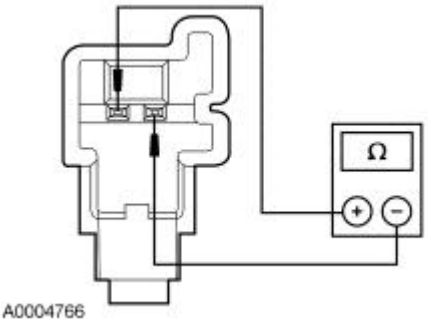
Under normal operation, the in-vehicle air temperature sensor receives a ground from the electronic automatic temperature control (EATC) module through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the in-vehicle air temperature sensor from the EATC module through circuit VH414 (GN/BU).

Possible Causes

- An open in circuit RH111 (GY/BU) or VH414 (GN/BU)
- A short to ground in circuit VH414 (GN/BU)
- A short together in circuit RH111 (GY/BU) and VH414 (GN/BU)
- In-vehicle air temperature sensor
- EATC module

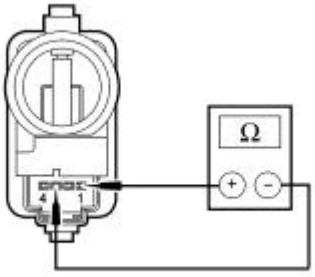
PINPOINT TEST A: DTC B1251 OR DTC B1253 — IN-VEHICLE TEMPERATURE SENSOR OPEN CIRCUIT OR SHORT TO GROUND

Test Step	Result / Action to Take
A1 CHECK THE SENSOR RESISTANCE	
• Key in OFF position. • Disconnect: In-Vehicle Temperature Sensor C233 (Expedition) or C2247 (Navigator). • **NOTE:** Expedition only. • Measure the resistance between in-vehicle temperature sensor C233 terminals.	**Yes** GO to A2 . **No** INSTALL a new in-vehicle temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



A0004766

- **NOTE:** Navigator only.
- Measure the resistance between in-vehicle temperature sensor C2247 terminals.

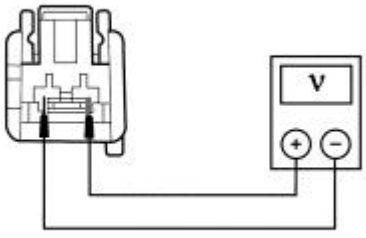


A0047071

- **Is the resistance within the specified values for these temperature ranges: 10-20°C (50-68°F), 37,000-58,000 ohms; 20-30°C (68-86°F), 24,000-37,000 ohms; 30-40°C (86-104°F), 16,000-24,000 ohms?**

A2 CHECK THE EATC SENSOR OUTPUT VOLTAGE

- Key in ON position.
- Press the AUTO button.
- **NOTE:** Expedition only.
- Measure the voltage between in-vehicle temperature sensor C233-1, circuit VH414 (GN/BU) and C233-2, circuit RH111 (GY/BU).

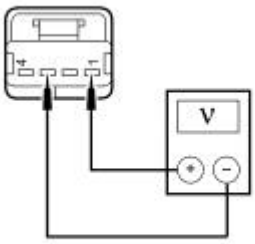


A0001977

- **NOTE:** Navigator only.
- Measure the voltage between in-vehicle temperature sensor C2247-1, circuit VH414 (GN/BU) and C2247-2, circuit RH111 (GY/BU).

Yes
INSTALL a new in-vehicle sensor. If code returns, GO to A7 .

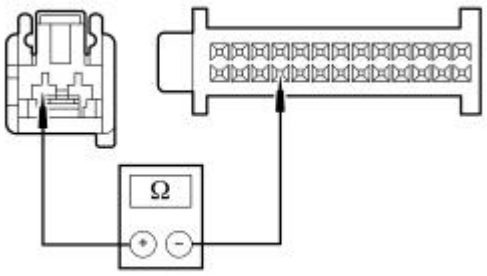
No
If diagnosing DTC B1251, GO to A3 . If diagnosing DTC B1253, GO to A5 .



A0047072

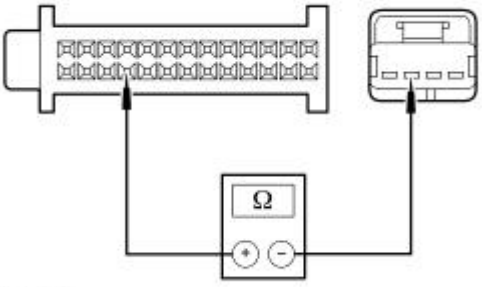
- **Is the voltage between 4.7 and 5.1 volts?**

A3 CHECK CIRCUIT VH414 (GN/BU) FOR AN OPEN	
• Key in OFF position. • Disconnect: EATC Module C228a. • **NOTE:** Expedition only. • Measure the resistance between EATC module C228a-3, circuit VH414 (GN/BU) and in-vehicle temperature sensor C233-1, circuit VH414 (GN/BU).  N0054649 • **NOTE:** Navigator only. • Measure the resistance between EATC module C228a-3, circuit VH414 (GN/BU) and in-vehicle temperature sensor C2247-1, circuit VH414 (GN/BU).  N0054787 • **Is the resistance less than 5 ohms?**	**Yes** GO to A4 . **No** REPAIR circuit VH414 (GN/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A4 CHECK CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• **NOTE:** Expedition only. • Measure the resistance between EATC module C228a-10, circuit RH111 (GY/BU) and in-vehicle temperature sensor C233-2, circuit RH111 (GY/BU).	**Yes** GO to A7 . **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



N0054650

- **NOTE:** Navigator only.
- Measure the resistance between EATC module C228a-10, circuit RH111 (GY/BU) and in-vehicle temperature sensor C2247-3, circuit RH111 (GY/BU).

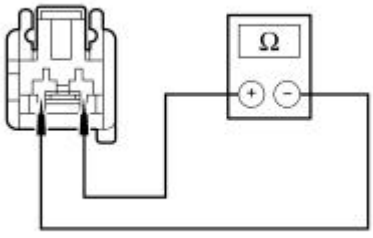


N0054788

- **Is the resistance less than 5 ohms?**

A5 CHECK CIRCUIT VH414 (GN/BU) FOR A SHORT TO CIRCUIT RH111 (GY/BU)

- Key in OFF position.
- Disconnect: EATC Module C228b.
- **NOTE:** Expedition only.
- Measure the resistance between in-vehicle temperature sensor C233-1, circuit VH414 (GN/BU) and C233-2, circuit RH111 (GY/BU).



A0052122

- **NOTE:** Navigator only.
- Measure the resistance between in-vehicle temperature sensor C233-1, circuit VH414 (GN/BU) and C2247-3, circuit RH111 (GY/BU).

Yes
GO to A6 .

No
REPAIR circuit VH414 (GN/BU) for a short to circuit RH111 (GY/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 A0047075 • **Is the resistance greater than 10,000 ohms?**	
A6 CHECK CIRCUIT VH414 (GN/BU) FOR A SHORT TO GROUND	
• Measure the resistance between EATC module C228a-3, circuit VH414 (GN/BU) and ground.  N0054651 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A7 . **No** REPAIR circuit VH414 (GN/BU) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A7 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EATC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test B: DTC B1255 or DTC B1257 — Ambient Temperature Sensor Open Circuit or Short to Ground

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the ambient air temperature sensor receives a ground from the electronic automatic temperature control (EATC) module through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the ambient air temperature sensor from the EATC module through circuit VH407 (YE/GN).

Possible Causes

- An open in circuit RH111 (GY/BU) or VH407 (YE/GN)
- A short to ground in circuit VH407 (YE/GN)
- A short together in circuit RH111 (GY/BU) and VH407 (YE/GN)
- Ambient air temperature sensor
- EATC module

PINPOINT TEST B: DTC B1255 OR DTC B1257 — AMBIENT TEMPERATURE SENSOR OPEN CIRCUIT OR SHORT TO GROUND

Test Step	Result / Action to Take
B1 CHECK THE SENSOR RESISTANCE	
• Key in OFF position. • Disconnect: Ambient Temperature Sensor C132. • Measure the resistance between the ambient temperature sensor C132 terminals.  A0013640 • **Is the resistance within the specified values for these temperature ranges: 10-20°C (50-68°F), 37,000-58,000 ohms; 20-30°C (68-86°F), 24,000-37,000 ohms; 30-40°C (86-104°F), 16,000-24,000 ohms?**	**Yes** GO to B2 . **No** INSTALL a new in-vehicle temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B2 CHECK THE EATC SENSOR OUTPUT VOLTAGE	
• Key in ON position. • Press the AUTO button. • Measure the voltage between ambient temperature sensor C132-2, circuit VH407 (YE/GN) and C132-1, circuit RH111 (GY/BU).  A0013641 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new ambient temperature sensor. If code returns, GO to B7 . **No** If diagnosing DTC B1255, GO to B3 . If diagnosing DTC B1257, GO to B5 .
B3 CHECK CIRCUIT VH407 (YE/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: EATC Module C228a. • Measure the resistance between EATC module C228a-2, circuit VH407 (YE/GN) and ambient temperature sensor C132-2, circuit VH407 (YE/GN).	**Yes** GO to B4 . **No** REPAIR circuit VH407

 N0054652 • **Is the resistance less than 5 ohms?**	(YE/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B4 CHECK CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• Measure the resistance between EATC module C228a-10, circuit RH111 (GY/BU) and ambient temperature sensor C132-1, circuit RH111 (GY/BU).  N0054653 • **Is the resistance less than 5 ohms?**	**Yes** GO to B7 . **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B5 CHECK CIRCUIT VH407 (YE/GN) FOR A SHORT TO CIRCUIT RH111 (GY/BU)	
• Key in OFF position. • Disconnect: EATC Module C228a. • Measure the resistance between ambient temperature sensor C132-2, circuit VH407 (YE/GN) and C132-1, circuit RH111 (GY/BU).  N0054654 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B6 . **No** REPAIR circuit VH407 (YE/GN) for a short to circuit RH111 (GY/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B6 CHECK CIRCUIT VH407 (YE/GN) FOR A SHORT TO GROUND	
• Measure the resistance between EATC module C228a-2, circuit VH407 (YE/GN) and ground.	**Yes** GO to B7 . **No** REPAIR circuit VH407 (YE/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal

 • **Is the resistance greater than 10,000 ohms?**	operation.
B7 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EATC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test C: DTC B2796, DTC B2795, DTC B2426 or DTC B2427 — Solar Radiation Sensor Open Circuit or Short to Ground

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the solar radiation sensor receives a ground through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the solar radiation sensor from the electronic automatic temperature control (EATC) module through circuit VH417 (YE/OG) (LH) and circuit VH416 (VT/GY) (RH).

Possible Causes

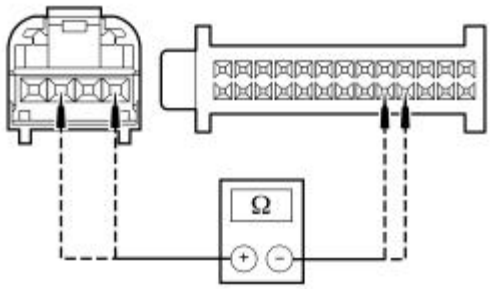
- An open in circuit RH111 (GY/BU), VH416 (VT/GY) or VH417 (YE/OG)
- A short to ground in circuit VH417 (YE/OG) or VH416 (VT/GY)
- A short together in circuit RH111 (GY/BU), VH416 (VT/GY) or VH417 (YE/OG)
- Solar radiation sensor
- EATC module

PINPOINT TEST C: DTC B2796, DTC B2795, DTC B2426 or DTC B2427 — SOLAR RADIATION SENSOR OPEN CIRCUIT OR SHORT TO GROUND

Test Step	Result / Action to Take
C1 CHECK THE SOLAR RADIATION SENSOR	

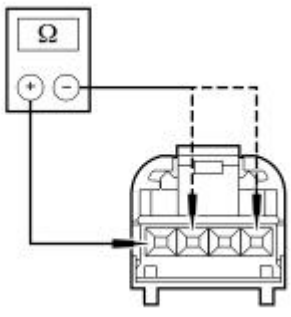
RESISTANCE	
• Key in OFF position. • Disconnect: Solar Radiation Sensor C286. • Measure the resistance between the solar radiation sensor terminals 4 and 1 and between 4 and 3, component side.  N0041877 • **Is continuity present and the resistance greater than 0 ohm?**	**Yes** GO to C2 . **No** INSTALL a new solar radiation sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C2 CHECK THE SOLAR RADIATION SENSOR REFERENCE VOLTAGE	
• Key in ON position. • Press the AUTO button. • Measure the voltage between solar radiation sensor C286-4, circuit RH111 (GY/BU) and solar radiation sensor: ▪ C286-3, circuit VH417 (YE/OG) ▪ C286-1, circuit VH416 (VT/GY)  N0041878 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to C7 . **No** If diagnosing DTC B2796 or DTC B2426, GO to C3 . If diagnosing DTC B2795 or DTC B2427, GO to C5 .
C3 CHECK CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between solar radiation sensor C286-4, circuit RH111 (GY/BU) and EATC module C228a-10, circuit RH111 (GY/BU).  N0054656 • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

C4 CHECK CIRCUIT VH417 (YE/OG) OR CIRCUIT VH416 (VT/GY) FOR AN OPEN	

• Disconnect: EATC Module C228a.
• Measure the resistance between EATC module:.
  ▪ (for DTC 2796) C228a-5, circuit VH417 (YE/OG) and solar radiation sensor C286-3, circuit VH417 (YE/OG)
  ▪ (for DTC 2726) C228a-4, circuit VH416 (VT/GY) and solar radiation sensor C286-1, circuit VH416 (VT/GY)
  	


N0054657
• **Is the resistance less than 5 ohms?**
	Yes
	GO to C7 .
	
	No
	REPAIR circuit VH416 (VT/GY) or circuit VH417 (YE/OG) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

C5 CHECK CIRCUIT VH417 (YE/OG) OR CIRCUIT VH416 (VT/GY) FOR A SHORT TO CIRCUIT RH111 (GY/BU)	

• Key in OFF position.
• Disconnect: EATC Module C228a.
• Measure the resistance between solar radiation sensor C286-4, circuit RH111 (GY/BU) and solar radiation sensor:
  ▪ (for DTC 2795) C286-3, circuit VH417 (YE/OG)
  ▪ (for DTC 2427) C286-1, circuit VH416 (VT/GY)
  	


N0054658
• **Is the resistance less than 5 ohms?**
	Yes

	No
	REPAIR circuits VH417 (YE/OG) and VH416 (VT/GY) for a short to circuit RH111 (GY/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

C6 CHECK CIRCUIT VH416 (VT/GY) AND VH417 (YE/OG) FOR A SHORT TO GROUND	

• Measure the resistance between ground and solar radiation sensor:
  ▪ (for DTC 2795) C286-3, circuit VH417 (YE/OG)
  ▪ (for DTC 2427) C286-1, circuit VH416 (VT/GY)
	Yes
	GO to C7 .
	
	No
	REPAIR circuit VH416 (VT/GY) or VH417 (YE/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0041881 • **Is the resistance greater than 10,000 ohms?**	
C7 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EATC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR The DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: DTC B2411 or DTC B2412 — A/C Humidity Sensor Open Circuit or Short to Ground

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the A/C humidity sensor is grounded through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the A/C humidity sensor from the electronic automatic temperature control (EATC) module through circuit VH413 (WH/BU). The EATC module receives the humidity value through circuit LH115 (WH).

Possible causes

- An open in circuit RH111 (GY/BU), VH413 (WH/BU) or LH115 (WH)
- A short together in circuit RH111 (GY/BU) and LH115 (WH)
- A short to ground in circuit LH115 (WH)
- A short to voltage in circuit VH413 (WH/BU)
- A/C humidity sensor
- EATC module

PINPOINT TEST D: DTC B2411 OR DTC B2412 — A/C HUMIDITY SENSOR OPEN CIRCUIT, SHORT TO GROUND OR FAILURE

Test Step	Result / Action to Take
D1 CHECK THE A/C HUMIDITY SENSOR VOLTAGE INPUT	

• Key in OFF position. • Disconnect: A/C Humidity Sensor C2247. • Key in ON position. • Press the AUTO button on the EATC module. • Measure the voltage between A/C humidity sensor C2247-2, circuit VH413 (WH/BU) and ground.  A0047094 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to D4 . **No** GO to D2 .
D2 CHECK CIRCUIT VH413 (WH/BU) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: EATC Module C228b. • Key in ON position. • Measure the voltage between A/C humidity sensor C2247-2, circuit VH413 (WH/BU) and ground.  A0047094 • **Is voltage present?**	**Yes** REPAIR circuit VH413 (WH/BU) for a short to voltage. TEST the system for normal operation. **No** GO to D3 .
D3 CHECK CIRCUIT VH413 (WH/BU) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between EATC module C228b-9, circuit VH413 (WH/BU) and A/C humidity sensor C2247-2, circuit VH413 (WH/BU).  N0054659 • **Is the resistance less than 5 ohms?**	**Yes** GO to D10 . **No** REPAIR circuit VH413 (WH/BU) for an open. TEST the system for normal operation.
D4 CHECK THE A/C HUMIDITY SENSOR GROUND	
• Measure the voltage between A/C humidity sensor C2247-2, circuit VH413 (WH/BU) and A/C humidity sensor C2247-3, circuit RH111 (GY/BU).	**Yes** GO to D6 .

 A0047096 • **Is the voltage between 4.7 and 5.1 volts?**	**No** GO to D5 .
D5 CHECK CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• Key in OFF position. • Disconnect: EATC Module C228a. • Measure the resistance between EATC module C228a-10, circuit RH111 (GY/BU) and A/C humidity sensor C2247-3, circuit RH111 (GY/BU).  N0054660 • **Is the resistance less than 5 ohms?**	**Yes** GO to D10 . **No** REPAIR circuit RH111 (GY/BU) for an open. TEST the system for normal operation.
D6 CHECK CIRCUIT LH115 (WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: EATC Module C228b. • Measure the resistance between EATC module C228b-22, circuit LH115 (WH) and A/C humidity sensor C2247-4, circuit LH115 (WH).  N0054661 • **Is the resistance less than 5 ohms?**	**Yes** GO to D7 . **No** REPAIR circuit LH115 (WH) for an open. TEST the system for normal operation.
D7 CHECK CIRCUIT LH115 (WH) FOR A SHORT TO CIRCUIT RH111 (GY/BU)	
• Disconnect: EATC Module C228a. • Measure the resistance between EATC module C228b-22, circuit LH115 (WH) and EATC module C228a-10, circuit RH111 (GY/BU).	**Yes** GO to D8 . **No** REPAIR circuit LH115 (WH) for a short to circuit RH111 (GY/BU). TEST the system for normal operation.

 N0054662 • **Is the resistance greater than 10,000 ohms?**	
D8 CHECK CIRCUIT LH115 (WH) FOR A SHORT TO GROUND	
• Measure the resistance between EATC module C228b-22, circuit LH115 (WH) ground.  N0054663 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D9 . **No** REPAIR circuit LH115 (WH) for a short ground. TEST the system for normal operation.
D9 CHECK THE A/C HUMIDITY SENSOR VOLTAGE OUTPUT	
• Key in ON position. • Measure the voltage between A/C humidity sensor C2247-4, circuit LH115 (WH) and ground by back-probing the sensor.  A0048686 • **Is the voltage between 0.3 and 4.3 volts?**	**Yes** GO to D10 . **No** INSTALL a new A/C humidity sensor. TEST the system for normal operation.
D10 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EATC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded

	connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test E: DTC B2826 or DTC B2827 — Evaporator Temperature Sensor Open Circuit or Short to Ground

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the evaporator discharge air temperature sensor receives a ground from the electronic automatic temperature control (EATC) module through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the evaporator discharge air temperature sensor from the EATC module through circuit VH406 (VT/BN).

Possible Causes

- An open in circuit RH111 (GY/BU) or VH406 (VT/BN)
- A short to ground in circuit VH406 (VT/BN)
- An short together in circuit RH111 (GY/BU) and VH406 (VT/BN)
- Evaporator discharge air temperature sensor
- EATC module

PINPOINT TEST E: DTC B2826 OR DTC B2827 — EVAPORATOR TEMPERATURE SENSOR OPEN CIRCUIT OR SHORT TO GROUND

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>E1 CHECK THE SENSOR RESISTANCE

• Key in OFF position.
• Disconnect: Evaporator Discharge Temperature Sensor C2323.
• Measure the resistance between the evaporator discharge temperature sensor C2323 terminals and compare to the table below.

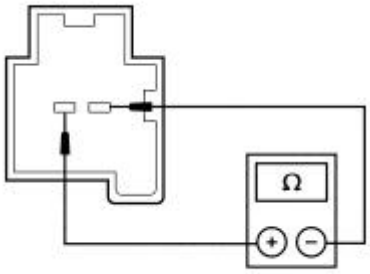
GO to E2 .

No
INSTALL a new in-vehicle temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.</td></tr>
</table>



A0004761

- **Is the resistance within the specified values for the temperatures?**

E2 CHECK THE EATC SENSOR OUTPUT VOLTAGE	
• Key in ON position. • Press the AUTO button. • Measure the voltage between evaporator discharge temperature sensor C2323-1, circuit VH406 (VT/BN) and C2323-2, circuit RH111 (GY/BU).  N0054664 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new evaporator discharge sensor. If code returns, GO to E7 . **No** If diagnosing DTC B1946, GO to E3 . If diagnosing DTC B1947, GO to E5 .
E3 CHECK CIRCUIT VH406 (VT/BN) FOR AN OPEN	
• Key in OFF position. • Disconnect: EATC Module C228a or EMTC Module C294a. • Measure the resistance between EMTC module C294a-6 or EATC module C228a-6, circuit VH406 (VT/BN) and evaporator discharge temperature sensor C2323-1, circuit VH406 (VT/BN).  N0054665 • **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR circuit VH406 (VT/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E4 CHECK CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• Measure the resistance between EMTC module C294a-10 or EATC module C228a-10, circuit RH111 (GY/BU) and evaporator discharge temperature sensor C2323-2, circuit RH111 (GY/BU).	**Yes** GO to E7 . **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR

 N0054666 • **Is the resistance less than 5 ohms?**	the DTCs. REPEAT the self-test. TEST the system for normal operation.
E5 CHECK CIRCUIT VH406 (VT/BN) FOR A SHORT TO CIRCUIT RH111 (GY/BU)	
• Key in OFF position. • Disconnect: EATC Module C228a or EMTC Module C294a. • Measure the resistance between evaporator discharge temperature sensor C2323-1, circuit VH406 (VT/BN) and C2323-2, circuit RH111 (GY/BU).  A0052122 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E6 . **No** REPAIR circuit VH406 (VT/BN) for a short to circuit RH111 (GY/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E6 CHECK CIRCUIT VH406 (VT/BN) FOR A SHORT TO GROUND	
• Measure the resistance between EMTC module C294a-6 or EATC module C228a-6, circuit VH406 (VT/BN) and ground.  N0054667 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E7 . **No** REPAIR circuit VH406 (VT/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E7 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • **NOTE:** EATC systems only. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EMTC or EATC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The

	concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test F: DTC B2268 or DTC B2269 — The Steering Wheel Control Switches are Inoperative/Do Not Operate Correctly

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the steering wheel control switches receive a ground from the electronic automatic temperature control (EATC) module through circuit RH111 (GY/BU). The EATC module senses the resistance (depending on what button is pressed) from the steering wheel control switches through circuit CH447 (YE/GY).

Possible Causes

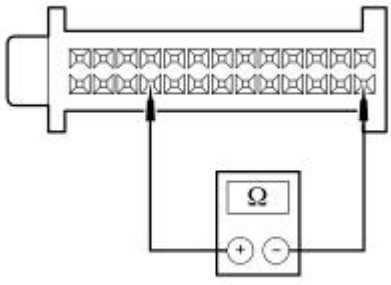
- An open in circuit RH111 (GY/BU) and CH447 (YE/GY)
- A short together in circuit RH111 (GY/BU) or CH447 (YE/GY)
- Steering wheel control switch
- EATC module

PINPOINT TEST F: DTC B2268 OR DTC B2269 — THE STEERING WHEEL CONTROL SWITCHES ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

NOTE: Before carrying out the following test, verify that the vehicle is equipped with, and the module is configured for, redundant steering wheel controls.

Test Step	Result / Action to Take
F1 CHECK THE INPUT TO THE EATC MODULE • Key in OFF position. • Disconnect: EATC Module C228a. • Measure the resistance between EATC module C228a-1, circuit CH447 (YE/GY) and EATC module C228a-10, circuit RH111 (GY/BU).  N0055824 • **Is the resistance reading between 759 and 840 ohms?**	**Yes** GO to F2 . **No** If the resistance is greater than 840 ohms, GO to F5 . If the resistance is less than 759 ohms, GO to F7 .
F2 CHECK THE STEERING WHEEL CONTROL SWITCH OUTPUT	

- Measure the resistance between EATC module C228a-1, circuit CH447 (YE/GY) and EATC module C228a-10, circuit RH111 (GY/BU).



N0055824

- Press each steering wheel control switch and compare the resistance reading to the chart below.

Switch	Resistance (ohms)
None	759-840
TEMP +	101-113
TEMP -	350-388
FAN +	190-211
FAN -	48-54

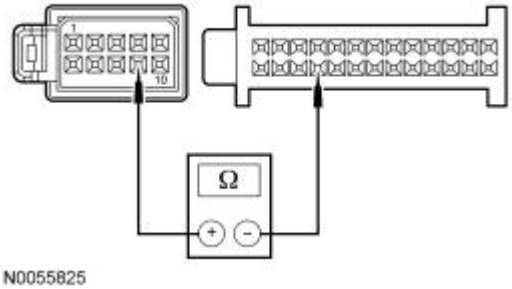
- **Are the resistance readings within the range?**

Yes
GO to F10 .

No
If the TEMP -/TEMP + is incorrect, GO to F3 . If the FAN -/FAN + is incorrect, INSTALL a new LH steering wheel control switch. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

F3 CHECK CIRCUIT RH111 (GY/BU) TO THE RH SWITCH FOR AN OPEN

- **NOTE:** For Navigator only.
- Measure the resistance between EATC module C228a-10, circuit RH111 (GY/BU) and RH steering wheel control switch connector pin 9.

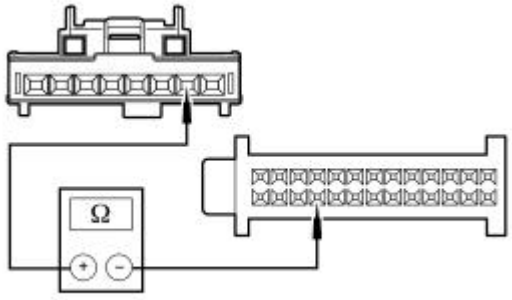


N0055825

- **NOTE:** For Expedition only.
- Measure the resistance between EATC module C228a-10, circuit RH111 (GY/BU) and RH steering wheel control switch connector pin 2.

Yes
GO to F4 .

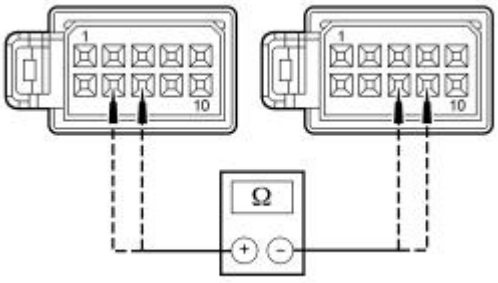
No
REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

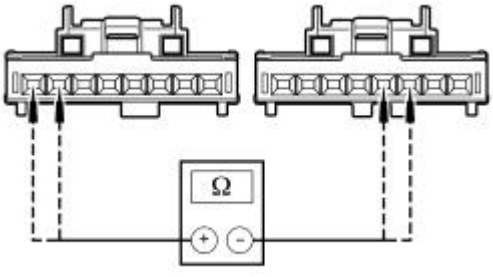


N0061812

- **Is the resistance less than 5 ohms?**

F4 CHECK THE STEERING WHEEL CIRCUITS FOR AN OPEN	

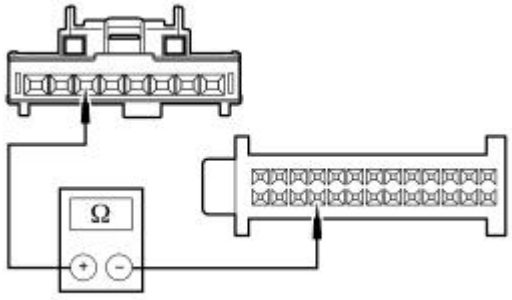
• **NOTE:** For Navigator only.
• Measure the resistance between:
  ▪ RH steering wheel control switch connector pin 7 and LH steering wheel control switch connector pin 8.
  ▪ RH steering wheel control switch connector pin 8 and LH steering wheel control switch connector pin 9.
  	


N0055826
• **NOTE:** For Expedition only.
• Measure the resistance between:
  ▪ RH steering wheel control switch connector pin 4 and LH steering wheel control switch connector pin 7.
  ▪ RH steering wheel control switch connector pin 3 and LH steering wheel control switch connector pin 8.
  	


N0040353
• **Is the resistance less than 5 ohms?**
	Yes
	INSTALL a new RH steering wheel control switch. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	REPAIR steering wheel circuit(s) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

F5 CHECK CIRCUIT CH447 (YE/GY) TO THE LH SWITCH FOR AN OPEN	
• **NOTE:** For Navigator only. • Measure the resistance between EATC module C228a-	**Yes** GO to F6 .

1, circuit CH447 (YE/GY) and the LH steering wheel control switch connector pin 7.  N0055827 • **NOTE:** For Expediton only. • Measure the resistance between EATC module C228a-1, circuit CH447 (YE/GY) and the LH steering wheel control switch connector pin 5.  N0061813 • **Is the resistance less than 5 ohms?**	**No** REPAIR circuit CH447 (YE/GY) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
F6 CHECK CIRCUIT RH111 (GY/BU) TO THE LH SWITCH FOR AN OPEN • **NOTE:** For Navigator only. • Measure the resistance between EATC module C228a-10, circuit RH111 (GY/BU) and LH steering wheel control switch connector pin 10.  N0055828 • **NOTE:** For Expedition only. • Measure the resistance between EATC module C228a-10, circuit RH111 (GY/BU) and LH steering wheel control switch connector pin 6.	**Yes** INSTALL a new LH steering wheel control switch. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



N0061814

- **Is the resistance less than 5 ohms?**

F7 CHECK THE RH STEERING WHEEL CONTROL SWITCH	
• Disconnect: RH Steering Wheel Control Switch. • Measure the resistance between EATC module C228b-1, circuit CH447 (YE/GY) and EATC module C228a-10, circuit RH111 (GY/BU).  N0055824 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new RH steering wheel control switch. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to F8 .
F8 CHECK THE LH STEERING WHEEL CONTROL SWITCH	
• Disconnect: LH Steering Wheel Control Switch. • Measure the resistance between EATC module C228b-1, circuit CH447 (YE/GY) and EATC module C228a-10, circuit RH111 (GY/BU).  N0055824 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to F9 . **No** REPAIR circuit CH447 (YE/GY) for a short to circuit RH111 (GY/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
F9 CHECK THE STEERING WHEEL CIRCUITS FOR A SHORT TOGETHER	

• **NOTE:** For Navigator only.
• Measure the resistance between:
  ▪ RH steering wheel control switch connector pin 7, and RH steering wheel control switch connector pin 8.
  ▪ RH steering wheel control switch connector pin 7, and RH steering wheel control switch connector pin 9.
	Yes
	INSTALL a new LH steering wheel control switch. REFER to Section 415-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

■ RH steering wheel control switch connector pin 8, and RH steering wheel control switch connector pin 9.  N0061815 • **NOTE:** For Expedition only. • Measure the resistance between: ■ RH steering wheel control switch connector pin 4, and RH steering wheel control switch connector pin 3. ■ RH steering wheel control switch connector pin 4, and RH steering wheel control switch connector pin 2. ■ RH steering wheel control switch connector pin 3, and RH steering wheel control switch connector pin 2.  N0061816 • **Are the resistances greater than 10,000 ohms?**	**No** REPAIR the steering wheel circuits for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
F10 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • Carry out the EATC On-Demand Self Test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EATC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs.

Pinpoint Test G: The Air Inlet Door is Inoperative

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

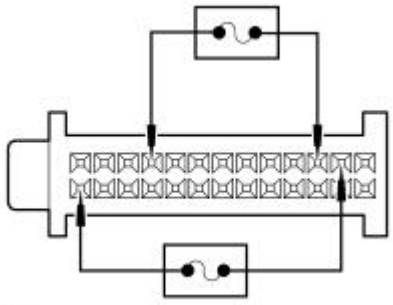
Under normal operation, the air inlet door actuator motors are supplied voltage or ground on circuit CH202 (BU/GN), depending on desired actuator rotation, by the electronic manual temperature control (EMTC) module or electronic automatic temperature control (EATC) module. The EMTC module or EATC module then supplies the appropriate voltage or ground to the other side of the actuator motor on circuit CH203 (GN/BN).

Possible Causes

- An open, short to voltage, ground or together in circuits CH202 (BU/GN) or CH203 (GN/BN)
- Air inlet door actuator
- EATC module
- EMTC module
- Stuck or bound linkage or door

PINPOINT TEST G: THE AIR INLET DOOR IS INOPERATIVE

Test Step	Result / Action to Take
G1 CHECK THE AIR INLET DOOR ACTUATOR CLOCKWISE OPERATION	
• Disconnect: EMTC Module C294a or EATC Module C228a. • Remove the door actuator and disengage the actuator driveshaft from the actuator door. • Mark the door actuator driveshaft position. • Connect a fused jumper wire between EMTC module C294a-15 or EATC module C228a-15, circuit CH203 (GN/BN) and C294a-23 or C228a-23, circuit GD133 (BK). Connect a second fused jumper wire between EMTC module C294a-16 or EATC module C228a-16, circuit CH202 (BU/GN) and C294a-13 or C228a-13, circuit SBP15 (WH/RD).  N0054668 • **Does the actuator motor move in the clockwise direction?**	**Yes** GO to G2 . **No** GO to G3 .
G2 CHECK THE AIR INLET DOOR ACTUATOR COUNTERCLOCKWISE OPERATION	
• Connect a fused jumper wire between EMTC module C294a-15 or EATC module C228a-15, circuit CH203 (GN/BN) and C294a-13 or C228a-13, circuit SBP15 (WH/RD). Connect a second fused jumper wire between EMTC module or EATC module EMTC module C294a-16 or EATC module C228a-16, circuit CH202 (BU/GN) and C294a-23 or C228a-23, circuit GD133 (BK).	**Yes** INSPECT for binding or broken door and linkage. If no condition is found. GO to G10 . **No** GO to G3 .



N0054669

- **Does the actuator motor move in the counterclockwise direction?**

G3 CHECK CIRCUIT CH202 (BU/GN) FOR A SHORT TO GROUND	
• Disconnect: Recirc Door Actuator C2363. • Measure the resistance between ground and EMTC module C294a-16 or EATC module C228a-16, circuit CH202 (BU/GN).  N0054670 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G4 . **No** REPAIR circuit CH202 (BU/GN) for a short to ground. TEST the system for normal operation.
G4 CHECK CIRCUIT CH203 (GN/BN) FOR A SHORT TO GROUND	
• Measure the resistance between ground and EMTC module C294a-15 or EATC module C228a-15, circuit CH203 (GN/BN).  N0054671 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G5 . **No** REPAIR circuit CH203 (GN/BN) for a short to ground. TEST the system for normal operation.
G5 CHECK CIRCUIT CH202 (BU/GN) FOR A SHORT TO POWER	
• Key in ON position. • Measure the voltage between ground and EMTC module C294a-16 or EATC module C228a-16, circuit CH202 (BU/GN).	**Yes** REPAIR circuit CH202 (BU/GN) for a short to power. TEST the system for normal operation. **No** GO to G6 .

 N0054672 • **Is voltage present?**	
G6 CHECK CIRCUIT CH203 (GN/BN) FOR A SHORT TO POWER	
• Measure the voltage between ground and EMTC module C294a-15 or EATC module C228a-15, circuit CH203 (GN/BN).  N0054673 • **Is voltage present?**	**Yes** REPAIR circuit CH203 (GN/BN) for a short to power. TEST the system for normal operation. **No** GO to G7 .
G7 CHECK CIRCUIT CH202 (BU/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between EMTC module C294a-16 or EATC module C228a-16, circuit CH202 (BU/GN) and recirc door actuator C2363-6, circuit CH202 (BU/GN).  N0054674 • **Is the resistance less than 5 ohms?**	**Yes** GO to G8 . **No** REPAIR circuit CH202 (BU/GN) for an open. TEST the system for normal operation.
G8 CHECK CIRCUIT CH203 (GN/BN) FOR AN OPEN	
• Measure the resistance between EMTC module C294a-15 or EATC module C228a-15, circuit CH203 (GN/BN) and recirc door actuator C2363-1, circuit CH203 (GN/BN).	**Yes** GO to G9 . **No** REPAIR circuit CH203 (GN/BN) for an open. TEST the system for normal operation.

 N0054675 • **Is the resistance less than 5 ohms?**	
G9 CHECK CIRCUIT CH203 (GN/BN) FOR A SHORT TO CIRCUIT CH202 (BU/GN)	
• Measure the resistance between EMTC module C294a-15 or EATC module C228a-15, circuit CH203 (GN/BN) and EMTC module C294a-16 or EATC module C228a-16, circuit CH202 (BU/GN).  N0055848 • **Is the resistance less than 5 ohms?**	**Yes** INSPECT for binding or broken linkage. If no condition is found, GO to G11 . **No** REPAIR circuit CH203 (GN/BN) for a short to circuit CH202 (BU/GN). TEST the system for normal operation.
G10 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • **NOTE:** EATC systems only. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EATC or EMTC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G11 CHECK ACTUATOR CONNECTION	

• **NOTE:** NOTE: EATC only.
• Clear the DTCs.
• Disconnect the actuator connector.
• Check for:
  ▪ corrosion.
  ▪ pushed-out connectors.
  ▪ incorrectly seated connector.
• Connect and correctly seat the actuator connector.
	Yes
	INSTALL a new actuator. REFER to Section 412-01 . TEST the system for normal operation.
	
	No

• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • **NOTE:** NOTE: EATC only. • Carry out the EATC On-Demand Self Test. • Operate the system. • **Does the concern return?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs.

Pinpoint Test H: Incorrect/Erratic Direction of Airflow From Outlets

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, to rotate the mode door actuator clockwise, the electronic manual temperature control (EMTC) module or electronic automatic temperature control (EATC) module supplies voltage to the FLOOR/DEFROST/PANEL mode door actuator motor through the circuit CH228 (YE/GY), and supplies ground through circuit CH229 (WH/BU). To rotate the mode door actuator counterclockwise, the EMTC module or EATC module reverses the voltage and ground circuits.

The mode door actuator feedback resistor is supplied a ground from the EMTC module or EATC module through circuit RH111 (GY/BU) and a 5-volt reference voltage on circuit LH111 (BN/WH). The EMTC module or EATC module reads the voltage on the mode door actuator feedback circuit VH436 (YE/VT) to determine the mode door actuator position by the position of the actuator feedback resistor wiper arm.

Possible Causes

- An open, short to voltage, ground or together in circuits CH229 (WH/BU), CH228 (YE/GY), RH111 (GY/BU), LH111 (BN/WH) and VH436 (YE/VT)
- A short to ground in circuits CH229 (WH/BU), CH228 (YE/GY), RH111 (GY/BU), LH111 (BN/WH) and VH436 (YE/VT)
- A short to ground in circuits CH229 (WH/BU), CH228 (YE/GY), LH111 (BN/WH) and VH436 (YE/VT)
- A short to voltage in circuits CH229 (WH/BU), CH228 (YE/GY), LH111 (BN/WH) and VH436 (YE/VT)
- A short together in circuits CH229 (WH/BU), CH228 (YE/GY), RH111 (GY/BU), LH111 (BN/WH) and VH436 (YE/VT)
- Mode door actuator
- EATC module
- EMTC module
- Stuck or bound linkage or door

PINPOINT TEST H: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS

Test Step	Result / Action to Take
H1 CHECK THE AIRFLOW	
• Key in ON position. • Check the airflow in the PANEL, RECIRC, DEFROST and FLOOR modes. • **Is the airflow correct in each setting?**	**Yes** The system is operating normally.

	No GO to H2 . If the RECIRC button does not change the air inlet door position, Go To Pinpoint Test D .
H2 CHECK THE FEEDBACK POTENTIOMETER TOTAL RESISTANCE • Disconnect: EATC Module C228a or EMTC Module C294a. • **NOTE:** EATC only. • Disconnect: RH Temperature Blend Door Actuator C2092. • Disconnect: LH Temperature Blend Door Actuator C2091. • Disconnect: Air Inlet Door Actuator C2363. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU).  N0054676 • **Is the resistance between 16,800 and 25,200 ohms?**	**Yes** GO to H3 . **No** If the resistance is greater than 25,200 ohms, GO to H5 . If the resistance is less than 16,800 ohms, GO to H7 .
H3 CHECK THE POTENTIOMETER LOW SIDE RESISTANCE • Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and EATC module C228a-8 or EMTC module C294a-8, circuit VH436 (YE/VT).  N0054677 • **Are the resistances between 500 and 20,500 ohms?**	**Yes** GO to H4 . **No** If the resistance is greater than 20,500 ohms, GO to H8 . If the resistance is less than 500 ohms, GO to H9 .
H4 CHECK THE POTENTIOMETER HIGH SIDE RESISTANCE • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228a-8 or EMTC module C294a-8, circuit VH436 (YE/VT).  N0054678	**Yes** GO to H11 . **No** If the resistance is greater than 20,500 ohms, INSTALL a new door actuator. TEST the system for normal operation. If the resistance is less than 500 ohms, GO to H10 .

• **Is the resistance between 500 and 20,500 ohms?**	
H5 CHECK CIRCUIT LH111 (BN/WH) FOR AN OPEN	
• Disconnect: Floor/Defrost/Panel Door Actuator C2278. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and floor/defrost/panel door actuator C2278-3, circuit LH111 (BN/WH).  N0054679 • **Is the resistance less than 5 ohms?**	**Yes** GO to H6 . **No** REPAIR circuit LH111 (BN/WH) for an open. TEST the system for normal operation.
H6 CHECK THE ACTUATOR RETURN CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• Measure the resistance between EATC module C228a-10 or EMTC module , circuit RH111 (GY/BU) and floor/defrost/panel door actuator C2278-2, circuit RH111 (GY/BU).  N0054680 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new door actuator. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) for an open. TEST the system for normal operation.
H7 CHECK CIRCUIT RH111 (GY/BU) AND CIRCUIT LH111 (BN/WH) FOR A SHORT TOGETHER	
• Disconnect: Floor/Defrost/Panel Door Actuator C2278. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU).  N0054676 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new door actuator. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) and circuit LH111 (BN/WH) for a short together. TEST the system for normal operation.
H8 CHECK CIRCUIT VH436 (YE/VT) FOR AN OPEN	
• Disconnect: Floor/Defrost/Panel Door Actuator C2278. • Measure the resistance between floor/defrost/panel door actuator, EATC module C228a-8 or EMTC module C294a-8, circuit VH436	**Yes** INSTALL a new door actuator. TEST the

(YE/VT) and floor/defrost/panel door actuator C2278-4, circuit VH436 (YE/VT).  N0054681 • **Is the resistance less than 5 ohms?**	system for normal operation. **No** REPAIR circuit VH436 (YE/VT) for an open. TEST the system for normal operation.
H9 CHECK CIRCUIT RH111 (GY/BU) FOR A SHORT TO CIRCUIT VH436 (YE/VT)	
• Disconnect: Floor/Defrost/Panel Door Actuator C2278. • Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and EATC module C228a-8 or EMTC module C294a-8, circuit VH436 (YE/VT).  N0054677 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new door actuator. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) and circuit VH436 (YE/VT) for a short together. TEST the system for normal operation.
H10 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO CIRCUIT VH436 (YE/VT)	
• Disconnect: Floor/Defrost/Panel Door Actuator C2278. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228a-8 or EMTC module C294a-8, circuit VH436 (YE/VT).  N0054678 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new door actuator. TEST the system for normal operation. **No** REPAIR circuit LH111 (BN/WH) and circuit VH436 (YE/VT) for a short together. TEST the system for normal operation.
H11 CHECK CIRCUIT LH111 (BN/WH) OR CIRCUIT VH436 (YE/VT) FOR A SHORT TO GROUND	

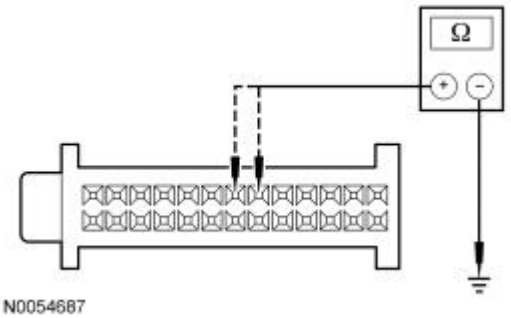
• Disconnect: Floor/Defrost/Panel Door Actuator C2278.
• Measure the resistance between ground and the following:
  ▪ EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH).
  ▪ EATC module C228a-8 or EMTC module C294a-8, circuit VH436 (YE/VT).
	Yes
	GO to H12 .
	
	No
	REPAIR circuit LH111 (BN/WH) or circuit

 N0054682 • **Are the resistances greater than 10,000 ohms?**	VH436 (YE/VT) for a short to ground. TEST the system for normal operation.
H12 CHECK CIRCUIT RH111 (GY/BU) OR CIRCUIT VH436 (YE/VT) FOR A SHORT TO POWER	

• Key in ON position.
• Measure the voltage between ground and the following:
  ▪ EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU).
  ▪ EATC module C228a-8 or EMTC module C294a-8, circuit VH436 (YE/VT).
 N0054683
• **Is voltage present?**
	Yes
	REPAIR circuit RH111 (GY/BU) or circuit VH436 (YE/VT) for a short to power. TEST the system for normal operation.
	
	No
	GO to H13 .

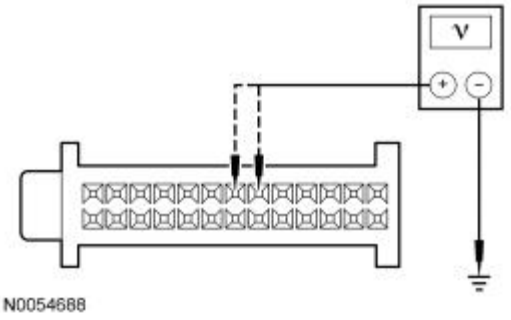
H13 CHECK THE DOOR ACTUATOR CLOCKWISE OPERATION	
• Key in OFF position. • Connect: Floor/Defrost/Panel Door Actuator C2278. • Remove the door actuator and disengage the actuator driveshaft from the actuator door. • Mark the door actuator driveshaft position. • Key in ON position. • Connect a fused jumper wire between EATC module C228a-13 or EMTC module C294a-13, circuit SBP15 (WH/RD) and EATC module C228a-19 or EMTC module C294a-19, circuit CH229 (WH/BU). Connect a second fused jumper wire between EATC module C228a-23 or EMTC module C294a-23, circuit GD133 (BK) and EATC module C228a-20 or EMTC module C294a-20, circuit CH228 (YE/GY).  N0054684	**Yes** GO to H14 . **No** GO to H15 .

• **Does the actuator motor move in the clockwise direction?**	
H14 CHECK THE DOOR ACTUATOR COUNTERCLOCKWISE OPERATION	
• Connect a fused jumper wire between EATC module C228a-23 or EMTC module C294a-23, circuit GD133 (BK) and EATC module C228a-19 or EMTC module C294a-19, circuit CH229 (WH/BU). Connect a second fused jumper wire between EATC module C228a-13 or EMTC module C294a-13, circuit SBP15 (WH/RD) and EATC module C228a-20 or EMTC module C294a-20, circuit CH228 (YE/GY).  N0054685 • **Does the actuator motor move in the counterclockwise direction?**	**Yes** INSPECT for binding or broken door and linkage. If no condition is found, GO to H19 . **No** GO to H15 .
H15 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN	
• Disconnect: Floor/Defrost/Panel Door Actuator C2278. • Measure the resistance between: ▪ EATC module C228a-19 or EMTC module C294a-19, circuit CH229 (WH/BU) and floor/defrost/panel door actuator C2278-1, circuit CH229 (WH/BU). ▪ EATC module C228a-20 or EMTC module C294a-20, circuit CH228 (YE/GY) and floor/defrost/panel door actuator C2278-6, circuit CH228 (YE/GY).  N0054686 • **Are the resistances less than 5 ohms?**	**Yes** GO to H16 . **No** REPAIR the circuit CH228 (YE/GY) or circuit CH229 (WH/BU) for an open. TEST the system for normal operation.
H16 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ▪ EATC module C228a-19 or EMTC module C294a-19, circuit CH229 (WH/BU). ▪ EATC module C228a-20 or EMTC module C294a-20, circuit CH228 (YE/GY).	**Yes** GO to H17 . **No** REPAIR the circuit CH228 (YE/GY) or circuit CH229 (WH/BU) for a short to ground. TEST the system for normal operation.



- **Are the resistances greater than 10,000 ohms?**

H17 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO POWER	

• Key in ON position.
• Measure the voltage between ground and:
  ▪ EATC module C228a-19 or EMTC module C294a-19, circuit CH229 (WH/BU).
  ▪ EATC module C228a-20 or EMTC module C294a-20, circuit CH228 (YE/GY).
  	


• **Is voltage present?**
	Yes
	REPAIR the circuit CH228 (YE/GY) or circuit CH229 (WH/BU) for a short to power. TEST the system for normal operation.
	
	No
	GO to H18 .

H18 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TOGETHER	
• Key in OFF position. • Measure the resistance between EATC module C228a-20 or EMTC module C294a-20, circuit CH228 (YE/GY) and EATC module C228a-19 or EMTC module C294a-19, circuit CH229 (WH/BU).  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSPECT for binding or broken linkage. If no condition is found, INSTALL a new door actuator. TEST the system for normal operation. **No** REPAIR circuit CH228 (YE/GY) and CH229 (WH/BU) for a short together. TEST the system for normal operation.
H19 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • **NOTE:** EATC systems only. • Carry out the EATC on-demand self test. • Operate the system.	**Yes** INSTALL a new EATC or EMTC module. REFER to Section 412-01 . TEST the system for

• **Does the concern return?**	normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test I: The EATC System is Inoperative, Intermittent or Incorrect Operation

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the electronic automatic temperature control (EATC) module receives a ground through circuit GD133 (BK). The EATC module is supplied constant battery voltage through circuit SBP15 (WH/RD) and ignition switched voltage through circuit CBP37 (WH).

NOTE: For a complete explanation of the EATC system functions, refer to Description and Operation in this section.

Possible Causes

- Fuse(s)
- An open in circuit GD133 (BK), SBP15 (WH/RD) or CBP37 (WH)
- EATC module

PINPOINT TEST I: THE EATC SYSTEM IS INOPERATIVE, INTERMITTENT OR INCORRECT OPERATION

Test Step	Result / Action to Take
I1 VERIFY AUTOMATIC OPERATION	
• Key in ON position. • With the engine running, press the AUTO button. • **Does the indicator above the AUTO button illuminate and the selected temperature for both the driver and passenger appear in the display window?**	**Yes** GO to I2 . **No** GO to I11 .
I2 CARRY OUT THE EATC MODULE SELF-TEST	
• Key in ON position. • Carry out the EATC module self-test. Refer to the Electronic Automatic Temperature Control Module Self-Test in this section. Record the DTCs displayed, if any. • **Were any DTCs displayed as a result of the EATC self-test?**	**Yes** REFER to the EATC module Diagnostic Trouble Code (DTC) Index. CARRY OUT the necessary diagnosis and REPAIR as required. **No** GO to I3 .
I3 CHECK THE VACUUM FLUORESCENT DISPLAY	

• Exit self-test by pressing the DEFROST button. Observe the button indicators and function symbols displayed on the vacuum fluorescent display while changing the temperature, blower speed and functions. • **Are the display and indicators correct and complete without any missing elements?**	**Yes** GO to I4 . **No** INSTALL a new EATC module. TEST the system for normal operation.
I4 CHECK THE BLOWER MANUAL OVERRIDE OPERATION	
• Press the blower motor speed override control fully up and fully down. • **Does the blower motor speed increase from low speed to high and high speed to low?**	**Yes** GO to I5 . **No** If the blower motor is inoperative, Go To Pinpoint Test P . If the blower motor does not operate correctly, Go To Pinpoint Test Q .
I5 VERIFY THE DEFROST OVERRIDE OPERATION	
• Press the override button for DEFROST operation. • **Is outside air being discharged from the windshield defroster nozzle and the side window demisters?**	**Yes** GO to I6 . **No** Go To Pinpoint Test H .
I6 VERIFY THE FLOOR OVERRIDE OPERATION	
• Press the override button for FLOOR operation. • **Is outside air being discharged from the floor duct?**	**Yes** GO to I7 . **No** Go To Pinpoint Test H .
I7 VERIFY THE PANEL OVERRIDE OPERATION	
• Press the override button for PANEL operation. • **Is outside air being discharged from the instrument panel registers?**	**Yes** GO to I8 . **No** Go To Pinpoint Test H .
I8 VERIFY THE A/C CLUTCH DOES NOT ENGAGE IN THE PANEL MODE	
• In PANEL operation and the A/C OFF, listen for the compressor clutch to engage. • **Does the A/C clutch engage with the PANEL override button pressed?**	**Yes** Go To Pinpoint Test L . **No** GO to I9 .
I9 VERIFY THE A/C CLUTCH ENGAGEMENT IN THE A/C MODE	
• Make sure the ambient air temperature is above 6°C (43°F). • Press the override button for A/C operation. • **Does the A/C clutch engage when the A/C override button is pressed?**	**Yes** GO to I10 . **No** Go To Pinpoint Test K .
I10 VERIFY THE RECIRC OVERRIDE OPERATION	
• Press the PANEL and RECIRC override buttons. • **Is recirculated air being discharged from the instrument panel registers?**	**Yes** The test is complete. The system is functioning normally.

	No Go To Pinpoint Test G .
I11 CHECK THE EATC MODULE FUNCTIONS • Press each function button and observe the display. • **Does the EATC perform and display any functions?**	**Yes** INSTALL a new EATC module. TEST the system for normal operation. **No** GO to I12 .
I12 CHECK CIRCUIT GD133 (BK) FOR AN OPEN • Key in OFF position. • Disconnect: EATC Module C228a. • Measure the resistance between EATC module C228a-23, circuit GD133 (BK) and ground.  N0054689 • **Is the resistance less than 5 ohms?**	**Yes** GO to I13 . **No** REPAIR circuit GD133 (BK) for an open. TEST the system for normal operation.
I13 CHECK CIRCUIT SBP15 (WH/RD) AND CIRCUIT CBP37 (WH) FOR AN OPEN • Key in ON position. • Measure the voltage between EATC module C228a-13, circuit SBP15 (WH/RD), C228a-12, circuit CBP37 (WH) and ground.  N0054690 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new EATC module. TEST the system for normal operation. **No** VERIFY smart junction box (SJB) fuse 15 (10A) and fuse 37 (10A) is OK. If OK, REPAIR circuit SBP15 (WH/RD) or CBP37 (WH) for an open. TEST the system for normal operation.

Pinpoint Test J: Insufficient, Erratic or No Heat

Normal Operation

Under normal operation, warm coolant flows from the engine through the heater core and back to the engine.

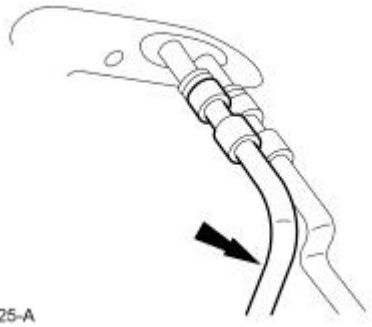
Possible Causes

- Plugged heater core
- Coolant level

- Temperature blend door

PINPOINT TEST J: INSUFFICIENT, ERRATIC OR NO HEAT

Test Step	Result / Action to Take
J1 CHECK FOR CORRECT ENGINE COOLANT LEVEL	
• Key in OFF position. • Check the engine coolant level when hot and cold. • **Is the engine coolant at the correct level (hot/cold) as indicated on the engine coolant recovery reservoir?**	**Yes** GO to J3 . **No** GO to J2 .
J2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS	
• Pressure test the cooling system for leaks. Refer to Section 303-03 . • **Does the engine cooling system leak?**	**Yes** REPAIR the engine coolant leak. TEST the system for normal operation. **No** GO to J3 .
J3 CHECK FOR COOLANT FLOW TO THE HEATER CORE	
WARNING: The heater core inlet hose will become too hot to handle and may cause serious burns if the system is working correctly. • Run the engine until it reaches normal operation temperature. Select the FLOOR position on the control assembly. Set the temperature control to full warm. • Feel the heater core inlet hose to see if it is hot.  GL1024-A • **Is the heater core inlet hose hot?**	**Yes** GO to J4 . **No** REFER to Section 303-03 to check cooling system function.
J4 CHECK FOR A PLUGGED OR RESTRICTED HEATER CORE	
WARNING: The heater core outlet hose will become too hot to handle and may cause serious burns if the system is operating correctly. • Feel the heater core outlet hose to see if it is hot.	**Yes** Go To Pinpoint Test J and diagnose for a blend door actuator. **No** INSTALL a new heater core. TEST the system for normal operation.



- **Is the heater core outlet hose hot?**

Pinpoint Test K: The Air Conditioning (A/C) is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, when A/C is requested, a message is sent over the MSCAN bus to the PCM. Ignition voltage is provided to the A/C clutch relay switch. When the powertrain control module (PCM) energizes the relay, ignition voltage is supplied to the A/C clutch through circuit CH401 (VT/WH). Ground is supplied for the A/C clutch through circuit GD138 (BK/WH).

Possible Causes

- Fuse
- An open in circuits CH401 (VT/WH) or GD138 (BK/WH)
- PCM
- EATC module
- EMTC module
- A/C evaporator discharge temperature sensor
- A/C pressure transducer
- A/C compressor clutch field coil
- A/C control relay
- A/C clutch air gap
- Battery junction box (BJB)

PINPOINT TEST K: THE AIR CONDITIONING (A/C) IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: Some PCM DTCs may inhibit air conditioning (A/C) operation. If any PCM DTCs are retrieved, diagnose those first. Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

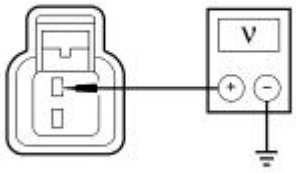
NOTE: Before carrying out the following test, diagnose any instrument cluster DTCs.

NOTE: When disconnecting and reconnecting the pressure transducer electrical connector, make sure that the connector-locking device is in place and that the locking device and connector are correctly and fully seated.

NOTE: Before carrying out the following test, check that the A/C system pressure is above 290 kPa (42

psi). If the pressure is below 290 kPa (42 psi), refer to Fluorescent Dye Leak Detection in this section.

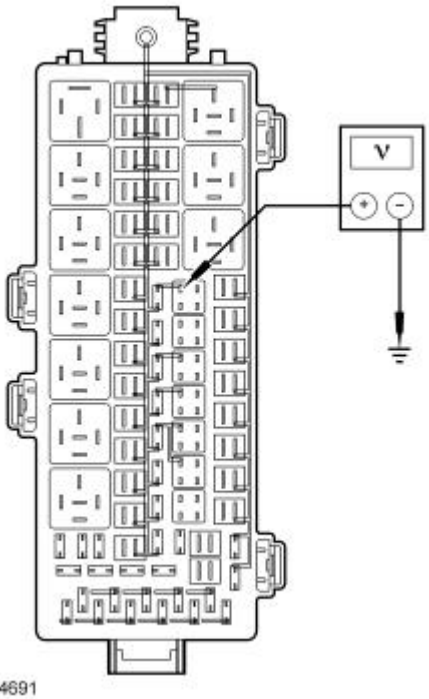
Test Step	Result / Action to Take
K1 CHECK THE A/C PRESSURE PCM PID	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: A/C Pressure PCM PID. • With the manifold gauge set connected, compare the pressure readings of the manifold gauge set and the A/C pressure PID. • **Are the pressure values of the manifold gauge set and the A/C pressure PID similar?**	**Yes** GO to K2. **No** INSTALL a new A/C pressure transducer. TEST the system for normal operation.
K2 CHECK THE A/C SWITCH PID WITH THE A/C ON	
• Enter the following diagnostic mode on the diagnostic tool: PCM A/C Switch PID. • Press the PANEL and A/C manual override buttons on the EATC module or select PANEL mode and press the A/C button on the EMTC module. • **Does the PCM A/C switch PID read ON?**	**Yes** EATC, GO to K3. EMTC, CARRY OUT the A/C evaporator discharge temperature sensor component test in this section. If the sensor tests OK, GO to K4. **No** GO to K10.
K3 CHECK THE A/C EVAPORATOR DISCHARGE TEMPERATURE PID	
• Allow the vehicle exterior and interior to stabilize to an ambient temperature above 16°C (60°F). • Enter the following diagnostic mode on the diagnostic tool: A/C Evaporator Discharge Temperature EATC PID. • **Does the A/C evaporator discharge temperature PID read similar to the ambient temperature?**	**Yes** GO to K4. **No** INSTALL a new A/C evaporator discharge temperature sensor. TEST the system for normal operation.
K4 CHECK THE A/C CLUTCH RELAY PID WITH THE A/C ON	
• Enter the following diagnostic mode on the diagnostic tool: PCM A/C Clutch Relay PID. • **Does the PCM A/C clutch relay PID read ON?**	**Yes** GO to K5. **No** GO to K11.
K5 CHECK THE VOLTAGE AT THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Key in OFF position. • Disconnect: A/C Compressor Clutch Field Coil C100. • Key in ON position. • Press the PANEL and A/C manual override buttons on the EATC module or select MAX A/C on the EMTC module. • Measure the voltage between A/C compressor clutch field coil C100-1, circuit CH401 (VT/WH) and ground.	**Yes** GO to K6. **No** GO to K8.



A0048576

- **Is the voltage greater than 10 volts?**

K6 CHECK THE GROUND AT THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Key in OFF position. • Measure the resistance between A/C compressor clutch field coil C100-2, circuit GD138 (BK/WH) and ground.  N0003086 • **Is the resistance less than 5 ohms?**	**Yes** GO to K7 . **No** REPAIR circuit GD138 (BK/WH) for an open. TEST the system for normal operation.
K7 CHECK THE A/C COMPRESSOR CLUTCH AIR GAP	
• Measure the A/C compressor clutch air gap at 3 equally spaced locations between the clutch hub and the A/C compressor clutch pulley.  A0031504 • **Is the A/C compressor clutch air gap greater than 0.75 mm (0.030 in)?**	**Yes** ADJUST the A/C compressor clutch gap. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new A/C compressor clutch field coil. TEST the system for normal operation.
K8 CHECK THE A/C CLUTCH RELAY FOR VOLTAGE	
• Key in OFF position. • Disconnect: A/C Clutch Relay. • Key in ON position. • Measure the voltage between the A/C clutch relay socket and ground.	**Yes** GO to K9 . **No** VERIFY battery junction box (BJB) fuse 30 (10A) is OK. If OK, INSTALL a new BJB. TEST the system for normal operation.



N0054691

- **Is the voltage greater than 10 volts?**

K9 CHECK CIRCUIT CH401 (VT/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the A/C clutch relay socket, circuit CH401 (VT/WH) and A/C compressor clutch field coil C100-1, circuit CH401 (VT/WH).  N0054692 • **Is the resistance less than 5 ohms?**	**Yes** CARRY OUT the A/C clutch relay component test. If the relay tests OK, GO to K10 . **No** REPAIR circuit CH401 (VT/WH) for an open. TEST the system for normal operation.
K10 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process.	**Yes** INSTALL a new EATC or EMTC module. REFER to Section 412-

• **NOTE:** EATC systems only. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
K11 CHECK THE PCM MODULE CONNECTION	

• Clear the DTCs.
• Disconnect all of the PCM connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out connectors.
  ▪ incorrectly seated connector.
• Connect and correctly seat all of the PCM connectors.
• Operate the system.
• **Does the concern return?**
	Yes
	INSTALL a new PCM. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: The Air Conditioning (A/C) is Always On

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, when A/C is requested, a message is sent over the MSCAN bus to the powertrain control module (PCM). Ignition voltage is provided to the A/C clutch relay switch. When the PCM energizes the relay, ignition voltage is supplied to the A/C clutch through circuit CH401 (VT/WH). Ground is supplied for the A/C clutch through circuit GD138 (BK/WH).

Possible Causes

- An short to voltage on circuit CH401 (VT/WH)
- PCM
- EATC module
- EMTC module
- A/C evaporator discharge temperature sensor
- A/C pressure transducer
- A/C control relay
- A/C clutch air gap

PINPOINT TEST L: THE AIR CONDITIONING (A/C) IS ALWAYS ON

NOTE: Before carrying out the following test, diagnose any PCM or instrument cluster DTCs.

NOTE: When disconnecting and reconnecting the pressure transducer electrical connector, make sure that the connector-locking device is in place and that the locking device and connector are correctly and fully seated.

Test Step	Result / Action to Take
L1 CHECK THE A/C PRESSURE PCM PID • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: A/C Pressure PCM PID. • With the manifold gauge set connected, compare the pressure readings of the manifold gauge set and the A/C pressure PID. • **Are the pressure values of the manifold gauge set and the A/C pressure PID similar?**	**Yes** GO to L2 . **No** INSTALL a new A/C pressure transducer. TEST the system for normal operation.
L2 CHECK THE A/C REQUEST PID WITH THE A/C OFF • Enter the following diagnostic mode on the diagnostic tool: PCM A/C Request PID. • **Does the PCM A/C request PID read ON?**	**Yes** EATC, GO to L3 . EMTC, CARRY OUT the A/C evaporator discharge temperature sensor component test in this section. If the sensor tests OK, GO to L4 . **No** GO to L5 .
L3 CHECK THE A/C EVAPORATOR TEMPERATURE PID • Allow the vehicle exterior and interior to stabilize to an ambient temperature above 16°C (60°F). • Enter the following diagnostic mode on the diagnostic tool: A/C Evaporator Discharge Temperature ETC PID. • **Does the A/C evaporator discharge temperature PID read similar to the ambient temperature?**	**Yes** GO to L4 . **No** INSTALL a new A/C evaporator discharge temperature sensor. TEST the system for normal operation.
L4 CHECK THE A/C SWITCH PID WITH THE A/C OFF • Enter the following diagnostic mode on the diagnostic tool: PCM A/C Switch PID. • **Does the PCM A/C switch PID read ON?**	**Yes** GO to L8 . **No** GO to L9 .
L5 CHECK THE A/C CLUTCH RELAY PID WITH THE A/C OFF • Enter the following diagnostic mode on the diagnostic tool: PCM A/C Clutch Relay PID. • **Does the PCM A/C clutch relay PID read ON?**	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to L6 .
L6 CHECK FOR VOLTAGE TO THE A/C COMPRESSOR CLUTCH FIELD COIL • Key in OFF position. • Disconnect: A/C Compressor Clutch Field Coil C100. • Key in ON position. • Select the OFF position on the EMTC module. • Measure the voltage between A/C compressor clutch field coil C100-1, circuit CH401 (VT/WH) and ground.	**Yes** GO to L7 . **No** ADJUST the A/C compressor clutch gap. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation.

 A0048576 • **Is the voltage greater than 10 volts?**	
L7 CHECK CIRCUIT CH401 (VT/WH) FOR A SHORT TO VOLTAGE • Key in OFF position. • Disconnect: A/C Clutch Relay. • Key in ON position. • Measure the voltage between A/C compressor clutch field coil C100-1, circuit CH401 (VT/WH) and ground.  A0048576 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit CH401 (VT/WH) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new A/C clutch relay. CHECK the A/C clutch diode. INSTALL a new diode if necessary. TEST the system for normal operation.
L8 CHECK THE MODULE CONNECTION • Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • **NOTE:** EATC systems only. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EATC or EMTC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

L9 CHECK THE PCM MODULE CONNECTION
• Clear the DTCs.
• Disconnect all of the PCM connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out connectors.
  ▪ incorrectly seated connector.
• Connect and correctly seat all of the PCM connectors.
• Operate the system.
• **Does the concern return?**
	Yes
	INSTALL a new PCM. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test M: Temperature Control is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, to rotate the blend door actuator clockwise, the electronic manual temperature control (EMTC) module or electronic automatic temperature control (EATC) module supplies voltage to the blend door actuator motors through the door actuator feed A circuits, and supplies ground through the door actuator feed B circuits. To rotate the blend door actuator counterclockwise, the EMTC module or EATC module reverses the voltage and ground circuits.

The blend door actuator feedback resistors are supplied a ground from the EMTC module or EATC module by the blend door actuator return circuits and a 5-volt reference voltage on the blend door actuator reference circuits. The EMTC module or EATC module reads the voltage on the blend door actuator feedback circuits to determine the blend door actuator position by the position of the actuator feedback resistor wiper arm.

Door actuator feed A circuits
- LH blend — CH238 (YE/OG)
- RH blend — CH213 (BN/GN)

Door actuator feed B circuits
- LH blend — CH239 (BU/WH)
- RH blend — CH212 (BU/OG)

Door actuator return circuits
- LH blend — RH111 (GY/BU)
- RH blend — RH111 (GY/BU)

Door actuator reference circuits
- LH blend — LH111 (BN/WH)
- RH blend — LH111 (BN/WH)

Door actuator feedback circuits
- LH blend — VH440 (BU/BN)
- RH blend — VH441 (WH/BN)

Possible Causes
- An open, short to voltage, ground or together in door actuator open, close, return, reference or feedback circuits
- Blend door actuator
- EATC module
- EMTC module
- Stuck or bound linkage or door

PINPOINT TEST M: TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

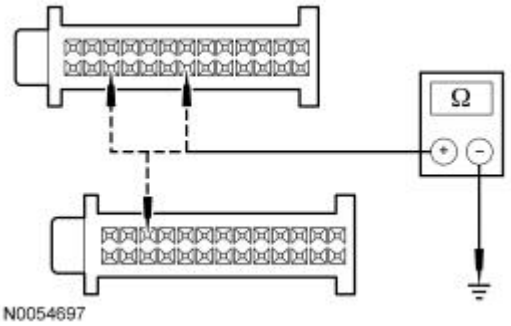
Test Step	Result / Action to Take

M1 CHECK THE FEEDBACK POTENTIOMETER TOTAL RESISTANCE	
• Disconnect: EATC Module C228a or EMTC Module C294a. • Disconnect: EATC Module C228b. • Disconnect: For DTC B2266, RH Temperature Blend Door Actuator C2092. • Disconnect: For DTC B2267, LH Temperature Blend Door Actuator C2091. • Disconnect: Mode Door Actuator C2278. • Disconnect: Air Inlet Door Actuator C2363. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU).  N0054676 • **Is the resistance between 8,400 and 12,600 ohms?**	**Yes** GO to M2 . **No** If the resistance is greater than 12,600 ohms, GO to M4 . If the resistance is less than 8,400 ohms, GO to M6 .
M2 CHECK THE POTENTIOMETER LOW SIDE RESISTANCE	
• Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and the following: ▪ For DTC B2266, EATC module C228a-7 or EMTC module C294a-7, circuit VH440 (BU/BN). ▪ For DTC B2267, EATC module C228b-24, circuit VH441 (WH/BN).  N0054693 • **Are the resistances between 250 and 10,250 ohms?**	**Yes** GO to M3 . **No** If the resistance is greater than 10,250 ohms, GO to M7 . If the resistance is less than 250 ohms, GO to M8 .
M3 CHECK THE POTENTIOMETER HIGH SIDE RESISTANCE	
• Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and the following: ▪ For DTC B2266, EATC module C228a-7 or EMTC module C294a-7, circuit VH440 (BU/BN). ▪ For DTC B2267, EATC module C228b-24, circuit VH441 (WH/BN).	**Yes** GO to M10 . **No** If the resistance is greater than 10,250 ohms, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the resistance is less than 250

 N0054694 • **Are the resistances between 250 and 10,250 ohms?**	ohms, GO to M9 .
M4 CHECK CIRCUIT LH111 (BN/WH) FOR AN OPEN • Disconnect: For DTC B2266, LH Blend Door Actuator C2091. • Disconnect: For DTC B2267, RH Blend Door Actuator C2092. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and the following: ▪ For DTC B2266, LH blend door actuator C2091-3, circuit LH111 (BN/WH). ▪ For DTC B2267, RH blend door actuator C2092-3, circuit LH111 (BN/WH).  N0054679 • **Are the resistances less than 5 ohms?**	**Yes** GO to M5 . **No** REPAIR circuit LH111 (BN/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M5 CHECK THE ACTUATOR RETURN CIRCUIT RH111 (GY/BU) FOR AN OPEN • Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and the following: ▪ For DTC B2266, LH blend door actuator C2091-2, circuit RH111 (GY/BU). ▪ For DTC B2267, RH blend door actuator C2092-2, circuit RH111 (GY/BU).  N0054680 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

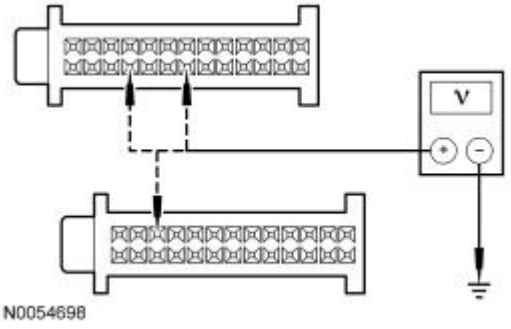
M6 CHECK CIRCUIT RH111 (GY/BU) AND CIRCUIT LH111 (BN/WH) FOR A SHORT TOGETHER	
• Disconnect: For DTC B2266, LH Blend Door Actuator C2091. • Disconnect: For DTC B2267, RH Blend Door Actuator C2092. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU).  N0054676 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) and circuit LH111 (BN/WH) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M7 CHECK CIRCUIT VH441 (WH/BN) OR CIRCUIT VH440 (BU/BN) FOR AN OPEN	
• Disconnect: For DTC B2266, LH Blend Door Actuator C2091. • Disconnect: For DTC B2267, RH Blend Door Actuator C2092. • Measure the resistance between the following: ▪ For DTC B2266, EATC module C228a-7 or EMTC module C294a-7, circuit VH440 (BU/BN) and floor door actuator C2091-4, circuit VH440 (BU/BN). ▪ For DTC B2267, EATC module C228b-24, circuit VH441 (WH/BN) and RH blend door actuator C2092-4, circuit VH441 (WH/BN).  N0054695 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit VH441 (WH/BN) or circuit VH440 (BU/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M8 CHECK CIRCUIT RH111 (GY/BU) FOR A SHORT TO CIRCUIT VH441 (WH/BN) OR CIRCUIT VH440 (BU/BN)	
• Disconnect: For DTC B2266, LH Blend Door Actuator C2091. • Disconnect: For DTC B2267, RH Blend Door Actuator C2092. • Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and the following: ▪ For DTC B2266, EATC module C228a-7 or EMTC module C294a-7, circuit VH440 (BU/BN).	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111

■ For DTC B2267, EATC module C228b-24, circuit VH441 (WH/BN).  • **Is the resistance greater than 10,000 ohms?**	(GY/BU) and circuit VH441 (WH/BN) or circuit VH440 (BU/BN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M9 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO CIRCUIT VH441 (WH/BN) OR CIRCUIT VH440 (BU/BN)	
• Disconnect: For DTC B2266, LH Blend Door Actuator C2091. • Disconnect: For DTC B2267, RH Blend Door Actuator C2092. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and the following: ■ For DTC B2266, EATC module C228a-7 or EMTC module C294a-7, circuit VH440 (BU/BN). ■ For DTC B2267, EATC module C228b-24, circuit VH441 (WH/BN).  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit LH111 (BN/WH) and circuit VH441 (WH/BN) or circuit VH440 (BU/BN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M10 CHECK CIRCUITS LH111 (BN/WH), VH440 (BU/BN), OR VH441 (WH/BN) FOR A SHORT TO GROUND	
• Disconnect: For DTC B2266, LH Blend Door Actuator C2091. • Disconnect: For DTC B2267, RH Blend Door Actuator C2092. • Measure the resistance between ground and the following: ■ EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH). ■ For DTC B2266, EATC module C228a-7 or EMTC module C294a-7, circuit VH440 (BU/BN). ■ For DTC B2267, EATC module C228b-24, circuit VH441 (WH/BN).	**Yes** GO to M11 . **No** REPAIR circuit LH111 (BN/WH), VH441 (WH/BN) or VH440 (BU/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



- **Are the resistances greater than 10,000 ohms?**

M11 CHECK CIRCUITS RH111 (GY/BU), VH440 (BU/BN) OR VH441 (WH/BN) FOR A SHORT TO POWER	

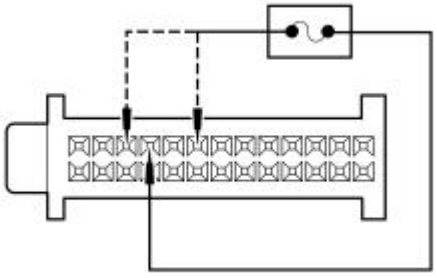
• Key in ON position.
• Measure the voltage between ground and the following:
  ▪ EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU).
  ▪ For DTC B2266, EATC module C228a-7 or EMTC module C294a-7, circuit VH440 (BU/BN).
  ▪ For DTC B2267, EATC module C228b-24, circuit VH441 (WH/BN).
  	


• **Are voltages present?**
	Yes
	REPAIR circuits RH111 (GY/BU), VH441 (WH/BN) or VH440 (BU/BN) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	GO to M12 .

M12 CHECK THE DOOR ACTUATOR CLOCKWISE OPERATION	

• Remove the door actuator and disengage the actuator driveshaft from the actuator door.
• Mark the door actuator driveshaft position.
• Connect a fused jumper wire between EATC module C228a-13 or EMTC module C294a-13, circuit SBP15 (WH/RD) and:
  ▪ For DTC B2266, EATC module C228a-22 or EMTC module C294a-22, circuit CH238 (YE/OG).
  ▪ For DTC B2267, EATC module C228a-26, circuit CH213 (BN/GN).
  	
	Yes
	GO to M13 .
	
	No
	GO to M14 .

- Connect a second fused jumper wire between EATC module C228a-23 or EMTC module C294a-23, circuit GD133 (BK) and:
  - For DTC B2266 or LH blend door actuator, EATC module C228a-21 or EMTC module C294a-21, circuit CH239 (BU/WH).
  - For DTC B2267 or RH blend door actuator, EATC module C228a-24, circuit CH212 (BU/OG).

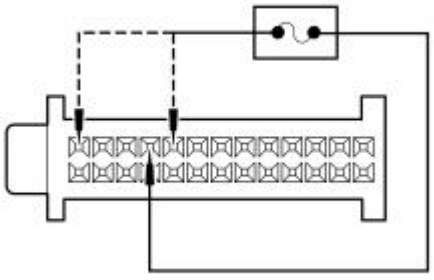


N0054700

- **Does the actuator motor move in the clockwise direction?**

M13 CHECK THE DOOR ACTUATOR COUNTERCLOCKWISE OPERATION

- Connect a fused jumper wire between EATC module C228a-23 or EMTC module C294a-23, circuit GD133 (BK) and :
  - For DTC B2266, EATC module C228a-22 or EMTC module C294a-22, circuit CH238 (YE/OG).
  - For DTC B2267, EATC module C228a-26, circuit CH213 (BN/GN).

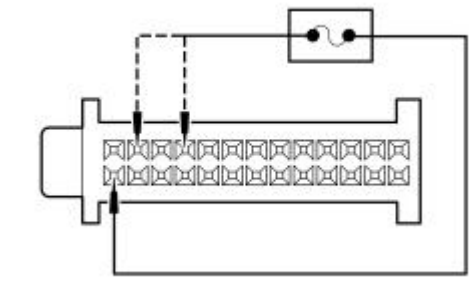


N0054701

- Connect a second fused jumper wire between EATC module C228a-13 or EMTC module C294a-13, circuit SBP15 (WH/RD) and:
  - For DTC B2266, EATC module C228a-21 or EMTC module C294a-21, circuit CH239 (BU/WH).
  - For DTC B2267, EATC module C228b-25, circuit CH212 (BU/OG).

Yes
INSPECT for binding or broken door and linkage. If no condition is found, GO to M18 .

No
GO to M14 .

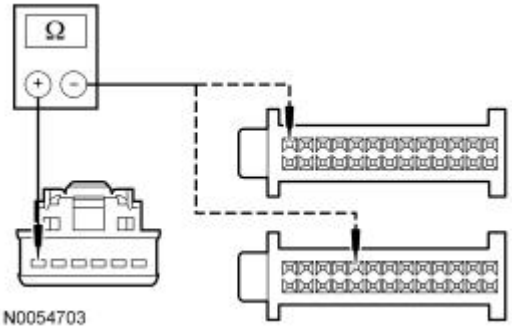


N0054702

- **Does the actuator motor move in the counterclockwise direction?**

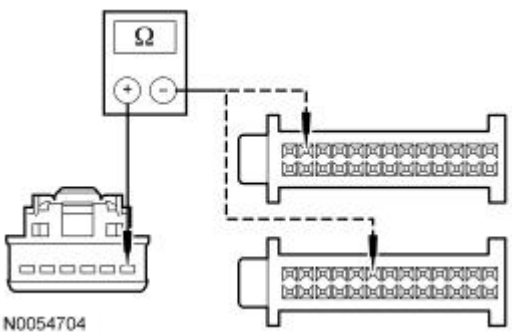
M14 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN

- Disconnect: For DTC B2266, LH Blend Door Actuator C2091.
- Disconnect: For DTC B2267, RH Blend Door Actuator C2092.
- Measure the resistance between:
  - For DTC B2266, EATC module C228a-22 or EMTC module C294a-22, circuit CH238 (YE/OG) and LH blend door actuator C2091-6, circuit CH238 (YE/OG).
  - For DTC B2267, EATC module C228b-26, circuit CH213 (BN/GN) and RH blend door actuator C2092-6, circuit CH213 (BN/GN).



N0054703

- Measure the resistance between:
  - For DTC B2266, EATC module C228a-21 or EMTC module C294a-21, circuit CH239 (BU/WH) and LH blend door actuator C2091-1, circuit CH239 (BU/WH).
  - For DTC B2267, EATC module C228b-25, circuit CH212 (BU/OG) and RH blend door actuator C2092-1, circuit CH212 (BU/OG).



N0054704

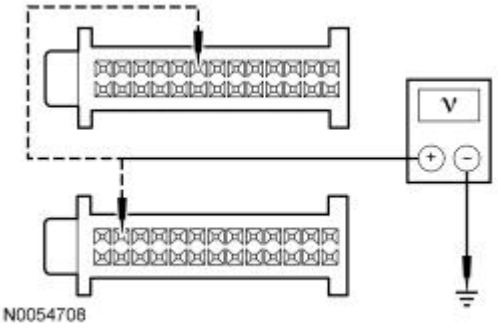
- **Are the resistances less than 5 ohms?**

Yes
GO to M15 .

No
REPAIR the circuit(s) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

M15 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ▪ For DTC B2266, EATC module C228a-22 or EMTC module C294a-22, circuit CH238 (YE/OG). ▪ For DTC B2267, EATC module C228b-26, circuit CH213 (BN/GN).  N0054705 • Measure the resistance between ground and: ▪ For DTC B2266, EATC module C228a-21 or EMTC module C294a-21, circuit CH239 (BU/WH). ▪ For DTC C2267, EATC module C228b-25, circuit CH212 (BU/OG).  N0054706 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to M16 . **No** REPAIR the circuit(s) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M16 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO POWER	
• Key in ON position. • Measure the voltage between ground and: ▪ For DTC B2266, EATC module C228a-22 or EMTC module C294a-22, circuit CH238 (YE/OG). ▪ For DTC C2267, EATC module C228b-26, circuit CH213 (BN/GN).  N0054707 • Measure the voltage between ground and: ▪ For DTC B2266, EATC module C228a-21 or EMTC	**Yes** REPAIR the circuit(s) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to M17 .

module C294a-21, circuit CH239 (BU/WH).
- For DTC C2267, EATC module C228b-25, circuit CH212 (BU/OG).



- **Is voltage present?**

M17 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TOGETHER	
• Key in OFF position. • **NOTE:** For DTC B2266. • Measure the resistance between EATC module C228a-21 or EMTC module C228a-21, circuit CH239 (BU/WH) and EATC module C228a-22 or EMTC module C228a-22, circuit CH238 (YE/OG).  • **NOTE:** For DTC C2267. • Measure the resistance between EATC module C228b-25 or EMTC module C294b-25, circuit CH212 (BU/OG) and EATC module C228b-26 or EMTC module C294b-26, circuit CH213 (BN/GN).  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSPECT for binding or broken linkage. If no condition is found, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit(s) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M18 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • **NOTE:** EATC systems only. • Carry out the EATC on-demand self test. • Operate the system.	**Yes** INSTALL a new EATC or EMTC module. REFER to Section 412-01 . TEST the system for normal operation.

• **Does the concern return?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test N: The Blower Motor is Inoperative — EMTC

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

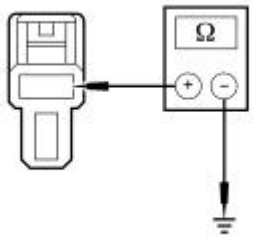
Under normal operation, the blower motor relay coil receives ignition voltage through circuit CBB67 (GN/BN). The coil receives ground from the electronic manual temperature control (EMTC) module through circuit CH123 (VT/GN) if any function selector position but OFF is selected. Voltage is supplied to the relay switch contact. When the relay coil is energized, voltage is delivered to the blower motor through circuit CH402 (YE/GN). Ground for the blower motor is provided through circuit CH430 (VT/OG) from the blower resistor or the blower switch (HI). The blower resistor and blower switch is grounded through circuit GD138 (BK/WH).

Possible Causes

- Fuse(s)
- An open in circuit CH430 (VT/OG), GD138 (BK/WH), CH402 (YE/GN), CH123 (VT/GN) or CBB67 (GN/BN)
- Blower motor
- Blower motor relay
- Blower motor switch
- Battery junction box (BJB)
- EMTC module

PINPOINT TEST N: THE BLOWER MOTOR IS INOPERATIVE — EMTC

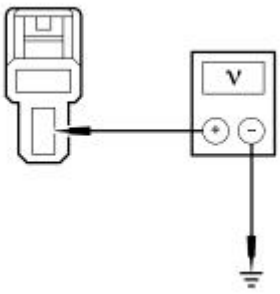
Test Step	Result / Action to Take
N1 CHECK CIRCUIT CH430 (VT/OG) FOR GROUND	
• Disconnect: Blower Motor C288. • Turn the function selector switch to the PANEL position. • Turn the blower motor switch to the HI position. • Measure the resistance between blower motor connector C288-1, circuit CH430 (VT/OG) and ground.	**Yes** GO to N4 . **No** GO to N2 .



N0054711

- **Is the resistance less than 5 ohms?**

N2 CHECK CIRCUIT CH430 (VT/OG) FOR AN OPEN	
• Disconnect: Blower Motor Switch C294b. • Measure the resistance between blower motor switch C294c-2, circuit CH430 (VT/OG) and blower motor C288-1, circuit CH430 (VT/OG).  N0054712 • **Is the resistance less than 5 ohms?**	**Yes** GO to N3 . **No** REPAIR circuit CH430 (VT/OG) for an open. TEST the system for normal operation.
N3 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between blower motor switch C294c-1, circuit GD138 (BK/WH) and ground.  A0040182 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new blower motor switch. TEST the system for normal operation. **No** REPAIR circuit GD138 (BK/WH) for an open. TEST the system for normal operation.
N4 CHECK A/C BLOWER MOTOR CIRCUIT CH402 (YE/GN) FOR VOLTAGE	
• Key in ON position. • Measure the voltage between blower motor connector C288-2, circuit CH402 (YE/GN) and ground.	**Yes** INSTALL a new blower motor. TEST the system for normal operation. **No** GO to N5 .

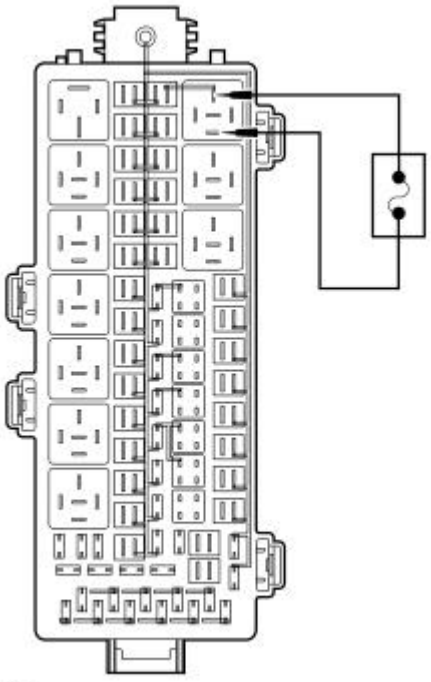


N0054713

- **Is the voltage greater than 10 volts?**

N5 CHECK CIRCUIT CH402 (YE/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Blower Motor Relay. • Measure the resistance between blower motor relay connector pin 87, circuit CH402 (YE/GN) and blower motor C288-2, circuit CH402 (YE/GN).  N0054714 • **Is the resistance less than 5 ohms?**	**Yes** GO to N6 . **No** REPAIR circuit CH402 (YE/GN) for an open. TEST the system for normal operation.

N6 CHECK THE BLOWER MOTOR RELAY	
• Connect: Blower Motor C288. • Key in ON position. • Connect a fused jumper lead between blower motor relay socket pin 30 and pin 87, circuit CH402 (YE/GN).	**Yes** GO to N7 . **No** VERIFY battery junction box (BJB) fuse 24 (40A) is OK. If OK, INSTALL a new BJB. TEST the system for normal operation.



N0054715

- **Does the blower motor operate?**

N7 CHECK THE RELAY COIL SUPPLY VOLTAGE	
• Key in OFF position. • Measure the voltage between blower motor relay socket pin 85, circuit CBB67 (GN/BN) and ground.  N0054716 • **Is the voltage greater than 10 volts?**	**Yes** GO to N8 . **No** VERIFY smart junction box (SJB) fuse 67 (10A) is OK. If OK, REPAIR circuit CBB67 (GN/BN) for an open. TEST the system for normal operation.
N8 CHECK THE BLOWER MOTOR RELAY	
• Key in ON position. • Measure the voltage between blower motor relay socket pin 86, circuit CH123 (VT/GN) and socket pin 85, circuit CBB67 (GN/BN).	**Yes** INSTALL a new blower motor relay. TEST the system for normal operation.

 N0054717 • **Is the voltage greater than 10 volts?**	**No** GO to N9 .
N9 CHECK CIRCUIT CH123 (VT/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: EMTC Module C294a. • Measure the resistance between blower motor relay connector pin 86, circuit CH123 (VT/GN) and EMTC module C294a-24, circuit CH123 (VT/GN).  N0054718 • **Is the resistance less than 5 ohms?**	**Yes** GO to N10 . **No** REPAIR circuit CH123 (VT/GN) for an open. TEST the system for normal operation.
N10 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control	**Yes** INSTALL a new EMTC

(EMTC) Module Cold Boot Process. • Operate the system. • **Does the concern return?**	module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test O: The Blower Motor Does Not Operate Correctly — EMTC

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the blower motor is provided a ground from the blower resistor through circuit CH430 (VT/OG). The resistor gets a ground from circuit GD138 (BK/WH) in the lowest blower setting. In MED-LO and MED-HI the resistor gets a ground from the blower motor switch through circuit CH428 (GN/WH) or CH429 (GY/BN), depending on selected speed. In HI, the blower motor is grounded directly through the blower motor switch from circuit CH430 (VT/OG) to circuit GD138 (BK/WH). The blower switch receives its ground from circuit GD138 (BK/WH).

Possible Causes

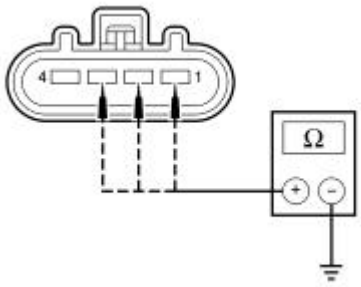
- An open in circuit GD138 (BK/WH), CH428 (GN/WH), CH429 (GY/BN) or CH430 (VT/OG)
- A short to ground in circuit CH428 (GN/WH), CH429 (GY/BN) or CH430 (VT/OG)
- A short together in circuits CH428 (GN/WH), CH429 (GY/BN) or CH430 (VT/OG)
- Blower motor resistor
- Blower motor switch

PINPOINT TEST O: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY — EMTC

Test Step	Result / Action to Take
O1 CHECK THE BLOWER MOTOR OPERATION	
• Key in ON position. • Turn the function selector switch to the FLOOR position. • Select all blower speed positions. • **Does the blower motor operate in any position?**	**Yes** If the blower motor does not operate in HI, GO to O2 . If the blower motor does not operate in MED-HI, GO to O3 . If the blower motor does not operate in MED-LO, GO to O4 . If the blower motor does not operate in LO, GO to O5 . For all other symptoms, GO to O7 .

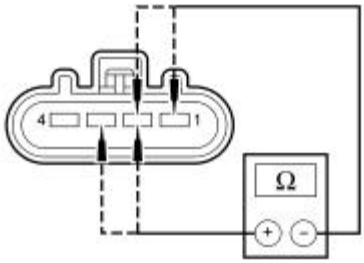
	No Go To Pinpoint Test N .
O2 CHECK CIRCUIT CH430 (VT/OG) FOR AN OPEN	
• Key in OFF position. • Disconnect: Blower Motor Switch C294c. • Disconnect: Blower Motor C288. • Measure the resistance between blower motor switch C294c-2, circuit CH430 (VT/OG) and blower motor C288-1, circuit CH430 (VT/OG).  N0054712 • **Is the resistance less than 5 ohms?**	**Yes** GO to O6 . **No** REPAIR circuit CH430 (VT/OG) for an open. TEST the system for normal operation.
O3 CHECK CIRCUIT CH429 (GY/BN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Blower Motor Switch C294c. • Disconnect: Blower Motor Resistor C2185. • Measure the resistance between blower motor switch C294c-3, circuit CH429 (GY/BN) and blower motor resistor C2185-3, circuit CH429 (GY/BN).  A0071487 • **Is the resistance less than 5 ohms?**	**Yes** GO to O6 . **No** REPAIR circuit CH429 (GY/BN) for an open. TEST the system for normal operation.
O4 CHECK CIRCUIT CH428 (GN/WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: Blower Motor Switch C294c. • Disconnect: Blower Motor Resistor C2185. • Measure the resistance between blower motor switch C294c-4, circuit CH428 (GN/WH) and blower motor resistor C2185-1, circuit CH428 (GN/WH).	**Yes** GO to O6 . **No** REPAIR circuit CH428 (GN/WH) for an open. TEST the system for normal operation.

 A0071488 • **Is the resistance less than 5 ohms?**	
O5 CHECK BLOWER MOTOR RESISTOR GROUND CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between blower motor resistor C2185-4, circuit GD138 (BK/WH) and ground.  A0035320 • **Is the resistance less than 5 ohms?**	**Yes** GO to O6 . **No** REPAIR circuit GD138 (BK/WH) for an open. TEST the system for normal operation.
O6 CHECK THE BLOWER MOTOR RESISTOR	
• Carry out the blower motor resistor component test in this section. • **Does the blower motor resistor test good?**	**Yes** GO to O7 . **No** INSTALL a new blower motor resistor. TEST the system for normal operation.
O7 CHECK THE BLOWER MOTOR SWITCH CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between blower motor switch C294c-1, circuit GD138 (BK/WH) and ground.  A0020414 • **Is the resistance less than 5 ohms?**	**Yes** GO to O8 . **No** REPAIR circuit GD138 (BK/WH) for an open. TEST the system for normal operation.
O8 CHECK CIRCUITS CH430 (VT/OG), CH428 (GN/WH) AND CH429 (GY/BN) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Blower Motor C288.	**Yes** GO to O9 .

• Disconnect: Blower Motor Resistor C2185.
• Place the blower switch in the lowest setting.
• Measure the resistance between ground and blower motor resistor C2185, circuit:
  ▪ CH428 (GN/WH) pin 1
  ▪ CH430 (VT/OG) pin 2
  ▪ CH429 (GY/BN) pin 3
  	


A0051664
• **Are the resistances less than 5 ohms?**
	No
	REPAIR the affected circuit for a short to ground. TEST the system for normal operation.

O9 CHECK THE BLOWER MOTOR CIRCUITS FOR SHORTS TOGETHER	

• Measure the resistance between blower motor resistor C2185:
  ▪ pin 1, circuit CH428 (GN/WH) and pin 2, circuit CH430 (VT/OG).
  ▪ pin 1, circuit CH428 (GN/WH) and pin 3, circuit CH429 (GY/BN).
  ▪ pin 2, circuit CH430 (VT/OG) and pin 3, circuit CH429 (GY/BN).
  	


A0051665
• **Are the resistances greater than 10,000 ohms?**
	Yes
	INSTALL a new blower motor switch. TEST the system for normal operation.
	
	No
	REPAIR the affected circuits. TEST the system for normal operation.

Pinpoint Test P: The Blower Motor is Inoperative — EATC

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

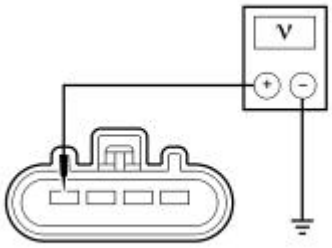
Under normal operation, the blower motor relay coil receives a ground from the electronic automatic temperature control (EATC) module through circuit CH123 (VT/GN). The coil receives ignition voltage through circuit CBB67 (GN/BN). Voltage is supplied to the relay switch contact. When the relay coil is energized, voltage is delivered to the blower motor and the blower motor control module through circuit CH402 (YE/GN). Ground for the motor is provided through circuit VH301 (YE/BU) from the blower control module. Ground for the blower control module is provided by circuit GD138 (BK/WH). The EATC module sends a pulse width modulated signal to the blower control module through circuit VH101 (WH/VT) to control the blower speed.

Possible Causes

- Fuse(s)
- An open in circuit GD138 (BK/WH), CH402 (YE/GN), CH123 (VT/GN), VH301 (YE/BU), VH101 (WH/VT) or CBB67 (GN/BN)
- A short to ground in circuit VH101 (WH/VT)
- A short to voltage in circuit CH123 (VT/GN)
- Blower motor relay
- Blower motor control module
- EATC module
- Blower motor
- Battery junction box (BJB)

PINPOINT TEST P: THE BLOWER MOTOR IS INOPERATIVE — EATC

Test Step	Result / Action to Take
P1 VERIFY THE BLOWER MOTOR OPERATION	
• Key in ON position. • Press the PANEL button on the EATC module. Adjust the blower motor setting to LO and then to HI. • **Is the blower motor inoperative in all settings?**	**Yes** GO to P2 . **No** Go To Pinpoint Test N .
P2 CHECK FOR VOLTAGE TO THE BLOWER MOTOR	
• Key in OFF position. • Disconnect: Blower Motor C288. • Key in ON position. • Measure the voltage between blower motor C288-2, circuit CH402 (YE/GN) and ground.  N0054713 • **Is the voltage greater than 10 volts?**	**Yes** GO to P3 . **No** GO to P9 .
P3 CHECK FOR VOLTAGE TO THE BLOWER MOTOR CONTROLLER	
• Key in OFF position. • Disconnect: Blower Motor Speed Control C297. • Key in ON position. • Measure the voltage between blower motor speed control C297-4, circuit CH402 (YE/GN) and ground.	**Yes** GO to P4 . **No** REPAIR circuit CH402 (YE/GN) for an open. TEST the system for normal operation.

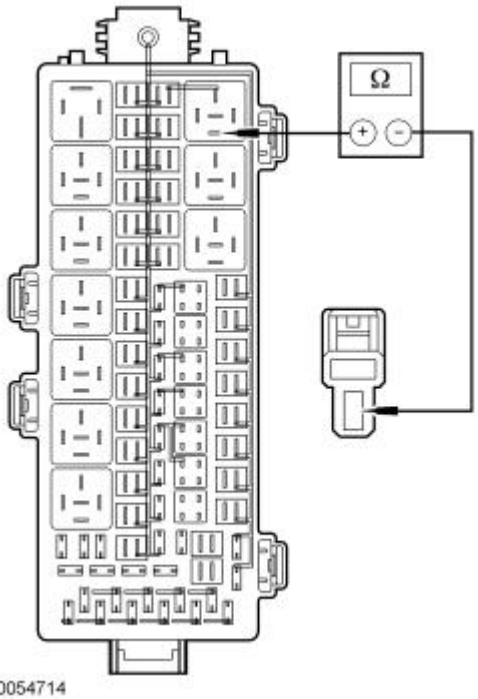


N0001798

- **Is the voltage greater than 10 volts?**

P4 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between blower motor speed control C297-1, circuit GD138 (BK/WH) and ground.  N0001799 • **Is the resistance less than 5 ohms?**	**Yes** GO to P5 . **No** REPAIR circuit GD138 (BK/WH) for an open. TEST the system for normal operation.
P5 CHECK CIRCUIT VH301 (YE/BU) FOR AN OPEN	
• Measure the resistance between blower motor C288-1, circuit VH301 (YE/BU) and blower motor speed control C297-2, circuit VH301 (YE/BU).  N0054719 • **Is the resistance less than 5 ohms?**	**Yes** GO to P6 . **No** REPAIR circuit VH301 (YE/BU) for an open. TEST the system for normal operation.
P6 CHECK THE BLOWER MOTOR	
• Connect: Blower Motor C288. • Connect a fused jumper lead between blower motor speed control C297-2, circuit VH301 (YE/BU) and C297-1, circuit GD138 (BK/WH).	**Yes** GO to P7 . **No** INSTALL a new blower motor. TEST the system for normal operation.

 N0001800 • Key in ON position. • **Does the blower motor operate?**	
P7 CHECK CIRCUIT VH101 (WH/VT) FOR A SHORT TO GROUND	
• Key in OFF position. • Remove the fused jumper lead from blower motor speed control C297. • Disconnect: EATC Module C228b. • Measure the resistance between blower motor speed control C297-3, circuit VH101 (WH/VT) and ground.  N0001801 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P8 . **No** REPAIR circuit VH101 (WH/VT) for a short to ground. TEST the system for normal operation.
P8 CHECK CIRCUIT VH101 (WH/VT) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between blower motor speed control C297-3, circuit VH101 (WH/VT) and EATC module C228b-16, circuit VH101 (WH/VT).  N0054720 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new blower motor speed control. TEST the system for normal operation. If the blower motor is still inoperative, INSTALL a new EATC module. TEST the system for normal operation. **No** REPAIR circuit VH101 (WH/VT) for an open. TEST the system for normal operation.
P9 CHECK CIRCUIT CH402 (YE/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Blower Motor Relay. • Measure the resistance between blower motor relay socket pin 87, circuit CH402 (YE/GN) and blower motor C288-2, circuit CH402 (YE/GN).	**Yes** GO to P10 . **No** REPAIR circuit CH402 (YE/GN) for an open. TEST the system for normal operation.



N0054714

- **Is the resistance less than 5 ohms?**

P10 CHECK THE RELAY COIL SUPPLY VOLTAGE	
• Measure the voltage between blower motor relay socket pin 85, circuit CBB67 (GN/BN) and ground.  N0054716 • **Is the voltage greater than 10 volts?**	**Yes** GO to P11 . **No** VERIFY smart junction box (SJB) fuse 67 (10A) is OK. If OK, REPAIR circuit CBB67 (GN/BN) for an open. TEST the system for normal operation.
P11 CHECK THE RELAY SWITCH POWER CIRCUIT FOR AN OPEN	
• Measure the voltage between blower motor relay socket pin 30 and ground.	**Yes** GO to P12 . **No**

 N0054721 • **Is the voltage greater than 10 volts?**	VERIFY battery junction box (BJB) fuse 24 (40A) is OK. If OK, INSTALL a new BJB. TEST the system for normal operation.
P12 CHECK THE EATC MODULE OUTPUT	
• Key in ON position. • Measure the voltage between blower motor relay socket pin 85, circuit CBB67 (GN/BN) and socket pin 86, circuit CH123 (VT/GN).  N0054717 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new blower motor relay. TEST the system for normal operation. **No** GO to P13 .
P13 CHECK CIRCUIT CH123 (VT/GN) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: EATC Module C228a.	**Yes** REPAIR circuit CH123 (VT/GN)

• Key in ON position. • Measure the voltage between blower motor relay socket pin 86, circuit CH123 (VT/GN) and ground.  N0054722 • **Is voltage present?**	for a short to voltage. TEST the system for normal operation. **No** GO to P14 .
P14 CHECK CIRCUIT CH123 (VT/GN) FOR AN OPEN	
• Measure the resistance between EATC module C228a-24, circuit CH123 (VT/GN) and blower motor relay socket pin 86, circuit CH123 (VT/GN).  N0054723 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new EATC module. TEST the system for normal operation. **No** REPAIR circuit CH123 (VT/GN) for an open. TEST the system for normal operation.

Pinpoint Test Q: The Blower Motor Does Not Operate Correctly — EATC

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

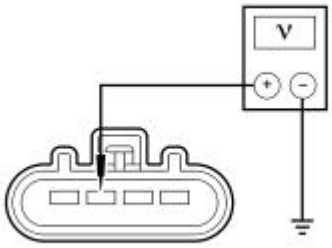
Under normal operation, the blower motor relay coil receives a ground from the electronic automatic temperature control (EATC) module through circuit CH123 (VT/GN). The coil receives ignition voltage through circuit CBB67 (GN/BN). Voltage is supplied to the relay switch contact. When the relay coil is energized, voltage is delivered to the blower motor and the blower motor control module through circuit CH402 (YE/GN). Ground for the motor is provided through circuit VH301 (YE/BU) from the blower control module. Ground for the blower control module is provided by circuit GD138 (BK/WH). The EATC module sends pulse a width modulated signal to the blower control module through circuit VH101 (WH/VT) to control the blower speed.

Possible Causes

- An open in circuit VH101 (WH/VT)
- A short to ground in circuit VH301 (YE/BU) or circuit CH123 (VT/GN)
- A short to voltage in circuit VH101 (WH/VT) or circuit CH402 (YE/GN)
- Blower motor control module
- EATC module

PINPOINT TEST Q: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY — EATC

Test Step	Result / Action to Take
Q1 VERIFY THE BLOWER MOTOR OPERATION • Key in ON position. • Press the PANEL button on the EATC module. Adjust the blower motor setting to LO and then to HI. • **Does the blower motor operate at any setting?**	**Yes** If the blower motor operates always in HI, GO to Q2 . If the blower motor is always ON, GO to Q5 . **No** Go To Pinpoint Test P .
Q2 CHECK CIRCUIT VH301 (YE/BU) FOR A SHORT TO GROUND • Key in OFF position. • Disconnect: Blower Motor Speed Control C297. • Key in ON position. • **Does the blower motor operate?**	**Yes** REPAIR circuit VH301 (YE/BU) for a short to ground. TEST the system for normal operation. **No** GO to Q3 .
Q3 CHECK CIRCUIT VH101 (WH/VT) FOR A SHORT TO VOLTAGE • Key in OFF position. • Disconnect: EATC Module C228b. • Key in ON position. • Measure the voltage between blower motor speed control C297-3, circuit VH101 (WH/VT) and ground.	**Yes** REPAIR circuit VH101 (WH/VT) for a short to voltage. TEST the system for normal operation. **No** GO to Q4 .



N0001804

- **Is voltage present?**

Q4 CHECK CIRCUIT VH101 (WH/VT) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between blower motor speed control C297-3, circuit VH101 (WH/VT) and EATC module C228b-16, circuit VH101 (WH/VT).  N0054724 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new blower motor speed control. TEST the system for normal operation. **No** REPAIR circuit VH101 (WH/VT) for an open. TEST the system for normal operation.
Q5 CHECK THE EATC MODULE OUTPUT	
• Key in OFF position. • Disconnect: Blower Motor Relay. • Key in ON position. • Press the EATC OFF button. • Measure the voltage between blower motor relay socket pin 85, circuit CBB67 (GN/BN) and socket pin 86, circuit CH123 (VT/GN).	**Yes** GO to Q6 . **No** GO to Q7 .

 N0054717 • **Is the voltage greater than 10 volts?**	
Q6 CHECK CIRCUIT CH123 (VT/GN) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: EATC Module C228a. • Measure the resistance between blower motor relay socket pin 86, circuit CH123 (VT/GN) and ground.  N0054725 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Q8 . **No** REPAIR circuit CH123 (VT/GN) for a short to ground. TEST the system for normal operation.
Q7 CHECK CIRCUIT CH402 (YE/GN) FOR A SHORT TO VOLTAGE	
• Key in OFF position.	**Yes**

• Disconnect: Blower Motor C288. • Key in ON position. • Measure the voltage between blower motor C288-2, circuit CH402 (YE/GN) and ground.  N0054713 • **Is the voltage greater than 10 volts?**	REPAIR circuit CH402 (YE/GN) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new blower motor speed control. TEST the system for normal operation. If the blower motor still does not operate correctly, GO to Q8 .
Q8 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EATC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test R: The Auxiliary Blower Motor is Inoperative

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the auxiliary blower motor relay 1 coil receives ignition voltage through circuit CBP46 (WH/BU). The coil receives ground from the electronic automatic temperature control (EATC) module or electronic manual temperature control (EMTC) module through circuit CH112 (VT/WH) if any auxiliary blower speed but OFF is selected. Voltage is supplied to the relay switch contact through circuit SBB11 (BU/RD). When the relay coil is energized, voltage is delivered to the blower motor through circuit CHA05 (BN/WH). Ground for the blower motor is provided through circuit CHA06 (YE/VT) from the blower motor resistor. The blower resistor is grounded through circuit GD151 (BK/GN).

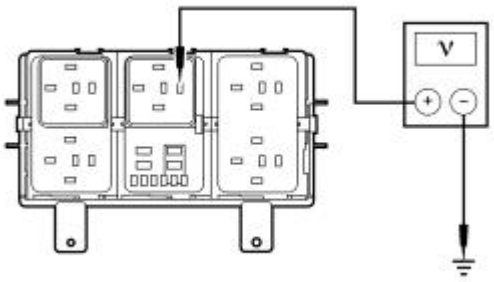
Possible Causes

- Fuse(s)
- An open in circuit SBB11 (BU/RD), CH112 (VT/WH), GD151 (BK/GN), CHA05 (BN/WH), CHA06 (YE/VT) or CBP46 (WH/BU).
- Auxiliary blower motor
- Auxiliary blower motor relay 1
- Auxiliary blower motor resistor
- EATC module

- EMTC module

PINPOINT TEST R: THE AUXILIARY BLOWER MOTOR IS INOPERATIVE

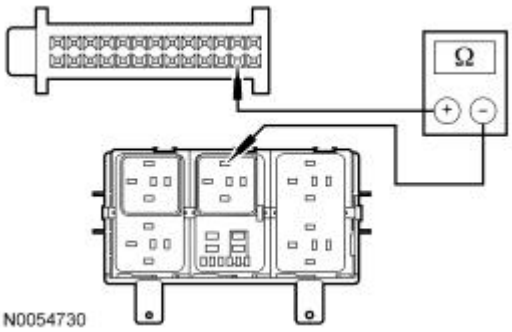
Test Step	Result / Action to Take
R1 CHECK CIRCUIT CHA05 (BN/WH) FOR VOLTAGE • Key in OFF position. • Disconnect: Auxiliary Blower Motor C4106 (Expedition/Navigator) or C4334 (Expedition EL/Navigator L). • Key in ON position. • **NOTE:** Expedition/Navigator only. • Measure the voltage between auxiliary blower motor C4334-1, circuit CHA05 (BN/WH) and ground.  AM0416-A • **NOTE:** Expedition EL/Navigator L only. • Measure the voltage between auxiliary blower motor C4106-2, circuit CHA05 (BN/WH) and ground.  N0054726 • **Is the voltage greater than 10 volts?**	**Yes** GO to R6 . **No** GO to R2 .
R2 CHECK CIRCUIT SBB11 (BU/RD) FOR VOLTAGE • Key in OFF position. • Disconnect: Auxiliary Blower Motor Relay 1. • Key in ON position. • Measure the voltage between the auxiliary blower motor relay 1 socket pin 87, circuit SBB11 (BU/RD) and ground.	**Yes** GO to R3 . **No** VERIFY battery junction box (BJB) fuse 11 (30A) is OK. If OK, REPAIR circuit SBB11 (BU/RD) for an open. TEST the system for normal operation.



N0054727

- **Is the voltage greater than 10 volts?**

R3 CHECK CIRCUIT CBP46 (WH/BU) FOR VOLTAGE	
• Measure the voltage between the auxiliary blower motor relay 1 socket pin 86, circuit CBP46 (WH/BU) and ground.  N0054728 • **Is the voltage greater than 10 volts?**	**Yes** GO to R4 . **No** VERIFY smart junction box (SJB) fuse 46 (7.5A) is OK. If OK, REPAIR circuit CBP46 (WH/BU) for an open. TEST the system for normal operation.
R4 CHECK CIRCUIT CH112 (VT/WH) FOR GROUND	
• With the auxiliary blower on, measure the resistance between the auxiliary blower motor relay 1 socket pin 85, circuit CH112 (VT/WH) and ground.  N0054729 • **Is the resistance less than 5 ohms?**	**Yes** CARRY OUT the relay component test on the auxiliary blower motor relay 1. If OK, REPAIR circuit CHA05 (BN/WH) for an open. TEST the system for normal operation. **No** GO to R5 .
R5 CHECK CIRCUIT CH112 (VT/WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: EATC Module C228b or EMTC Module C294b. • Measure the resistance between EATC module C228b-2 or EMTC module C294b-2, circuit CH112 (VT/WH) and auxiliary blower motor relay 1 socket pin 85, circuit CH112 (VT/WH).	**Yes** GO to R8 . **No** REPAIR circuit CH112 (VT/WH) for an open. TEST the system for normal operation.



- **Is the resistance less than 5 ohms?**

R6 CHECK CIRCUIT CHA06 (YE/VT) FOR GROUND	
• Key in OFF position. • **NOTE:** Expedition/Navigator only. • Measure the resistance between auxiliary blower motor C4334-2, circuit CHA06 (YE/VT) and ground.  • **NOTE:** Expedition EL/Navigator L only. • Measure the resistance between auxiliary blower motor C4106-1, circuit CHA06 (YE/VT) and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new auxiliary blower motor. TEST the system for normal operation. **No** GO to R7 .
R7 CHECK CIRCUIT GD151 (BK/GN) FOR GROUND	
• Key in OFF position. • Disconnect: Auxiliary Blower Motor Resistor C4343 (Expedition/Navigator) or C4107 (Expedition EL/Navigator L). • **NOTE:** Expedition/Navigator only. • Measure the resistance between auxiliary blower motor resistor C4343-4, circuit GD151 (BK/GN) and ground.	**Yes** CARRY OUT the component test on the auxiliary blower motor resistor. If OK, REPAIR circuit CHA06 (YE/VT) for an open. TEST the system for normal operation. **No** REPAIR circuit GD151 (BK/GN) for an open. TEST the system for normal operation.

 AM1809-A • **NOTE:** Expedition EL/Navigator L only. • Measure the resistance between auxiliary blower motor resistor C4107-2, circuit GD151 (BK/GN) and ground.  N0054732 • **Is the resistance less than 5 ohms?**	
R8 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • **NOTE:** EATC only. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EATC or EMTC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR The DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test S: The Auxiliary Blower Motor Does Not Operate Correctly

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, ground for the blower motor is provided through circuit CHA06 (YE/VT) from the blower motor resistor. The blower resistor is grounded through circuit GD151 (BK/GN). The blower motor relay coils are supplied through circuit SBB11 (BU/RD). Blower motor speed is received by the electronic automatic temperature control (EATC) module or electronic manual temperature control (EMTC) module from the rear auxiliary control through circuit VHA17 (VT/GN). Reference voltage for the

blower speed selector resistor is provided by the EMTC or EATC module through circuit LH111 (BN/WH). The auxiliary blower motor relay 1 coil receives ground from the EMTC or EATC module through circuit CH112 (VT/WH) if any blower speed but OFF is selected.

In LO, ground for the blower motor is provided through the blower motor resistor.

In MED-LO, blower motor relay 2 is grounded by the EMTC or EATC module through circuit CH114 (GN/WH). Blower motor ground circuit CHA06 (YE/VT) is connected through one half of the blower motor resistor to circuit CHA08 (GN/OG). Circuit CHA08 (GN/OG) is connected through blower motor speed relay 2 to the blower motor resistor through circuit CHA07 (BU/GY). The blower resistor is grounded through circuit GD151 (BK/GN).

In MED-HI, blower motor relay 3 is grounded by the EMTC or EATC module through circuit CH113 (VT/GY). Blower motor ground circuit CHA06 (YE/VT) is connected through blower motor relay 3 to circuit CHA08 (GN/OG). Circuit CHA08 (GN/OG) is connected through one half of the blower motor resistor to the blower motor resistor to ground circuit GD151 (BK/GN).

In HI, blower motor relays 2 and 3 are grounded by the EMTC or EATC module through circuit CH114 (GN/WH) and CH113 (VT/GY). Blower motor ground circuit CHA06 (YE/VT) is connected through blower motor speed relay 3 to circuit CHA08 (GN/OG). Circuit CHA08 (GN/OG) is connected through blower motor relay 2 to the blower motor resistor ground circuit GD151 (BK/GN) by circuit CHA07 (BU/GY).

Possible Causes

- An open in circuit CH114 (GN/WH), CH113 (VT/GY), SBB11 (BU/RD), CHA08 (GN/OG), CHA07 (BU/GY) or CHA06 (YE/VT)
- A short to ground in circuit CH112 (VT/WH), CH114 (GN/WH), CH113 (VT/GY), CHA06 (YE/VT) or CHA08 (GN/OG)
- A short to voltage in circuit CHA05 (BN/WH)
- A short together in circuits CHA08 (GN/OG), CHA07 (BU/GY) and CHA06 (YE/VT)
- Auxiliary blower motor relay 1
- Auxiliary blower motor relay 3
- Auxiliary blower motor relay 2
- Auxiliary blower motor resistor
- EATC module
- EMTC module

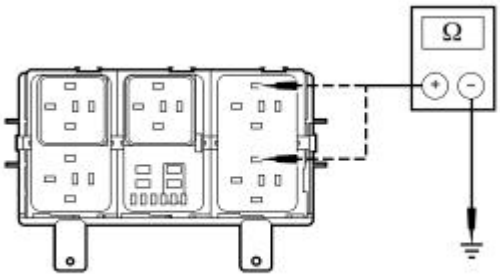
PINPOINT TEST S: THE AUXILIARY BLOWER MOTOR DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
S1 CHECK THE AUXILIARY BLOWER MOTOR OPERATION	
• Key in ON position. • Turn the auxiliary climate controls OFF. • **Is the auxiliary blower motor ON?**	**Yes** CARRY OUT the relay component test on the auxiliary blower motor relay 1. If OK, GO to S2 . **No** GO to S4 .
S2 CHECK CIRCUIT CHA05 (BN/WH) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Auxiliary Blower Motor C4106 (Expedition/Navigator) or C4334 (Expedition EL/Navigator L). • Disconnect: Auxiliary Blower Motor Relay 1 .	**Yes** REPAIR circuit CHA05 (BN/WH) for a short to voltage. TEST the system for normal operation.

• Key in ON position. • Measure the voltage between the auxiliary blower motor relay 1 socket pin 30, circuit CHA05 (BN/WH) and ground.  N0054733 • **Is voltage present?**	**No** GO to S3 .
S3 CHECK CIRCUIT CH112 (VT/WH) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: EATC C228b. • Measure the resistance between ground and auxiliary blower motor relay 1 socket pin 85, circuit CH112 (VT/WH).  N0054729 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S14 . **No** REPAIR circuit CH112 (VT/WH) for a short to ground. TEST the system for normal operation.
S4 CHECK THE AUXILIARY BLOWER MOTOR OPERATION	
• Select all auxiliary blower speeds. • **Is the auxiliary blower motor always 1 speed?**	**Yes** GO to S5 . **No** GO to S6 .
S5 CHECK CIRCUIT CHA06 (YE/VT) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Auxiliary Blower Motor Relay 3. • Disconnect: Auxiliary Blower Motor Resistor C4343 (Expedition/Navigator) or C4107 (Expedition EL/Navigator L). • Measure the resistance between auxiliary blower motor relay 3 socket pin 87, circuit CHA06 (YE/VT) and ground.	**Yes** GO to S14 . **No** REPAIR circuit CHA06 (YE/VT) for a short to ground. TEST the system for normal operation.

 N0054734 • **Is the resistance less than 5 ohms?**	
S6 CHECK THE AUXILIARY BLOWER MOTOR OPERATION • Select all auxiliary blower speeds. • **Is the auxiliary blower motor inoperative in any speed?**	**Yes** CARRY OUT the component test on the auxiliary blower motor resistor. If OK, REPAIR circuit CHA06 (YE/VT) for an open. TEST the system for normal operation. **No** CARRY OUT the relay component test on the auxiliary blower motor relay 2 and 3. If OK, GO to S7.
S7 CHECK CIRCUIT SBB11 (BU/RD) FOR VOLTAGE • Key in OFF position. • Disconnect: Auxiliary Blower Motor Speed Relay 2 and 3. • Key in ON position. • Measure the voltage between the auxiliary blower motor relay 2 and 3 socket pin 86, circuit SBB11 (BU/RD) and ground.  N0054735 • **Is the voltage greater than 10 volts?**	**Yes** GO to S8. **No** REPAIR circuit SBB11 (BU/RD) for an open. TEST the system for normal operation.

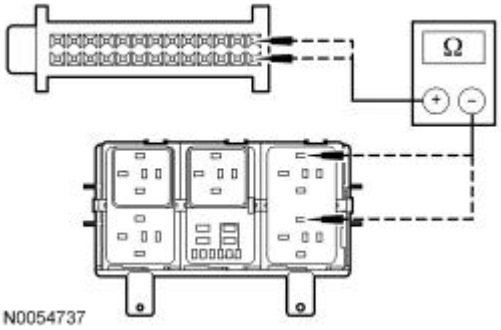
S8 CHECK CIRCUIT CH114 (GN/WH) AND CIRCUIT CH113 (VT/GY) FOR A SHORT TO GROUND
• Key in OFF position.
• Disconnect: EATC Module C228b or EMTC Module C294b.
• Measure the resistance between ground and:
  ▪ auxiliary blower motor relay 3 socket pin 85, circuit CH114 (GN/WH).
  ▪ auxiliary blower motor relay 2 socket pin 85, circuit CH113 (VT/GY).
	Yes
	GO to S9.
	
	No
	REPAIR circuit CH114 (GN/WH) or CH113 (VT/GY) for a short to ground. TEST the system for normal operation.



N0054736

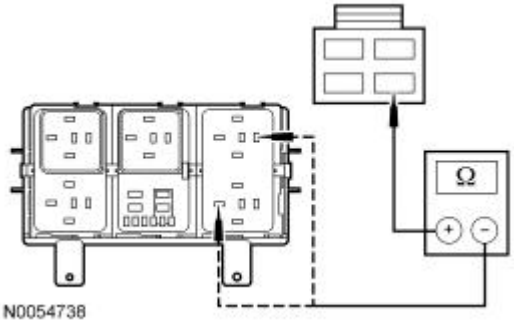
- **Are the resistances greater than 10,000 ohms?**

S9 CHECK CIRCUIT CH114 (GN/WH) AND CIRCUIT CH113 (VT/GY) FOR AN OPEN	

• Measure the resistance between:
  ▪ EATC module C228b-14 or EMTC module C294b-14, circuit CH114 (GN/WH) and auxiliary blower motor relay 3 socket pin 85, circuit CH114 (GN/WH).
  ▪ EATC module C228b-1 or EMTC module C294b-1, circuit CH113 (VT/GY) and auxiliary blower motor relay 2 socket pin 85, circuit CH113 (VT/GY).
  	


N0054737
• **Are the resistances less than 5 ohms?**
	Yes
	GO to S10 .
	
	No
	REPAIR circuit CH114 (GN/WH) or CH113 (VT/GY) for an open. TEST the system for normal operation.

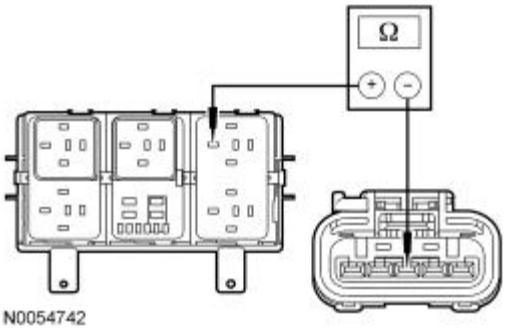
S10 CHECK CIRCUIT CHA08 (GN/OG) FOR AN OPEN	

• Disconnect: Auxiliary Blower Motor Resistor C4343 (Expedition/Navigator) or C4107 (Expedition EL/Navigator L).
• **NOTE:** Expedition/Navigator only.
• Measure the resistance between auxiliary blower motor resistor C4343-3, circuit CHA08 (GN/OG) and:
  ▪ auxiliary blower motor relay 3 socket pin 30, circuit CHA08 (GN/OG).
  ▪ auxiliary blower motor relay 2 socket pin 87, circuit CHA08 (GN/OG).
  	


N0054738
• **NOTE:** Expedition EL/Navigator L only.
	Yes
	GO to S11 .
	
	No
	REPAIR circuit CHA08 (GN/OG) for an open. TEST the system for normal operation.

• Measure the resistance between auxiliary blower motor resistor C4107-4, circuit CHA08 (GN/OG) and: ▪ auxiliary blower motor relay 3 socket pin 30, circuit CHA08 (GN/OG). ▪ auxiliary blower motor relay 2 socket pin 87, circuit CHA08 (GN/OG).  N0054739 • **Are the resistances less than 5 ohms?**	
S11 CHECK CIRCUIT CHA08 (GN/OG) FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ▪ auxiliary blower motor relay 3 socket pin 30, circuit CHA08 (GN/OG). ▪ auxiliary blower motor relay 2 socket pin 87, circuit CHA08 (GN/OG).  N0054740 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S12 . **No** REPAIR circuit CHA08 (GN/OG) for a short to ground. TEST the system for normal operation.
S12 CHECK CIRCUIT CHA07 (BU/GY) FOR AN OPEN	
• **NOTE:** Expedition/Navigator only. • Measure the resistance between auxiliary blower motor resistor C4343-2, circuit CHA07 (BU/GY) and auxiliary blower motor relay 2 socket pin 30, circuit CHA07 (BU/GY).  N0054741 • **NOTE:** Expedition EL/Navigator L only. • Measure the resistance between auxiliary blower motor resistor C4107-3, circuit CHA07 (BU/GY) and auxiliary	**Yes** GO to S13 . **No** REPAIR circuit CHA07 (BU/GY) for an open. TEST the system for normal operation.

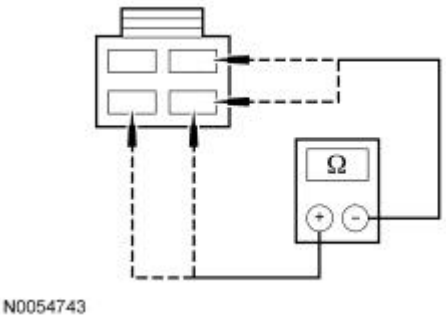
blower motor relay 2 socket pin 30, circuit CHA07 (BU/GY).



- **Is the resistance less than 5 ohms?**

S13 CHECK CIRCUITS CHA08 (GN/OG), CHA07 (BU/GY) AND CHA06 (YE/VT) FOR A SHORT TOGETHER

- **NOTE:** Expedition/Navigator only.
- Measure the resistance between auxiliary blower motor resistor :
  - C4343-1, circuit CHA06 (YE/VT) and auxiliary blower motor resistor C4343-3, circuit CHA08 (GN/OG).
  - C4343-1, circuit CHA06 (YE/VT) and auxiliary blower motor resistor C4343-2, circuit CHA07 (BU/GY).
  - C4343-3, circuit CHA08 (GN/OG) and auxiliary blower motor resistor C4343-2, circuit CHA07 (BU/GY).



- **NOTE:** Expedition EL/Navigator L only.
- Measure the resistance between auxiliary blower motor resistor :
  - C4107-5, circuit CHA06 (YE/VT) and auxiliary blower motor resistor C4107-4, circuit CHA08 (GN/OG).
  - C4107-5, circuit CHA06 (YE/VT) and auxiliary blower motor resistor C4107-3, circuit CHA07 (BU/GY).
  - C4107-4, circuit CHA08 (GN/OG) and auxiliary blower motor resistor C4107-3, circuit CHA07 (BU/GY).

Yes
REPAIR circuit CHA06 (YE/VT) for an open between auxiliary blower motor relay 3 and the auxiliary blower motor resistor. TEST the system for normal operation.

No
REPAIR circuit CHA08 (GN/OG), CHA07 (BU/GY) or CHA06 (YE/VT) for a short together. TEST the system for normal operation.

 N0054744 • **Are the resistances greater than 10,000 ohms?**	
S14 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • **NOTE:** EATC only. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new EATC or EMTC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test T: The Temperature Control is Inoperative/Does Not Operate Correctly Using the Front/Rear Auxiliary Climate Controls

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, to rotate the temperature door actuator clockwise, the electronic manual temperature control (EMTC) or electronic automatic temperature control (EATC) module supplies voltage to the auxiliary temperature door actuator through the circuit CH233 (VT/BN), and supplies ground through circuit CH234 (YE/GN). To rotate the auxiliary temperature door actuator counterclockwise, the EMTC or EATC module reverses the voltage and ground circuits.

The auxiliary temperature door actuator feedback resistor is supplied a ground from the EMTC or EATC module through circuit RH111 (GY/BU) and a 5-volt reference voltage on circuit LH111 (BN/WH). The EMTC or EATC module reads the voltage on the auxiliary temperature door actuator feedback circuit VH439 (GY/VT) to determine the auxiliary temperature door actuator position by the position of the actuator feedback resistor wiper arm.

The auxiliary temperature control is supplied a 5-volt reference through circuit LH111 (BN/WH) and ground through circuit RH111 (GY/BU). When the temperature control is adjusted, the EMTC or EATC receives the signal through circuit VHA15 (YE/GY).

Possible Causes

- An open, short to voltage, ground or together in circuits CH233 (VT/BN), CH234 (YE/GN), RH111

(GY/BU), LH111 (BN/WH) and VH439 (GY/VT)
- A short to ground in circuits CH233 (VT/BN), CH234 (YE/GN), LH111 (BN/WH) and VH439 (GY/VT)
- A short to voltage in circuits CH233 (VT/BN), CH234 (YE/GN), RH111 (GY/BU) and VH439 (GY/VT)
- A short together in circuits CH233 (VT/BN), CH234 (YE/GN), RH111 (GY/BU), LH111 (BN/WH) and VH439 (GY/VT)
- Auxiliary temperature door actuator
- EATC module
- Stuck or bound linkage or door

PINPOINT TEST T: THE TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY USING THE FRONT/REAR AUXILIARY CLIMATE CONTROLS

Test Step	Result / Action to Take
T1 CHECK THE FEEDBACK POTENTIOMETER TOTAL RESISTANCE - Disconnect: EATC Module C228a or EMTC Module C294a. - Disconnect: EATC Module C228b or EMTC Module C294b. - Disconnect: Auxiliary Panel/Floor Door Actuator C3044 (Expedition/Navigator) or C4342 (Expedition EL/Navigator L). - Disconnect: Auxiliary Climate Controls C3198. - Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU).  N0054745 - **Is the resistance between 8,400 and 12,600 ohms?**	**Yes** GO to T2. **No** If the resistance is greater than 12,600 ohms, GO to T4. If the resistance is less than 8,400 ohms, GO to T6.
T2 CHECK THE POTENTIOMETER LOW SIDE RESISTANCE - Measure the resistance between EATC module C228a-10 or EMTC module C294a-10 or EMTC module C294b-18, circuit RH111 (GY/BU) and EATC module C228b-18, circuit VH439 (GY/VT).  N0054746	**Yes** GO to T3. **No** If the resistance is greater than 10,250 ohms, GO to T7. If the resistance is less than 250 ohms, GO to T8.

• **Is the resistance between 250 and 10,250 ohms?**	
T3 CHECK THE POTENTIOMETER HIGH SIDE RESISTANCE	
• Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228b-18 or EMTC module C294b-18, circuit VH439 (GY/VT).  N0054747 • **Is the resistance between 250 and 10,250 ohms?**	**Yes** GO to T10 . **No** If the resistance is greater than 10,250 ohms, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the resistance is less than 250 ohms, GO to T9 .
T4 CHECK CIRCUIT LH111 (BN/WH) FOR AN OPEN	
• Disconnect: Auxiliary Temperature Door Actuator C3004 (Expedition/Navigator) or C4341 (Expedition EL/Navigator L). • **NOTE:** Expedition/Navigator only. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and auxiliary temperature door actuator C3004-6, circuit LH111 (BN/WH).  N0054748 • **NOTE:** Expedition EL/Navigator L only. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and auxiliary temperature door actuator C4341-3, circuit LH111 (BN/WH).  N0054749 • **Is the resistance less than 5 ohms?**	**Yes** GO to T5 . **No** REPAIR circuit LH111 (BN/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
T5 CHECK THE ACTUATOR RETURN CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• **NOTE:** Expedition/Navigator only.	**Yes**

• Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and auxiliary temperature door actuator C3004-5, circuit RH111 (GY/BU).  N0054750 • **NOTE:** Expedition EL/Navigator L only. • Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and auxiliary temperature door actuator C4341-2, circuit RH111 (GY/BU).  N0054751 • **Is the resistance less than 5 ohms?**	INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
T6 CHECK CIRCUIT RH111 (GY/BU) AND CIRCUIT LH111 (BN/WH) FOR A SHORT TOGETHER	
• Disconnect: Auxiliary Temperature Door Actuator C3004 (Expedition/Navigator) or C4341 (Expedition EL/Navigator L). • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU).  N0054745 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) and circuit LH111 (BN/WH) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
T7 CHECK CIRCUIT VH439 (GY/VT) FOR AN OPEN	
• Disconnect: Auxiliary Temperature Door Actuator C3004 (Expedition/Navigator) or C4341 (Expedition EL/Navigator L). • **NOTE:** Expedition/Navigator only. • Measure the resistance between EATC module C228b-18	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal

or EMTC module C294b-18, circuit VH439 (GY/VT) and auxiliary temperature door actuator C3004-1, circuit VH439 (GY/VT).  N0054752 • **NOTE:** Expedition EL/Navigator L only. • Measure the resistance between EATC module C228b-18 or EMTC module C294b-18, circuit VH439 (GY/VT) and auxiliary temperature door actuator C4341-4, circuit VH439 (GY/VT).  N0054753 • **Is the resistance less than 5 ohms?**	operation. **No** REPAIR circuit VH439 (GY/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
T8 CHECK CIRCUIT RH111 (GY/BU) FOR A SHORT TO CIRCUIT VH439 (GY/VT)	
• Disconnect: Auxiliary Temperature Door Actuator C3004 (Expedition/Navigator) or C4341 (Expedition EL/Navigator L). • Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and EATC module C228b-18 or EMTC module C294b-18, circuit VH439 (GY/VT).  N0054746 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) and circuit VH439 (GY/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
T9 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO CIRCUIT VH439 (GY/VT)	
• Disconnect: Auxiliary Temperature Door Actuator C3004 (Expedition/Navigator) or C4341 (Expedition EL/Navigator L). • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal

EATC module C228b-18 or EMTC module C294b-18, circuit VH439 (GY/VT).  N0054747 • **Is the resistance greater than 10,000 ohms?**	operation. **No** REPAIR circuit LH111 (BN/WH) and circuit VH439 (GY/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
T10 CHECK CIRCUIT LH111 (BN/WH) OR CIRCUIT VH439 (GY/VT) FOR A SHORT TO GROUND	
• Disconnect: Auxiliary Temperature Door Actuator C3004 (Expedition/Navigator) or C4341 (Expedition EL/Navigator L). • Measure the resistance between ground and the following: ▪ EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH). ▪ EATC module C228b-18 or EMTC module C294b-18, circuit VH439 (GY/VT).  N0054754 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to T11 . **No** REPAIR circuit LH111 (BN/WH) or circuit VH439 (GY/VT) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
T11 CHECK CIRCUIT RH111 (GY/BU) OR CIRCUIT VH439 (GY/VT) FOR A SHORT TO POWER	
• Key in ON position. • Measure the voltage between ground and the following: ▪ EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU). ▪ EATC module C228b-18 or EMTC module C294b-18, circuit VH439 (GY/VT).  N0054755 • **Are voltages present?**	**Yes** REPAIR circuit RH111 (GY/BU) or VH439 (GY/VT) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to T12 .

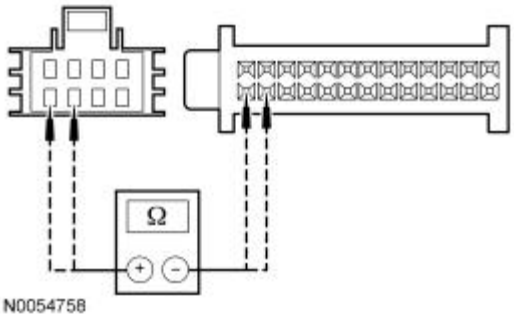
T12 CHECK THE DOOR ACTUATOR CLOCKWISE OPERATION	

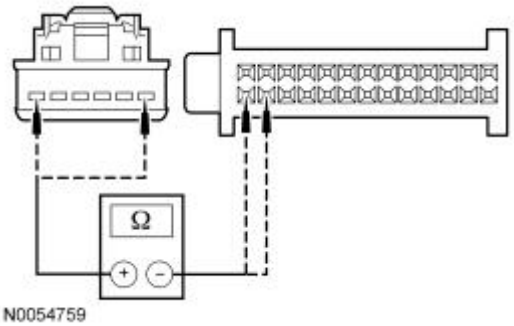
• Key in OFF position.
• Connect: Auxiliary Temperature Door Actuator C3004 (Expedition/Navigator) or C4341 (Expedition EL/Navigator L).
• Remove the door actuator and disengage the actuator driveshaft from the actuator door.
• Mark the door actuator driveshaft position.
• Key in ON position.
• Connect a fused jumper wire between:
  ▪ EATC module C228a-13 or EMTC module C294a-13, circuit SBP15 (WH/RD) and EATC module C228b-13 or EMTC module C294b-13, circuit CH233 (VT/BN).
  ▪ EATC module C228a-23 or EMTC module C294a-23, circuit GD133 (BK) and EATC module C228b-12 or EMTC module C294b-12, circuit CH234 (YE/GN).
 N0054756
• **Does the actuator motor move in the clockwise direction?**
	Yes
	GO to T13 .
	
	No
	GO to T14 .

T13 CHECK THE DOOR ACTUATOR COUNTERCLOCKWISE OPERATION	

• Connect a fused jumper wire between:
  ▪ EATC module C228a-23 or EMTC module C294a-23, circuit GD133 (BK) and EATC module C228b-13 or EMTC module C294b-13, circuit CH233 (VT/BN).
  ▪ EATC module C228a-13 or EMTC module C294a-13, circuit SBP15 (WH/RD) and EATC module C228b-12 or EMTC module C294b-12, circuit CH234 (YE/GN).
 N0054757
• **Does the actuator motor move in the counterclockwise direction?**
	Yes
	INSPECT for binding or broken door and linkage. If no condition is found, GO to T18 .
	
	No
	GO to T14 .

T14 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN	
• Disconnect: Auxiliary Temperature Door Actuator C3004	**Yes**

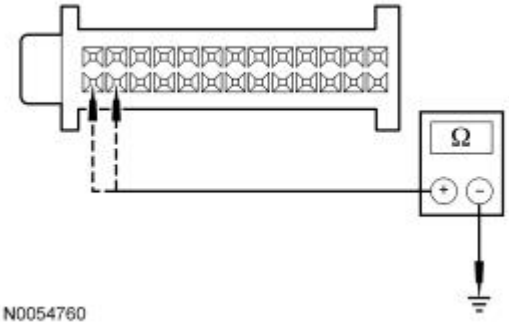
(Expedition/Navigator) or C4341 (Expedition EL/Navigator L).
• **NOTE:** Expedition/Navigator only.
• Measure the resistance between EATC module:
  ▪ C228b-13 or EMTC module C294b-13, circuit CH233 (VT/BN) and auxiliary temperature door actuator C3004-8, circuit CH233 (VT/BN).
  ▪ C228b-12 or EMTC module C294b-12, circuit CH234 (YE/GN) and auxiliary temperature door actuator C3004-7, circuit CH234 (YE/GN).
  	


N0054758
• **NOTE:** Expedition EL/Navigator L only.
• Measure the resistance between EATC module:
  ▪ C228b-13 or EMTC module C294b-13, circuit CH233 (VT/BN) and auxiliary temperature door actuator C4341-6, circuit CH233 (VT/BN).
  ▪ C228b-12 or EMTC module C294b-12, circuit CH234 (YE/GN) and auxiliary temperature door actuator C4341-1, circuit CH234 (YE/GN).
  	


N0054759
• **Are the resistances less than 5 ohms?**
	GO to T15 .
	
	No
	REPAIR the circuit CH233 (VT/BN) or circuit CH234 (YE/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

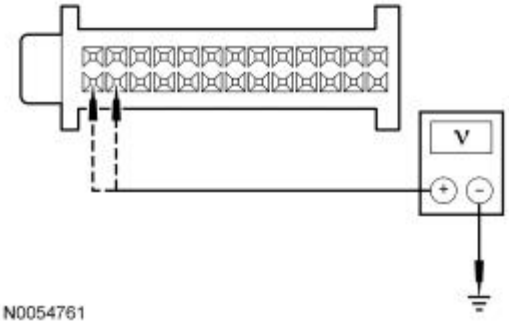
T15 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO GROUND	

• Measure the resistance between ground and EATC module:
  ▪ C228b-13 or EMTC module C294b-13, circuit CH233 (VT/BN).
  ▪ C228b-12 or EMTC module C294b-12, circuit CH234 (YE/GN).
	Yes
	GO to T16 .
	
	No
	REPAIR the circuit CH233 (VT/BN) or circuit CH234 (YE/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



- **Are the resistances greater than 10,000 ohms?**

T16 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO POWER	

• Key in ON position.
• Measure the voltage between ground and EATC module:
  ▪ C228b-13 or EMTC module C294b-13, circuit CH233 (VT/BN).
  ▪ C228b-12 or EMTC module C294b-12, circuit CH234 (YE/GN).
  	


• **Is voltage present?**
	Yes
	REPAIR the circuit CH233 (VT/BN) or CH234 (YE/GN) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
	
	No
	GO to T17 .

T17 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TOGETHER	
• Key in OFF position. • Measure the resistance between EATC module C228b-12 or EMTC module C294b-12, circuit CH234 (YE/GN) and EATC module C228b-13 or EMTC module C294b-13, circuit CH233 (VT/BN).  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSPECT for binding or broken linkage. If no condition is found, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit CH233 (VT/BN) or CH234 (YE/GN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
T18 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • **NOTE:** EATC only. • Carry out the EATC on-demand self test.	**Yes** For EATC systems, INSTALL a new EATC module. REFER to Section 412-01 . TEST the system for normal operation.

• Operate the system. • **Does the concern return?**	For EMTC systems, Go To Pinpoint Test v **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test U: The Panel/Floor Control is Inoperative/Does Not Operate Correctly Using the Front/Rear Auxiliary Climate Controls

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, to rotate the mode door actuator clockwise, the electronic manual temperature control (EMTC) or electronic automatic temperature control (EATC) module supplies voltage to the auxiliary panel/floor door actuator through the circuit CH207 (BU/GY), and supplies ground through circuit CH208 (GN/OG). To rotate the auxiliary panel/floor door actuator counterclockwise, the EMTC or EATC module reverses the voltage and ground circuits.

The auxiliary panel/floor door actuator feedback resistor is supplied a ground from the EMTC or EATC module through circuit RH111 (GY/BU) and a 5-volt reference voltage on circuit LH111 (BN/WH). The EMTC or EATC module reads the voltage on the auxiliary panel/floor door actuator feedback circuit VH438 (GN/VT) to determine the auxiliary panel/floor door actuator position by the position of the actuator feedback resistor wiper arm.

The auxiliary panel/floor control is supplied a 5-volt reference through circuit LH111 (BN/WH) and ground through circuit RH111 (GY/BU). When the panel/floor control is adjusted, the EMTC or EATC receives the signal through circuit VHA15 (YE/GY).

Possible Causes

- An open, short to voltage, ground or together in circuits CH207 (BU/GY), CH208 (GN/OG), RH111 (GY/BU), LH111 (BN/WH) and VH438 (GN/VT)
- A short to ground in circuits CH207 (BU/GY), CH208 (GN/OG), LH111 (BN/WH) and VH438 (GN/VT)
- A short to voltage in circuits CH207 (BU/GY), CH208 (GN/OG), RH111 (GY/BU) and VH438 (GN/VT)
- A short together in circuits CH207 (BU/GY), CH208 (GN/OG), RH111 (GY/BU), LH111 (BN/WH) and VH438 (GN/VT)
- Auxiliary panel/floor door actuator
- EATC module
- Stuck or bound linkage or door

PINPOINT TEST U: THE PANEL/FLOOR CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY USING THE FRONT/REAR AUXILIARY CLIMATE CONTROLS

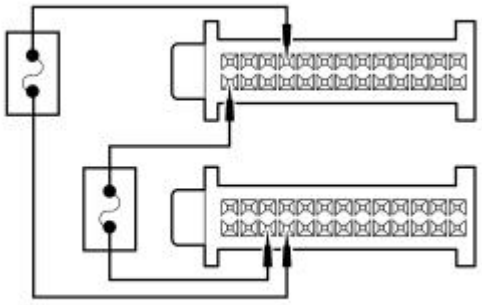
Test Step	Result / Action to Take
U1 CHECK THE FEEDBACK POTENTIOMETER TOTAL RESISTANCE	
• Disconnect: EATC Module C228a or EMTC Module C294a. • Disconnect: EATC Module C228b or EMTC Module C294b. • Disconnect: Auxiliary Temperature Door Actuator C3004 (Expedition/Navigator) or C4341 (Expedition EL/Navigator L). • Disconnect: Auxiliary Climate Controls C3198. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU).  N0054745 • **Is the resistance between 8,400 and 12,600 ohms?**	**Yes** GO to U2 . **No** If the resistance is greater than 12,600 ohms, GO to U4 . If the resistance is less than 8,400 ohms, GO to U6 .
U2 CHECK THE POTENTIOMETER LOW SIDE RESISTANCE	
• Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and EATC module C228b-19 or EMTC module C294b-19, circuit VH438 (GN/VT).  N0054763 • **Is the resistance between 250 and 10,250 ohms?**	**Yes** GO to U3 . **No** If the resistance is greater than 10,250 ohms, GO to U7 . If the resistance is less than 250 ohms, GO to U8 .
U3 CHECK THE POTENTIOMETER HIGH SIDE RESISTANCE	
• Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228b-19 or EMTC module C294b-19, circuit VH438 (GN/VT).  N0054764	**Yes** GO to U10 . **No** If the resistance is greater than 10,250 ohms, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If the resistance is less than 250 ohms, GO to U9 .

• **Is the resistance between 250 and 10,250 ohms?**	
U4 CHECK CIRCUIT LH111 (BN/WH) FOR AN OPEN	
• Disconnect: Auxiliary Panel/Floor Door Actuator C3044 (Expedition/Navigator) or C4342 (Expedition EL/Navigator L). • **NOTE:** Expedition/Navigator only. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and auxiliary panel/floor door actuator C3044-6, circuit LH111 (BN/WH).  N0054765 • **NOTE:** Expedition EL/Navigator L only. • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and auxiliary panel/floor door actuator C4342-2, circuit LH111 (BN/WH).  N0054766 • **Is the resistance less than 5 ohms?**	**Yes** GO to U5 . **No** REPAIR circuit LH111 (BN/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U5 CHECK THE ACTUATOR RETURN CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• **NOTE:** Expedition/Navigator only. • Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and auxiliary panel/floor door actuator C3044-5, circuit RH111 (GY/BU).  N0054767 • **NOTE:** Expedition EL/Navigator L only. • Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

auxiliary panel/floor door actuator C4342-3, circuit RH111 (GY/BU).  N0054768 • **Is the resistance less than 5 ohms?**	
U6 CHECK CIRCUIT RH111 (GY/BU) AND CIRCUIT LH111 (BN/WH) FOR A SHORT TOGETHER	
• Disconnect: Auxiliary Panel/Floor Door Actuator C3044 (Expedition/Navigator) or C4342 (Expedition EL/Navigator L). • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU).  N0054745 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) and circuit LH111 (BN/WH) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U7 CHECK CIRCUIT VH438 (GN/VT) FOR AN OPEN	
• Disconnect: Auxiliary Panel/Floor Door Actuator C3044 (Expedition/Navigator) or C4342 (Expedition EL/Navigator L). • **NOTE:** Expedition/Navigator only. • Measure the resistance between EATC module C228b-19 or EMTC module C294b-19, circuit VH438 (GN/VT) and auxiliary panel/floor door actuator C3044-1, circuit VH438 (GN/VT).  N0054769 • **NOTE:** Expedition EL/Navigator L only. • Measure the resistance between EATC module C228b-19 or EMTC module C294b-19, circuit VH438 (GN/VT) and auxiliary panel/floor door actuator C4342-4, circuit VH438	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit VH438 (GN/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

(GN/VT).  N0054770 • **Is the resistance less than 5 ohms?**	
U8 CHECK CIRCUIT RH111 (GY/BU) FOR A SHORT TO CIRCUIT VH438 (GN/VT)	
• Disconnect: Auxiliary Panel/Floor Door Actuator C3044 (Expedition/Navigator) or C4342 (Expedition EL/Navigator L). • Measure the resistance between EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU) and EATC module C228b-19 or EMTC module C294b-19, circuit VH438 (GN/VT).  N0054763 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) and circuit VH438 (GN/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U9 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO CIRCUIT VH438 (GN/VT)	
• Disconnect: Auxiliary Panel/Floor Door Actuator C3044 (Expedition/Navigator) or C4342 (Expedition EL/Navigator L). • Measure the resistance between EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH) and EATC module C228b-19 or EMTC module C294b-19, circuit VH438 (GN/VT).  N0054771 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit LH111 (BN/WH) and circuit VH438 (GN/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U10 CHECK CIRCUIT LH111 (BN/WH) OR CIRCUIT VH438 (GN/VT) FOR A SHORT TO GROUND	
• Disconnect: Auxiliary Panel/Floor Door Actuator C3044	**Yes**

(Expedition/Navigator) or C4342 (Expedition EL/Navigator L). • Measure the resistance between ground and the following: ▪ EATC module C228a-11 or EMTC module C294a-11, circuit LH111 (BN/WH). ▪ EATC module C228b-19 or EMTC module C294b-19, circuit VH438 (GN/VT).  N0054772 • **Are the resistances greater than 10,000 ohms?**	GO to U11 . **No** REPAIR circuit LH111 (BN/WH) or circuit VH438 (GN/VT) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U11 CHECK CIRCUIT RH111 (GY/BU) OR CIRCUIT VH438 (GN/VT) FOR A SHORT TO POWER	
• Key in ON position. • Measure the voltage between ground and the following: ▪ EATC module C228a-10 or EMTC module C294a-10, circuit RH111 (GY/BU). ▪ EATC module C228b-19 or EMTC module C294b-19, circuit VH438 (GN/VT).  N0054773 • **Are voltages present?**	**Yes** REPAIR circuit RH111 (GY/BU) or circuit VH438 (GN/VT) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to U12 .
U12 CHECK THE DOOR ACTUATOR CLOCKWISE OPERATION	
• Key in OFF position. • Connect: Auxiliary Panel/Floor Door Actuator C3044 (Expedition/Navigator) or C4342 (Expedition EL/Navigator L). • Remove the door actuator and disengage the actuator driveshaft from the actuator door. • Mark the door actuator driveshaft position. • Key in ON position. • Connect a fused jumper wire between: ▪ EATC module C228a-13 or EMTC module C294a-13, circuit SBP15 (WH/RD) and EATC module C228b-11 or EMTC module C294b-11, circuit CH207 (BU/GY). ▪ EATC module C228a-23 or EMTC module C294a-23, circuit GD133 (BK) and EATC module C228b-10 or EMTC module C294b-10, circuit CH208 (GN/OG).	**Yes** GO to U13 . **No** GO to U14 .



N0054774

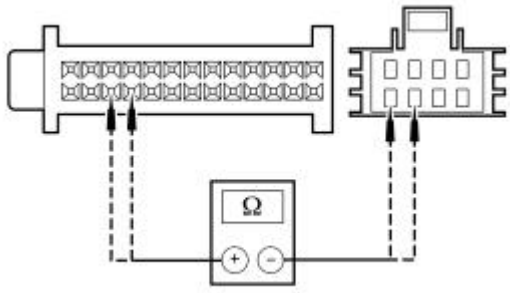
- **Does the actuator motor move in the clockwise direction?**

U13 CHECK THE DOOR ACTUATOR COUNTERCLOCKWISE OPERATION	

• Connect a fused jumper wire between:
  ▪ EATC module C228a-23 or EMTC module C294a-23, circuit GD133 (BK) and EATC module C228b-11 or EMTC module C294b-11, circuit CH207 (BU/GY).
  ▪ EATC module C228a-13 or EMTC module C294a-13, circuit SBP15 (WH/RD) and EATC module C228b-10 or EMTC module C294b-10, circuit CH208 (GN/OG).
 N0054775
• **Does the actuator motor move in the counterclockwise direction?**
	Yes
	INSPECT for binding or broken door and linkage. If no condition is found, GO to U18 .
	
	No
	GO to U14 .

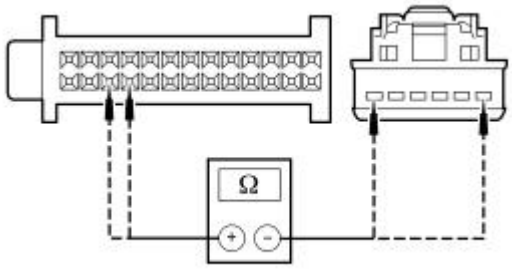
U14 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN	

• Disconnect: Auxiliary Panel/Floor Door Actuator C3044 (Expedition/Navigator) or C4342 (Expedition EL/Navigator L).
• **NOTE:** Expedition/Navigator only.
• Measure the resistance between EATC module:
  ▪ C228b-11 or EMTC module C294b-11, circuit CH207 (BU/GY) and auxiliary panel/floor door actuator C3044-8, circuit CH207 (BU/GY).
  ▪ C228b-10 or EMTC module C294b-10, circuit CH208 (GN/OG) and auxiliary panel/floor door actuator C3044-7, circuit CH208 (GN/OG).
	Yes
	GO to U15 .
	
	No
	REPAIR the circuit CH207 (BU/GY) or CH208 (GN/OG) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



N0054776

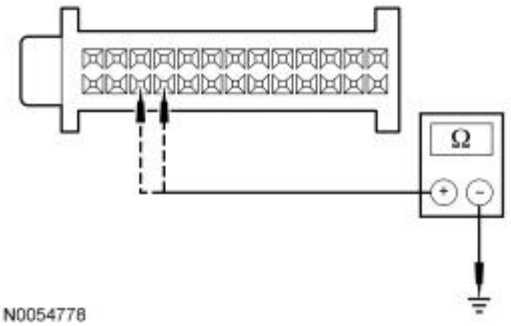
- **NOTE:** Expedition EL/Navigator L only.
- Measure the resistance between EATC module:
  - C228b-11 or EMTC module C294b-11, circuit CH207 (BU/GY) and auxiliary panel/floor door actuator C4342-1, circuit CH207 (BU/GY).
  - C228b-10 or EMTC module C294b-10, circuit CH208 (GN/OG) and auxiliary panel/floor door actuator C4342-6, circuit CH208 (GN/OG).



N0054777

- **Are the resistances less than 5 ohms?**

U15 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO GROUND	

• Measure the resistance between ground and EATC module:
  ▪ C228b-11 or EMTC module C294b-11, circuit CH207 (BU/GY).
  ▪ C228b-10 or EMTC module C294b-10, circuit CH208 (GN/OG).
  	


N0054778
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to U16 .
	
	No
	REPAIR the circuit CH207 (BU/GY) or CH208 (GN/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

U16 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO POWER	

• Key in ON position.
• Measure the voltage between ground and EATC module:
  ▪ C228b-11 or EMTC module C294b-11, circuit CH207 (BU/GY).
  ▪ C228b-10 or EMTC module C294b-10, circuit CH208
	Yes
	REPAIR the circuit CH207 (BU/GY) or CH208 (GN/OG) for a short to power. CLEAR the DTCs. REPEAT the self-

(GN/OG).  N0054779 • **Is voltage present?**	test. TEST the system for normal operation. **No** GO to U17 .
U17 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TOGETHER	
• Key in OFF position. • Measure the resistance between EATC module C228b-10 or EMTC module C294b-10, circuit CH208 (GN/OG) and EATC module C228b-11 or EMTC module C294b-11, circuit CH207 (BU/GY).  N0054745 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSPECT for binding or broken linkage. If no condition is found, INSTALL a new door actuator. TEST the system for normal operation. **No** REPAIR circuits CH207 (BU/GY) and CH208 (GN/OG) for a short together. TEST the system for normal operation.
U18 CHECK THE MODULE CONNECTION	
• Carry out the Electronic Automatic Temperature Control (EATC) Module and Electronic Manual Temperature Control (EMTC) Module Cold Boot Process. • **NOTE:** EATC only. • Carry out the EATC on-demand self test. • Operate the system. • **Does the concern return?**	**Yes** EATC systems, INSTALL a new EATC module. REFER to Section 412-01 . TEST the system for normal operation. EMTC systems, Go To Pinpoint Test v **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test V: The Temperature, Panel/Floor and Blower Motor Controls are Inoperative/Do Not Operate Correctly Using the Front/Rear Auxiliary Climate Controls

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the panel/floor and cool/warm signal is received by the electronic manual temperature control (EMTC) or electronic automatic temperature control (EATC) module from the rear auxiliary control through circuit VHA15 (YE/GY). The blower speed signal is received by the EMTC or EATC from the rear auxiliary control through circuit VHA17 (VT/GN). Reference voltage for the auxiliary controls signal resistor is provided by the EMTC or EATC module through circuit LH111 (BN/WH). Ground for the auxiliary controls signal resistor is provided by the EMTC or EATC module through circuit RH111 (GY/BU).

The control is supplied a 5-volt reference through circuit LH111 (BN/WH) and ground through circuit RH111 (GY/BU). When the temperature control is adjusted, the EMTC or EATC receives the signal through circuit VHA15 (YE/GY).

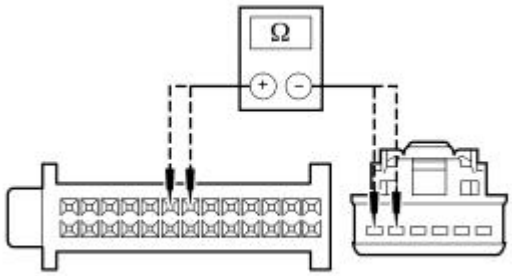
Possible Causes

- An open in circuit RH111 (GY/BU), VHA15 (YE/GY), VHA17 (VT/GN) or LH111 (BN/WH)
- A short to ground in circuit VHA15 (YE/GY), VHA17 (VT/GN) or LH111 (BN/WH)
- A short to voltage in circuit VHA15 (YE/GY), VHA17 (VT/GN) or RH111 (GY/BU)
- A short together circuits RH111 (GY/BU) and VHA15 (YE/GY), VHA17 (VT/GN) or LH111 (BN/WH)
- Rear auxiliary control
- EATC module
- EMTC module

PINPOINT TEST V: THE TEMPERATURE, PANEL/FLOOR AND BLOWER MOTOR CONTROLS ARE INOPERATIVE/DO NOT OPERATE CORRECTLY USING THE FRONT/REAR AUXILIARY CLIMATE CONTROLS

Test Step	Result / Action to Take
V1 CHECK EMTC/EATC DTCS	
• Key in ON position. • Check for EMTC/EATC DTCs. • **Is DTC B2918 or B2919 present?**	**Yes** One DTC present, GO to V2 . Both DTCs present, GO to V5 . **No** GO to V7 .
V2 CHECK CIRCUIT VHA15 (YE/GY) OR CIRCUIT VHA17 (VT/GN) FOR AN OPEN	

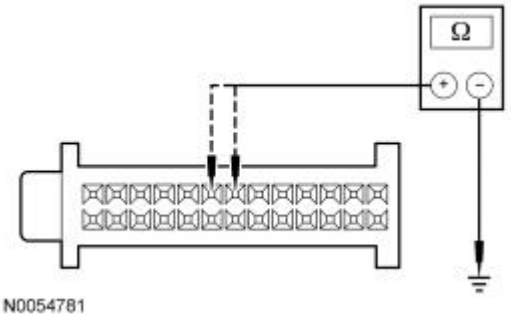
• Key in OFF position.
• Disconnect: Auxiliary Controls C3198.
• Disconnect: EATC Module C228b or EMTC Module C294b.
• Measure the resistance between EATC module:
  ▪ (DTC B2918 only) C228b-21, circuit VHA15 (YE/GY) and auxiliary controls C3198-5, circuit VHA15 (YE/GY).
  ▪ (DTC B2919 only) C228b-20, circuit VHA17 (VT/GN) and auxiliary controls C3198-6, circuit VHA17 (VT/GN).
	Yes
	GO to V3 .
	
	No
	REPAIR circuit VHA15 (YE/GY) or circuit VHA17 (VT/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



N0054780

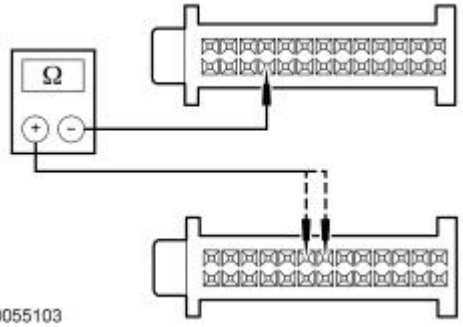
- **Are the resistances less than 5 ohms?**

V3 CHECK CIRCUIT VHA15 (YE/GY) OR CIRCUIT VHA17 (VT/GN) FOR A SHORT TO GROUND	

• Measure the resistance between ground and:
  ▪ (DTC B2918 only) EMTC module C294b-21or EATC module C228b-21, circuit VHA15 (YE/GY).
  ▪ (DTC B2919 only) EMTC module C294b-20 or EATC module C228b-20, circuit VHA17 (VT/GN).
  	


N0054781
• **Are the resistances greater than 10,000 ohms?**
	Yes
	GO to V4 .
	
	No
	REPAIR circuit VHA15 (YE/GY) or circuit VHA17 (VT/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

V4 CHECK CIRCUIT VHA15 (YE/GY) OR CIRCUIT VHA17 (VT/GN) FOR A SHORT TO CIRCUIT RH111 (GY/BU)	

• Measure the resistance between EMTC module C294a-10 or EATC module C228a-10, circuit RH111 (GY/BU) and:
  ▪ (DTC B2918 only) EMTC module C294b-21 or EATC module C228b-21, circuit VHA15 (YE/GY).
  ▪ (DTC B2919 only) EMTC module C294b-20 or EATC module C228b-20, circuit VHA17 (VT/GN).
  	


N0055103
• **Are the resistances greater than 10,000 ohms?**
	Yes
	INSTALL a new EATC or EMTC module. REFER to Section 412-01 . TEST the system for normal operation.
	
	No
	REPAIR circuit VHA15 (YE/GY) or circuit VHA17 (VT/GN) for a short to circuit RH111 (GY/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

V5 CHECK CIRCUIT RH111 (GY/BU) AND CIRCUIT LH111 (BN/WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: Auxiliary Controls C3198. • Disconnect: EATC Module C228a or C244a.	**Yes** GO to V6 .

• Measure the resistance between: ▪ EMTC module C294a-11 or EATC module C228a-11, circuit LH111 (BN/WH) and auxiliary controls C3198-4, circuit LH111 (BN/WH). ▪ EMTC module C294a-10 or EATC module C228a-10, circuit RH111 (GY/BU) and auxiliary controls C3198-2, circuit RH111 (GY/BU).  N0054782 • **Is the resistance greater than 10,000 ohms?**	**No** REPAIR circuit RH111 (GY/BU) or circuit LH111 (BN/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
V6 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO GROUND	
• Disconnect: Auxiliary Temperature Door Actuator C3004 (Expedition/Navigator) or C4341 (Expedition EL/Navigator L). • Disconnect: Auxiliary Panel/Floor Door Actuator C3044 (Expedition/Navigator) or C4342 (Expedition EL/Navigator L). • Measure the resistance between ground and EMTC module C294a-11 or EATC module C228a-11, circuit LH111 (BN/WH).  N0054783 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to V7 . **No** REPAIR circuit LH111 (BN/WH) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
V7 CHECK CIRCUIT VHA15 (YE/GY) AND CIRCUIT VHA17 (VT/GN) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Auxiliary Controls C3198. • Disconnect: EATC Module C228b or EMTC Module C294b. • Key in ON position. • Measure the voltage between: ▪ EMTC module C294b-20 or EATC module C228b-20, circuit VHA17 (VT/GN). ▪ EMTC module C294b-21 or EATC module C228b-21, circuit VHA15 (YE/GY).	**Yes** REPAIR circuit VHA15 (YE/GY) or circuit VHA17 (VT/GN) for a short to voltage. TEST the system for normal operation. **No** GO to V8 .

 N0054784 • **Are voltages present?**	
V8 CHECK CIRCUIT RH111 (GY/BU) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Auxiliary Temperature Door Actuator C3004 (Expedition/Navigator) or C4341 (Expedition EL/Navigator L). • Disconnect: Auxiliary Panel/Floor Door Actuator C3044 (Expedition/Navigator) or C4342 (Expedition EL/Navigator L). • Key in ON position. • Measure the voltage between ground and EMTC module C294a-10 or EATC module C228a-10, circuit RH111 (GY/BU).  N0054785 • **Is voltage present?**	**Yes** REPAIR circuit RH111 (GY/BU) for a short to voltage. TEST the system for normal operation. **No** GO to V9 .
V9 CHECK CIRCUIT RH111 (GY/BU) AND CIRCUIT LH111 (BN/WH) FOR A SHORT TOGETHER	
• Key in OFF position. • Measure the resistance between EMTC module C294a-11 or EATC module C228a-11, circuit LH111 (BN/WH) and EMTC module C294a-10 or EATC module C228a-10, circuit RH111 (GY/BU).  N0054745 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to V10 . **No** REPAIR circuit RH111 (GY/BU) and circuit LH111 (BN/WH) for a short together. TEST the system for normal operation.
V10 CHECK CIRCUIT VHA15 (YE/GY) AND CIRCUIT VHA17 (VT/GN) FOR A SHORT TOGETHER	
• Measure the resistance between EMTC module C294b-21 or EATC module C228b-21, circuit VHA15 (YE/GY) and EMTC	**Yes** INSTALL a new auxiliary

module C294b-20 or EATC module C228b-20, circuit VHA17 (VT/GN).  • **Is the resistance greater than 10,000 ohms?**	control. TEST the system for normal operation. **No** REPAIR circuit VHA15 (YE/GY) and circuit VHA17 (VT/GN) for a short together. TEST the system for normal operation.

Pinpoint Test W: DTC B1676 — Battery Voltage Out of Range

Refer to Wiring Diagrams Cell 54 , Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 , Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the EMTC or EATC module receives a ground through circuit GD133 (BK). The EMTC or EATC module is supplied constant battery voltage through circuit SBP15 (WH/RD) and ignition switched voltage through circuit CBP37 (WH).

Possible Causes

- Fuse(s)
- An open in circuit GD133 (BK), SBP15 (WH/RD) or CBP37 (WH)
- EATC module
- EMTC module

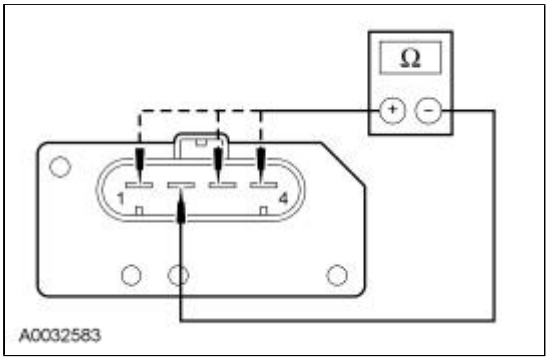
PINPOINT TEST W: DTC B1676 — BATTERY VOLTAGE OUT OF RANGE

Test Step	Result / Action to Take
W1 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Key in OFF position. • Disconnect: EATC Module C228a or EMTC C294a. • Measure the resistance between EMTC C294a-23 or EATC module C228a-23, circuit GD133 (BK) and ground.	**Yes** GO to W2 . **No** REPAIR circuit GD133 (BK). TEST the system for normal operation.

 N0054689 • **Is the resistance less than 5 ohms?**	
W2 CHECK CIRCUIT SBP15 (WH/RD) AND CIRCUIT CBP37 (WH) FOR AN OPEN	
• Key in ON position. • Measure the voltage between EMTC module C294a-13 or EATC module C228a-13, circuit SBP15 (WH/RD), EMTC module C294a-12 or EATC module C228a-12, circuit CBP37 (WH) and ground.  N0054690 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new EMTC or EATC module. TEST the system for normal operation. **No** If DTC B1676 is present in mutiple modules, refer to section Section 414-00 . If DTC B1676 is present only in the EMTC or EATC module, VERIFY smart junction box (SJB) fuse 15 (10A) and fuse 37 (10A) is OK. If OK, REPAIR circuit SBP15 (WH/RD) or CBP37 (WH) for an open. TEST the system for normal operation.

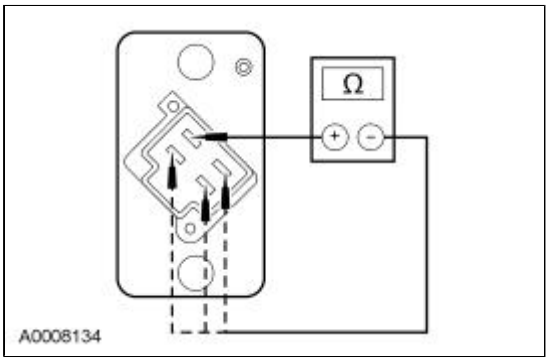
Component Tests

Resistor — Blower Motor



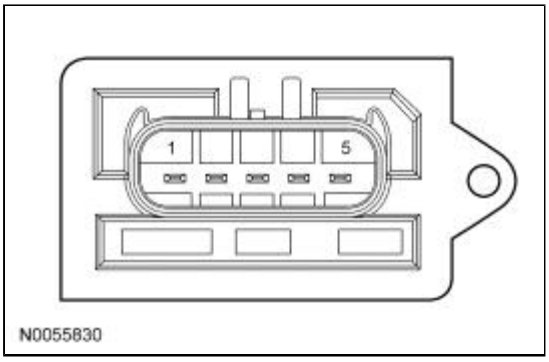
Blower Motor Resistor Pins	Resistance
4 and 2	2.1-2.6 ohms
2 and 3	0.3-0.4 ohms
2 and 1	0.9-1.0 ohms

Resistor — Auxiliary Blower Motor (Expedition/Navigator)



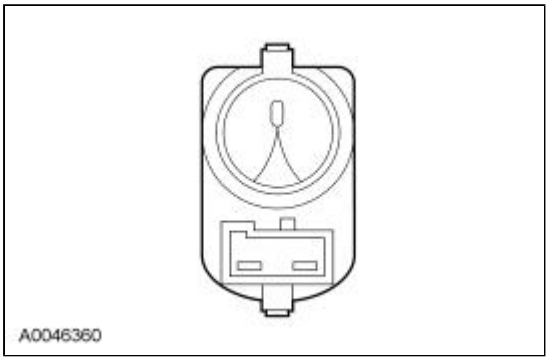
Blower Motor Resistor Pins	Resistance
4 and 2	0 ohms
4 and 3	0.3-0.4 ohms
4 and 1	1.4-1.7 ohms
3 and 1	1.1-1.4 ohms

Resistor — Auxiliary Blower Motor (Expedition EL/Navigator L)



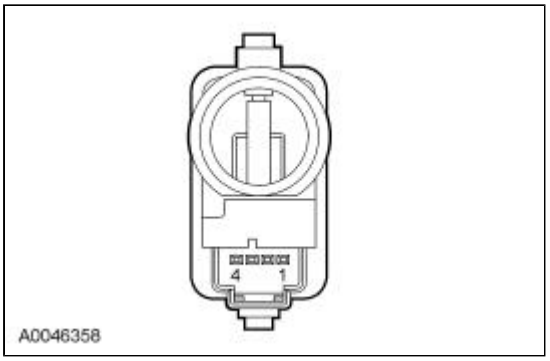
Blower Motor Resistor Pins	Resistance
2 and 3	0 ohms
2 and 4	0.3-0.4 ohms
2 and 2	1.4-1.7 ohms
4 and 5	1.1-1.4 ohms

Temperature Sensor — In-Vehicle, Expedition



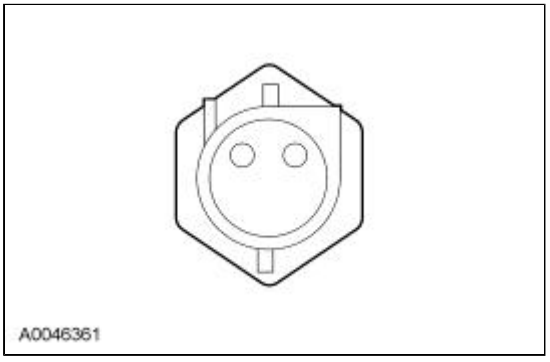
Temperature	Resistance
10-20°C (50-68°F)	37,000-58,000 ohms
20-30°C (68-86°F)	24,000-37,000 ohms
30-40°C (86-104°F)	16,000-24,000 ohms

Temperature Sensor — In-Vehicle, Navigator



Temperature	Resistance between pins 1 and 3
10-20°C (50-68°F)	37,000-58,000 ohms
20-30°C (68-86°F)	24,000-37,000 ohms
30-40°C (86-104°F)	16,000-24,000 ohms

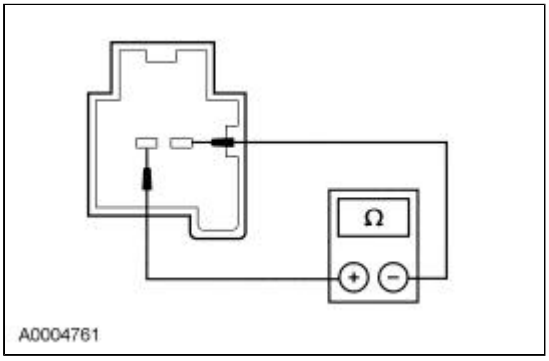
Temperature Sensor — Ambient



Ambient Temperature	Resistance
10-20°C (50-68°F)	37,000-58,000 ohms
20-30°C (68-86°F)	24,000-37,000 ohms

30-40°C (86-104°F)	16,000-24,000 ohms

Temperature Sensor — Evaporator Discharge



Ambient Temperature	Resistance
-40°C (-40°F)	832,591-1,017,523 ohms
-20°C (-4°F)	263,111-290,807 ohms
0°C (32°F)	91,058-100,644 ohms
20°C (68°F)	35,473-39,207 ohms
25°C (77°F)	28,500-31,500 ohms
40°C (104°F)	15,307-16,919 ohms
60°C (140°F)	7,171-7,925 ohms
100°C (212°F)	1,976-2,184 ohms
120°C (248°F)	1,131-1,251 ohms

Heater Core

WARNING: Carbon monoxide is colorless, odorless and dangerous. If it is necessary to operate the engine with the vehicle in a closed area such as a garage, always use an exhaust collector to vent the exhaust gases outside the closed area.

1. **NOTE:** Testing of returned heater cores reveals that a large percentage of heater cores are good and did not require the installation of a new heater core. If a heater core leak is suspected, the heater core must be tested by following the plugged heater core component test before the heater core pressure test. Carry out a system inspection by checking the heater system thoroughly as follows:

   Inspect for evidence of coolant leakage at the heater hose to heater core attachments. A coolant leak in the heater hose could follow the heater core tube to the heater core and appear as a leak in the heater core.

2. **NOTE:** Spring-type clamps are installed as original equipment. Installation and overtightening of non-specified clamps can cause leakage at the heater hose connection and damage the heater core.

   Check the integrity of the heater hose clamps.

Heater Core — Plugged

WARNING: The heater core inlet hose will become too hot to handle if the system is working correctly.

1. Check to see that the engine coolant is at the correct level.

2. Start the engine and turn on the heater.

3. When the engine coolant reaches operating temperature, feel the heater core inlet and outlet hoses to see if they are hot.

4. If the outlet only is not hot:
   - the heater core may have an air pocket.
   - the heater core may be plugged.

5. If the inlet only is not hot:
   - the thermostat may not be working correctly.

Heater Core — Pressure Test

Use the Pressure Test Kit to carry out the pressure test.

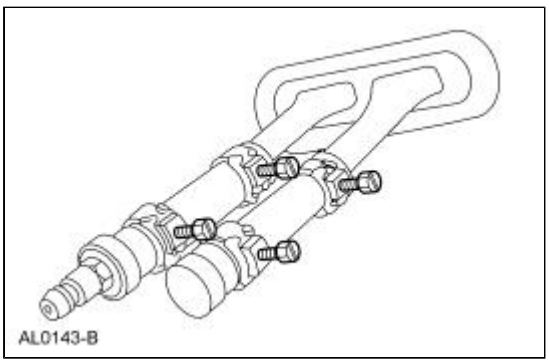
1. **NOTE:** Due to space limitations, a bench test may be necessary for pressure testing.

   Drain the coolant from the cooling system.

2. Disconnect the heater hoses from the heater core.

3. Install a short piece of heater hose, approximately 101 mm (4 in) long on each heater core tube.

4. Fill the heater core and heater hoses with water and install the plug BT-7422-B and the adapter BT-7422-A from the Pressure Test Kit. Secure the heater hoses, plug and adapter with hose clamps.



5. Attach the pump and gauge assembly from the Pressure Test Kit to the adapter.

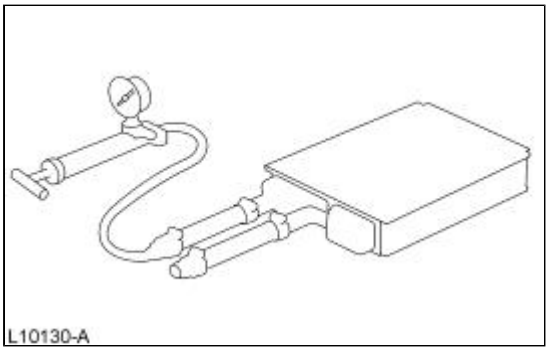
6. Close the bleed valve at the base of the gauge. Pump 138 kPa (20 psi) of air pressure into the heater core.

7. Observe the pressure gauge for a minimum of 3 minutes.

8. If the pressure drops, check the heater hose connections to the core tubes for leaks. If the heater hoses do not leak, remove the heater core from the vehicle and carry out the bench test.

Heater Core — Bench Test

1. Remove the heater core from the vehicle.
2. Drain all of the coolant from the heater core.
3. Connect the 101 mm (4 in) test heater hoses with plug and adapter to the core tubes. Then connect the Pressure Test Kit to the adapter.
4. Apply 138 kPa (20 psi) of air pressure to the heater core. Submerge the heater core in water.
5. If a leak is observed, install a new heater core.



Evaporator/Condenser Core — On-Vehicle Leak Test

1. Discharge and recover the refrigerant. Refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.
2. Disconnect the suspect evaporator core or condenser core from the A/C system.
3. Clean the manifold fittings.
4. Connect the appropriate test fittings from the A/C Fittings Set to the condenser or evaporator core tube connections.
5. **NOTE:** The automatic shut-off valves on some gauge set hoses do not open when connected to the test fittings. If available, use hoses without shut-off valves. If hoses with shut-off valves are used, make sure the valve opens when attached to the test fittings or install an adapter that will activate the valve. The test is not valid if the shut-off valve does not open.

   Connect the red and blue hoses from the R-134a Manifold Gauge Set to the test fittings on the evaporator core or condenser core. Connect the yellow hose to a known good vacuum pump.
6. Open both gauge set valves and start the vacuum pump. Allow the vacuum pump to operate for a minimum of 45 minutes after the gauge set low pressure gauge indicates 101 kPa (30 in-Hg). The 45-minute evacuation is necessary to remove any refrigerant from oil left in the evaporator core or condenser core. If the refrigerant is not completely removed from the oil, outgassing will degrade the vacuum and appear as a refrigerant leak.
7. If the low pressure gauge reading will not drop to 101 kPa (30 in-Hg) when the valves on the gauge and manifold set are open and the vacuum pump is operating, close the gauge set valves

and observe the low pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Recheck the test fitting connections and gauge set connections before installing a new evaporator core or condenser core.

8. After evacuating for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low pressure gauge; it should remain at the 101 kPa (30 in-Hg) mark.
    - If the low pressure gauge reading rises 34 or more kPa (10 or more in-Hg) of vacuum from the 101 kPa (30 in-Hg) position in 10 minutes, a leak is indicated.
    - If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge.
    - If a small amount of vacuum is lost, operate the vacuum pump with gauge valves open for an additional 30 minutes to remove any remaining refrigerant from the oil in the evaporator core or condenser core. Then recheck for loss of vacuum.
    - If a very small leak is suspected, allow the system to sit overnight with vacuum applied and check for vacuum loss.

9. If the evaporator core or condenser core does leak, as verified by the above procedure, install a new evaporator core or condenser core.

A/C Compressor — External Leak Test

1. Install the A/C Pressure Test Adapter on the port of the A/C compressor, using the existing manifold retaining bolt.

2. Connect the high and low pressure lines of a manifold gauge set or a refrigerant recovery/recycling station such as the R-134a A/C service center to the corresponding fittings on the A/C Pressure Test Adapter.

3. Attach the center hose of a manifold gauge set to a refrigerant container standing in an upright position.

4. Hand-rotate the compressor shaft 10 complete revolutions to distribute the oil inside the A/C compressor.

5. Open the low pressure gauge valve, the high pressure gauge valve and the valve on the refrigerant container to allow the refrigerant vapor to flow into the A/C compressor.

6. Using the Refrigerant Leak Detector, check for leaks at the compressor shaft.

7. If a shaft seal leak is found, install a new compressor shaft seal. If an external leak is found, install a new A/C compressor.

8. When the leak test is complete, recover the refrigerant from the compressor.

Spring Lock Coupling

Printable View (186 KB)

Special Tool(s)

 ST2352-A	Remover, Refrigerant Coupling Spring 412-039 (T84L-19623-B)

Material

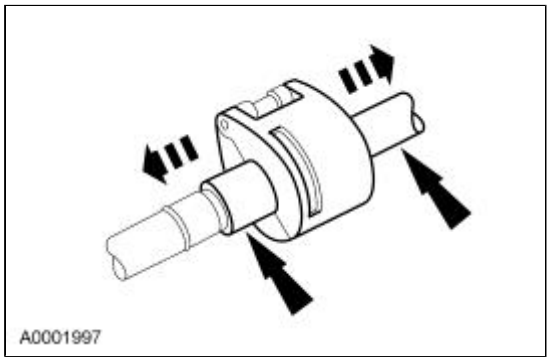
Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Disconnect

1. Remove the spring lock coupling clip, if equipped.

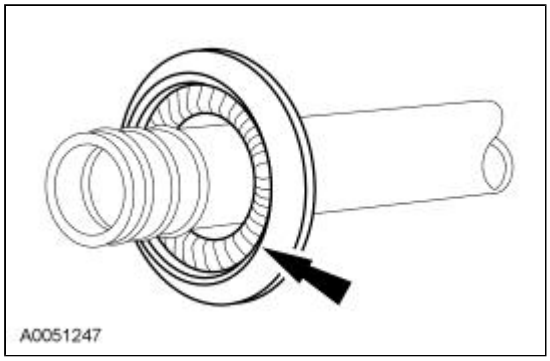
2. **CAUTION: Do not use metal tools to remove the O-ring seals. They can cause axial scratches across the O-ring seal grooves, resulting in refrigerant leaks.**

   Push the tool into the cage opening to release the female fitting from the spring lock coupling spring and pull the fitting apart.
   - Remove the O-ring seals using a non-metallic tool.



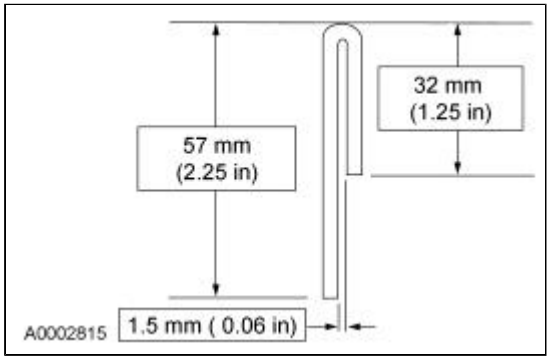
3. **CAUTION: Do not use a screwdriver or similar tool to remove the A/C tube lock coupling spring; this can cause axial scratches across the O-ring seal grooves resulting in refrigerant leaks.**

   Remove the spring lock coupling spring with a small hooked wire.



Cleaning

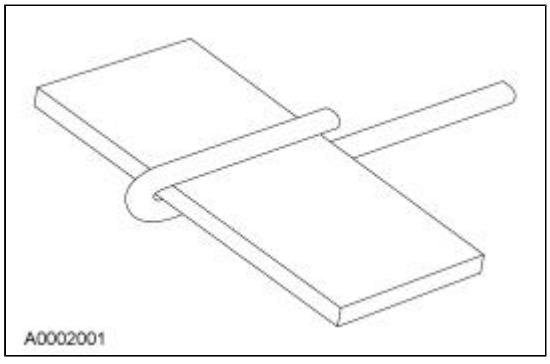
1. Fabricate a cleaning tool from a 1/8 inch diameter brazing rod.



2. Cut an abrasive pad from maroon colored 3M Scotch Brite® with the dimensions corresponding to the coupling size.

Coupling Size	Pad Size
3/8 in	25 x 50 mm (1 x 2 in)
1/2 in	25 x 50 mm (1 x 2 in)
5/8 in	25 x 76 mm (1 x 3 in)
3/4 in	25 x 102 mm (1 x 4 in)

3. Assemble the pad to the tool.

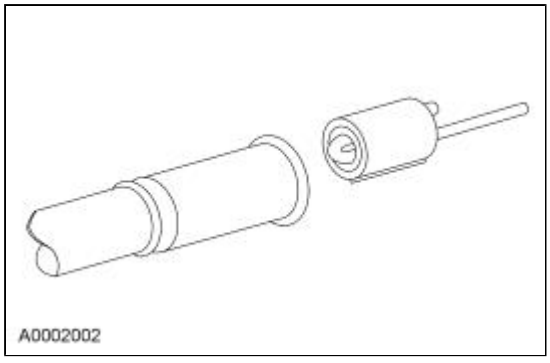


4. Coat the abrasive pad with mineral oil.

5. Roll the pad on the tool and install it in a variable speed drill motor.

6. **CAUTION: Maintain low speed drill rotation when inserting or removing the cleaning tool to prevent axial scratches which may cause future leaks.**

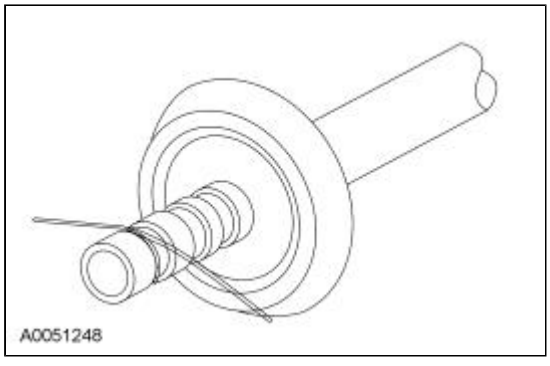
   Polish for one minute at moderate speed (less than 1,500 rpm) or until the surface is clean and free of scratches or foreign material.



7. Clean the fitting with a lint-free cloth.

8. Inspect the surface for grooves or scratches. If grooves and scratches are still present, install a new component.

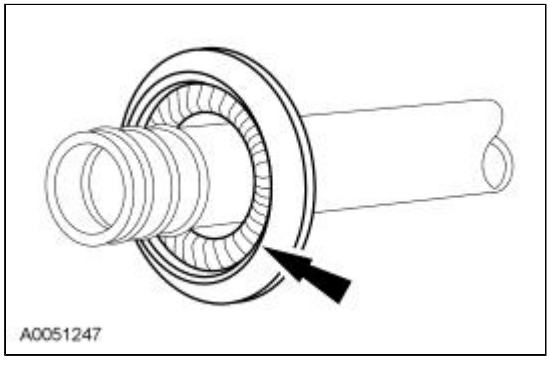
9. Clean the O-ring seal grooves with a 300 mm (12 in) length of natural fiber string.
   - Loop the string around the grooves and pull the string back and forth.



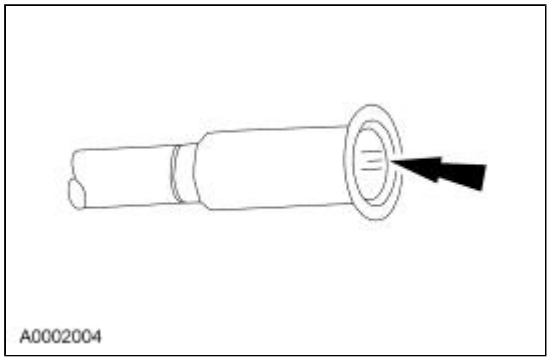
10. Remove any foreign material from the grooves with a lint-free cloth.

Connect

1. Install the spring lock coupling spring.

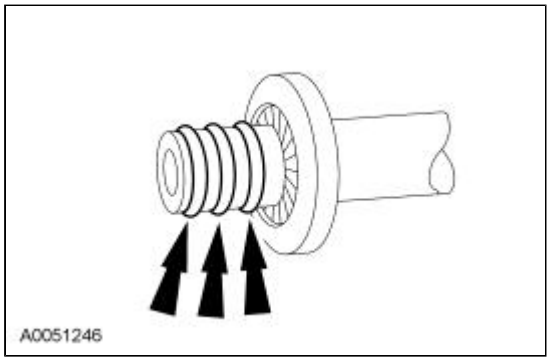


2. Lubricate the inside of the coupling with PAG oil.

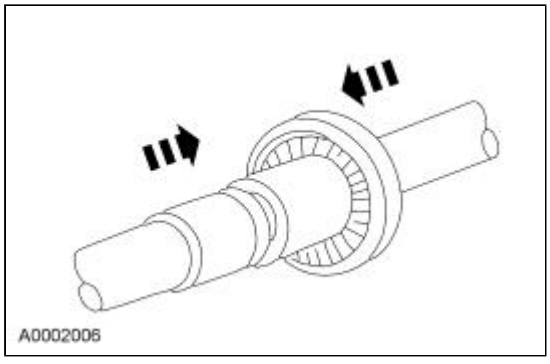


3. **CAUTION: Use only the new O-ring seals. The use of any O-ring seals other than those specified in the Ford Master Parts Catalog may result in intermittent leakage during vehicle operation.**

   Install the O-ring seals.



4. Connect the spring lock coupling fittings with a twisting motion until the spring lock coupling spring snaps over the flared end of the female fitting.



5. Install the spring lock coupling clip.

Heater Hose Coupling

Printable View (136 KB)

Special Tool(s)

ST1648-A	Remover, Heater Hose Inlet Tube 412-042 (T85T-18539-AH)

Disconnect

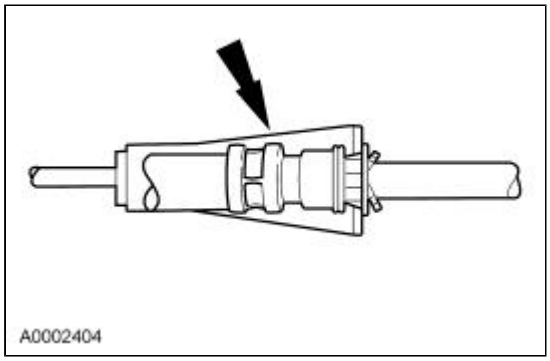
1. **WARNING: The engine must be off, fully cool and the cooling system fully depressurized before attempting to disconnect any heater water hoses. Failure to comply with this warning can result in serious injury or burns from hot liquid escaping out of the engine cooling system.**

   Depressurize the engine cooling system.

2. Push the heater water hose toward the tube to fully expose the locking tabs.

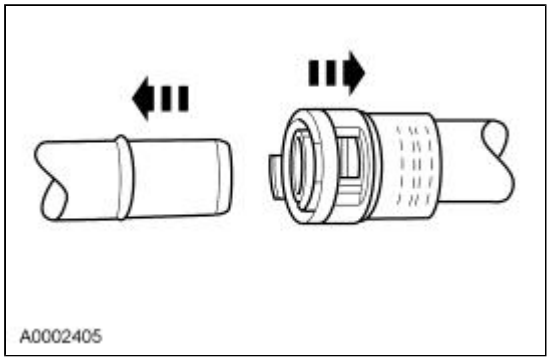
3. **NOTE:** When compressing the white coupling retainer, the Heater Hose Disconnect Tool must be perpendicular to and on the highest point of the coupling.

   Push the special tool over the coupling retainer windows to compress the retainer locking tabs.

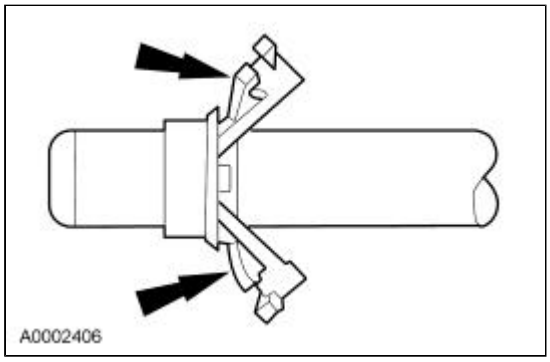


4. **NOTE:** A slight twisting motion while pulling on the heater water hose may be necessary to assist in the removal.

   Pull the heater water hose away from the heater core tube.



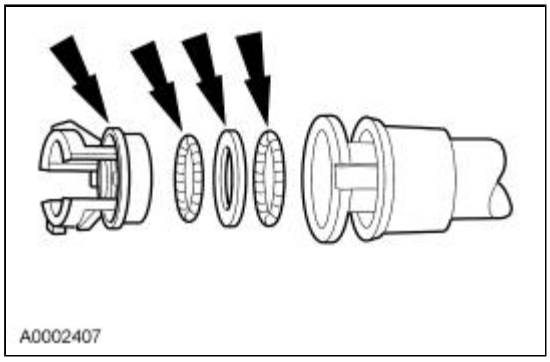
5. Plug the heater water hose.
6. Remove the white coupling retainer from the tube.
7. Spread the retainer tabs apart and slide the retainer off the tube.



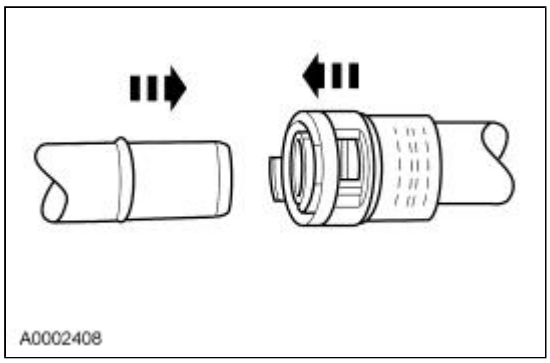
8. Discard the retainer.

Connect

1. Clean the tubes and lubricate with MERPOL® meeting Ford specification ESE-M99B144-B or plain water.
2. Install a new coupling retainer, spacer, and lubricated O-ring seals into the quick disconnect coupling housing.



3. Push the heater water hose with a quick disconnect coupling onto the tube.

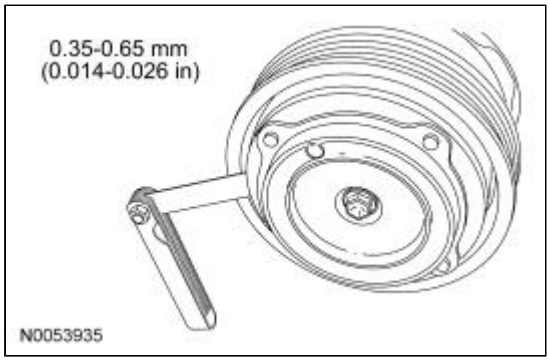


4. Make sure the coupling is fully engaged by lightly pulling on the heater water hose.

Air Conditioning (A/C) Clutch Air Gap Adjustment

Printable View (91 KB)

1. Check the A/C clutch air gap at 3 equally spaced places between the clutch plate and the A/C clutch pulley.



2. Remove the clutch plate. Add or remove spacers between the clutch plate hub and the compressor shaft until the clearance is within specification.

Electronic Leak Detection

Printable View (119 KB)

Special Tool(s)

ST2351-A	H10PM Refrigerant Leak Detector With Battery 216-00001 or equivalent

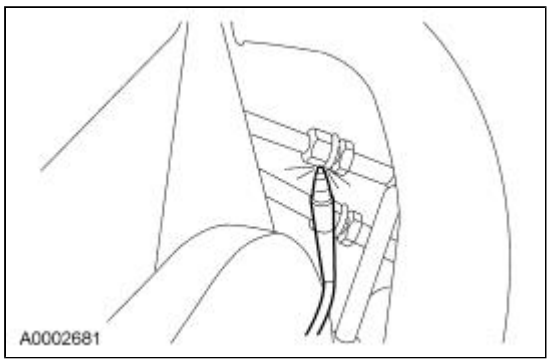
CAUTION: Good ventilation is necessary in the area where electronic A/C leak testing is to be carried out. If the surrounding air is contaminated with refrigerant gas, the leak detector will indicate this gas all the time. Odors from other chemicals such as antifreeze, diesel fuel, disc brake cleaner or other cleaning solvents can cause the same problem. Using a fan to ventilate the area to be tested before proceeding with the leak detection procedure is helpful in removing small traces of contamination from the air, but the fan should be turned off during actual testing.

1. **NOTE:** The system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.

   Leak test the refrigerant system using the leak detector. Follow the instructions included with the leak detector for handling and operation techniques.

      A0002680

2. If a leak is found, recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.
   - Repair the system.
   - Test the system for normal operation.



A0002681

Fluorescent Dye Leak Detection

Printable View (212 KB)

Special Tool(s)

ST2738-A	R-134a Refrigerant Center 176-00002 or equivalent
ST2739A	R-134a Refrigerant Center 023-00174 or equivalent

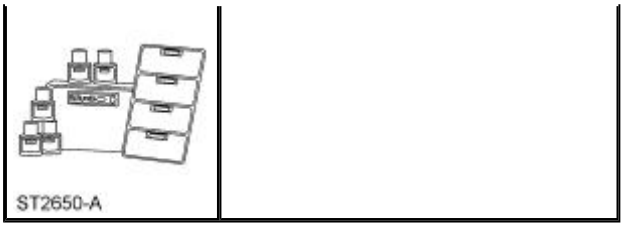
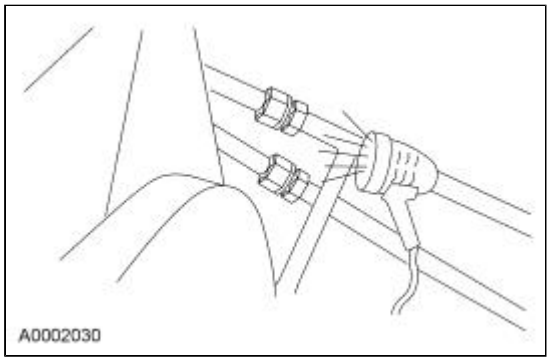
ST2649-A	Deluxe Injector Loop Kit 219-00069 or equivalent
	R-134a Leak Detection Dye 164-R6060



Fluorescent Dye Detection

NOTE: Ford Motor Company vehicles are produced with R-134a fluorescent dye installed in the refrigerant system from the factory. The location of leaks can be pinpointed by the bright yellow-green glow of the fluorescent dye under a UV lamp. Since more than one leak can exist, make sure to inspect each component, line and fitting in the refrigerant system for a leak.

1. Check for leaks using a Rotunda-approved UV lamp.
    - Inspect all components, lines and fittings of the refrigerant system.



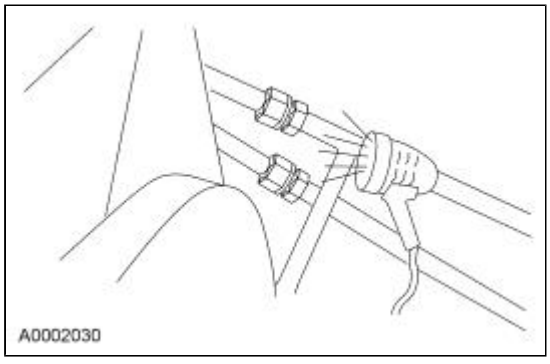
2. If a leak is found, recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

3. Repair the refrigerant system leak(s).

4. Evacuate and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

5. After the leak(s) is repaired, remove any traces of fluorescent dye with a general purpose oil solvent.

6. Verify the repair by running the vehicle for a short period of time and rechecking the area of the leak with a Rotunda-approved UV lamp.



Fluorescent Dye Injection — Using an A/C Refrigerant Center and Dye Injector

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in

refrigerant system leak diagnosis using a Rotunda-approved ultraviolet blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

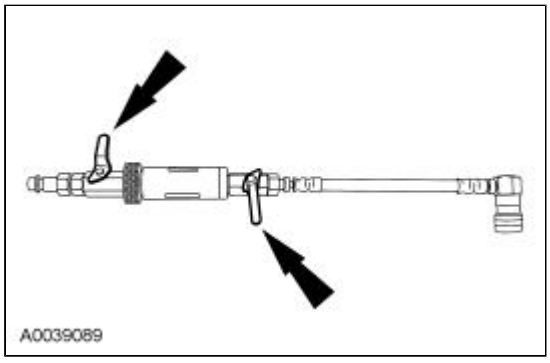
NOTE: Before using the R-134a fluorescent dye injector for the first time, refer to the manufacturer's instructions on evacuation of any non-condensable gasses from the hoses.

NOTE: Only connect the R-134a fluorescent dye injector to a manifold and gauge set or R-134a service center when fluorescent dye is to be injected. The R-134a fluorescent dye injector has a one way check valve that will prevent refrigerant system recovery and evacuation.

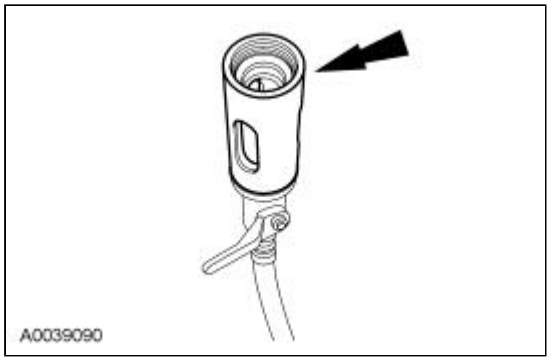
NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.

1. Connect an R-134a A/C refrigerant service center or a manifold and gauge set to the refrigerant system service port valves.

2. Verify that the valves on the fluorescent dye injector are closed.



3. Fill the fluorescent dye injector reservoir with 7 ml (0.25 oz) of fluorescent dye.



4. Install the fluorescent dye injector between the low-pressure service gauge port valve and the R-134a refrigerant service center or manifold gauge set.

5. Open all valves and inject the fluorescent dye into the refrigerant system.

6. When fluorescent dye injection is complete, close all valves.

7. Recover the refrigerant from the R-134a fluorescent dye injector.

8. Remove the fluorescent dye injector from the low-pressure service gauge port valve and the R-134a A/C refrigerant service center or manifold gauge set.

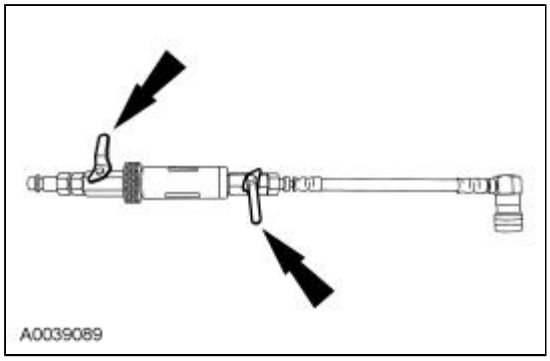
Fluorescent Dye Injection — Using a Dye Injector Loop Kit

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved ultraviolet blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

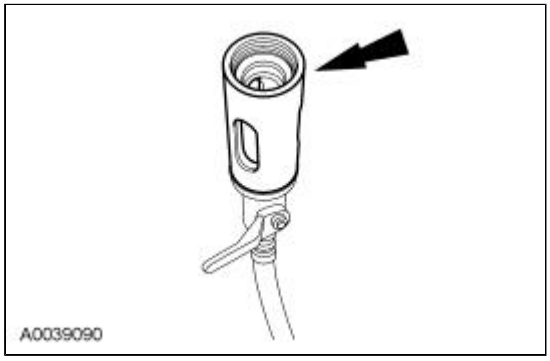
NOTE: Before using the R-134a fluorescent dye injector for the first time, refer to the equipment manufacturer's instructions on evacuation of non-condensable gasses from the hoses.

NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F).

1. Verify that the valves on the deluxe injector loop kit are closed.



2. Fill the deluxe injector loop kit reservoir with 7 ml (0.25 oz) of fluorescent dye.

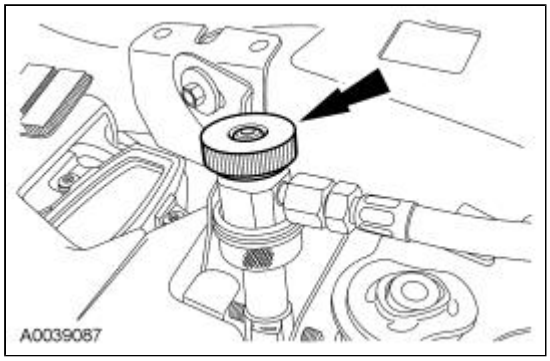


3. Install the deluxe injector loop kit between the high-pressure and low-pressure service gauge port valves.

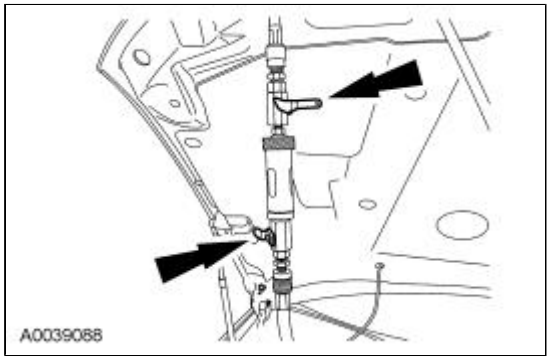
4. **CAUTION: Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine.**

   Start the engine.

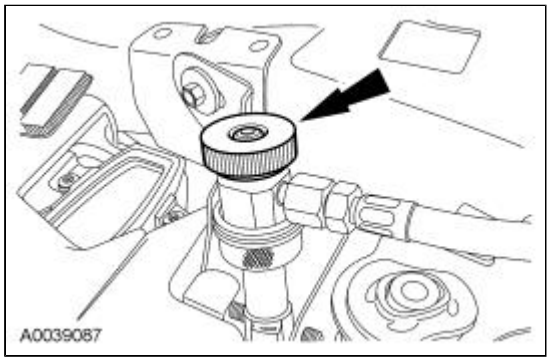
5. Open the high-pressure service valve.



6. Open the deluxe injector loop kit valves and inject the fluorescent dye into the refrigerant system.

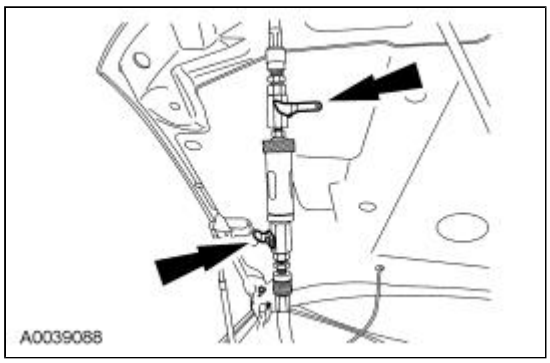


7. Close the high-pressure service valve to allow the pressure inside the deluxe injector loop kit to equalize with the suction side of the refrigerant system.



8. **NOTE:** Close the valves on the deluxe injector loop kit while the A/C compressor is operating.

   Close the valves on the deluxe injector loop kit.



9. **NOTE:** Leave all valves on the special tool closed when not in use.

Disconnect the high-pressure and low-pressure service valves and remove the deluxe injector loop kit from the vehicle.

Air Conditioning (A/C) System Flushing

Printable View (101 KB)

Special Tool(s)

ST2466-A	A/C Flush and Purge Machine 219-00022 (part of 219-00023) or equivalent
 ST2469-A	A/C Flush and Purge Fitting Kit 219-00024 (part of 219-00023) or equivalent
ST2985-A	A/C Flush Adapter Kit 219-00074 or equivalent

Material

Item	Specification
A/C System Flushing Solvent YN-23	—
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

WARNING: Use extreme care and observe all safety and service precautions related to the use of refrigerants.

WARNING: Due to refrigerant hazards, always wear safety goggles and non-penetrable gloves when working on or flushing A/C systems.

CAUTION: An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.

CAUTION: Suction accumulator or receiver/drier, thermal expansion valve (TXV) and/or

evaporator core orifice, and hoses with mufflers, should be removed when flushing the A/C system. Internal plumbing of these devices makes it impossible to correctly remove any residual-flushing agent. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The 3.785 liters (1 gallon) of A/C System Flushing Solvent YN-23 and FL1-A filter used in A/C Flush and Purge Machine 219-00022 are intended for use on one vehicle only. They may be used to flush both the A/C condenser core and the A/C evaporator core on an individual vehicle, but under no circumstances should they be used on more than one vehicle.

NOTE: Prior to using the A/C Flush and Purge Machine 219-00022 for the first time, review the operating instructions.

NOTE: Only the A/C Flush and Purge Machine kit 219-00023, which includes A/C Flush and Purge Machine 219-00022, A/C Flush and Purge Fitting Kit 219-00024 and A/C Systems Flushing Solvent, is approved for use on Ford vehicles. No other flushing device or solvent is approved for flushing heat exchangers (A/C condenser, A/C evaporator). Use of any other flusher or solvent may cause damage to the A/C system and the flushing unit.

NOTE: Ford Motor Company has approved a procedure to provide technicians with a non-CFC method of flushing contaminated A/C system heat exchangers. The procedure allows the specific components to be cleaned and flushed while installed in their normal in-vehicle location. The types of contamination flushed include particle matter that results from A/C compressor or desiccant failure and gummy residue that can form when refrigerant oil is overheated during A/C compressor seizure. The flushing process is a 2-step procedure that involves the use of an A/C Flush and Purge Machine 219-00022 to:

- circulate the flushing solvent through the heat exchanger in the reverse direction of normal refrigerant flow (back-flushing). Particulate matter picked up during flushing is filtered from the returning solvent before the solvent is returned to the reservoir for continued circulation.
- remove the flushing solvent from the heat exchanger. In this step of the procedure, pressurized air 621-862 kPa (90-125 psi) is used to push and evaporate any remaining flush solvent from the heat exchanger.

1. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Disconnect the refrigerant lines from the heat exchanger(s) to be flushed.

3. Connect the A/C flush and purge machine fitting kit and the A/C flush and purge machine to the heat exchanger to be flushed. Do not flush through the evaporator core orifice (if equipped), TXV (if equipped) or hoses with mufflers. Internal plumbing and material make-up of these components make it impossible to correctly remove foreign material or residual flushing solvent.

4. **NOTE:** Use 3.785L (1 gal) of A/C Systems Flushing Solvent to flush the heat exchanger for a minimum of 15 minutes. The flush solvent may be used for one or both heat exchangers in the A/C system. However, the flush solvent is intended for one vehicle only. The filter used on the flushing unit is also intended for use on one vehicle only.

   Flush the heat exchanger for a minimum of 15 minutes.

5. Apply 621-862 kPa (90-125 psi) pressurized air to the component for a minimum of 30 minutes. The 30-minute purge time is required to force and evaporate all residual solvent from the A/C system component. Failure to successfully remove all residual solvent within the component can result in system damage when reconnected and operated. Dispose of the used flush solvent and filter in accordance with local, state and federal regulations.

6. **NOTE:** A/C system filtering as described in this section is optional if system flushing is carried out. However, the filter kit use is recommended after flushing if the A/C system contamination is extensive.

   Install a new A/C evaporator core orifice (if equipped) and/or TXV (if equipped) in any vehicle

being serviced for an internal A/C compressor or desiccant failure.

7. Install new refrigerant hoses with mufflers if clogged with foreign material.

8. Install a new suction accumulator (if equipped), receiver/drier (if equipped) or receiver/drier cartridge (if equipped) in any vehicle being serviced for an internal A/C compressor or desiccant failure.

9. Reconnect the heat exchanger being serviced.

10. If a new A/C compressor is not to be installed, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

11. If a new A/C compressor is not to be installed, evacuate, leak test and charge the A/C system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant System Recovery

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation and charging may be accomplished using a separate recovery station, vacuum pump, charging meter and manifold gauge set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Prior to recovering, you must verify the purity of the refrigerant. For additional information, refer to Refrigerant Identification Testing in this section.

2. Connect an R-134a refrigerant service center to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.

3. Recover the refrigerant from the system following the operating instructions provided by the equipment manufacturer.

4. Once the refrigerant service center has recovered the refrigerant, switch OFF the power supply.

5. Allow the system to set for about 2 minutes, and observe the system vacuum reading. If the vacuum is not lost, disconnect the recovery equipment.

6. If the system does lose vacuum, repeat Steps 3 through 5 until the vacuum level remains stable for 2 minutes.

7. Carry out the required repairs.

Refrigerant System Evacuation Using an R-134a Service Center

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation and charging may be accomplished using a separate recovery station, vacuum pump, charging meter and manifold gauge set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Connect an R-134a service center to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.

2. Evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the vacuum pump for a minimum of 45 minutes.

3. Turn OFF the vacuum pump. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Evacuation Using an R-134a Manifold Gauge Set

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation and charging may be accomplished using a separate recovery station,

vacuum pump, charging meter and manifold gauge set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Connect the R-134a manifold gauge set to the low-side and high-side service gauge port valves.

2. Connect the center (yellow) hose from the manifold gauge set to the suction port on the vacuum pump.

3. Open all valves on the R-134a manifold gauge set and both service gauge port valves.

4. Turn on the vacuum pump and evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the vacuum pump for a minimum of 45 minutes.

5. Close the high-side and low-side valves on the manifold gauge set (not the service gauge port valves) and turn OFF the vacuum pump.

6. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Charging Using an R-134a Service Center

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation and charging may be accomplished using a separate recovery station, vacuum pump, charging meter and manifold gauge set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

2. Connect an R-134a A/C service center to the low-side and high-side service gauge port valves following the operating instructions provided by the equipment manufacturer.

3. Set the refrigerant charge amount, and charge the refrigerant system following the instructions provided by the equipment manufacturer.

Refrigerant System Charging

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation and charging may be accomplished using a separate recovery station, vacuum pump, charging meter and manifold gauge set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional

information, refer to Refrigerant Oil Adding in this section.

2. Assemble the R-134a manifold gauge set, automatic refrigerant charging meter and R-134a supply tank following the automatic refrigerant charging meter operating instructions.

3. Charge the refrigerant system following the automatic refrigerant charging meter operating instructions.

4. If the refrigerant flow stops before the refrigerant charge is complete, start the engine, select A/C operation and allow the refrigerant charge to complete.

Refrigerant System Filtering Following Air Conditioning (A/C) Compressor Installation

Printable View (132 KB)

Special Tool(s)

 ST2469-A	A/C Flush and Purge Fitting Kit 219-00024 or equivalent
ST2985-A	A/C Flush Adapter Kit 219-00074 or equivalent
ST1252-A	Set, A/C Fittings 412-DS028 (014-00333, D93L-19703-B) or equivalent
ST2819-A	Adapter Set, In-Line Connector Leak Check 412-DS036 or equivalent

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

WARNING: Use extreme care and observe all safety and service precautions related to the use of refrigerants.

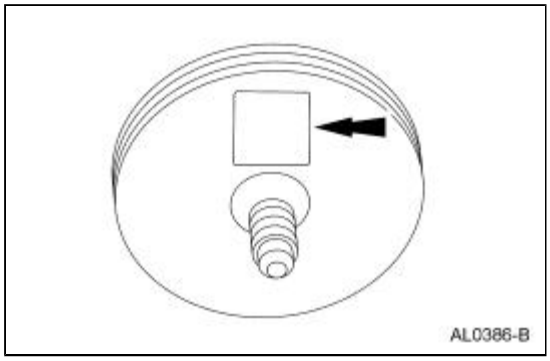
WARNING: Due to refrigerant hazards, always wear safety goggles and non-penetrable gloves when working on A/C systems.

CAUTION: An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery

equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer's procedures and instructions.

CAUTION: On vehicles being serviced for an internal compressor or desiccant failure, a new suction accumulator or receiver/drier, thermal expansion valve or evaporator core orifice and any hoses containing mufflers must be installed prior to filtering the A/C system. Internal plumbing of these devices makes it impossible to correctly remove any foreign material/debris. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The filter is intended for use on one vehicle only.

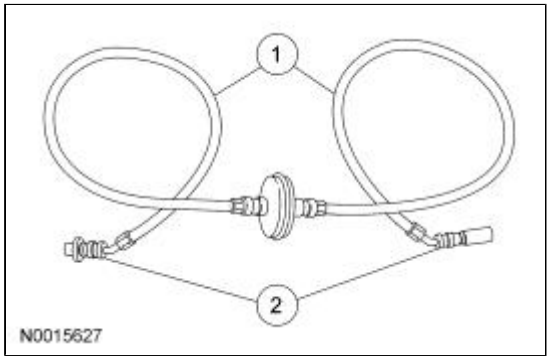
1. Orient the filter inlet toward the A/C condenser core.



2. **CAUTION: The flexible extension adapters included in the A/C Flush Adapter Kit (219-00074) are designed for low-pressure flushing and are not designed for use with a charged refrigerant system. Do not make the condenser fitting connections using the flexible extension adapters or damage to the adapters and loss of refrigerant will occur.**

   NOTE: The pancake filter is not permanently installed and will be removed at the end of this procedure.

   Disconnect the condenser outlet fitting and temporarily install the pancake filter between the 2 halves of the fitting.
   1. Use flexible refrigerant hose of 17,238 kPa (2,500 psi) burst rating.
   2. Make the connections using the correct adapters.



3. Lubricate the refrigerant system with the correct amount of clean refrigerant compressor oil. For additional information, refer to Refrigerant Oil Adding in this section.

4. Evacuate and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

5. Check all refrigerant system hoses, lines and the position of the newly installed filters to be sure

they do not interfere with other engine compartment components. If necessary, use tie-straps to make adjustments.

6. Provide adequate airflow to the front of the vehicle (with a fan, if necessary). Select A/C operation and set the blower motor speed to maximum. Start the engine and let it idle briefly. Make sure the A/C system is operating correctly.

7. Gradually bring the engine up to 1,200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1,000 rpm). Set the engine at 1,200 rpm and run it for one hour with the A/C system operating.

8. Stop the engine.

9. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

10. Remove the fittings, flexible hoses and pancake filter from between the condenser and the condenser to evaporator tube.

11. Discard the pancake filter. It can be used one time only.

12. Reconnect the condenser outlet fitting.

13. Evacuate, charge and leak-test the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant Oil Adding

Printable View (107 KB)

Special Tool(s)

ST2740A	Dye/Lubricant Injector 164-R0775
ST2737-A	Add-On Module Kit 219-00069

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Refrigerant Oil Adding

CAUTION: During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the refrigerant oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.

1. Refer to the chart below for refrigerant oil adding amounts and methods of installation.

Component	PAG Oil Amount	Method of Adding
A/C Compressor	See heading below	Add directly to A/C compressor before installation.
Suction Accumulator or Receiver/Drier	See heading below	Add directly to suction accumulator inlet port or inject to low-side service port during system charging.
Evaporator Core	45 ml (1.5 fl oz) added to the amount collected during refrigerant recovery	Add directly to evaporator core inlet tube or inject to low-side service port during system charging.
Condenser Core	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Add directly to condenser core inlet or inject to low-side service port during system charging.
Evaporator Core Orifice or Thermostatic Expansion	The amount collected during refrigerant recovery	Inject to low-side service port during system charging.

Valve		
A/C Pressure Relief Valve	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging.
Refrigerant Hose/Line	60 ml (2 fl oz) added to the amount collected during refrigerant recovery [a]	Inject to low-side service port during system charging.
O-ring Leak Repair	60 ml (2 fl oz) added to the amount collected during refrigerant recovery [b]	Inject to low-side service port during system charging.
Service Port Leak Repair	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging.

[a] If an excessive amount of refrigerant oil is lost due to a hose rupture/separation or other damage, the total system refrigerant oil capacity must be added.
[b] The amount specified may be used for one or multiple O-ring leak repairs. Do not multiply the refrigerant oil amount by the number of O-ring leaks being repaired.

Refrigerant Oil Adding for New A/C Compressor Installation

NOTE: Service A/C compressors are shipped without refrigerant oil.

1. Rotate the old A/C compressor shaft 8 to 10 full rotations (clockwise) while collecting the refrigerant oil in a clean measuring cup.
    - Add the same amount plus the amount collected during refrigerant recovery.

Refrigerant Oil Adding for New Suction Accumulator or Receiver/Drier Installation

1. Drill one 12.7 mm (1/2 in) hole in the old suction accumulator or receiver/drier cylinder and drain the oil into a clean measuring cup.

2. Add the quantity of oil drained, plus the amount collected during refrigerant recovery and 60 ml (2 fl oz).

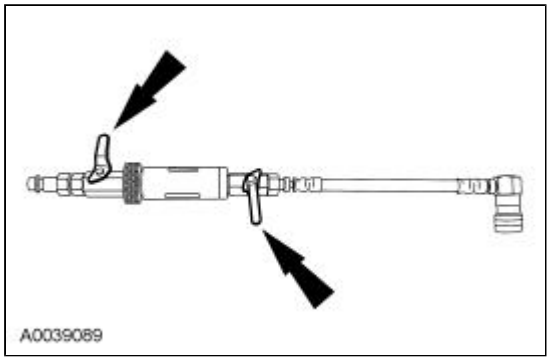
Oil Injection Using a Dye/Lubricant Injector

NOTE: If fluorescent leak detection dye is also to be added during A/C charging, the dye may be added to the dye/lubricant injector along with the refrigerant oil.

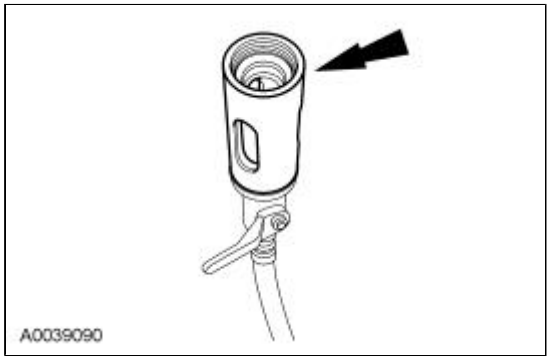
1. Evacuate the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Assemble the dye/lubricant injector using the correct adapters to match the amount of refrigerant compressor oil to be injected.

3. Verify that all the valves on the dye/lubricant injector are closed.



4. Fill the dye/lubricant injector with the correct amount of clean, new PAG oil.



5. Install the dye/lubricant injector between the low-side service gauge port valve and the refrigerant service station or manifold gauge set.

6. Open all valves and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant Identification Testing

Printable View (87 KB)

Special Tool(s)

ST1457-A	Refrigerant Identifier with Air-Radiator 198-00003 or equivalent

Refrigerant Identification

1. **NOTE:** An A/C refrigerant analyzer must be used to identify gas samples taken directly from the refrigeration system or storage containers prior to recovering or charging the refrigerant system.

   Follow the instructions included with the refrigerant identifier to obtain the sample for testing.

2. The scan tool will display one of the following:
   - If the purity level of R-134a is 98% or greater by weight, the green PASS light emitting diode (LED) will light. The weight concentrations of R-134a, R-12, R-22, hydrocarbons and air will be displayed on the digital display.
   - If refrigerant R-134a does not meet the 98% purity level, the red FAIL LED will light and an alarm will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons will be displayed on the digital display.
   - If hydrocarbon concentrations are 2% or greater by weight, the red FAIL LED will light, "Hydrocarbon High" will be displayed on the digital display, and an alarm will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons will also be displayed on the digital display.

3. The percentage of air contained in the sample will be displayed if the R-134a content is 98% or greater. The scan tool eliminates the effect of air when determining the refrigerant sample content because air is not considered a contaminant, although air can affect A/C system performance. When the scan tool has determined that a refrigerant source is pure (R-134a is 98% or greater by weight) and air concentration levels are 2% or greater by weight, the scan tool will prompt the user if an air purge is desired.

4. If contaminated refrigerant is detected, repeat the refrigerant identification test to verify that the refrigerant is indeed contaminated.

Contaminated Refrigerant Handling

CAUTION: If contaminated refrigerant is detected, DO NOT recover the refrigerant into R-134a recovery/recycling equipment.

NOTE: A new suction accumulator or receiver/drier must be installed as directed by the air conditioning system flushing procedure.

1. Recover the contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant only.
   - If this equipment is not available, contact an A/C service facility in your area with the

correct equipment to carry out this service.

2. Determine and correct the cause of the customers initial concern.
3. Flush the air conditioning system.
4. Dispose of the contaminated refrigerant in accordance with all federal, state and local regulations.

Air Conditioning (A/C) Odor Treatment

Printable View (92 KB)

Special Tool(s)

ST2940-A	Flexible Applicator Tool Kit 258-00004
ST2813-A	30 oz Sure Shot Pressure Sprayer 167-R4700 or equivalent

Material

Item	Specification
A/C Cooling Coil Coating YN-29	—

A/C Odor Treatment

WARNING: Avoid contact with eyes and skin. Contact with eyes and skin will cause irritation. Wear chemical goggles when using the A/C cooling coil coating.

WARNING: This procedure should only be carried out in well ventilated areas. Open all windows and doors of the vehicle. Leave doors and windows open during the entire procedure. Avoid breathing vapors.

WARNING: Read all instructions and warnings packaged with the A/C cooling coil coating. For additional information, see the material safety data sheet (MSDS) for this product.

NOTE: There are typically 4 types of objectionable odors found in a vehicle:

- Chemical odors
- Environmental odors
- Human and other interior-generated odors
- Microbiological odors

Before determining that A/C order treatment is required, the source and the circumstances under which the odor occurs must be determined.

NOTE: Chemical odors are usually constant regardless of the climate control system setting although they may be enhanced by A/C operation. Most chemical odors are caused by fluid leaks or incorrectly cured adhesives. Chemical odors can be eliminated by repairing the leaking component and removing any residue.

NOTE: Environmental odors usually occur for a short time and diminish after the vehicle passes through the affected area. These odors are typically only detected when the vehicle windows are open, or when the climate control system is operating in a mode that allows for fresh air. Environmental odors cannot be eliminated because they are external in source, but they may be minimized by switching to a climate control setting that uses recirculated air.

NOTE: Human and other interior-generated odors occur while the source is present and may linger for a short time after. These odors may be more noticeable during A/C operation. Human odors may be eliminated by removing the source and cleaning the affected area.

NOTE: Microbiological odors, if in the A/C system, usually last for about 30 seconds after the system is turned on. They will be detected while the A/C is turned on and using either outside or recirculated air. Microbiological odors that occur in areas other than the A/C system (for example, water in doors or wet carpeting) may last indefinitely and will be more intense when recirculated air is used. Microbiological odors will not be present at temperatures at or below 10°C (50°F).

Microbiological odors can be eliminated by removing the source and treating the affected area. Standing water must be allowed to drain and dry out. A/C systems may be treated by using A/C cooling coil coating as described in the service procedure below.

Microbiological odors result from microbial growth supported by warm temperatures and moisture. Microbiological odors are described as musty/mildew type smells and may occur on/in:

- foam seals.
- rubber seals.
- adhesives.
- standing water.
- water soaked carpet/trim.

1. Identify the type of odor present in the vehicle. Do not proceed with A/C odor treatment if the odor source is found to be outside of the A/C system. Refer to the following chart for examples.

Odor Source	Odor Description
Chemical Odors	
Coolant	Sweet smell
Fuel	Gasoline or diesel fuel smell
Oil	Oil type or burning smell
Power Steering Fluid	Oil type or burning smell
Transmission Fluid	Oil type or burning smell
Washer Fluid	Alcohol type smell
Gear Lube	Garlic/sulfur smell
Refrigerant Oil	Ether type smell
Carpet/trim Adhesives	Fishy, urine or sweet smell
Evaporator Core Coating	Wet cement type smell
Environmental Odors	
Exhaust	Exhaust, fuel or burning type smell
Industrial Pollutants	Various smells
Dust	Musty, mildew or wet cement type smell
Pollen	Sweet smell
Tobacco	Burning, tar smell
Human and Other Interior Generated Odors	

Body Secretions	Body odor
Perfuming Agents	Sweet or fragrance smell
Clothing	Musty, mildew or body odors
Food/Beverage	Sweet, musty, mildew or fishy smell
Microbiological Odors	
Microbiological Odors Occurring Inside of A/C System	Musty, mildew smell lasting about 30 seconds after A/C is turned on
Microbiological Odors Occurring Outside of A/C System	Musty, mildew smell lasting indefinitely and possibly more pronounced when using recirculated air

2. Identify the source of the odor.
   - Check the passenger and driver side carpet for moisture. Continue diagnosis if moisture is found.
   - Check the blower motor and blower motor cover (if equipped) for moisture resulting from water bypassing the cowl baffling system. Continue diagnosis if moisture is present.
   - Check the evaporator core drain tube for restriction.
   - Check the cowl top panel and air inlet screen for standing water or foreign material. If possible, remove any standing water and clean the air inlet screen using a wet/dry vacuum.
3. Open all vehicle windows.
4. Disconnect the low-side A/C pressure switch (cycling or low-charge protection) electrical connector.
5. Remove the evaporator air discharge temperature sensor (if equipped).
6. Set the following.
   - Enable the A/C using fresh air inlet.
   - Adjust the temperature setting to full warm.
   - Adjust the blower motor speed to HI.
7. Run the engine for 25 minutes to dry out the A/C system.
8. Turn the ignition OFF.
9. Remove the blower motor.
10. **NOTE:** Blower motor speed controls that are mounted outside of the evaporator core housing and not exposed to the blower motor airflow do not need to be removed.

    Remove the blower motor resistor (if equipped) or blower motor speed control (if equipped and exposed to the inside of the evaporator core housing).
11. **CAUTION: To avoid damage to the vehicle interior, do not spill or spray this product on any interior surface.**

    Add one full bottle of A/C cooling coil coating to the applicator or sprayer.
12. Insert the nozzle into the evaporator housing and direct the spray toward the evaporator core face. Spray the entire evaporator core face until empty.
13. Install the blower motor and blower motor resistor (if equipped) or blower motor speed control (if equipped).

14. Install the evaporator air discharge temperature sensor (if equipped),
15. Repeat Steps 6 through 8 to cure the evaporator core coating.
16. Connect the low-side A/C pressure switch (cycling or low-charge protection) electrical connector.

Air Conditioning

Printable View (139 KB)

The air conditioning system components are the following:

- A/C compressor
- A/C condenser core
- A/C evaporator core
- Receiver/drier cartridge
- Connecting refrigerant lines
- Thermostatic expansion valve
- Evaporator discharge air temperature sensor
- A/C high-pressure cutoff switch
- Low charge protection switch
- A/C compressor pressure relief valve

The refrigerant system incorporates an A/C compressor controlled by the powertrain control module (PCM) through an A/C clutch relay.

The A/C compressor clutch will only be engaged by the PCM if all of the following conditions are met:

- The climate control assembly is set to a mode which provides an A/C request to the PCM.
- The evaporator discharge air temperature sensor is reading a temperature above 3°C (37°F).
- The A/C pressure transducer is not reading an excessively high or excessively low pressure in the refrigerant system.
- The A/C compressor relay is switched to the CLOSED position by the PCM.
- The engine coolant temperature is not excessively high.
- The PCM has not detected a wide open throttle (WOT) condition.

Refer to Section 412-00 for operating specifications.

An A/C compressor pressure relief valve is installed in the A/C compressor to protect the refrigerant system against excessively high refrigerant pressure.

Refrigerant flow into the evaporator core is metered by a thermostatic expansion valve.

A/C Compressor and Clutch Assembly

NOTE: Internal FS20 A/C compressor components are not serviced separately. The A/C compressor is serviced only as an assembly. The clutch disc and hub, A/C compressor pulley and bearing and clutch field coil are serviceable.

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

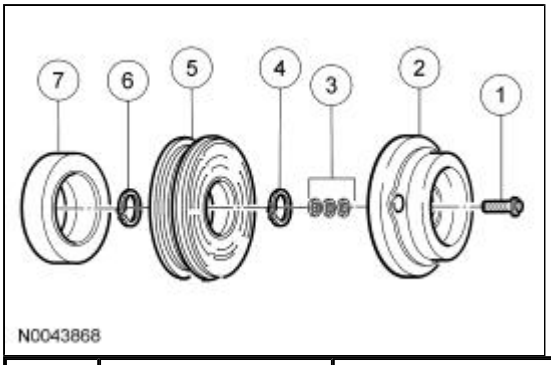
The FS20 A/C compressor uses the following:

- A non-serviceable shaft seal.
- A pressure relief valve installed in the rear of the compressor to protect the refrigerant system against excessively high refrigerant pressures.
- PAG oil or equivalent. This oil contains special additives required for the A/C compressor.

- PAG oil may have some slightly dark-colored streaks while maintaining normal oil viscosity. This is normal for this A/C compressor because of break-in wear that can discolor the oil.

Use standard oil matching procedures when installing new compressors.

A/C Compressor Clutch Assembly



Item	Part Number	Description
1	W711887	A/C clutch disc and hub bolt
2	19D786	A/C clutch disc and hub
3	19N689	A/C clutch disc and hub spacer
4	N805338	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	W711883	A/C clutch field coil snap ring
7	19D798	A/C clutch field coil

The magnetic A/C clutch has the following characteristics:

- The A/C clutch drives the compressor shaft.
- When battery positive voltage (B+) is applied to the A/C clutch field coil, the clutch disc and hub assembly is drawn toward the A/C clutch pulley.
- The magnetic force locks the clutch disc and hub assembly and the A/C clutch pulley together as one unit, causing the compressor shaft to rotate.
- When B+ is removed from the A/C clutch field coil, springs in the clutch disc and hub assembly move the clutch disc away from the A/C clutch pulley.

Thermostatic Expansion Valve

The thermostatic expansion valve (TXV) is located between the evaporator core lines and the thermostatic expansion valve manifold and tube assembly at the RH rear of the engine compartment. The TXV provides a restriction to the flow of refrigerant from the high-pressure side of the refrigerant system, and separates the low-pressure and high-pressure sides of the refrigerant system. Refrigerant entering and exiting the evaporator core passes through the TXV through 2 separate flow paths. An internal temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures and increases the amount of refrigerant entering the evaporator core at higher temperatures.

Evaporator Discharge Air Temperature Sensor

The evaporator discharge air temperature sensor communicates the evaporator discharge air temperature to the electronic manual temperature control (EMTC) module (if equipped) or electronic

automatic temperature control (EATC) module (if equipped).

The PCM maintains evaporator core temperature and prevents icing of the evaporator core, by disengaging the A/C compressor clutch when the evaporator discharge air temperature sensor reading falls below acceptable levels, and by engaging the A/C compressor clutch when the discharge air temperature rises above acceptable levels.

The evaporator discharge air temperature sensor is located on the heater core and evaporator core housing in the air-stream leaving the evaporator core.

A/C Pressure Transducer

The A/C pressure transducer communicates the compressor discharge pressure to the PCM. The PCM will interrupt A/C compressor operation in the event that the A/C pressure transducer indicates excessively high system discharge pressures. It is also used to sense low charge conditions. If the pressure is below a predetermined value for a given ambient temperature, the PCM will not allow the clutch to engage.

A/C Condenser/Power Steering Combo Cooler

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

The A/C condenser/power steering combo cooler is an aluminum fin-and-tube design heat exchanger located in front of the vehicle radiator. It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat and by condensing gas to liquid refrigerant as it is cooled.

The receiver/drier is incorporated onto the LH side of the condenser core. The receiver/drier cartridge is a separate component and can be removed and installed separately from the condenser core.

The top portion of the condenser/power steering combo cooler is partitioned from the refrigerant system and is used for power steering fluid cooling.

Evaporator Core

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle. Refer to Section 412-00 .

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

The evaporator core is an aluminum plate/fin type and is located in the heater core and evaporator core housing. A mixture of refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube, continues over to the remaining plate/fin sections and then moves out of the evaporator core through the evaporator core outlet tube. Air from the blower motor is cooled and dehumidified as it flows through the evaporator core fins.

Receiver/Drier

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

The receiver/drier is integral to the A/C condenser/power steering combo cooler. It stores high-pressure liquid after it leaves the condenser core. An A/C desiccant cartridge mounted inside the receiver/drier removes any retained moisture from the refrigerant. The receiver/drier cartridge is a separate component and can be removed and installed separately from the A/C condenser/power steering combo cooler.

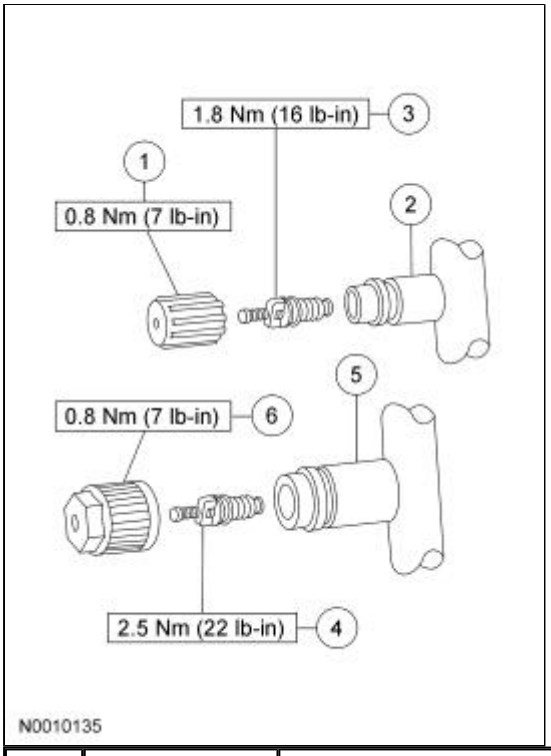
A/C Compressor Pressure Relief Valve

An A/C compressor pressure relief valve is incorporated in the compressor to prevent damage to the A/C compressor and other system components, and to avoid total refrigerant loss by relieving unusually high refrigerant system discharge pressure buildups. For information, regarding operating pressure(s) specifications, refer to Section 412-00 .

Service Gauge Port Valves

The high-pressure service gauge port valve is located on the high-pressure side of the TXV manifold and tube at the RH rear of the engine compartment.

The low-pressure service gauge port valve is located on the low-pressure side of the TXV manifold and tube at the RH rear of the engine compartment.



Item	Part Number	Description
1	19D702	Low-pressure service gauge port valve cap
2	—	Low-pressure service gauge port valve
3	19D701	Low-pressure Schrader-type valve
4	19D701	High-pressure Schrader-type valve
5	—	High-pressure service gauge port valve
6	19D702	High-pressure service gauge port valve cap

The fitting is an integral part of the refrigeration line or component.

- Special couplings are required for both the high-side and low-side service gauge ports.
- A very small amount of leakage will always be detectable around the Schrader-type valve, with the service gauge port valve cap removed, and is considered normal. A new Schrader-type valve core can be installed if the seal leaks excessively.
- The service gauge port valve caps are used as primary seals in the refrigerant system to prevent leakage through the Schrader-type valves from reaching the atmosphere. Always install and tighten the A/C service gauge port valve caps to the correct torque after they are removed.

Refrigerant System Dye

Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved ultraviolet blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage. Refer to Section 412-00 .

Air Distribution and Filtering

Printable View (79 KB)

NOTE: The air distribution system of this vehicle cannot be equipped with a cabin air filter.

There are 2 sources of air available to the air distribution system:

- Outside air
- Recirculated air

Recirculated air can be selected in any mode other than DEFROST using the RECIRC button on vehicles with manual climate control. Recirculated air is automatically used when the climate control assembly is set to the MAX A/C or OFF mode. Vehicles equipped with dual-zone electronic automatic temperature control (EATC) use recirculated air only when in the AUTOMATIC mode (if functioning to obtain selected temperatures), or when the RECIRC function is selected in any mode other than DEFROST.

Air distribution within the vehicle is determined by the function selector position (manual A/C), or the dual-zone EATC system in the AUTOMATIC mode. The air distribution mode on vehicles equipped with dual-zone EATC can be overridden by the driver if desired. Airflow mode doors are used to direct airflow within the plenum chamber. An electric actuator and cam assembly is used to position the airflow mode control doors.

Vehicles equipped with dual-zone EATC use a heater core and evaporator core housing with 2 separate temperature blend doors. This allows for individual temperature settings to be selected for the RH and LH air outlets. The airflow mode doors are not partitioned for separate RH and LH airflow positions, therefore the airflow mode will always remain similar for the RH and LH sides of the vehicle regardless of the temperatures selected.

Air enters the passenger compartment from the following:

- Instrument panel A/C registers
- Floor duct
- Windshield defroster
- Side window demisters
- Rear seat airflow duct (if equipped)

Passenger compartment air is exhausted from the vehicle through open windows or body air vents.

Control Components

Printable View (70 KB)

Two climate control systems are available:

- Electronic manual temperature control (EMTC) (Expedition only)
- Dual-zone electronic automatic temperature control (EATC)

Refer to the appropriate heading below for information concerning each system.

Manual Climate Control

The manual climate control components are used to select the following:

- Air inlet source (outside or recirculated)
- Blower motor speed
- Discharge air temperature (temperature blend)
- Discharge air location (DEFROST, PANEL, FLOOR)
- A/C compressor operation

Control System Inputs — Electronic Manual Temperature Control

Climate Control Assembly (EMTC Module)

The climate control assembly integrates the temperature control, airflow mode selection, A/C request button, recirculated air request button and rear defog switch into a single unit.

The temperature control setting determines air temperature. Movement of the temperature control from COOL (blue) to WARM (red) causes a corresponding movement of the temperature blend door and determines the air discharge temperature that the air distribution system will maintain. The temperature control switch is an integral part of the climate control assembly and cannot be installed separately.

The airflow mode setting determines discharge air location. Movement of the mode selector causes a corresponding movement of the airflow mode door actuators. The mode selector is an integral part of the climate control assembly and cannot be installed separately.

The A/C request button determines A/C compressor operation, except when the mode selector is in the OFF, MAX or DEFROST mode. The A/C request button is an integral part of the climate control assembly and cannot be installed separately.

The recirculated air request button determines air inlet source, except when the airflow mode selector is in the OFF, MAX or DEFROST mode. The recirculated air request button is an integral part of the climate control assembly and cannot be installed separately.

The rear defog button signals activation of the heated backlight and heated mirrors. The rear defog button is an integral part of the manual climate control assembly and cannot be installed separately.

The EMTC module is not equipped with self-test capabilities.

Blower Motor Switch

The blower motor switch controls blower motor speed by adding or bypassing resistors in the blower motor resistor in all function selector positions except OFF. The blower motor switch is mounted to the

climate control assembly and can be separately installed.

Control System Outputs — Electronic Manual Temperature Control

Blower Motor Resistor

The blower motor switch varies the blower motor ground circuit resistance by adding or bypassing series resistance in the blower motor resistor. Increased resistance will lower the blower motor speed, and lowered resistance will increase blower motor speed. When the blower motor is in the HIGH position, the blower motor resistor is bypassed.

The blower motor resistor is located on the heater core and evaporator core housing near the blower motor.

Temperature Blend Door Actuator

The temperature blend door actuator moves the temperature blend door on command from the EMTC module.

The temperature blend door actuator contains a reversible electric motor and a potentiometer. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal return circuit is connected to a wiper which is driven along the variable resistor by the actuator shaft. The signal returned to the EMTC module from the wiper indicates the position of the temperature blend door. The EMTC module drives the actuator motor in whichever direction is necessary to make the actuator wiper voltage agree with the expected EMTC module wiper voltage value.

The temperature blend door actuator is located on the heater core and evaporator core housing.

Mode Door Actuators

Electric mode door actuators are used to position the 3 airflow mode doors on command from the EMTC module. The 2 mode door actuators each contain a reversible electric motor. The DEFROST/PANEL/FLOOR door actuator contains a potentiometer to allow the EMTC module to monitor the position of the airflow mode doors. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal return circuit is connected to a wiper which is driven along the variable resistor by the actuator shaft. The signal returned to the EMTC module from the wiper indicates the position of the airflow mode door. The air inlet mode door actuator is driven to the full RECIRC or full FRESH air inlet position, and does not require a potentiometer circuit to monitor its position.

Dual-Zone Electronic Automatic Temperature Control

The dual-zone EATC module analyzes input from the following major sources:

- Temperature, mode and blower selection (made by the vehicle occupants)
- In-vehicle temperature
- In-vehicle humidity (Navigator only)
- Ambient temperature
- Evaporator discharge air temperature
- Sunload
- Vehicle speed
- Engine coolant temperature

Using these inputs, the dual-zone EATC module determines the correct conditions for the following outputs:

- A/C compressor operation

- Blower speed
- LH side temperature blend door position
- RH side temperature blend door position
- Airflow mode door positions

Control System Inputs — Dual-Zone EATC

EATC Module (Climate Control Assembly)

The EATC module provides an interface for the vehicle occupants to control the climate control system, or automatically controls the climate control system in the AUTO mode. The EATC module has a vacuum fluorescent display for displaying set temperature, airflow direction, blower speed and diagnostic trouble codes (DTCs). An on-board diagnostic (OBD) feature is incorporated to supply the technician with DTCs. These DTCs help direct the technician to the inoperative component.

Steering Wheel Audio/Climate Control Switch

The steering wheel audio/climate control switch allows the driver to adjust the passenger compartment temperature setting and manually override the blower motor speed setting.

For removal and installation of the steering wheel audio/climate control switch, refer to Section 415-01 .

Ambient Air Temperature Sensor

The ambient air temperature sensor contains a thermistor, which measures the temperature of outside air as a resistance and sends that reading to the dual-zone EATC module.

In-Vehicle Temperature/Humidity Sensor — Navigator

The in-vehicle temperature sensor contains 2 thermistors, which separately measure the in-vehicle air temperature and humidity and send those readings to the EATC module. An aspirator hose and elbow is connected between the heater core and evaporator core housing and the in-vehicle temperature and humidity sensor. The aspirator hose uses airflow from the heater core and evaporator core housing air stream to create a venturi-type suction to draw in-vehicle air through the in-vehicle temperature sensor and across the thermistors.

In-Vehicle Temperature Sensor — Expedition

The in-vehicle temperature sensor contains a thermistor, which measures the in-vehicle air temperature and sends that reading to the EATC module. An aspirator hose and elbow is connected between the heater core and evaporator core housing and the in-vehicle temperature sensor. The aspirator hose uses airflow through the heater core and evaporator core housing to create a venturi-type suction to draw in-vehicle air through the in-vehicle temperature sensor and across the thermistor.

Dual-Zone Solar Amplifier (Sunload Sensor)

The solar amplifier is a dual-zone type that supplies separate information to the dual-zone EATC module indicating LH side and RH side sunload. For information on the location and service of the solar amplifier, refer to Section 417-01 .

Control System Outputs — EATC

Blower Motor Speed Control

The blower motor speed control controls the blower motor speed by converting low power signals from the EATC module to a high current, variable ground feed for the blower motor. A delay function is used to provide a gradual increase or decrease in blower motor speed under all conditions.

The blower motor speed control is located on the heater core and evaporator core housing near the blower motor.

Temperature Blend Door Actuators

The dual-zone EATC system uses 2 temperature blend door actuators to control 2 separate temperature blend doors. The temperature blend doors independently vary the LH side and RH side temperature settings, as desired. The temperature blend door actuators each contain a reversible electric motor and a potentiometer. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal return circuit is connected to a wiper which is driven along the variable resistor by the actuator shaft. The signal returned to the EATC module from the wiper indicates the position of the temperature blend door. The EATC module drives the actuator motor in whichever direction is necessary to make the actuator wiper voltage agree with the expected EATC module wiper voltage value.

Mode Door Actuators

Electric mode door actuators are used to position the 3 airflow mode doors on command from the EATC module. The 2 mode door actuators each contain a reversible electric motor. The DEFROST/PANEL/FLOOR door actuator contains a potentiometer to allow the EATC module to monitor the position of the airflow mode doors. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal return circuit is connected to a wiper, which is driven along the variable resistor by the actuator shaft. The signal returned to the EATC module from the wiper indicates the position of the airflow mode door. The air inlet mode door actuator is driven to the full RECIRC or full FRESH air inlet position, and does not require a potentiometer circuit to monitor its position.

Heating and Ventilation

Printable View (64 KB)

The heating and ventilation system has the following features:

- Controls the temperature and, during A/C operation, reduces the relative humidity of the air inside the vehicle.
- Delivers heated or cooled air to maintain the vehicle interior temperature and comfort level.
- Cooling or heating can be adjusted to maintain the desired temperature.
- Uses a reheat method to provide conditioned air to the passenger compartment.
- All airflow from the blower motor passes through the A/C evaporator core.
- Temperature blending is controlled by the temperature blend door(s), which regulate(s) the amount of air that flows through and around the heater core, where it is then mixed and distributed.

Blower Motor

The blower motor pulls air from the air inlet and forces it into the heater core and evaporator core housing and the plenum chamber where it is mixed and distributed.

Heater Core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer the heat to air passing through the plenum.

Heater Core and Evaporator Core Housing

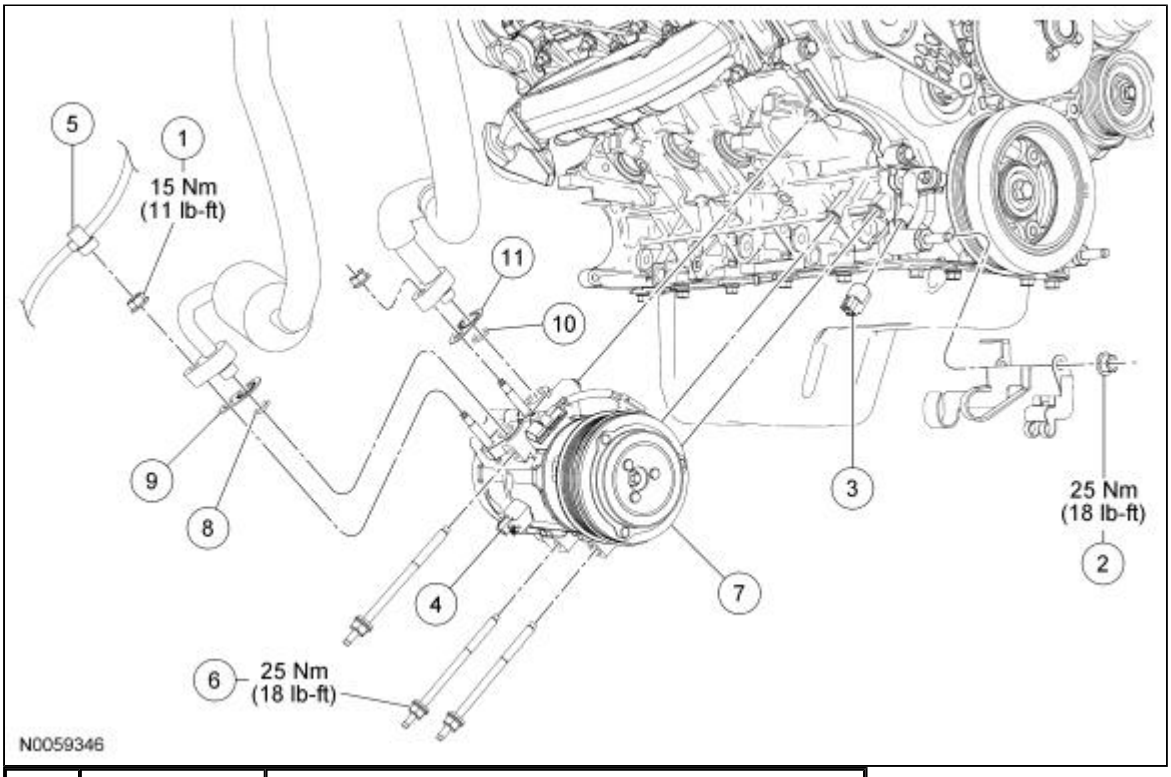
The heater core and evaporator core housing directs airflow from the blower motor through the evaporator core and heater core. All airflow from the blower motor passes through the evaporator core. The airflow is then directed through or around the heater core by the temperature blend door(s). After passing through the heater core, the airflow is distributed to plenum chamber where it is distributed to the selected vehicle outlets.

Air Conditioning (A/C) Compressor

Printable View (254 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	W520413	A/C compressor fitting nut (2 required)
2	N804758	Transmission cooler tube support bracket nut
3	12B637	Crankshaft position sensor electrical connector
4	12B637	Clutch field coil electrical connector
5	—	Wire harness retainer (part of 12B637)
6	W707821	A/C compressor stud bolt (3 required)
7	19703	A/C compressor
8	19E889	1/2-inch O-ring seal
9	19B588	1/2-inch Gasket seal
10	19E889	5/8-inch O-ring seal
11	19B588	5/8-inch Gasket seal

Removal and Installation

CAUTION: If installing a new air conditioning (A/C) compressor due to an internal failure of the old unit, you must carry out the following procedures to remove contamination from the air conditioning system:

- **If A/C flushing equipment is available, carry out flushing of the air conditioning system. For additional information, refer to Section 412-00 .**
- **If A/C flushing equipment is not available, carry out filtering of the A/C system after a new A/C compressor has been installed. For additional information, refer to Section 412-00 .**
- **Install a new thermostatic expansion valve (TXV) and TXV filter as directed by the A/C flushing or filtering procedure.**
- **Install a new receiver/drier cartridge as directed by the A/C flushing or filtering procedure.**

NOTE: If installing a new A/C compressor, the A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil must be inspected and transferred from the old unit to the new unit if suitable for reuse.

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If flushing of the air conditioning system has not been carried out, recover the refrigerant. For additional information, refer to Section 412-00 .

3. Remove the drive belt from the A/C compressor pulley.

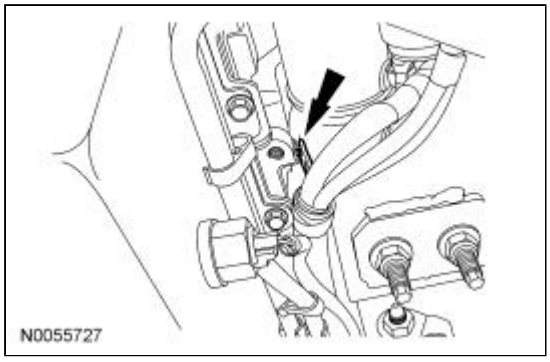
4. Detach the wire harness retainer from the A/C compressor stud and position the wire harness aside.

5. Remove the 2 A/C compressor fitting nuts and disconnect the fittings.
   - Discard the O-ring seals and gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).

Four wheel drive (4WD) vehicles

6. Release the tab on the bottom of the cooling fan shroud and rotate the lower portion of the cooling fan shroud upward.

7. Detach the battery cable pin-type retainer from the engine block below the starter motor.



8. Remove the transmission cooler tube support bracket nut and detach the battery cable bracket and transmission cooler line bracket from the front cover stud.

- To install, tighten to 25 Nm (18 lb-ft).

All vehicles

9. Disconnect the crankshaft position sensor electrical connector.

10. Disconnect the clutch field coil electrical connector.

11. Remove the 3 A/C compressor stud bolts.
    - To install, tighten to 25 Nm (18 lb-ft).

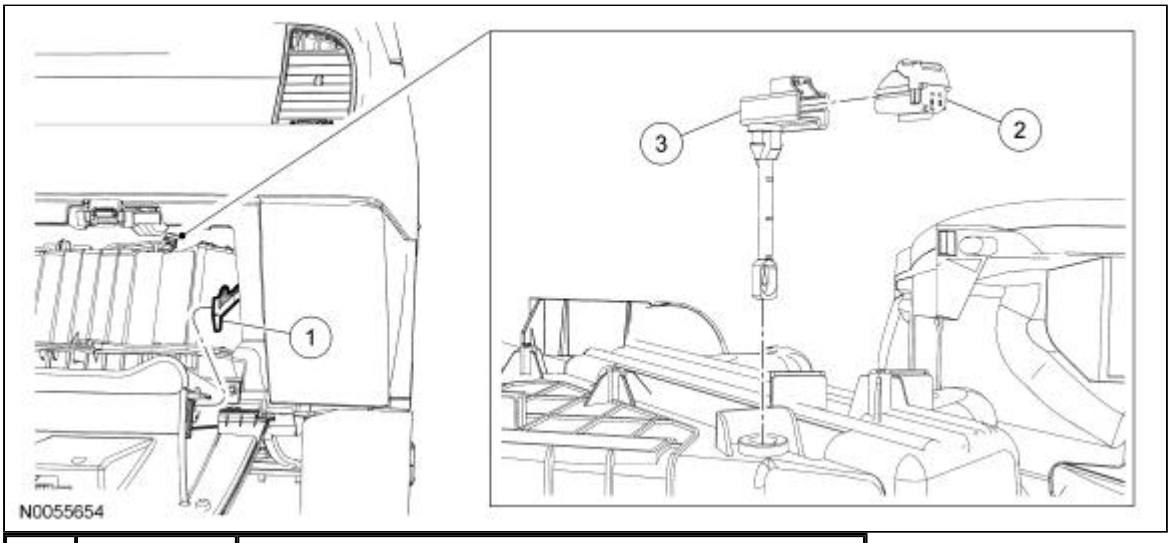
12. Remove the A/C compressor.

13. To install, reverse the removal procedure.
    - If a new A/C compressor is to be installed, the clutch assembly must be transferred from the old unit to the new unit. For additional information, refer to Clutch and Clutch Field Coil in this section.
    - Install new gasket seals and O-ring seals.
    - If filtering of the refrigerant system is not to be carried out, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

14. If filtering of the refrigerant system is not to be carried out, evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Air Conditioning (A/C) Evaporator Discharge Air Temperature Sensor

Printable View (137 KB)



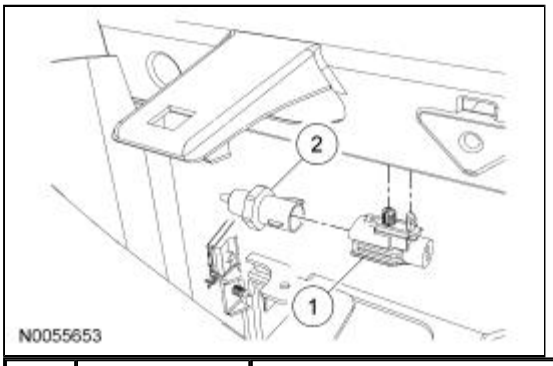
Item	Part Number	Description
1	—	Glove compartment dampener (part of 06024)
2	18B518	Evaporator discharge air temperature sensor electrical connector
3	19C734	Evaporator discharge air temperature sensor

Removal and Installation

1. Detach the glove compartment dampener and lower the glove compartment.
2. Disconnect the evaporator discharge air temperature sensor electrical connector.
3. Carefully pry the evaporator discharge air temperature sensor probe out of the heater core and evaporator core housing.
4. To install, reverse the removal procedure.

Ambient Air Temperature Sensor

Printable View (88 KB)



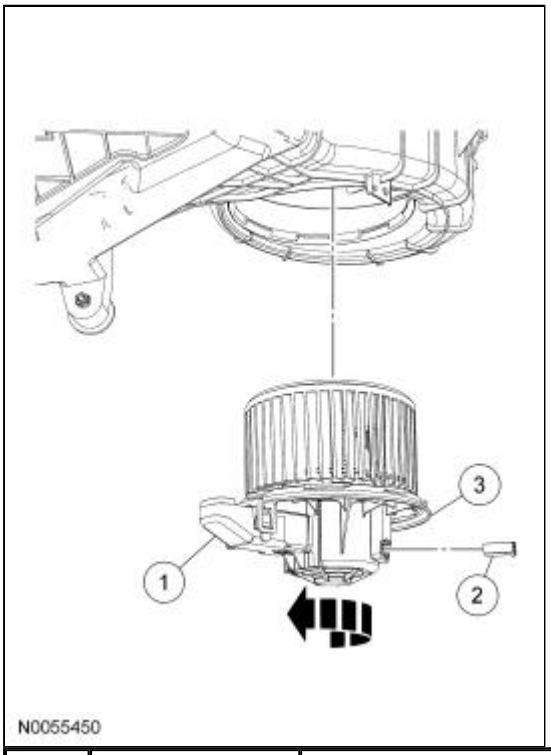
Item	Part Number	Description
1	12A581	Ambient air temperature sensor electrical connector
2	12A647	Ambient air temperature sensor

Removal and Installation

1. Remove the upper radiator sight shield.
2. Detach and disconnect the ambient temperature sensor electrical connector.
3. Remove the ambient air temperature sensor.
4. To install, reverse the removal procedure.

Blower Motor

Printable View (121 KB)



Item	Part Number	Description
1	—	Blower motor vent tube (part of 19805)
2	18B518	Blower motor electrical connector
3	19805	Blower motor

Removal and Installation

NOTE: The blower motor vent tube must be completely removed from the blower motor before it can be rotated and disengaged from the heater core and evaporator core housing.

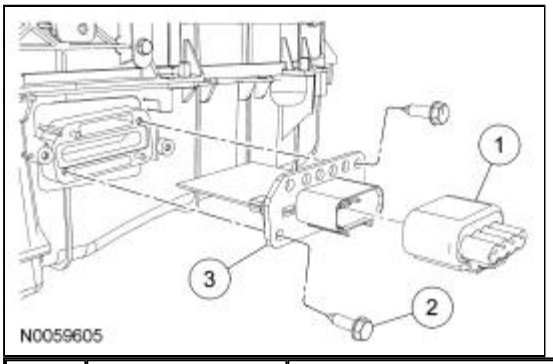
1. Remove the RH lower instrument panel insulator (if equipped).
2. Remove the RH lower A-pillar junction box cover.
3. Position the carpet below the blower motor aside.
4. Release the 2 blower motor vent tube clips and remove the blower motor vent tube.
5. Disconnect the blower motor electrical connector.
6. **NOTE:** The blower motor will have to be carefully manipulated along the dash panel insulator, and the dash panel insulator will have to be slightly deflected to allow the blower motor to clear the heater core and evaporator core housing.

   Rotate the blower motor counterclockwise to disengage it from the housing and remove the blower motor.

7. To install, reverse the removal procedure.

Blower Motor Resistor

Printable View (94 KB)



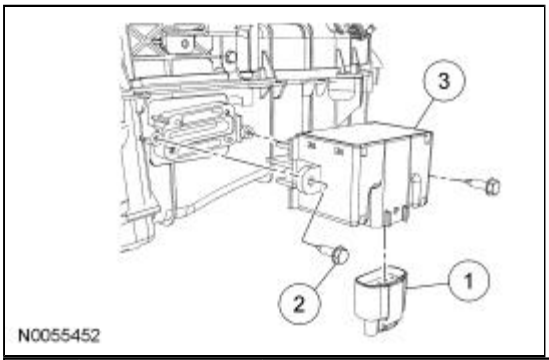
Item	Part Number	Description
1	18B518	Blower motor resistor electrical connector
2	W701696	Blower motor resistor screw (2 required)
3	18591	Blower motor resistor

Removal and Installation

1. Disconnect the blower motor resistor electrical connector.
2. Remove the 2 blower motor resistor screws.
3. Remove the blower motor resistor.
4. To install, reverse the removal procedure.

Blower Motor Speed Control

Printable View (90 KB)



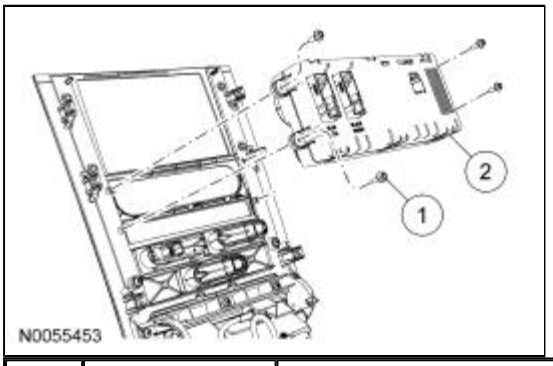
Item	Part Number	Description
1	18B518	Blower motor speed control electrical connector
2	W701696	Blower motor speed control screw (2 required)
3	19E624	Blower motor speed control

Removal and Installation

1. Remove the RH lower instrument panel insulator (if equipped).
2. Disconnect the blower motor speed control electrical connector.
3. Remove the 2 blower motor speed control screws.
4. Remove the blower motor speed control.
5. To install, reverse the removal procedure.

Climate Control Assembly

Printable View (116 KB)



Item	Part Number	Description
1	W706952	Climate control assembly screw (4 required)
2	19980	Climate control assembly

Removal and Installation

NOTE: Navigator shown, expedition similar.

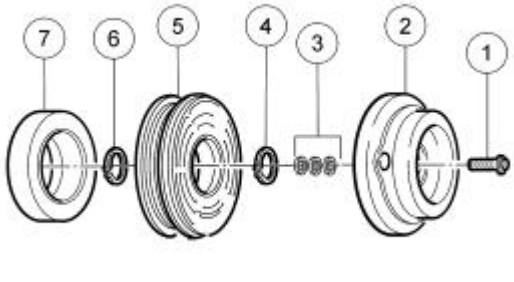
1. Remove the center instrument panel finish panel. For additional information, refer to Section 501-12 .
2. Remove the 4 climate control assembly screws.
3. Remove the climate control assembly.
4. To install, reverse the removal procedure.

Clutch and Clutch Field Coil

Printable View (185 KB)

Special Tool(s)

 ST2946-A	Holding Fixture, Compressor Clutch Disc and Hub 412-134
ST2382-A	Remover, Compressor Pulley 412-001 (T71P-19703-B)



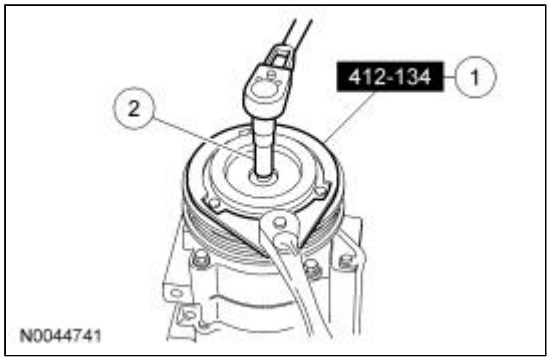
N0043868

Item	Part Number	Description
1	W711887	A/C clutch disc and hub bolt
2	19D786	A/C clutch disc and hub
3	19N689	A/C clutch hub disc and hub spacers
4	N805338	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	W711883	A/C clutch field coil snap ring
7	19D798	A/C clutch field coil

Removal

1. Remove the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor in this section.

2. Remove the A/C clutch disc and hub nut.
   1. Using the special tool, hold the A/C clutch disc and hub.
   2. Remove the A/C clutch disc and hub nut.

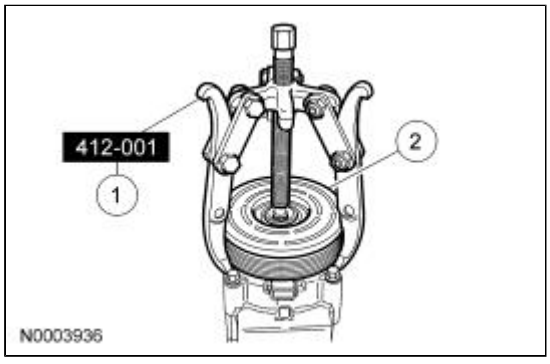


3. Remove the A/C clutch disc and hub.

4. Remove the A/C compressor pulley snap ring.

5. **CAUTION: Do not use air tools. Damage to the A/C clutch pulley or A/C compressor may result.**

   Using the special tool, remove the A/C compressor pulley.
   1. Install the special tool.
   2. Remove the A/C compressor pulley.



6. Remove the A/C clutch field coil snap ring.

7. Remove the A/C clutch field coil connector screw.

8. Remove the A/C clutch field coil.

Installation

NOTE: NOTE: The A/C clutch components should be reused unless obvious signs of damage are found. If excessive grooving is found, a new A/C clutch disc and hub and a new A/C compressor pulley must be installed together. Otherwise, each component can be installed individually where needed.

1. Visually inspect the A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil for damage.
   - Inspect for physical damage, including cracked or melted components or discoloration due to excessive heat.
   - Inspect for excessive wear, including grooving in the A/C clutch disc and hub or A/C compressor pulley that is more than fingernail depth.
   - Inspect for roughness in the A/C compressor pulley bearing.

2. Clean the A/C clutch field coil and pulley mounting surfaces.

3. Install the A/C clutch field coil.

4. Install the A/C clutch field coil snap ring.

5. **NOTE:** The A/C compressor pulley is a tight fit on the A/C compressor. It must be correctly aligned during installation.

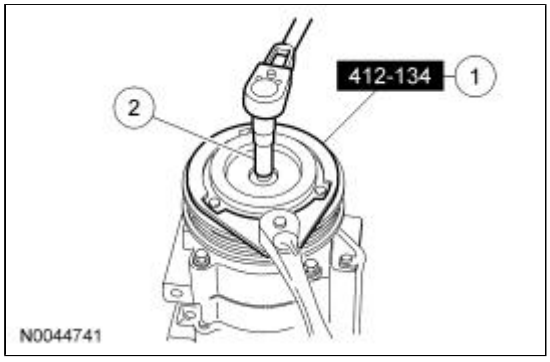
   Install the A/C compressor pulley.

6. Install the A/C compressor pulley snap ring with the bevel side out.

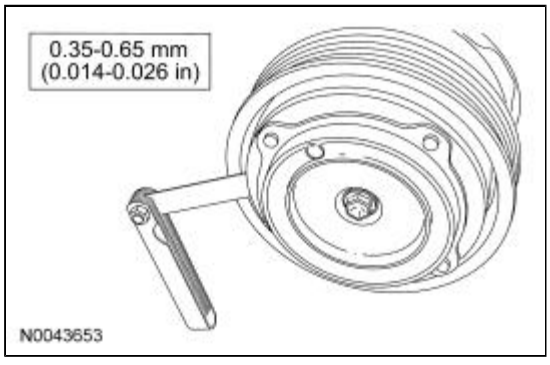
7. Place one nominal thickness A/C clutch disc and hub spacer inside the clutch hub spline opening.

8. Install the A/C clutch disc and hub.

9. Using the special tool, install the A/C compressor clutch disc and hub nut.
   1. Hold the A/C clutch disc and hub with the special tool.
   2. Tighten the nut to 13 Nm (10 lb-ft).



10. Measure and adjust the clutch air gap by removing or adding A/C clutch disc and hub spacers.



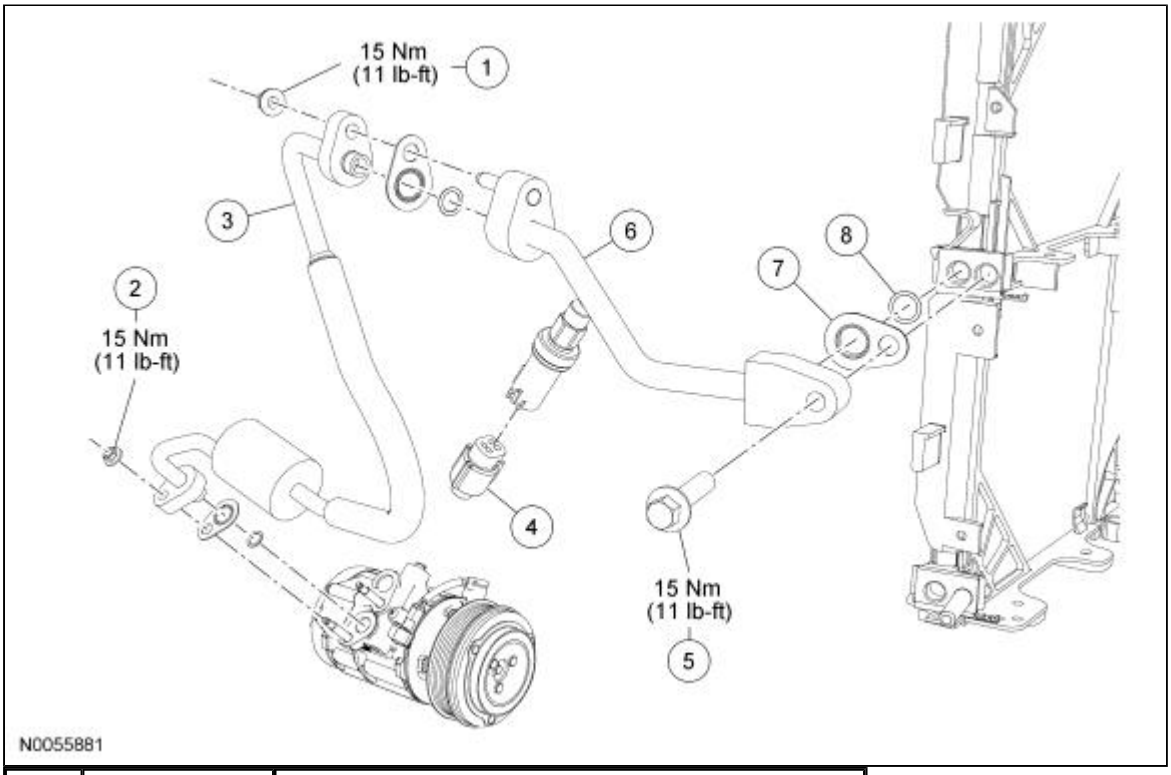
11. Install the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor in this section.

Compressor to Condenser Discharge Line

Printable View (166 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	W520413	Condenser inlet jumper line fitting nut
2	W520413	Compressor discharge fitting nut
3	19972	Compressor-to-condenser line
4	12A581	A/C pressure transducer electrical connector
5	W500110	Condenser inlet fitting bolt
6	19E558	Condenser inlet jumper line
7	19B588	Gasket seal (3 required)
8	19E889	O-ring seal (3 required)

Removal and Installation

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

2. Remove the compressor discharge fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (11 lb-ft).

3. Remove the condenser inlet jumper line fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (11 lb-ft).

4. Remove the compressor-to-condenser discharge line.

5. If removing the condenser inlet jumper line, remove the RH headlamp assembly. For additional information, refer to Section 417-01 .

6. If removing the condenser inlet jumper line, disconnect the A/C pressure transducer electrical connector.

7. If removing the condenser inlet jumper line, remove the condenser inlet fitting bolt and disconnect the fitting.
   - Discard the O-ring and gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).

8. Remove the condenser inlet jumper line.

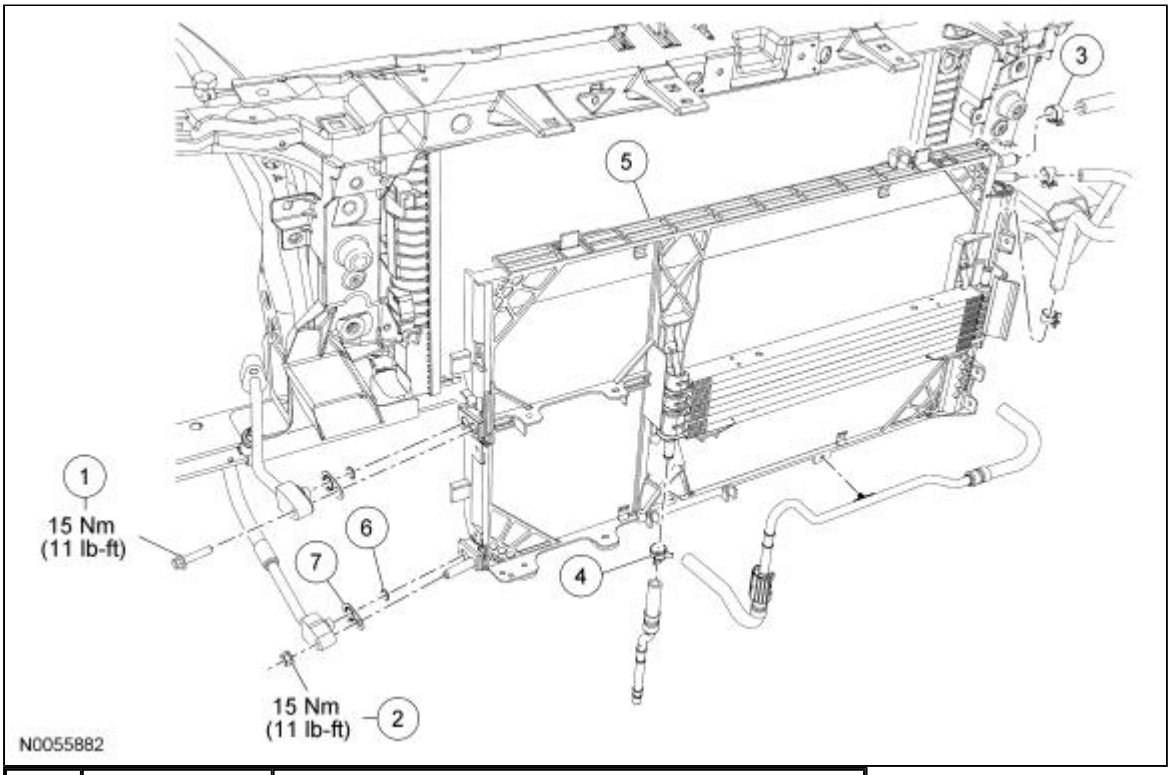
9. To install, reverse the removal procedure.
   - Install new gasket seals and O-ring seals.
   - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

Condenser Core

Printable View (365 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	W500110	Condenser inlet fitting bolt
2	W520413	Condenser outlet fitting nut
3	8287	Power steering cooler line clamp (2 required)
4	8287	Transmission cooler line clamp (2 required)
5	19712	Condenser core
6	19B558	O-ring seal (2 required)
7	19E889	Gasket seal (2 required)

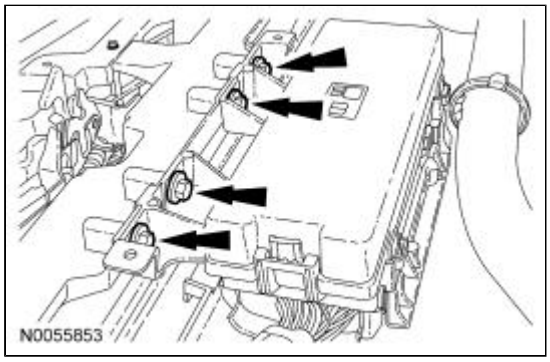
Removal and Installation

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

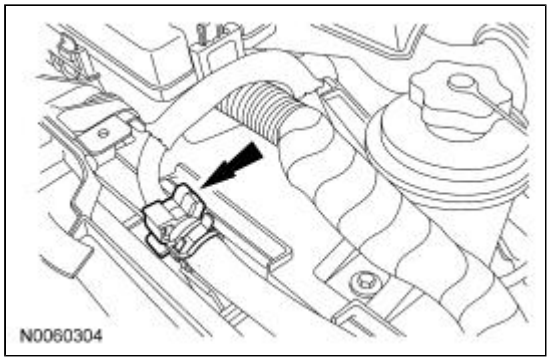
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section

100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .
3. Disconnect the battery cables. For additional information, refer to Section 414-01 .
4. Remove the upper radiator sight shield.
5. Remove the RH and LH headlamp assemblies. For additional information, refer to Section 417-01 .
6. Remove the air cleaner outlet tube. For additional information, refer to Section 303-12 .
7. Remove the 4 junction box bolts and position the junction box aside.

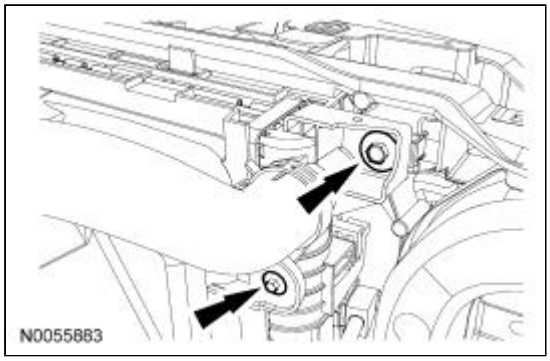


8. Detach the power steering cooler line clip.



9. Remove the condenser inlet fitting bolt and disconnect the fitting.
   - Discard the O-ring and gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).
10. Remove the condenser outlet fitting nut and disconnect the fitting.
    - Discard the O-ring and gasket seals.
    - To install, tighten to 15 Nm (11 lb-ft).
11. **NOTE:** RH bolts shown, LH similar.

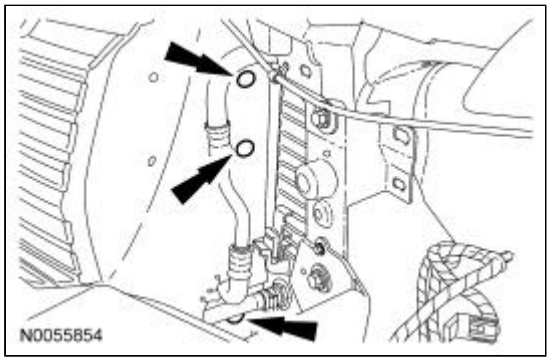
    Remove the 2 cooling module and 2 cooling fan shroud bolts.



12. Release the clamps and disconnect the 2 power steering cooler lines from the condenser core.

13. **NOTE:** LH air deflector shown, RH similar.

    Remove the 6 pin-type retainers and detach the RH and LH air deflectors from the condenser.



14. Remove the 9 lower radiator splash shield pin-type retainers and position the shield aside.

15. Release the clamps and disconnect the 2 transmission cooler lines from the transmission cooler.

16. Detach the transmission cooler line pin-type retainer from the condenser core bracket.

17. **NOTE:** The cooling module must be positioned rearward to raise and detach the 4 condenser mounts from the cooling module.

    NOTE: The condenser must be removed from below the vehicle.

    Detach and remove the condenser core and transmission cooler as an assembly.
    1. Position the cooling module rearward enough to allow the condenser to be lifted upward.
    2. Depress the retaining tabs on the 2 lower condenser mounting brackets and detach the 4 condenser mounting brackets from the cooling module
    3. Position the top of the condenser forward to detach the top lip of the condenser bracket from the cooling module and remove the condenser core and bracket.

18. To install, reverse the removal procedure.
    - Install new gasket seals and O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

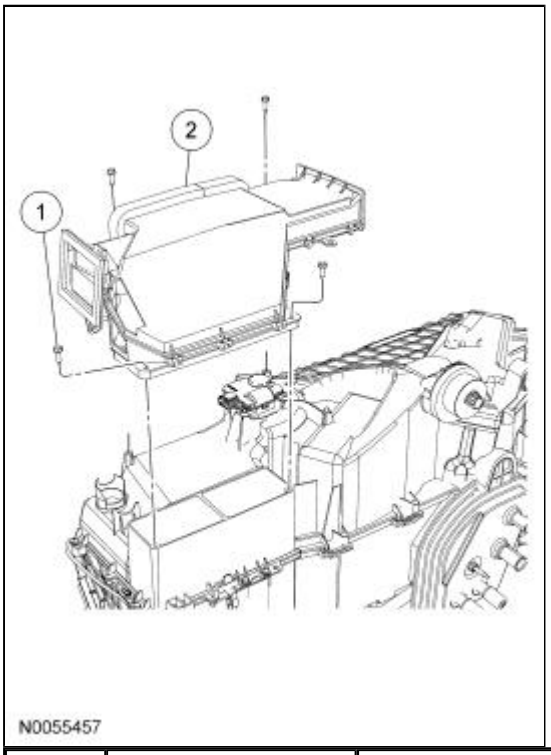
19. Fill the power steering fluid level. For additional information, refer to Section 211-00 .

20. Fill the transmission fluid level. For additional information, refer to Section 307-01A or Section 307-01B .

21. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Floor Duct

Printable View (120 KB)



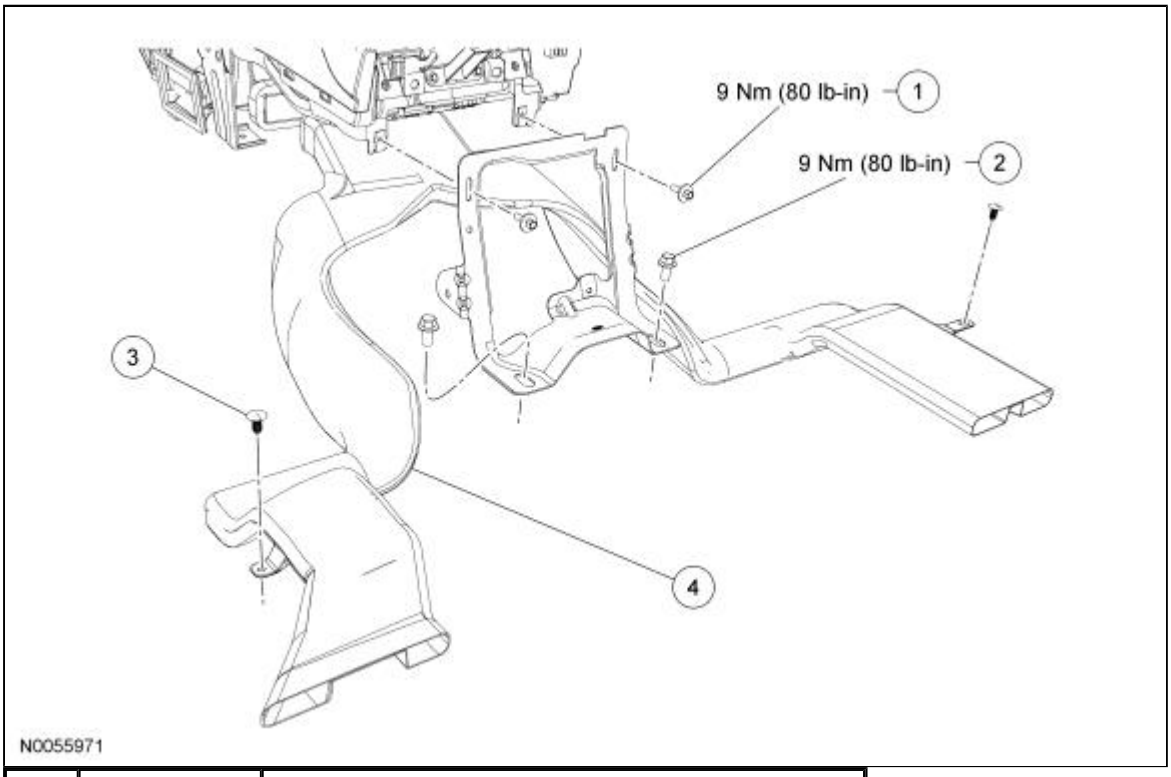
Item	Part Number	Description
1	W701696	Floor duct screw (4 required)
2	18C433	Floor duct

Removal and Installation

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Remove the 4 floor duct screws.
3. Remove the floor duct.
4. To install, reverse the removal procedure.

Footwell Duct — Rear

Printable View (131 KB)



Item	Part Number	Description
1	W704734	Instrument panel bracket upper bolt (2 required)
2	W505234	Instrument panel bracket lower bolt (2 required)
3	W705589	Rear footwell duct pin-type retainer (2 required)
4	—	Rear footwell duct

Removal and Installation

All vehicles

1. Remove the front seats. For additional information, refer to Section 501-10 .
2. Remove the front floor console. For additional information, refer to Section 501-12 .
3. Remove the RH and LH lower cowl trim panels and front door sill plates.

Navigator only

4. Remove the upper and lower instrument panel bracket bolts and position the instrument panel bracket aside.
   - To install, tighten to 9 Nm (80 lb-in).

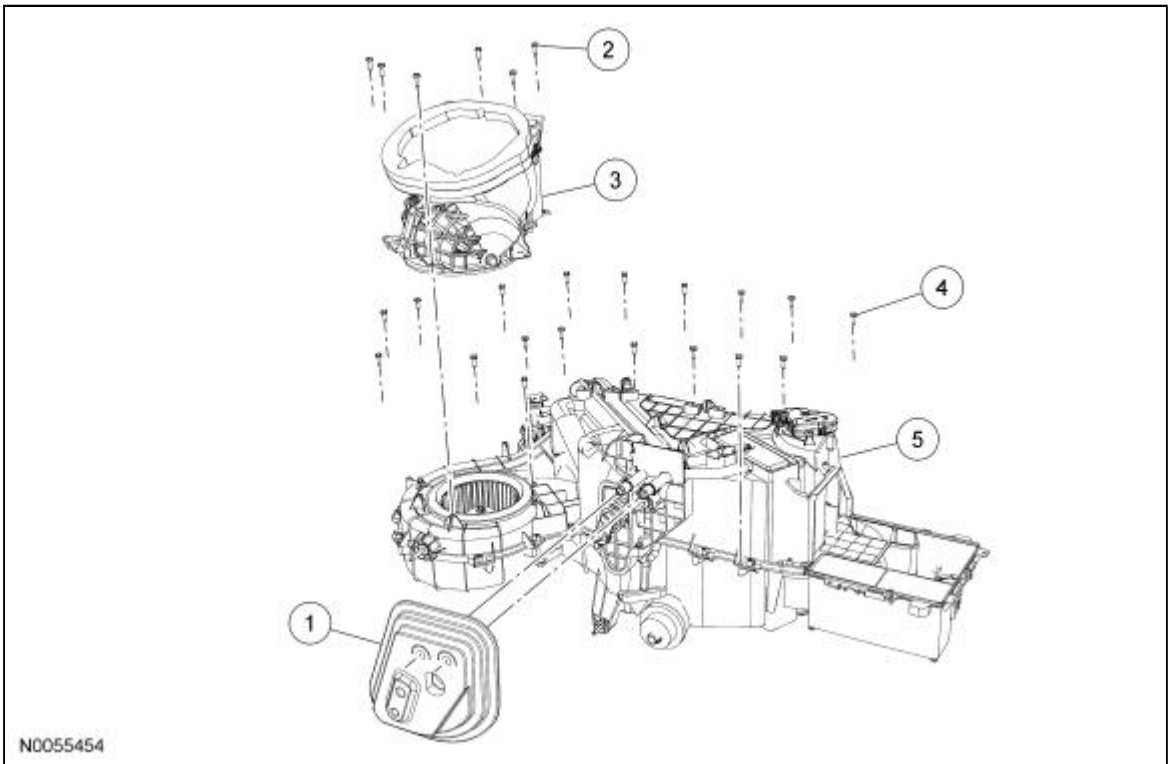
All vehicles

5. Fold back the carpet to completely uncover the rear footwell duct.

6. Remove the 2 rear footwell duct pin-type retainers.
7. Remove the rear footwell duct.
8. To install, reverse the removal procedure.

Evaporator Core

Printable View (246 KB)



Item	Part Number	Description
1	19C593	Dash panel seal
2	W701696	Air inlet duct screw (6 required)
3	19A618	Air inlet duct
4	W701696	Heater core and evaporator core housing screw (15 required)
5	19B555	Heater core and evaporator core housing

Removal and Installation

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle.

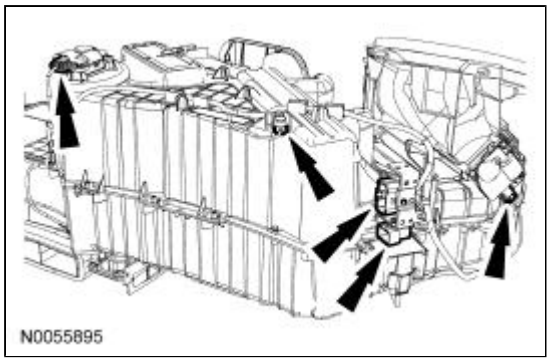
NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

NOTE: A new evaporator core seal is supplied as a kit with the evaporator core service part. Failure to install this seal, or failure to install it correctly, will result in air bypassing the evaporator core and loss of cooling efficiency.

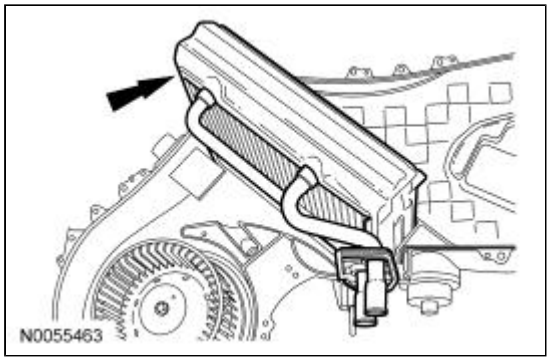
1. Remove the plenum chamber. For additional information, refer to Plenum Chamber in this section.

2. Remove 2 heater core quick disconnect fitting clips and the dash panel seal.

3. Detach the wire harness from the upper half of the heater core and evaporator core housing.



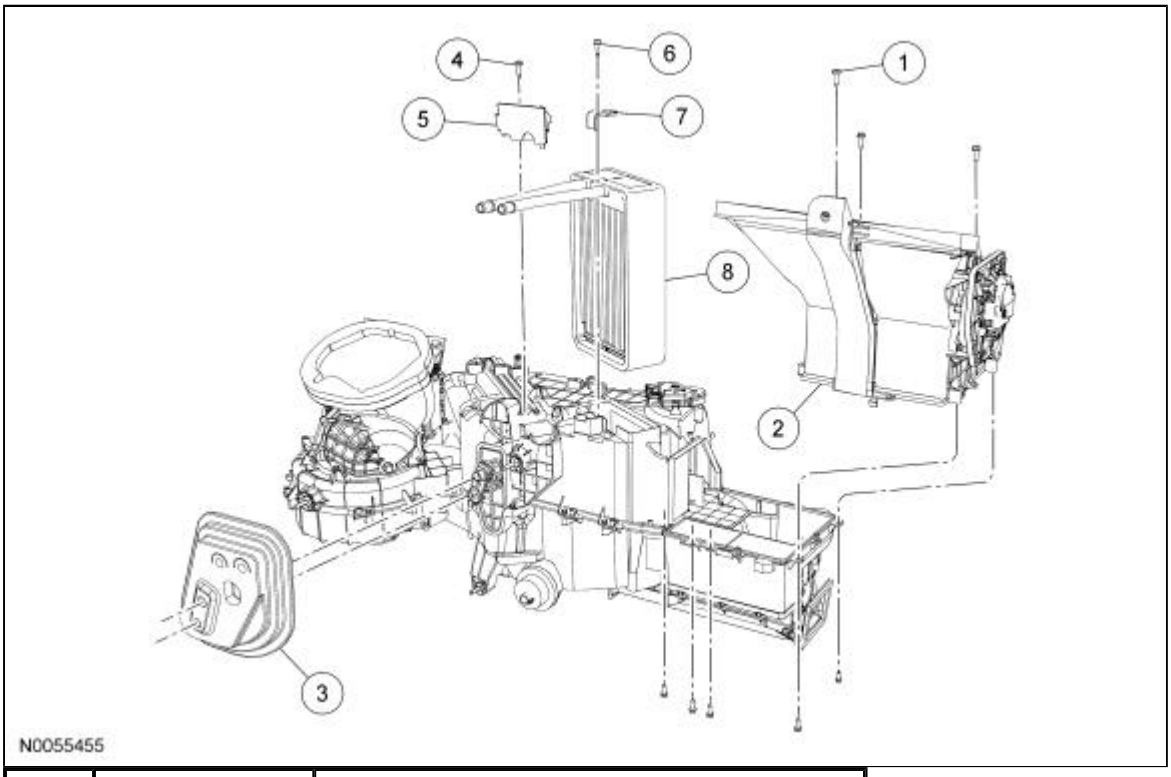
4. Remove the 6 air inlet duct screws and the air inlet duct.
5. Remove the 15 heater core and evaporator core housing screws.
6. Separate the 2 halves of the heater core and evaporator core housing.
7. Remove the evaporator core.



8. To install, reverse the removal procedure.

Heater Core

Printable View (184 KB)

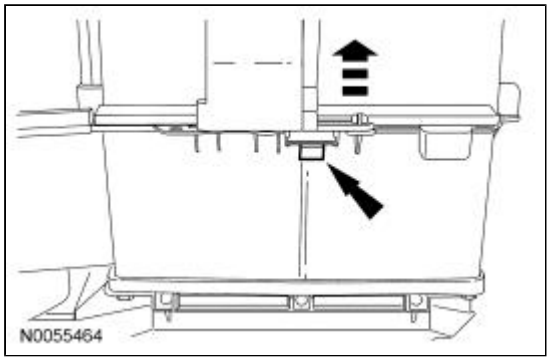


Item	Part Number	Description
1	W701696	Plenum chamber screw (8 required)
2	18471	Plenum chamber
3	19C593	Dash panel seal
4	W701696	Heater core tube bracket screw
5	18B689	Heater core tube bracket
6	W701696	Heater core bracket screw
7	18B689	Heater core bracket
8	18476	Heater core

Removal and Installation

NOTE: If a heater core leak is suspected, the heater core must be leak tested before it is removed from the vehicle. For additional information, refer to Section 412-00 .

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Remove the 8 plenum chamber screws.
3. Release the plenum chamber clip and position the plenum chamber aside.



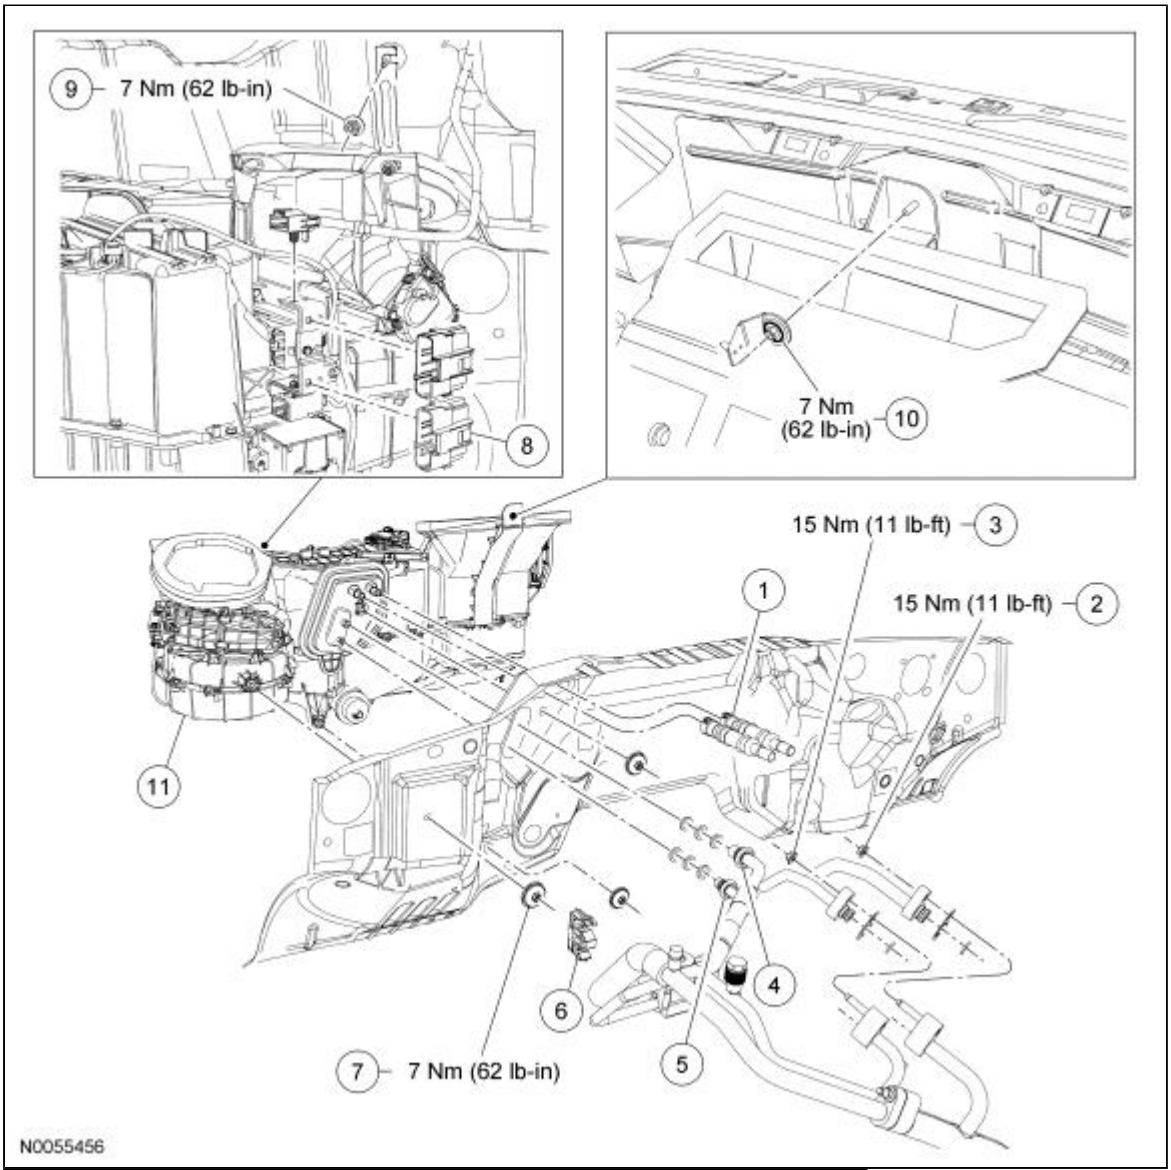
4. Remove 2 heater core fitting clips and the dash panel seal.
5. Remove the heater core tube bracket screw and the heater core tube bracket.
6. Remove the heater core bracket screw and the heater core bracket.
7. Remove the heater core.
8. To install, reverse the removal procedure.

Heater Core And Evaporator Core Housing

Printable View (363 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	18472	Heater core fitting (2 required)
2	W520413	Auxiliary evaporator outlet line fitting nut
3	W520413	Auxiliary evaporator inlet line fitting nut

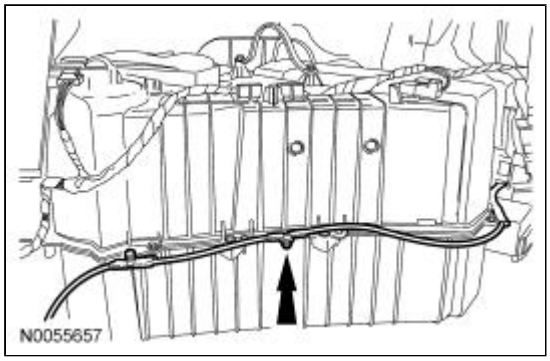
4	—	Evaporator outlet fitting (part of 19A498)
5	—	Evaporator inlet fitting (part of 19A498)
6	—	Thermostatic expansion valve (TXV) manifold and tube bracket (part of 19A498)
7	W708206	Heater core and evaporator core housing nut (3 required)
8	14401	Body harness electrical connector (3 required)
9	N806543	Air inlet duct bracket nut
10	—	Plenum chamber nut (part of 18471)
11	19B555	Heater core and evaporator core housing

Removal and Installation

NOTE: If an evaporator core leak is suspected, the evaporator must be vacuum leak tested before it is removed from the vehicle. For additional information, refer to Section 412-00 .

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Drain the engine coolant. For additional information, refer to Section 303-03 .
3. Remove the instrument panel. For additional information, refer to Section 501-12 .
4. Disconnect the 2 heater hose quick disconnect fittings at the heater core.
5. Remove the auxiliary evaporator outlet and inlet line fitting nuts and disconnect the fittings.
   - Discard the O-ring seals and gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).
6. Disconnect the evaporator outlet and inlet fittings.
   - Discard the O-ring seals.
7. Detach the thermostatic expansion valve (TXV) manifold and tube assembly from the line 2 brackets.
8. Detach the TXV manifold and tube assembly bracket from the heater core and evaporator core housing stud at the dash panel.
9. Remove the 3 heater core and evaporator core housing nuts.
   - To install, tighten to 7 Nm (62 lb-in).
10. Detach the 4 satellite radio antenna cable pin-type retainers from the heater core and evaporator core housing (if equipped).

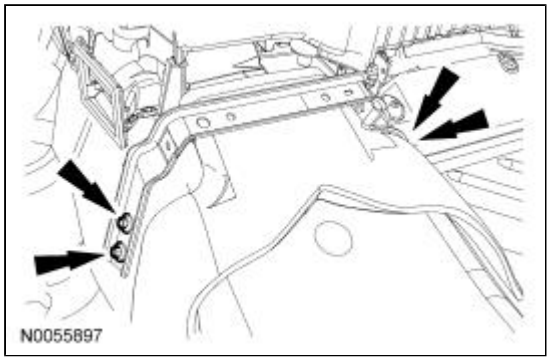


11. Detach the 3 body harness electrical connectors from the bracket below the air inlet duct.

12. Remove the air inlet duct bracket nut.
    - To install, tighten to 7 Nm (62 lb-in).

13. Remove the plenum chamber nut.
    - To install, tighten to 7 Nm (62 lb-in).

14. Remove the 4 tunnel instrument panel bracket bolts and the tunnel instrument panel bracket.



15. Detach the rear footwell duct from the heater core and evaporator core housing.

16. Remove the plenum chamber nut.

17. Remove the heater core and evaporator core housing.

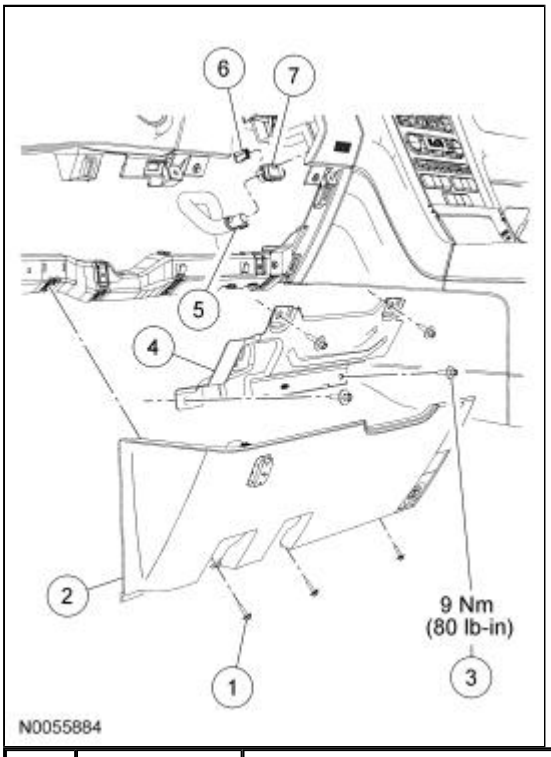
18. To install, reverse the removal procedure.
    - Install new gasket seals and O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

19. Fill the engine coolant level. For additional information, refer to Section 303-03 .

20. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

In-Vehicle Temperature and Humidity Sensor

Printable View (116 KB)



Item	Part Number	Description
1	W707628	Steering column cover screw (3 required)
2	7804459	Steering column cover
3	W71087	Steering column reinforcement bolt (4 required)
4	78017A26	Steering column reinforcement
5	19D888	Aspirator hose
6	14401	In-vehicle temperature and humidity sensor electrical connector
7	19C734	In-vehicle temperature and humidity sensor

Removal and Installation

1. Remove the 3 lower steering column cover screws and the lower steering column cover.
   - Disconnect the electrical connector.

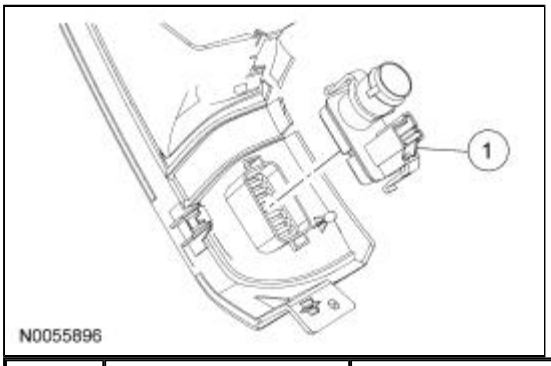
2. Remove the 4 steering column reinforcement bolts and position the steering column reinforcement aside.
   - To install, tighten to 9 Nm (80 lb-in).

3. Remove the in-vehicle temperature and humidity sensor.
   1. Detach the in-vehicle temperature and humidity sensor from the instrument panel finish panel.
   2. Disconnect the aspirator hose.
   3. Disconnect the in-vehicle temperature and humidity sensor electrical connector.

4. To install, reverse the removal procedure.

In-Vehicle Temperature Sensor

Printable View (90 KB)



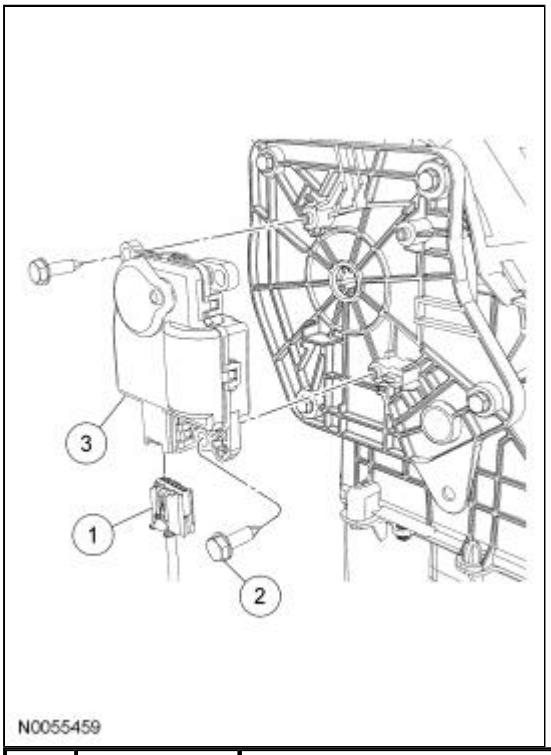
Item	Part Number	Description
1	19C734	In-vehicle temperature sensor

Removal and Installation

1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12
2. Remove the in-vehicle temperature sensor.
3. To install, reverse the removal procedure.

Mode Door Actuator — Defrost/Panel/Floor Door

Printable View (146 KB)



Item	Part Number	Description
1	18B518	Defrost/panel/floor door mode door actuator electrical connector
2	W701696	Defrost/panel/floor door mode door actuator screw (2 required)
3	19E616	Defrost/panel/floor door mode door actuator

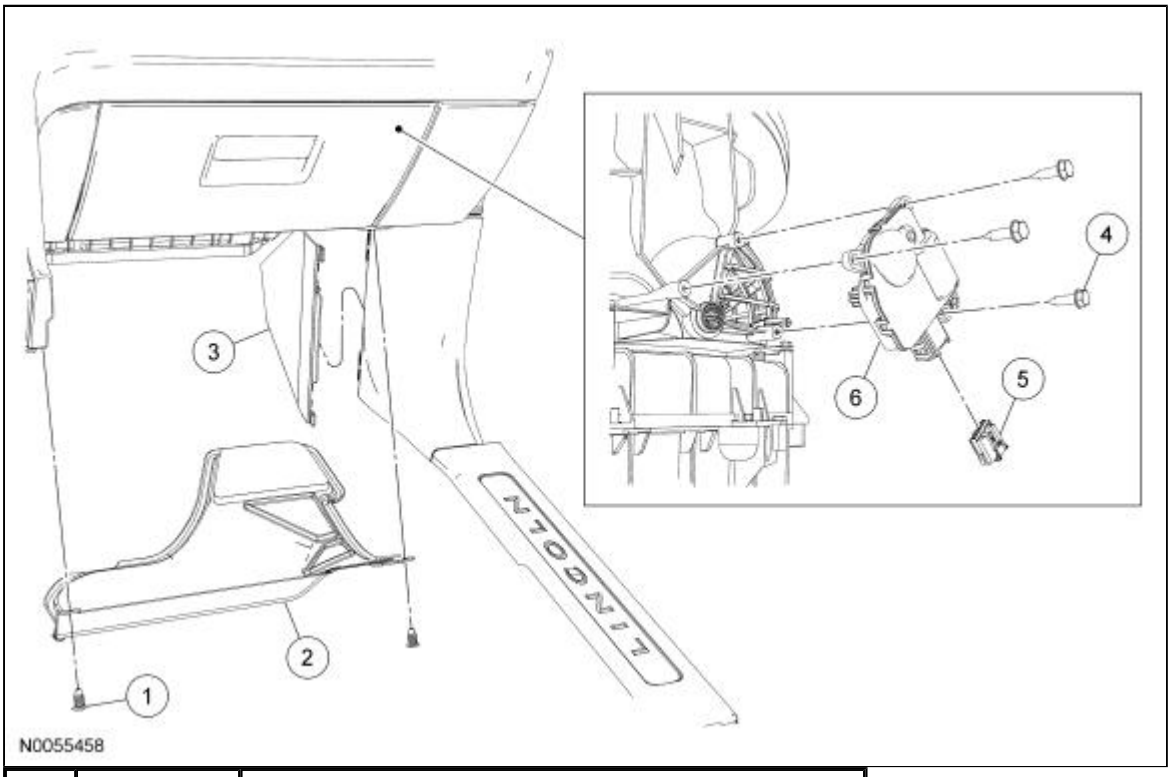
Removal and Installation

NOTE: The defrost/panel/floor mode door actuator can be accessed from underneath the LH side of the instrument panel.

1. Disconnect the defrost/panel/floor mode door actuator electrical connector.
2. Remove the 2 defrost/panel/floor mode door actuator screws.
3. Remove the defrost/panel/floor mode door actuator.
4. To install, reverse the removal procedure.

Mode Door Actuator — Air Inlet Door

Printable View (143 KB)



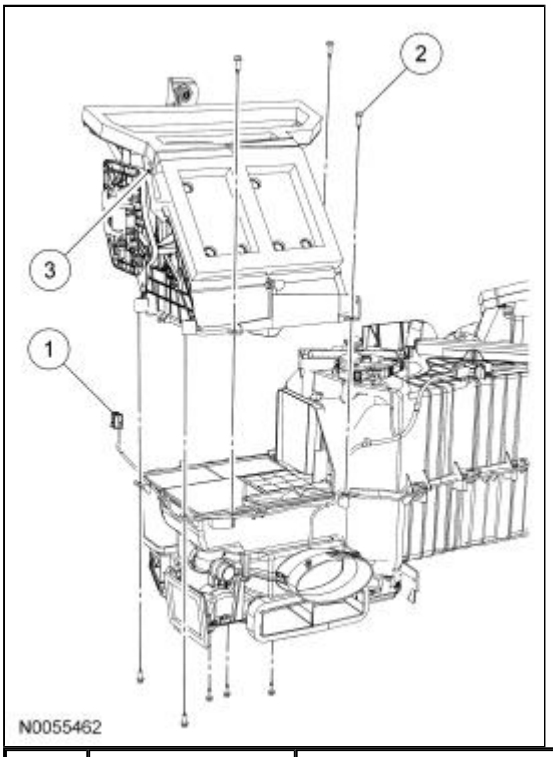
Item	Part Number	Description
1	—	RH lower instrument panel insulator pin-type retainer (2 required)
2	—	RH lower instrument panel insulator
3	02348	Junction box cover
4	W701696	Air inlet mode door actuator screw (3 required)
5	18B518	Air inlet mode door actuator electrical connector
6	19E616	Air inlet mode door actuator

Removal and Installation

1. Remove the RH lower instrument panel insulator (if equipped).
2. Remove the junction box cover at the RH lower A-pillar.
3. Remove the 3 air inlet mode door actuator screws.
4. Disconnect the air inlet mode door actuator electrical connector.
5. Remove the air inlet mode door actuator.
6. To install, reverse the removal procedure.

Plenum Chamber

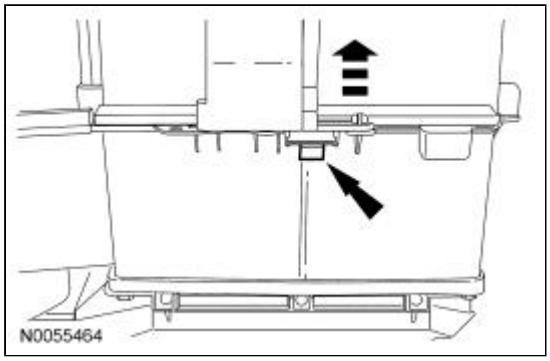
Printable View (145 KB)



Item	Part Number	Description
1	18B518	Mode door actuator electrical connector
2	W701696	Plenum chamber screw (8 required)
3	18471	Plenum chamber

Removal and Installation

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Disconnect the mode door actuator electrical connector and position the wire harness aside.
3. Remove the 8 plenum chamber screws.
4. Release the plenum chamber clip and remove the plenum chamber.



5. To install, reverse the removal procedure.

Receiver Drier

Printable View (120 KB)

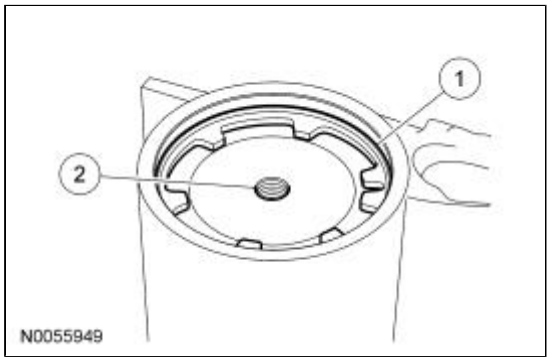
Material

Item	Specification
PAG Refrigerant Compressor Oil (R134a Systems) YN-12-D	WSH-M1C231-B

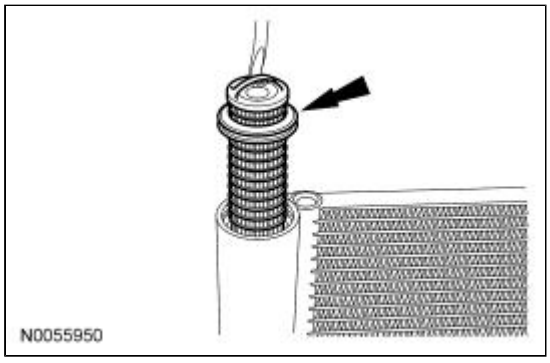
Removal and Installation

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

1. Remove the condenser core. For additional information, refer to Condenser Core in this section.
2. Unscrew and remove the plastic receiver/drier cap.
3. Remove the receiver/drier plug.
    1. Push the receiver/drier plug upwards and remove the snap ring.
    2. Install the bolt included with the receiver/drier cartridge service kit in the center of the receiver drier plug and remove the plug.



4. Using a suitable tool, grasp the receiver/drier cartridge grab handle and remove the receiver/drier cartridge.

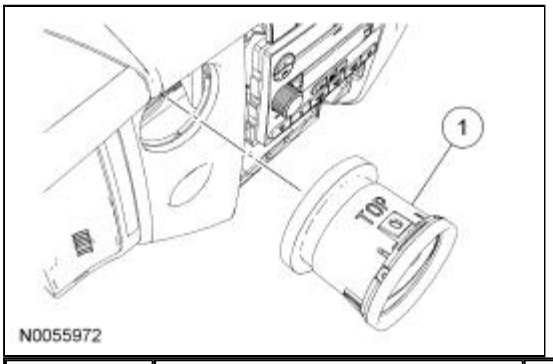


5. To install, reverse the removal procedure.

- Lubricate the receiver/drier plug O-ring seals using residual refrigerant oil from inside the receiver/drier.

Register — Expedition

Printable View (136 KB)



Item	Part Number	Description
1	19893	Register

Removal and Installation

LH register

1. Remove the steering column opening cover.
2. Remove the 4 steering column opening reinforcement bolts and the steering column reinforcement.
3. Remove the LH outer instrument panel trim panel.

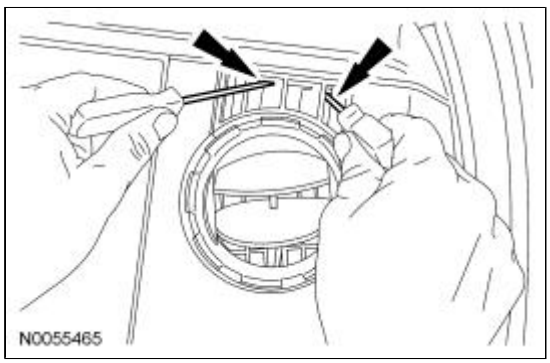
RH register

4. Lower the glove compartment

LH or RH register

5. Working through the instrument panel opening, depress the 2 clips on the sides of the register barrel and tilt the bottom of the register outward to keep the clips from re-engaging.
6. **NOTE:** RH register shown, LH similar.

   Using 2 suitable tools, release the clips through the demister nozzle opening and remove the register.



Center registers

7. Remove the center instrument panel finish panel. For additional information, refer to Section 501-12 .

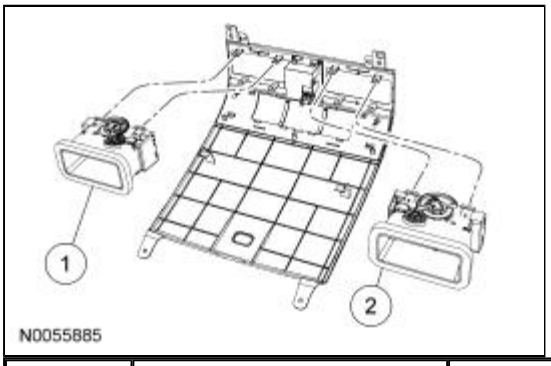
8. Working through the opening below the audio unit, release the 3 register retaining clips and remove the register.

All registers

9. To install, reverse the removal procedure.

Register — Center, Navigator

Printable View (93 KB)



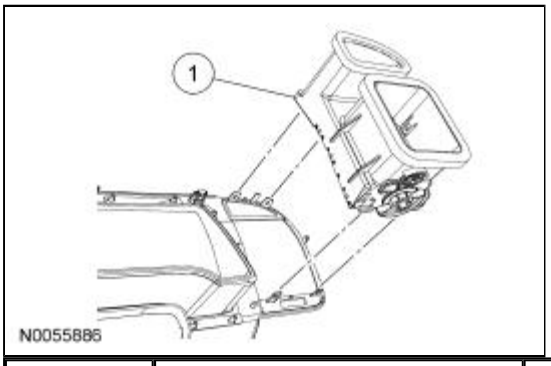
Item	Part Number	Description
1	19893	LH center register
2	19893	RH center register

Removal and Installation

1. Remove the upper center instrument panel finish panel. For additional information, refer to Section 501-12 .
2. Release the center register clips and remove the center registers.
3. To install, reverse the removal procedure.

Register — Driver Side, Navigator

Printable View (85 KB)



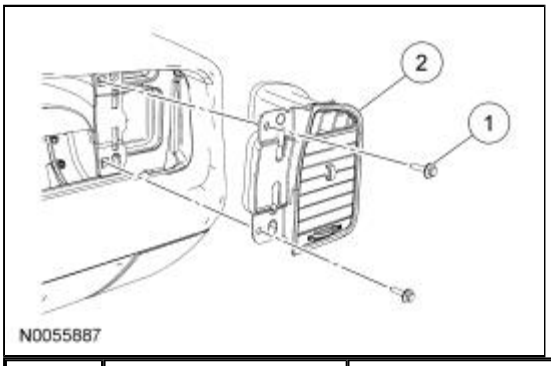
Item	Part Number	Description
1	19893	LH register

Removal and Installation

1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .
2. Release the clips and remove the LH register.
3. To install, reverse the removal procedure.

Register — Passenger Side, Navigator

Printable View (87 KB)



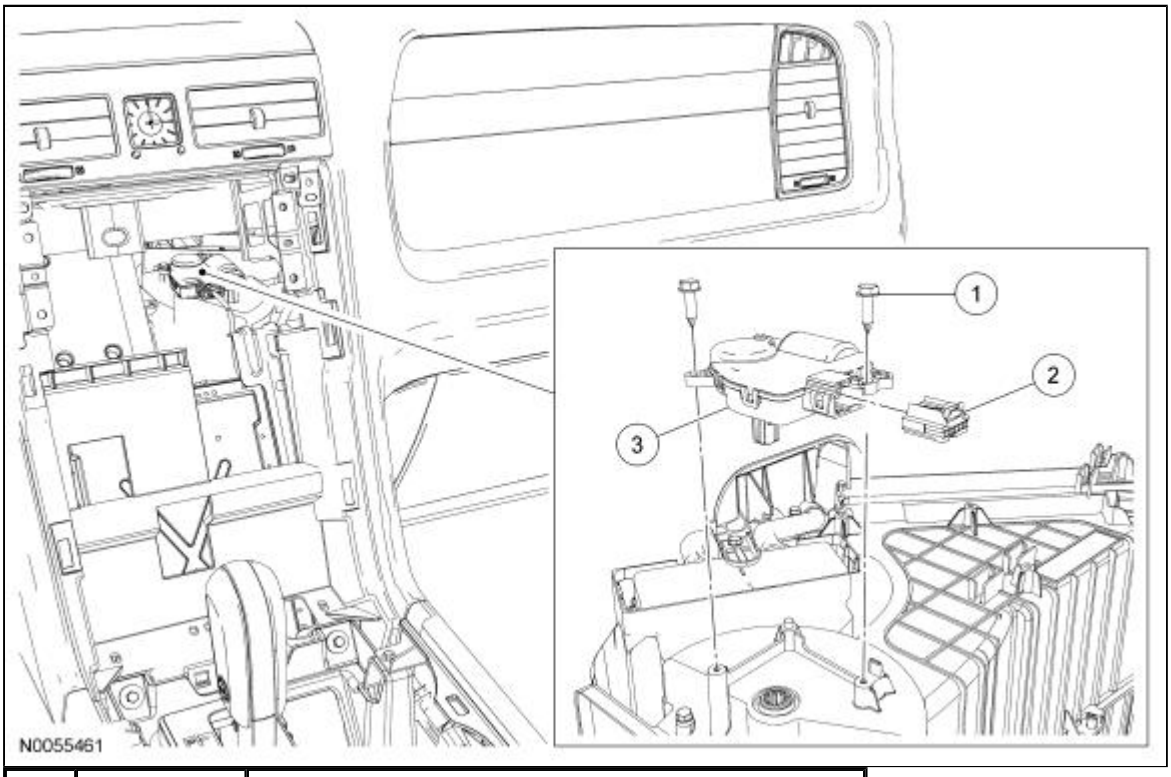
Item	Part Number	Description
1	W707628	RH register screw (2 required)
2	19893	RH register

Removal and Installation

1. Remove the passenger airbag module. For additional information, refer to Section 501-20B .
2. Remove the 2 RH register screws.
3. Remove the RH register.
4. To install, reverse the removal procedure.

Temperature Blend Door Actuator — RH

Printable View (221 KB)



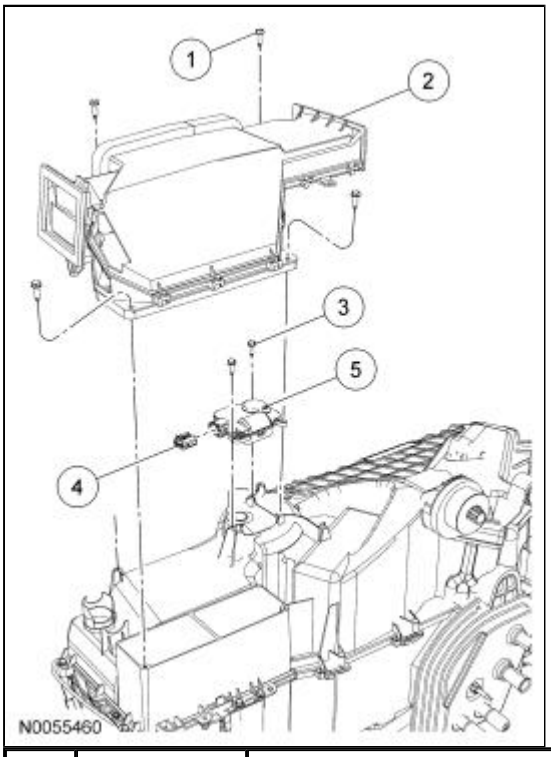
Item	Part Number	Description
1	W701696	RH temperature blend door actuator screw (2 required)
2	18B518	RH temperature blend door actuator electrical connector
3	19E616	RH temperature blend door actuator

Removal and Installation

1. Remove the audio unit. For additional information, refer to Section 415-01 .
2. Disconnect the RH temperature blend door actuator electrical connector.
3. Remove the 2 RH temperature blend door actuator screws.
4. Remove the RH temperature blend door actuator.
5. To install, reverse the removal procedure.

Temperature Blend Door Actuator — LH

Printable View (131 KB)



Item	Part Number	Description
1	W701696	Floor duct screw (4 required)
2	18C433	Floor duct
3	W701696	LH temperature blend door actuator screw (2 required)
4	18B518	LH temperature blend door actuator electrical connector
5	19E616	LH temperature blend door actuator

Removal and Installation

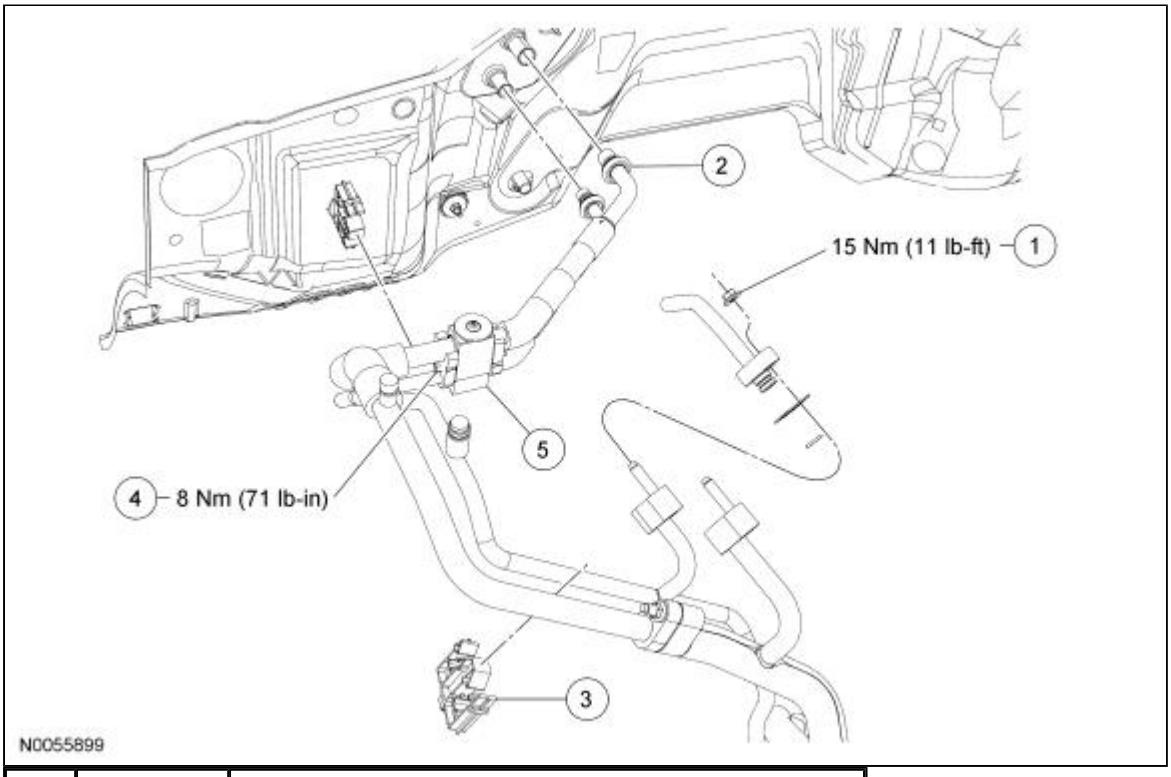
1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Remove the 4 floor duct screws.
3. Remove the floor duct.
4. Disconnect the LH temperature blend door actuator electrical connector.
5. Remove the 2 LH temperature blend door actuator screws.
6. Remove the LH temperature blend door actuator.
7. To install, reverse the removal procedure.

Thermostatic Expansion Valve

Printable View (210 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	W520413	Auxiliary evaporator inlet line fitting nut
2	—	Evaporator fitting (2 required) (part of 19A498)
3	—	Thermostatic expansion valve (TXV) manifold and tube bracket (2 required) (part of 19A498)
4	W500110	Thermostatic expansion valve fitting bolt
5	19849	Thermostatic expansion valve

Removal and Installation

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

All vehicles

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

Vehicles with auxiliary A/C

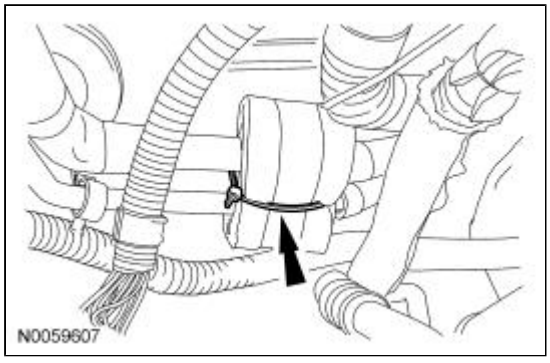
2. Remove the auxiliary evaporator inlet line fitting nut and disconnect the fitting.
    - Discard the gasket seal and O-ring seal.
    - To install, tighten to 15 Nm (11 lb-ft).

All vehicles

3. Disconnect the evaporator inlet and outlet fittings.
    - Discard the O-ring seals.

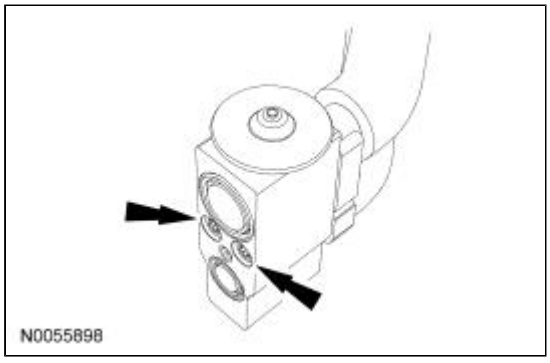
4. Detach the thermostatic expansion valve (TXV) manifold and tube assembly from the 2 TXV manifold and tube brackets.

5. Remove the tie-strap from the TXV insulator.



6. Remove the TXV fitting bolt.
    - Discard the O-ring seals.
    - To install, tighten to 8 Nm (71 lb-in).

7. Remove the 2 bolts and the TXV.
    - Discard the O-ring seals.
    - To install, tighten to 8 Nm (71 lb-in).



8. To install, reverse the removal procedure.
    - Install new gasket seals and O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

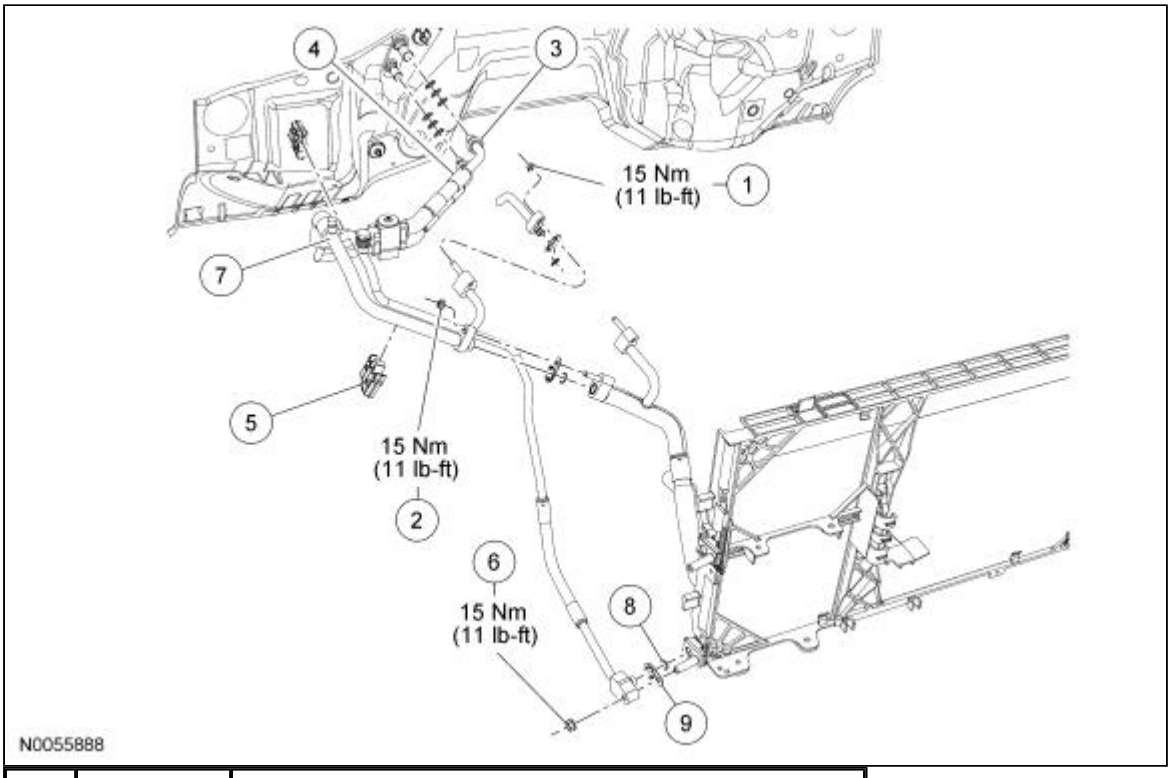
9. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Thermostatic Expansion Valve Manifold and Tube Assembly

Printable View (170 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	W520413	Auxiliary evaporator inlet line fitting nut
2	W520413	Thermostatic expansion valve manifold and tube suction fitting nut
3	—	Evaporator outlet fitting (part of 19A498)
4	—	Evaporator inlet fitting (part of 19A498)
5	—	Thermostatic expansion valve manifold and tube bracket (2 required) (part of 19A498)
6	W520413	Condenser outlet fitting nut
7	19A498	Thermostatic expansion valve manifold and tube assembly
8	19E889	O-ring seal (9 required)
9	19B558	Gasket seal (3 required)

Removal and Installation

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

1. Recover the refrigerant. For additional information, refer to Section 412-00 .

2. Remove the RH headlamp assembly. For additional information, refer to Section 417-01 .

3. Remove the auxiliary evaporator inlet line fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (11 lb-ft).

4. Disconnect the evaporator core inlet and outlet fittings.
   - Discard the O-ring seals.

5. Detach the thermostatic expansion valve (TXV) manifold and tube assembly from the 2 TXV manifold and tube brackets.

6. Remove the condenser outlet fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (11 lb-ft).

7. Remove the TXV manifold and tube suction fitting nut and disconnect the fitting.
   - Discard the O-ring seal and gasket seal.
   - To install, tighten to 15 Nm (11 lb-ft).

8. Remove the TXV manifold and tube assembly.

9. To install, reverse the removal procedure.
   - Install new O-ring seals.
   - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

10. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Printable View (79 KB)

General Specifications

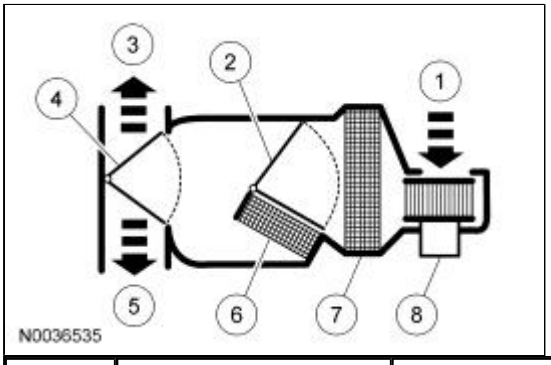
Floorpan bracket bolt	8	—	71
Thermostatic expansion valve (TXV) bolt	8	—	71

Auxiliary Climate Control

Printable View (102 KB)

An optional auxiliary climate control system is available. The system is a one-piece unit that is located on the RH side of the vehicle between the side windows and the floorpan, behind the rear wheel well. The driver has primary control of the auxiliary climate control system or can transfer control to a rear passenger control panel.

System Airflow



Item	Part Number	Description
1	—	Air inlet
2	—	Temperature blend door
3	—	Headliner airflow
4	—	Auxiliary mode door
5	—	Floor airflow
6	18476	Heater core
7	19860	Evaporator core
8	19805	Blower motor

The auxiliary air conditioning (A/C) and heating system has the following features:

- The auxiliary climate control system is functional whenever the instrument panel mounted climate control assembly is in any mode except OFF.
- The auxiliary blower motor recirculates the air inside the vehicle. Outside air is not available to the auxiliary system.
- Air is cooled and dehumidified by the auxiliary A/C evaporator core only if the front (main) climate control system is operating in a mode that requires A/C compressor operation.
- The temperature blend door and the auxiliary mode door are controlled by electric actuator motors.
- Movement of the auxiliary temperature control between cool and warm causes a corresponding movement of the temperature blend door to mix air flowing through and around the auxiliary heater core.
- Movement of the auxiliary mode control between PANEL and FLOOR causes a corresponding movement of the auxiliary mode door to direct airflow between the panel (headliner) registers and the floor duct.

Blower Motor

The auxiliary climate control system is equipped with a blower motor controlled by the blower motor switch on the front or rear auxiliary control assembly. The auxiliary blower motor is mounted to the auxiliary heater core and evaporator core housing behind the RH quarter trim panel.

Control Assembly

The auxiliary climate control system has dual controls for the front and rear passengers consisting of temperature/mode and blower speed. The front auxiliary A/C control functionality is integrated into the main instrument panel mounted climate control assembly. The rear auxiliary A/C control is mounted in the rear finish panel of the front floor console. Temperature and airflow mode are combined into a single setting. When the temperature is set to full cool the airflow mode will be automatically set to discharge from the headliner registers. When the temperature is set to full warm, the airflow mode will be set to discharge from the floor register.

Heater Core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer the heat to air passing through the auxiliary climate control housing.

Evaporator Core

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle. Refer to Section 412-00.

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

The evaporator core is an aluminum plate/fin type and is located in the auxiliary climate control housing. A mixture of refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube and then moves out of the evaporator core through the evaporator core outlet tube. When the A/C compressor is operating, air from the blower motor is cooled and dehumidified as it flows through the evaporator core fins.

Thermostatic Expansion Valve (TXV)

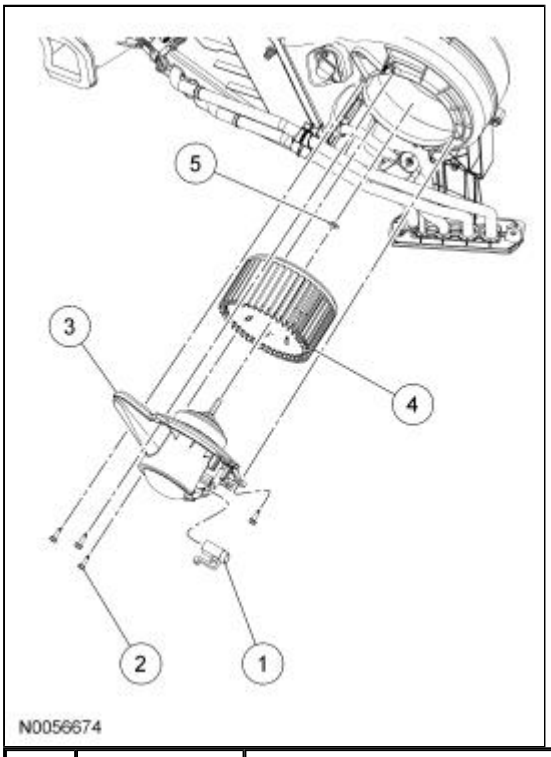
The TXV restricts the flow of refrigerant from the high-pressure side of the refrigerant system and separates the low-pressure and high-pressure sides of the auxiliary refrigerant system. Refrigerant entering and exiting the auxiliary evaporator core passes through the TXV through 2 separate flow paths. An internal temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures and increases the amount of refrigerant entering the evaporator core at higher temperatures.

Auxiliary A/C — Heater Lines

The auxiliary lines are secured to the underbody of the vehicle. Each auxiliary line is only available as a multiple-piece kit for ease of installation.

Auxiliary Blower Motor

Printable View (138 KB)



Item	Part Number	Description
1	13A409	Blower motor electrical connector (Expedition or Navigator)
1	19949	Blower motor electrical connector (Expedition EL)
2	W701696	Blower motor screw (Expedition or Navigator) (4 required)
2	—	Blower motor screw (Expedition EL) (3 required)
3	19805	Blower motor
4	19834	Blower motor wheel (Expedition or Navigator)
5	18A287	Blower motor wheel clip (Expedition EL)

Removal and Installation

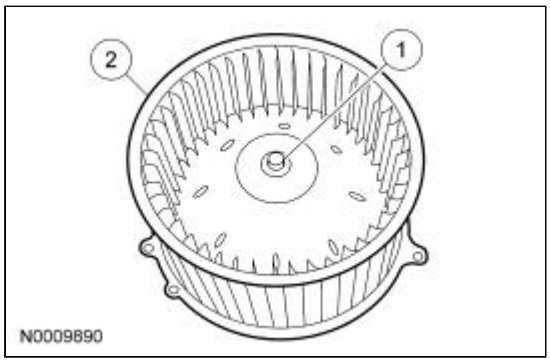
All vehicles

1. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .

2. Remove the blower motor.
   - Disconnect the blower motor electrical connector.
   - Remove the blower motor screws.
   - Remove the blower motor.

Expedition or Navigator only

3. Remove the blower motor wheel.
    1. Remove the blower motor wheel clip.
    2. Remove the blower motor wheel.

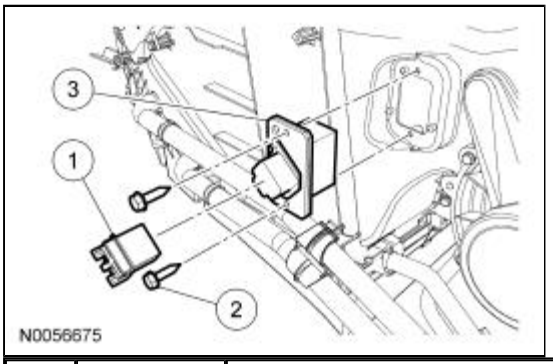


All vehicles

4. To install, reverse the removal procedure.

Auxiliary Blower Motor Resistor

Printable View (144 KB)



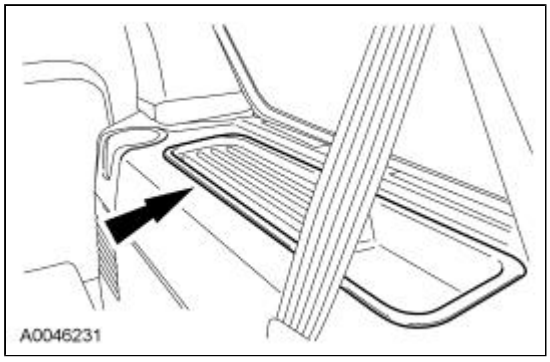
Item	Part Number	Description
1	13A409	Auxiliary blower motor resistor electrical connector (Expedition or Navigator)
1	19949	Auxiliary blower motor resistor electrical connector (Expedition EL)
2	W701696	Auxiliary blower motor resistor screw (Expedition or Navigator — 2 required) (Expedition EL — 1 required)
3	19A706	Auxiliary blower motor resistor

Removal and Installation

NOTE: Expedition or Navigator shown, Expedition EL similar.

All vehicles

1. Remove the RH quarter trim panel access panel.



Expedition or Navigator only

2. Remove the blower motor resistor.
   - Disconnect the blower motor resistor electrical connector.
   - Remove the 2 blower motor resistor screws and the blower motor resistor.

Expedition EL only

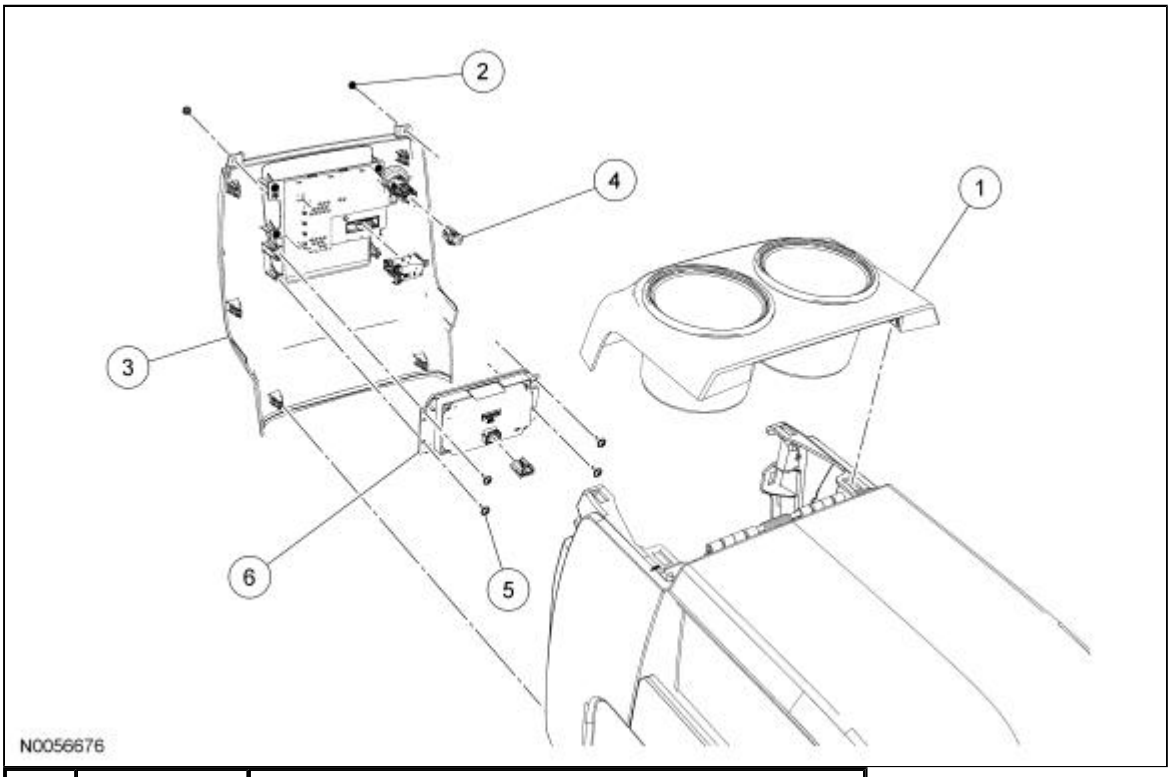
3. Remove the blower motor resistor.
    - Disconnect the blower motor resistor electrical connector.
    - Remove the blower motor resistor screw.
    - Detach the 2 blower motor resistor clips and remove the blower motor resistor.

All vehicles

4. To install, reverse the removal procedure.

Auxiliary Climate Control Assembly

Printable View (129 KB)



Item	Part Number	Description
1	7804567	Floor console upper finish panel
2	W708401	Floor console rear finish panel screw (2 required)
3	78045E24	Floor console rear finish panel
4	14A318	Floor console harness electrical connector (3 required)
5	W708401	Auxiliary climate control assembly screw (4 required)
6	19980	Auxiliary climate control assembly

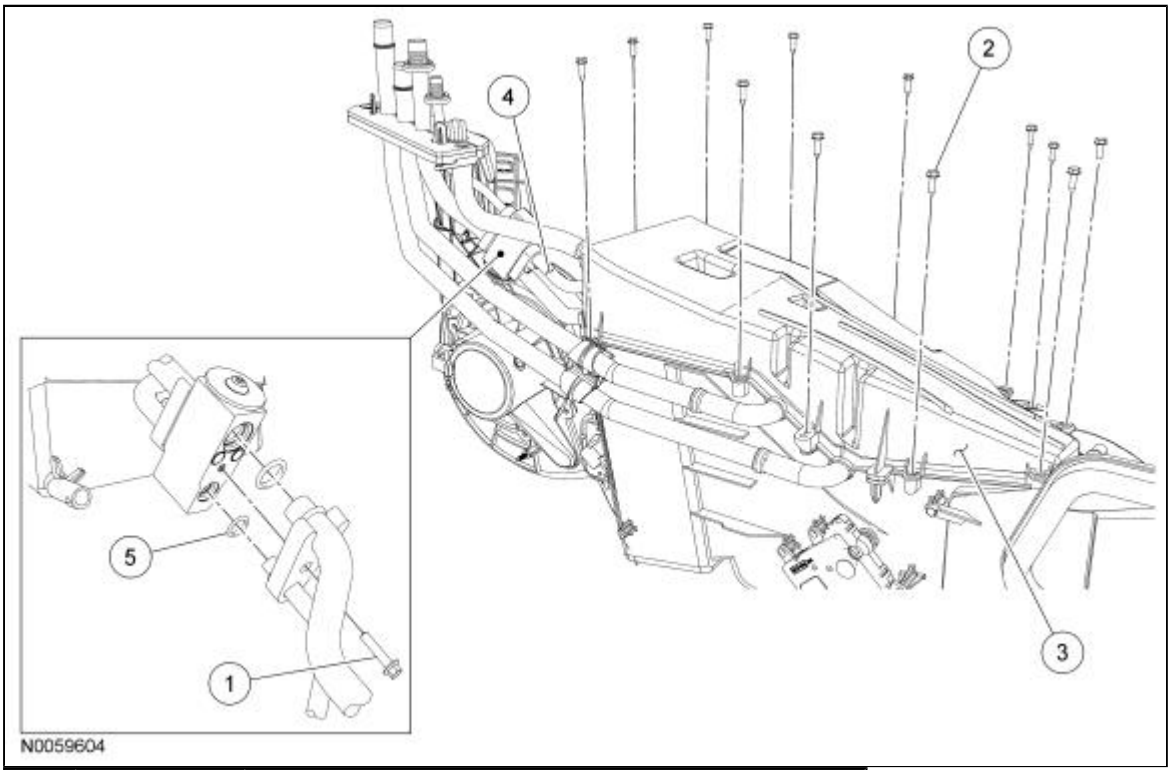
Removal and Installation

1. Remove the floor console upper finish panel.
2. Remove the 2 floor console rear finish panel screws.
3. Disengage the 6 clips and remove the floor console rear finish panel.
    - Disconnect the 3 floor console harness electrical connectors.
4. Remove the 4 auxiliary climate control assembly screws.
5. Remove the auxiliary climate control assembly.

6. To install, reverse the removal procedure.

Auxiliary Evaporator Core

Printable View (183 KB)



Item	Part Number	Description
1	—	Thermostatic expansion valve (TXV) fitting bolt
2	W701696	Evaporator/heater core access cover screw (12 required)
3	—	Evaporator/heater core access cover (part of 18D283)
4	19860	Evaporator core
5	19E889	O-ring seal (4 required)

Removal and Installation

NOTE: The auxiliary evaporator core is not available as a separate component for Expedition EL vehicles and is serviced only as an assembly with the auxiliary heater core and evaporator core housing. The auxiliary evaporator core is serviced as an individual component for Expedition and Navigator vehicles.

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested before it is removed from the vehicle.

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

All vehicles

1. Remove the auxiliary heater core and evaporator core housing. For additional information, refer to Auxiliary Heater Core and Evaporator Core Housing — Expedition, Navigator or Auxiliary Heater Core — Expedition EL in this section.

Expedition EL

2. Transfer the components from the old heater core and evaporator core housing to the new heater core and evaporator core housing as needed.

3. Install the auxiliary heater core and evaporator core housing. For additional information, refer to Auxiliary Heater Core — Expedition EL in this section.

Expedition or Navigator only

4. Remove the thermostatic expansion valve (TXV) fitting bolt and disconnect the fitting.
    - Discard the O-ring seals.

5. Remove the 12 evaporator/heater core access cover screws.

6. Remove the evaporator/heater core access cover.
    - Disconnect the evaporator drain tube.

7. Remove the evaporator core.

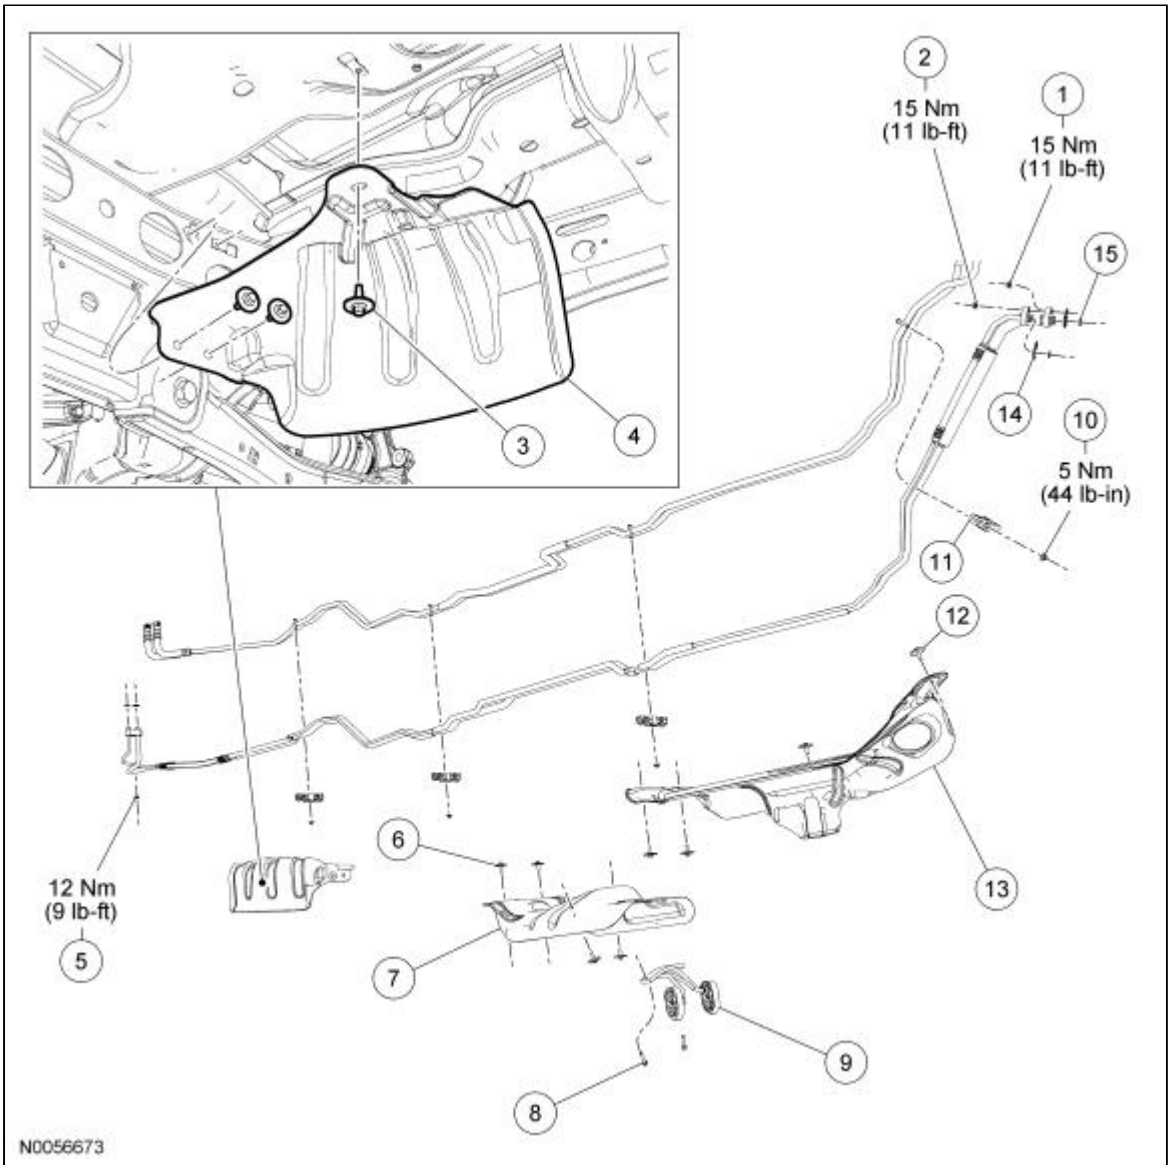
8. To install, reverse the removal procedure.
    - Install new O-ring seals.

Auxiliary Evaporator Outlet and Inlet Line

Printable View (358 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	W520413	Auxiliary evaporator outlet line front fitting nut
2	W520413	Auxiliary evaporator inlet line front fitting nut
3	W707959	Spare tire carrier splash shield bolt (3 required)

4	1A484	Spare tire carrier splash shield
5	W520413	Auxiliary evaporator outlet and inlet line rear fitting nut (Expedition EL)
6	W707959	Muffler heat shield bolt (4 required)
7	5290	Muffler heat shield
8	W500225	Exhaust hanger bolt (2 required)
9	5B245	Exhaust hanger
10	W701694	Auxiliary line bracket nut (4 required)
11	18N332	Auxiliary line bracket (4 required)
12	W707959	Catalytic converter heat shield bolt (4 required)
13	5G221	Catalytic converter heat shield
14	19B558	Gasket seal (4 required)
15	19E889	O-ring seal (2 required)

Removal

NOTE: The auxiliary evaporator inlet and outlet lines are not supplied together as an assembly for Expedition or Navigator vehicles. The auxiliary evaporator inlet line and outlet line are each installed from the factory as one-piece assemblies. The replacement parts are supplied as separate kits containing multiple-piece lines for ease of installation.

NOTE: The auxiliary evaporator inlet and outlet lines for Expedition EL vehicles are installed from the factory as a single one-piece assembly including both lines. The replacement part is supplied as a multiple-piece kit for ease of installation.

NOTE: For Expedition or Navigator vehicles, the following procedure can be used to remove and install one or both the auxiliary evaporator inlet and auxiliary evaporator outlet lines. If only one auxiliary evaporator line is to be removed and installed, cut or disconnect only the desired line at the specified points within the procedure. For Expedition EL vehicles, both lines must be removed.

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. **NOTE:** If only one auxiliary evaporator line is to be removed, disconnect only the desired line.

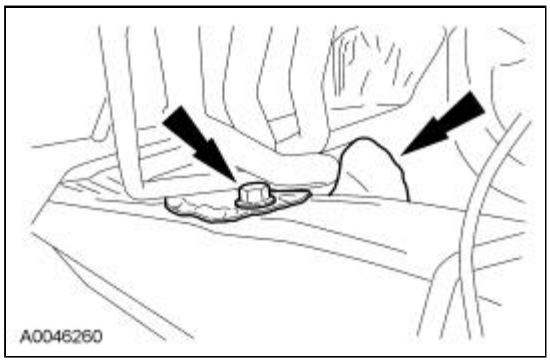
   Remove the auxiliary evaporator outlet and inlet line front fitting nut(s) and disconnect the fitting (s).
   - Discard the O-ring seals and gasket seals.

4. Remove the spare tire.

5. Remove the RH fender splash shield. For additional information, refer to Section 501-02 .

6. Working through the RH fender well opening, remove the front auxiliary line bracket nut and the front auxiliary line bracket.

7. Working through the RH fender well opening, remove the RH catalytic converter heat shield front bolt.



Expedition or Navigator only

8. **NOTE:** Both A/C fittings must be disconnected even if only one line is to be removed.

   Disconnect the auxiliary evaporator outlet and inlet line rear fittings.
   - Discard the O-ring seals.

Expedition EL only

9. Remove the RH rear wheel and tire assembly.

10. Remove the auxiliary evaporator outlet and inlet line rear fitting nut and disconnect the fitting.
    - Discard the gasket seals.

All vehicles

11. Remove the muffler. For additional information, refer to Section 309-00 .

12. Remove the 3 spare tire carrier splash shield bolts and the spare tire carrier splash shield.

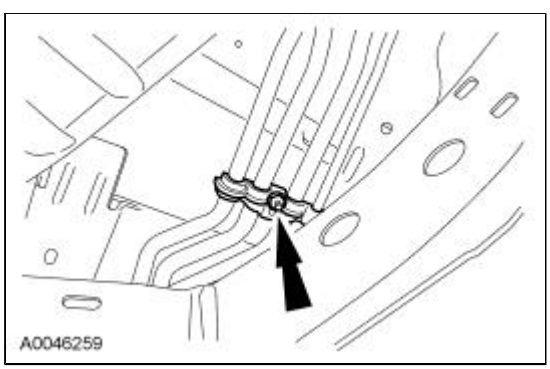
13. Remove the 3 muffler heat shield bolts and the heat shield.

14. Remove the 2 exhaust hanger bolts and the exhaust hanger.

15. Remove the RH catalyst monitoring sensor. For additional information, refer to Section 303-14 .

16. Remove the 3 remaining RH catalytic converter heat shield bolts and the heat shield.

17. Remove the 3 remaining auxiliary line bracket nuts and the auxiliary line brackets.



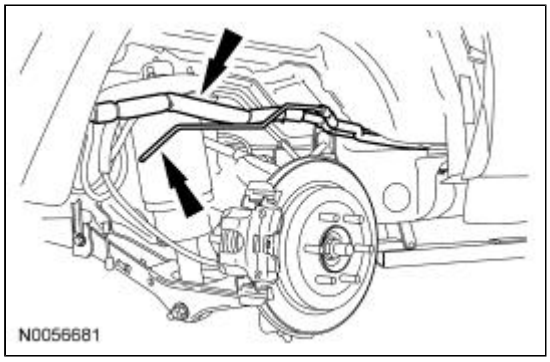
18. **NOTE:** If installing only one auxiliary evaporator line, cut only the desired line.

    Assemble and lay out the replacement line(s) in the same position as the existing line(s) and, using a suitable tool, cut the auxiliary evaporator line(s) in the same position as the fittings on the new line(s).

19. **NOTE:** Expedition EL shown.

    NOTE: For Expedition EL vehicles, the middle portion of the auxiliary evaporator outlet and inlet lines can be removed through the RH rear wheel well opening between the body and the frame.

    Remove the auxiliary evaporator line(s) in 3 separate pieces.



Installation

Expedition or Navigator only

1. Install the rear portion of the auxiliary evaporator line(s) and connect the auxiliary evaporator outlet and inlet line rear fittings.
    - Install new O-ring seals.

Expedition EL only

2. Install the rear portion of the auxiliary evaporator outlet and inlet line.

3. Connect the auxiliary evaporator outlet and inlet line rear fitting and install the nut.
    - Install new gasket seals.
    - Tighten to 12 Nm (9 lb-ft).

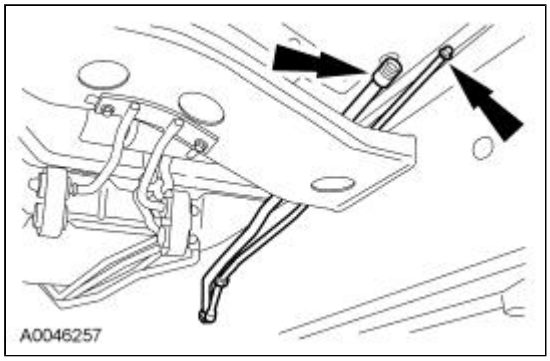
All vehicles

4. Install the front portion of the auxiliary evaporator outlet and inlet line(s).

5. Connect the evaporator outlet and inlet line front fitting(s) and install the nut(s).
    - Install new O-ring seals and gasket seals.
    - Tighten to 15 Nm (11 lb-ft).

6. **NOTE:** Loosely connect, but do not tighten, the fittings.

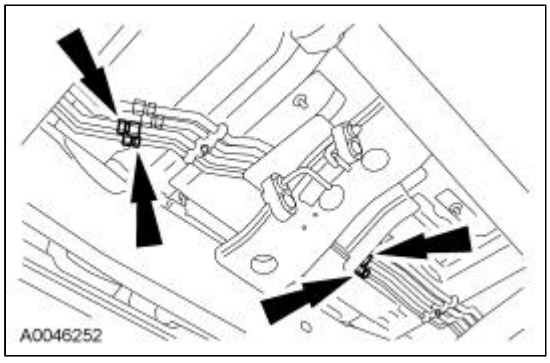
    Install the middle auxiliary evaporator line(s).



7. Starting from the rear of the vehicle, install the first 3 auxiliary line brackets and nuts.
    - Tighten to 5 Nm (44 lb-in).

8. **NOTE:** Expedition/Navigator shown, Expedition EL similar.

    Tighten the middle auxiliary evaporator line fittings.



9. Inspect the auxiliary evaporator lines for correct installation. Loosen, reposition and tighten as needed.

10. Install the RH catalytic converter heat shield and the 3 rear catalytic converter heat shield bolts.

11. Install the exhaust hanger and the 2 exhaust hanger bolts.

12. Install the muffler heat shield and the 3 muffler heat shield bolts.

13. Install the RH catalyst monitoring sensor. For additional information, refer to Section 303-14 .

14. Install the muffler. For additional information, refer to Section 309-00 .

15. Working through the RH fender well opening, Install the RH catalytic converter heat shield front bolt.

16. Install the front auxiliary line bracket and the front auxiliary line bracket nut.
    - Tighten to 5 Nm (44 lb-in).

17. Install the spare tire carrier splash shield and the 3 spare tire carrier splash shield bolts.

18. Install the RH front fender splash shield.

19. Install the RH front wheel.

Expedition EL only

20. Install the RH rear wheel and tire assembly.

All vehicles

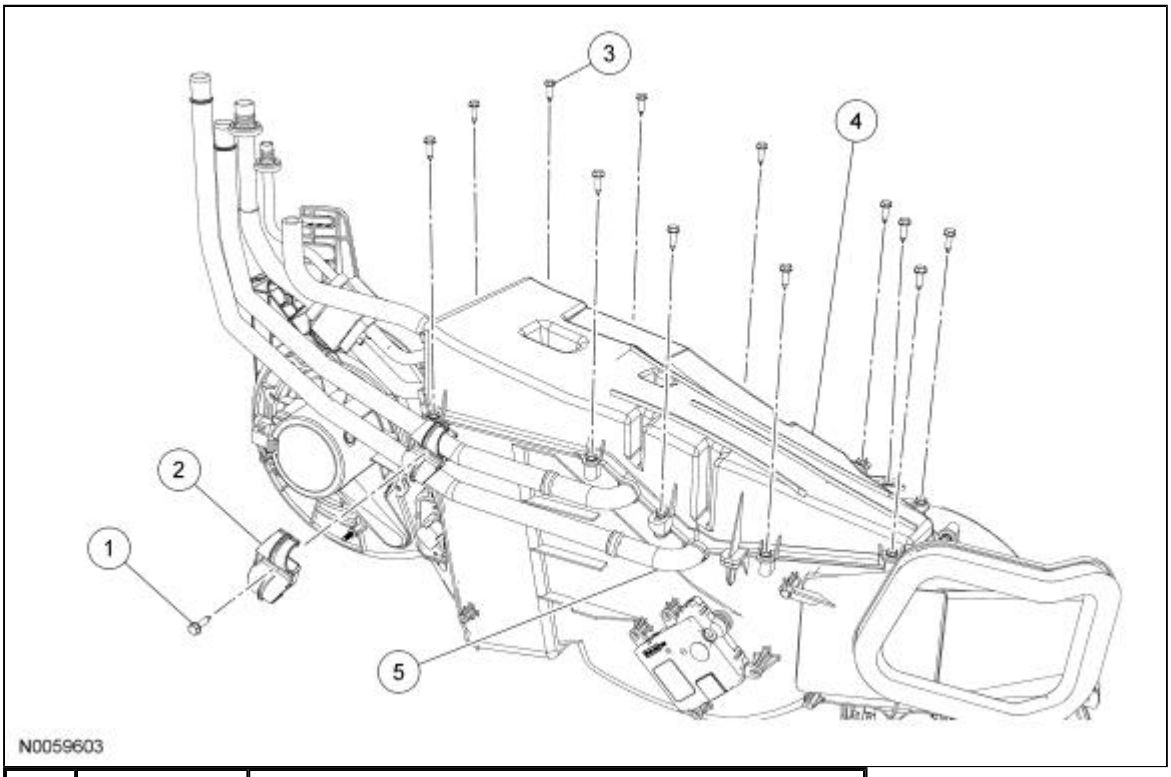
21. Install the spare tire.

22. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

23. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Auxiliary Heater Core — Expedition, Navigator

Printable View (206 KB)



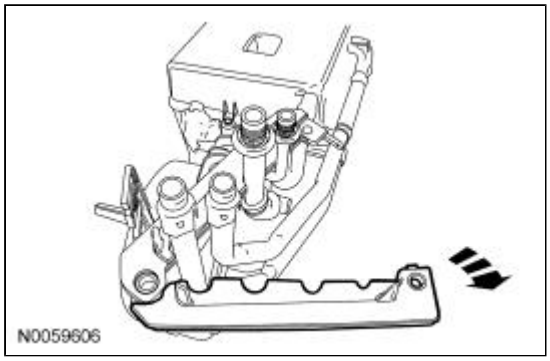
Item	Part Number	Description
1	W701696	Heater core tube bracket screw
2	18N332	Heater core tube bracket
3	W701696	Heater core cover screw (12 required)
4	—	Evaporator/heater core access cover (part of 18D283)
5	18476	Heater core

Removal and Installation

NOTE: If a heater core leak is suspected, the heater core must be pressure leak tested before it is removed from the vehicle.

1. Remove the auxiliary heater core and evaporator core housing. For additional information, refer to Auxiliary Heater Core and Evaporator Core Housing — Expedition, Navigator in this section.

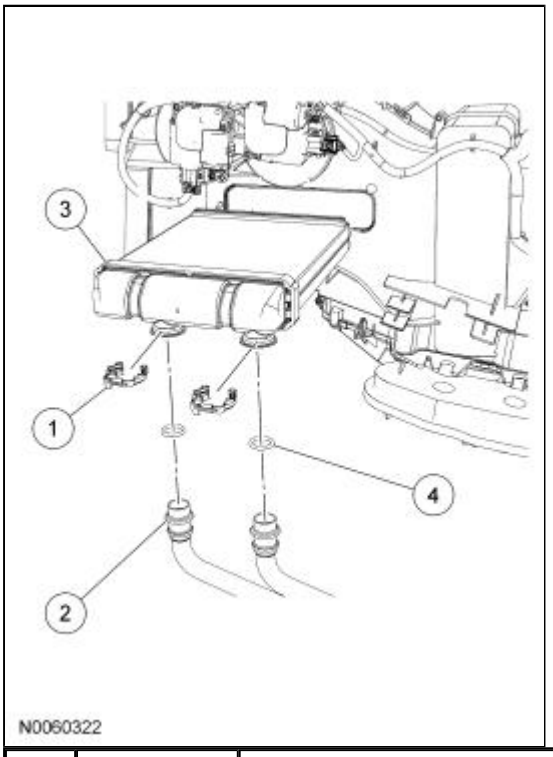
2. Release the clip and open the floorpan bracket.



3. Remove the heater core tube bracket screw and the heater core tube bracket.
4. Remove the 12 evaporator/heater core access cover screws.
5. Remove the evaporator/heater core access cover.
6. Remove the heater core.
7. To install, reverse the removal procedure.

Auxiliary Heater Core — Expedition EL

Printable View (215 KB)



Item	Part Number	Description
1	—	Auxiliary heater core tube fitting clip (2 required) (part of 18476)
2	—	Auxiliary heater core tube (2 required) (part of 18476)
3	18476	Auxiliary heater core
4	—	O-ring seal (2 required) (part of 18476)

Removal and Installation

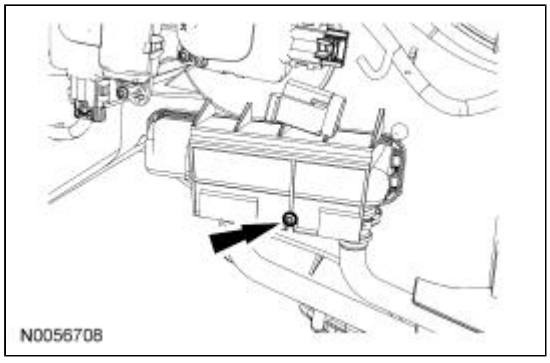
NOTE: If a heater core leak is suspected, the heater core must be pressure leak tested before it is removed from the vehicle.

NOTE: It is not necessary to install the new heater core tubes contained in the heater core service kit unless there is evidence of damage to the heater core tubes. New O-ring seals must be installed any time the heater core tubes are detached from the heater core.

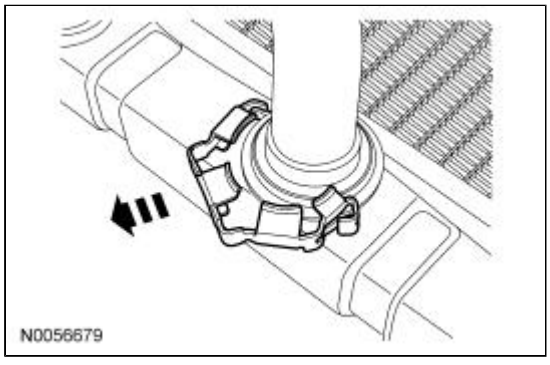
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Drain the engine coolant. For additional information, refer to Section 303-03 .
3. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .
4. Position a suitable drain pan and disconnect the 2 auxiliary heater outlet and inlet line quick

disconnect fittings at the floorpan connections to allow any residual coolant to drain from the auxiliary heater core.

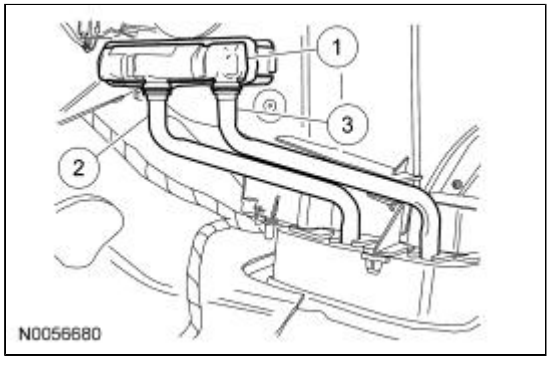
5. Remove the heater core door screw.



6. Remove the 2 auxiliary heater core tube fitting clips.



7. Disconnect the 2 auxiliary heater core tubes.
    1. Position the auxiliary heater core partially out of the housing.
    2. Disconnect the auxiliary heater core inlet tube.
    3. Disconnect the auxiliary heater core outlet tube.
        - Discard the O-ring seals.



8. Remove the auxiliary heater core.

9. **NOTE:** Use only the O-ring seals contained in the auxiliary heater core service kit.

   NOTE: Verify that the heater core tube fittings are completely seated in the heater core before installing the heater core tube fitting clips.

   To install, reverse the removal procedure.

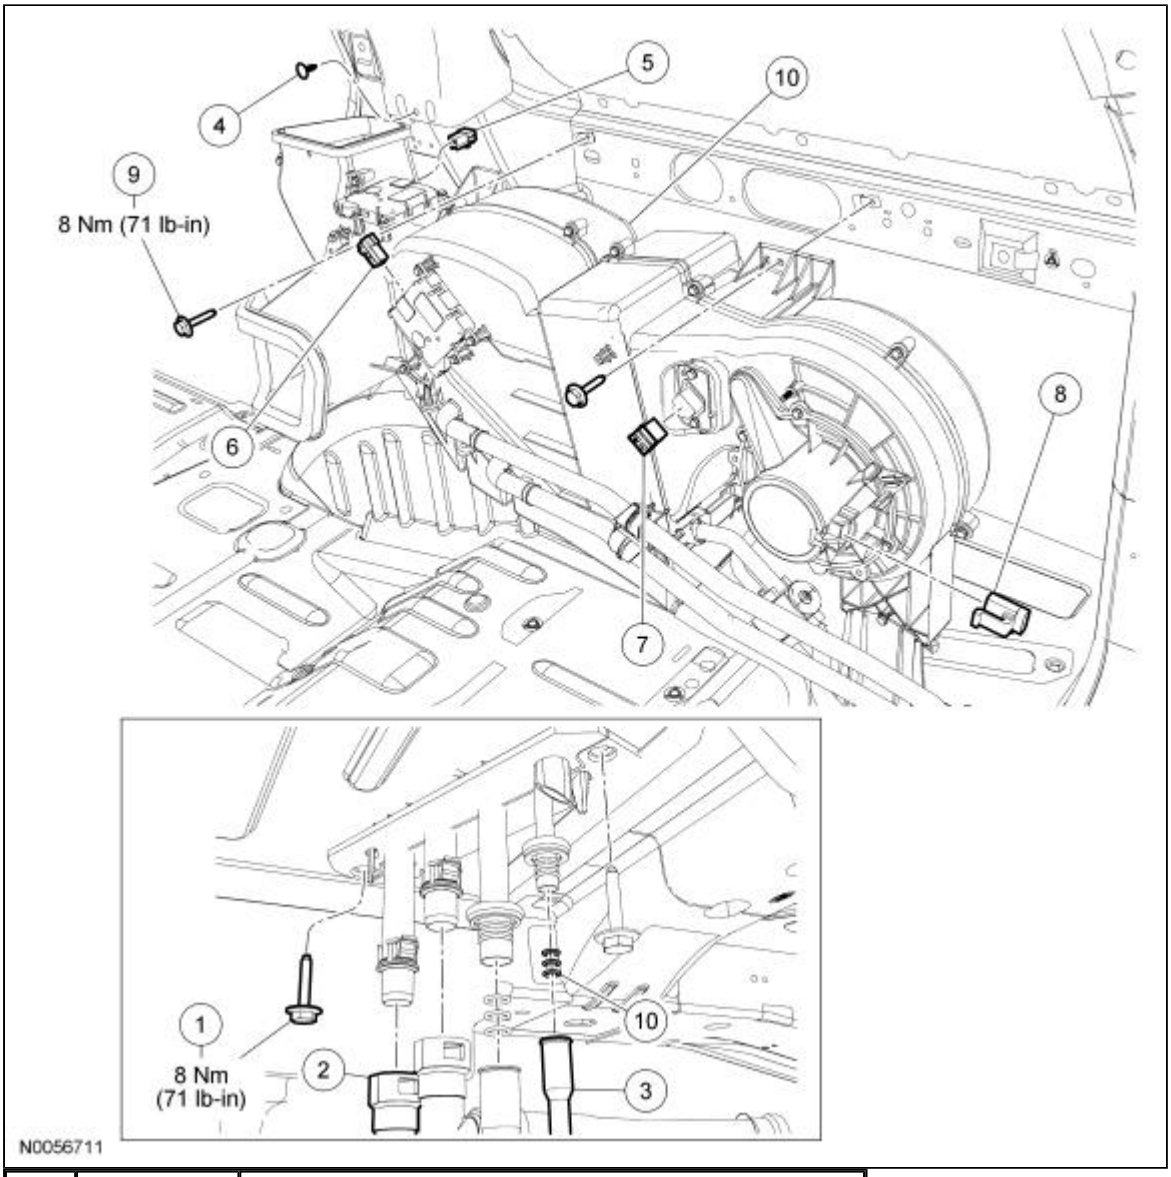
10. Fill the engine cooling system. For additional information, refer to Section 303-03 .

Auxiliary Heater Core and Evaporator Core Housing — Expedition, Navigator

Printable View (277 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	—	Floorpan bracket bolt (2 required)
2	—	Auxiliary heater hose fitting (2 required) (part of 18476)

3	—	Auxiliary evaporator line fittings (2 required) (part of 19835)
4	W705589	Auxiliary headliner duct pin-type retainer
5	13A409	Auxiliary mode door actuator electrical connector
6	13A409	Auxiliary temperature blend door electrical connector
7	13A409	Blower motor resistor electrical connector
8	13A409	Blower motor electrical connector
9	W707103	Auxiliary heater core and evaporator core housing bolt (2 required)
10	18D283	Auxiliary heater core and evaporator core housing
11	19E889	O-ring seal (6 required)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. Drain the engine coolant. For additional information, refer to Section 303-03 .

4. **NOTE:** Allow any residual coolant to drain from the auxiliary heater core after disconnecting the auxiliary heater hose fittings.

   Position a suitable drain pan and disconnect the 2 auxiliary heater hose fittings at the floorpan connection.

5. Disconnect the 2 auxiliary evaporator line fittings at the floorpan connection.
   - Discard the O-ring seals.

6. Remove the 2 floorpan bracket bolts.

7. Remove the auxiliary headliner duct pin-type retainer and disconnect the duct.

8. Disconnect the auxiliary mode door actuator electrical connector.

9. Disconnect the auxiliary temperature blend door actuator electrical connector.

10. Disconnect the auxiliary blower motor resistor electrical connector.

11. Disconnect the auxiliary blower motor electrical connector and detach the wire harness from the housing.

12. Remove the 2 auxiliary heater core and evaporator core housing bolts.
    - To install, tighten to 8 Nm (71 lb-in).

13. Remove the auxiliary heater core and evaporator core housing.

14. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

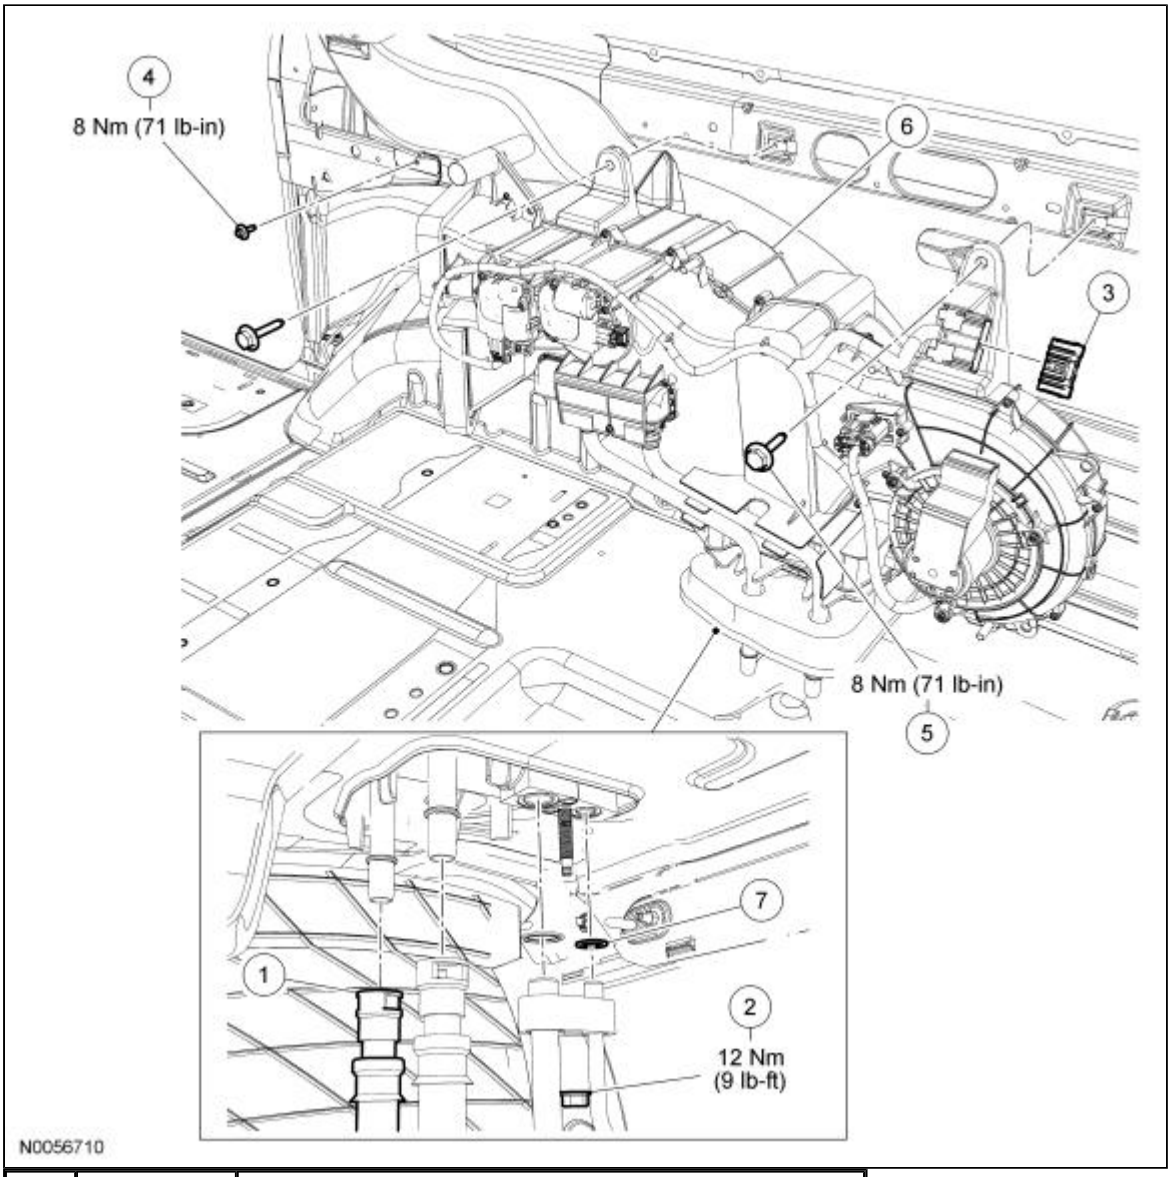
15. Fill the engine cooling system. For additional information, refer to Section 303-03 .

Auxiliary Heater Core and Evaporator Core Housing — Expedition EL

Printable View (295 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	—	Auxiliary heater core quick disconnect fitting (2 required) (part of 18476)
2	W520413	Auxiliary evaporator outlet and inlet line rear fitting

		nut
3	19949	Auxiliary climate control harness electrical connector
4	W705132	Auxiliary airflow duct bolt
5	W707103	Auxiliary heater core and evaporator core housing bolt (2 required)
6	18D283	Auxiliary heater core and evaporator core housing
7	19B558	Gasket seal (2 required)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. Drain the engine coolant. For additional information, refer to Section 303-03 .

4. Remove the RH rear quarter trim panel. For additional information, refer to Section 501-05 .

5. **NOTE:** Allow any residual coolant to drain from the auxiliary heater core after disconnecting the auxiliary heater core fittings.

   Position a suitable drain pan and disconnect the 2 auxiliary heater core quick disconnect fittings.

6. Remove the auxiliary evaporator outlet and inlet line rear fitting nut and disconnect the fitting.
   - Discard the gasket seals.
   - To install, tighten to 12 Nm (9 lb-ft).

7. Disconnect the auxiliary climate control harness electrical connector.

8. Remove the auxiliary airflow duct bolt.
   - To install, tighten to 8 Nm (71 lb-in).

9. Remove the 2 heater core and evaporator core housing bolts.
   - To install, tighten to 8 Nm (71 lb-in).

10. Remove the auxiliary heater core and evaporator core housing.

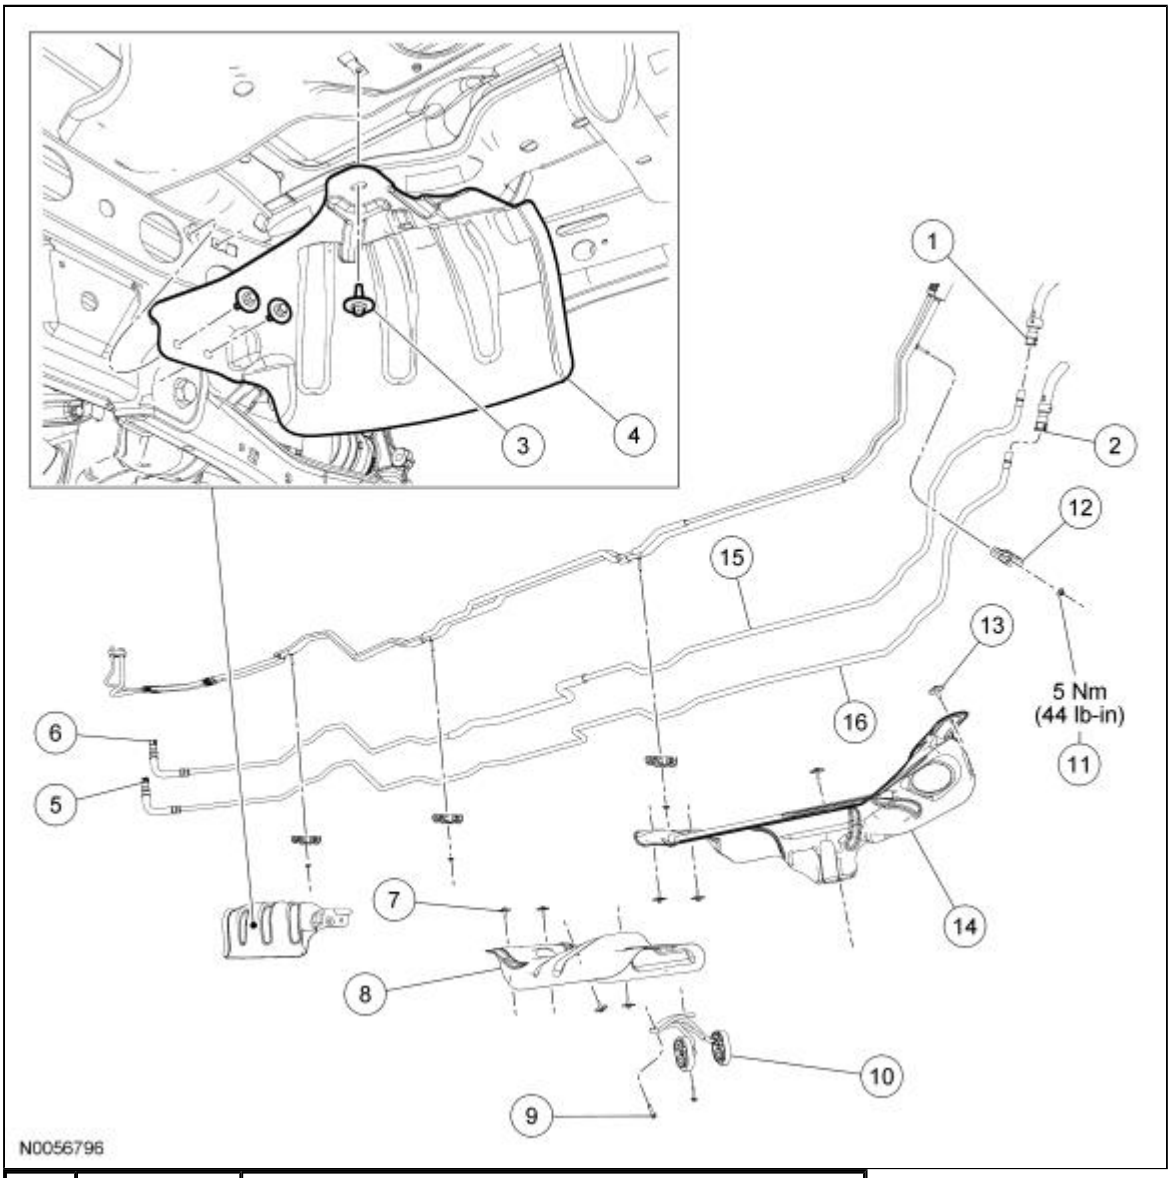
11. To install, reverse the removal procedure.
    - Install new gasket seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

12. Fill the engine coolant level. For additional information, refer to Section 303-03 .

13. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Auxiliary Heater Outlet and Inlet Line

Printable View (266 KB)



Item	Part Number	Description
1	—	Auxiliary heater inlet line front quick disconnect (part of 18472)
2	—	Auxiliary heater outlet line front quick disconnect (part of 18472)
3	W707959	Spare tire carrier splash shield bolt (3 required)
4	1A484	Spare tire carrier splash shield
5	—	Auxiliary heater outlet line rear quick disconnect (part of 18696)
6	—	Auxiliary heater inlet line rear quick disconnect (part of 18663)
7	W707959	Muffler heat shield bolt (4 required)

8	5290	Muffler heat shield
9	W500225	Exhaust hanger bolt (2 required)
10	5B245	Exhaust hanger
11	W701694	Auxiliary line bracket nut (4 required)
12	18N332	Auxiliary line bracket (4 required)
13	W707959	Catalytic converter heat shield bolt (4 required)
14	5G221	Catalytic converter heat shield
15	18663	Auxiliary heater inlet line
16	18696	Auxiliary heater outlet line

Removal

NOTE: The auxiliary heater inlet and outlet lines are not supplied together as an assembly. The auxiliary heater inlet line and outlet line are each installed from the factory as one-piece assemblies. The replacement parts are supplied as separate kits containing multiple-piece lines for ease of installation.

NOTE: The following procedure can be used to remove and install one or both the auxiliary evaporator inlet and auxiliary evaporator outlet lines. If only one auxiliary evaporator line is to be removed and installed, cut or disconnect only the desired line at the specified points within the procedure.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the engine coolant. For additional information, refer to Section 303-03 .

3. Remove the spare tire.

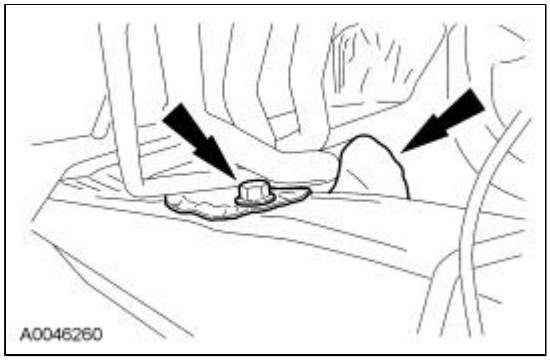
4. Remove the RH fender splash shield. For additional information, refer to Section 501-02 .

5. **NOTE:** If only one auxiliary heater line is to be removed, disconnect only the desired line.

   Disconnect the auxiliary heater outlet and/or inlet line front quick disconnect fitting(s).

6. Working through the RH fender well opening, remove the front auxiliary line bracket nut and the front auxiliary line bracket.

7. Working through the RH fender well opening, remove the RH catalytic converter heat shield front bolt.



Expedition EL only

8. Remove the RH rear wheel and tire assembly.

All vehicles

9. **NOTE:** If only one auxiliary heater line is to be removed, disconnect only the desired line.

   Disconnect the auxiliary heater outlet and inlet line rear quick disconnect fitting(s).

10. Remove the muffler. For additional information, refer to Section 309-00 .

11. Remove the 3 spare tire carrier splash shield bolts and the spare tire carrier splash shield.

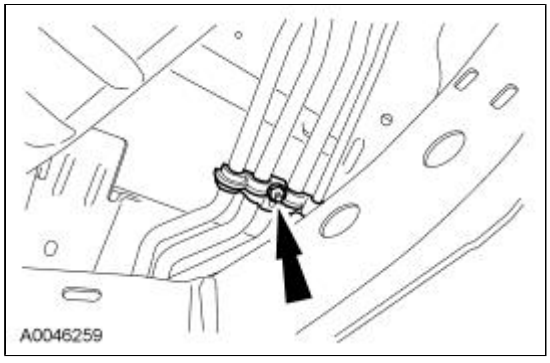
12. Remove the 3 muffler heat shield bolts and the muffler heat shield.

13. Remove the 2 exhaust hanger bolts and the exhaust hanger.

14. Remove the RH catalyst monitoring sensor. For additional information, refer to Section 303-14 .

15. Remove the 3 remaining RH catalytic converter heat shield bolts and the heat shield.

16. Remove the 3 remaining auxiliary line bracket nuts and the line brackets.



17. **NOTE:** If installing only one auxiliary heater line, cut only the desired line.

    Assemble and lay out the replacement line(s) in the same position as the existing line(s) and, using a suitable tool, cut the auxiliary heater line(s) in the same position as the fittings on the new line(s).

18. Remove the auxiliary heater line(s) in 3 separate pieces.

Installation

Expedition or Navigator only

1. Install the rear portion of the auxiliary heater outlet and inlet line(s) and connect the quick disconnect fittings.

All vehicles

2. Install the front auxiliary heater line(s) and connect the quick disconnect fittings.

3. **NOTE:** Loosely connect, but do not tighten, the fittings.

   Install the middle auxiliary heater line(s).

4. Starting from the rear of the vehicle, install the first 3 auxiliary line brackets and nuts.
    - Tighten to 5 Nm (44 lb-in).
5. Tighten the middle auxiliary heater line fittings.
6. Inspect the auxiliary heater lines for correct installation. Loosen, reposition and tighten as needed.
7. Install the RH catalytic converter heat shield and the 3 catalytic converter heat shield rear bolts.
8. Install the RH catalyst monitoring sensor. For additional information, refer to Section 303-14 .
9. Install the exhaust hanger and the 2 exhaust hanger bolts.
10. Install the muffler heat shield and the 3 muffler heat shield bolts.
11. Install the muffler. For additional information, refer to Section 309-00 .
12. Install the spare tire carrier splash shield and the 3 spare tire carrier splash shield bolts.
13. Working through the RH fender well opening, Install the RH catalytic converter heat shield front bolt.
14. Install the front auxiliary line bracket and the front auxiliary line bracket and nut.
    - Tighten to 5 Nm (44 lb-in).
15. Install the RH front fender splash shield.
16. Install the RH front wheel.

Expedition EL only

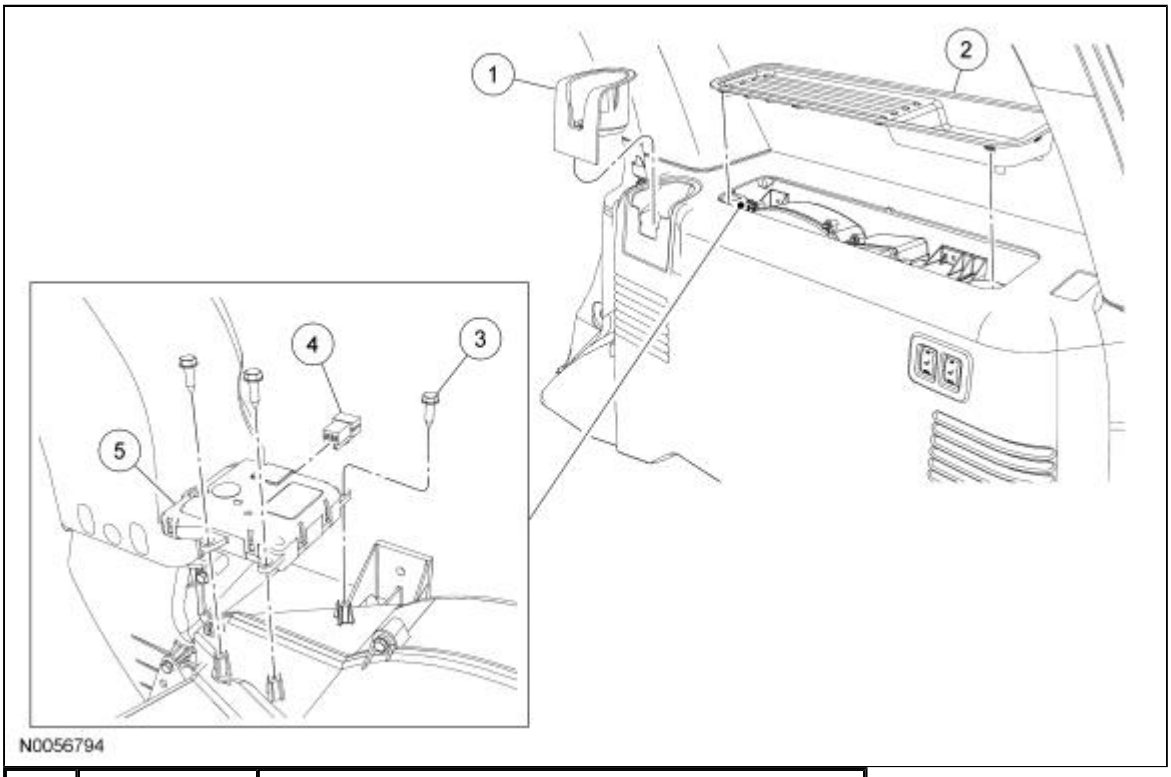
17. Install the RH rear wheel and tire assembly.

All vehicles

18. Install the spare tire.
19. Fill the engine cooling system. For additional information, refer to Section 303-03 .

Auxiliary Mode Door Actuator — Expedition, Navigator

Printable View (142 KB)



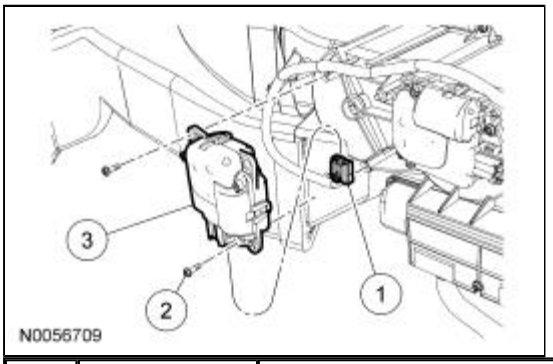
Item	Part Number	Description
1	13560	Quarter trim panel cup holder
2	13530	Quarter trim panel utility tray
3	W701696	Auxiliary mode door actuator screw (3 required)
4	13A409	Auxiliary mode door actuator electrical connector
5	19E616	Auxiliary mode door actuator

Removal and Installation

1. Remove the RH quarter trim panel cup holder.
2. Remove the RH quarter trim panel utility tray.
3. Remove the 3 auxiliary mode door actuator screws.
4. Disconnect the auxiliary mode door actuator electrical connector.
5. Remove the auxiliary mode door actuator.
6. To install, reverse the removal procedure.

Auxiliary Mode Door Actuator — Expedition EL

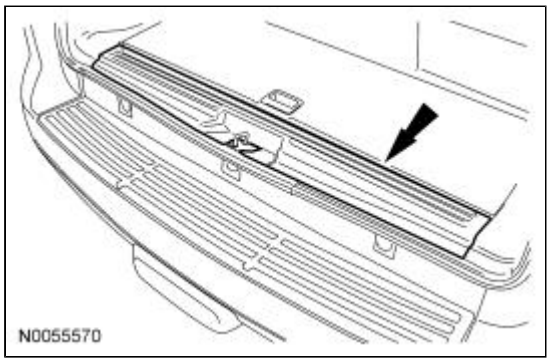
Printable View (224 KB)



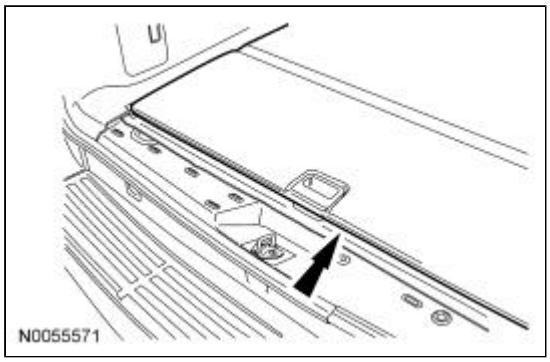
Item	Part Number	Description
1	19949	Auxiliary mode door actuator electrical connector
2	—	Auxiliary mode door actuator screw (2 required)
3	19E616	Auxiliary mode door actuator

Removal and Installation

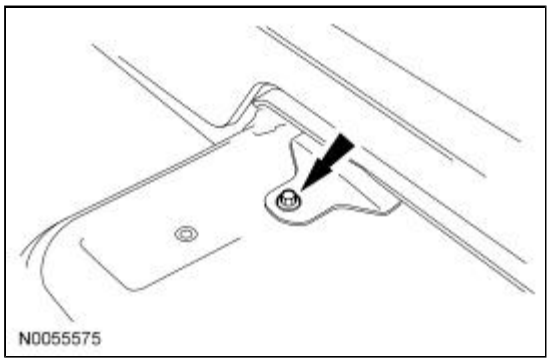
1. Fold the third row seats fully forward.
2. Remove the RH D-pillar trim panel. For additional information, refer to Section 501-05 .
3. Remove the liftgate sill plate.



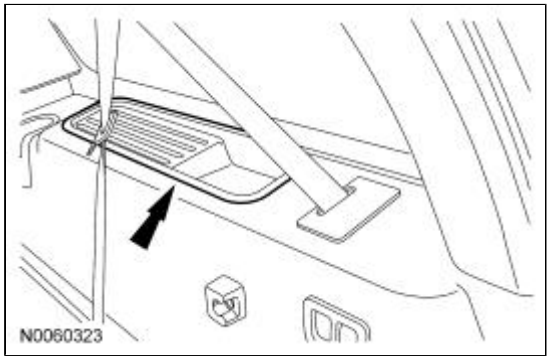
4. Remove the rear floor cargo space trim panel.



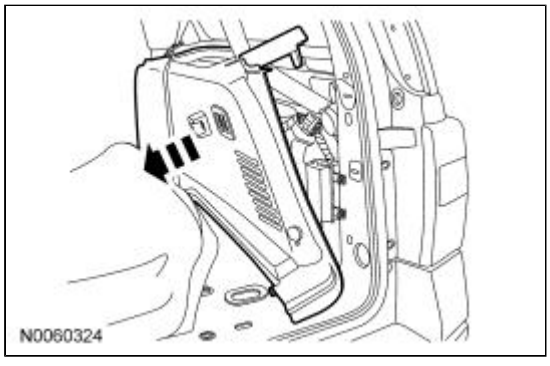
5. Position the rear floor cargo space floor trim aside and remove the RH rear quarter trim panel bolt.



6. Remove the RH quarter trim panel utility tray.



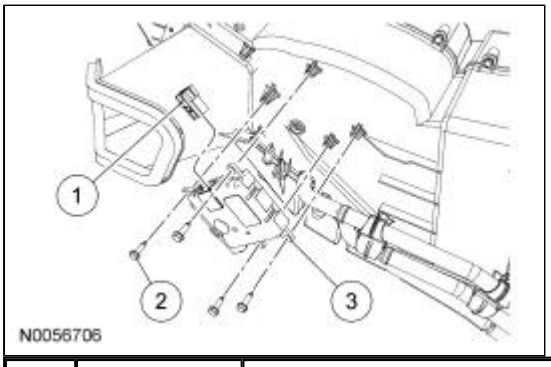
7. Detach the 3 rear and 5 upper RH quarter trim panel clips and position the quarter trim panel aside.



8. Disconnect the auxiliary mode door actuator electrical connector.
9. Remove the 2 auxiliary mode door actuator screws.
10. Remove the auxiliary mode door actuator.
11. To install, reverse the removal procedure.

Auxiliary Temperature Blend Door Actuator — Expedition, Navigator

Printable
View (96 KB)



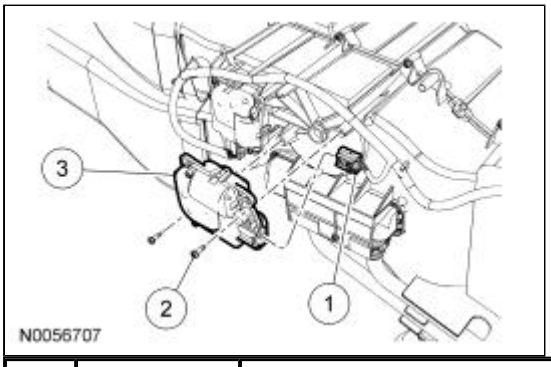
Item	Part Number	Description
1	13A409	Auxiliary temperature blend door actuator electrical connector
2	W701696	Auxiliary temperature blend door actuator screw (4 required)
3	19E616	Auxiliary temperature blend door actuator

Removal and Installation

1. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .
2. Disconnect the auxiliary temperature blend door actuator electrical connector.
3. Remove the 4 auxiliary temperature blend door actuator screws.
4. Remove the auxiliary temperature blend door actuator.
5. To install, reverse the removal procedure.

Auxiliary Temperature Blend Door Actuator — Expedition EL

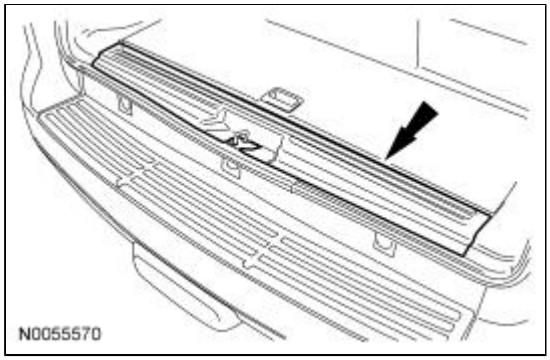
Printable View (228 KB)



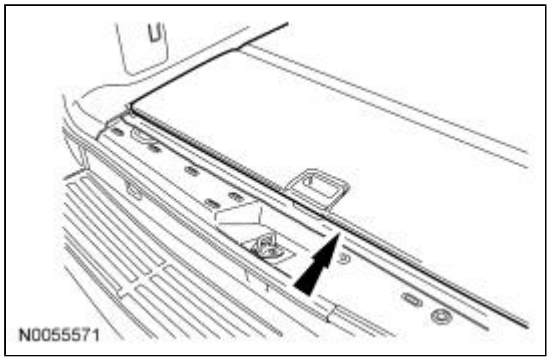
Item	Part Number	Description
1	19949	Auxiliary temperature blend door actuator electrical connector
2	—	Auxiliary temperature blend door actuator screw (2 required)
3	19E616	Auxiliary temperature blend door actuator

Removal and Installation

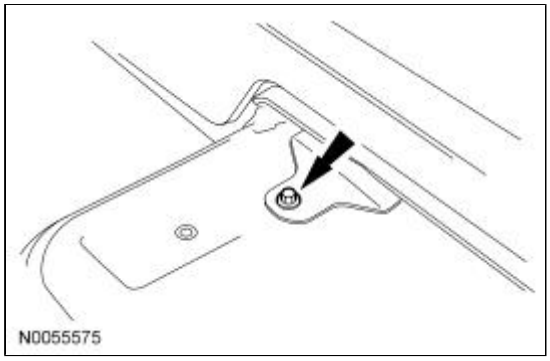
1. Fold the third row seats fully forward.
2. Remove the RH D-pillar trim panel. For additional information, refer to Section 501-05 .
3. Remove the liftgate sill plate.



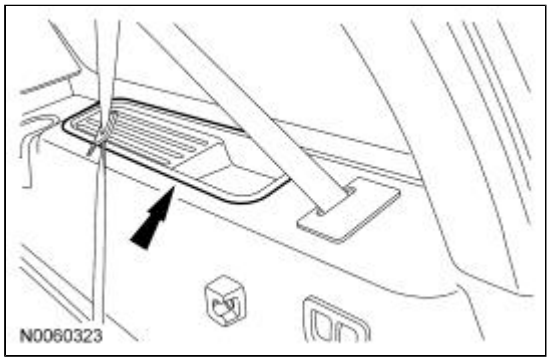
4. Remove the rear floor cargo space trim panel.



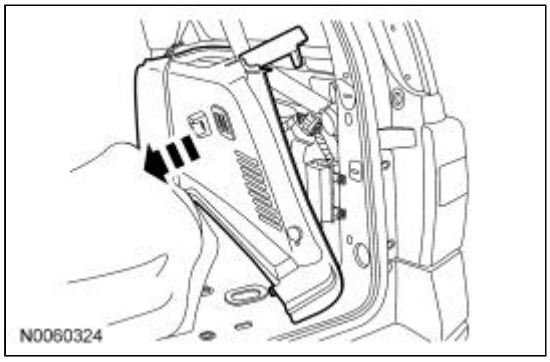
5. Position the rear floor cargo space floor trim aside and remove the RH rear quarter trim panel bolt.



6. Remove the RH quarter trim panel utility tray.



7. Detach the 3 rear and 5 upper RH quarter trim panel clips and position the quarter trim panel aside.



8. Disconnect the auxiliary temperature blend door actuator electrical connector.

9. Remove the 2 auxiliary temperature blend door actuator screws.

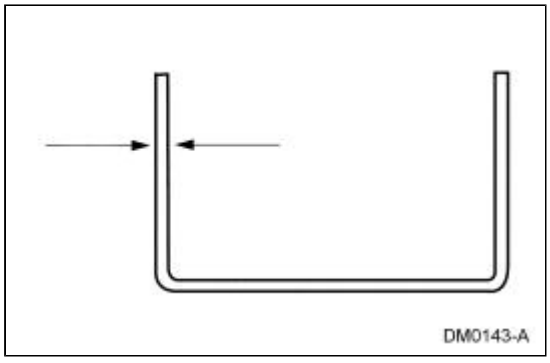
10. Remove the auxiliary temperature blend door actuator.
11. To install, reverse the removal procedure.

Register

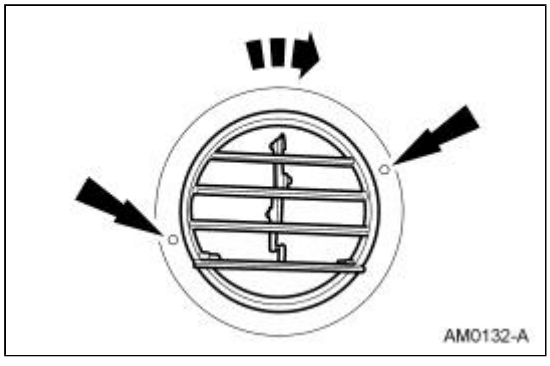
Printable View (81 KB)

Removal and Installation

1. Fabricate a removal tool from a 3.175 mm (0.12 in) diameter rod.



2. Rotate the register with the removal tool to align the retaining ears with the clearance openings and remove the register.



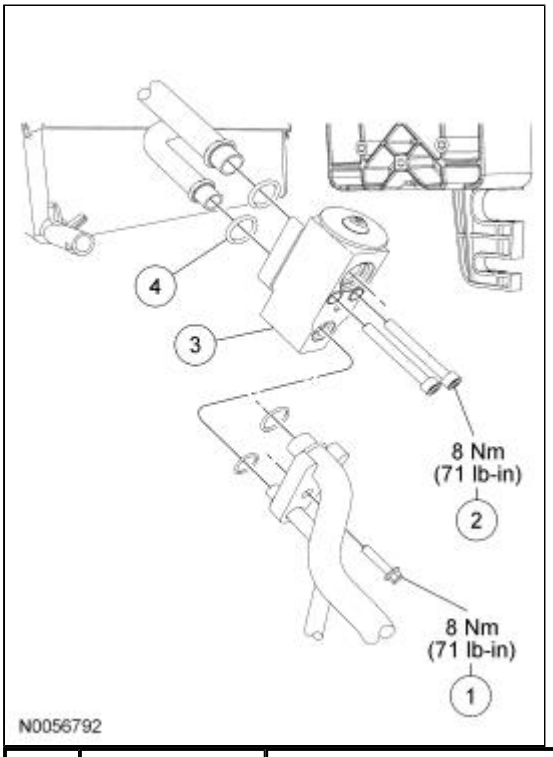
3. To install, reverse the removal procedure.

Thermostatic Expansion Valve — Expedition, Navigator

Printable View (100 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B



Item	Part Number	Description
1	—	Thermostatic expansion valve (TXV) fitting bolt
2	7A771	TXV bolt (2 required)
3	19849	TXV
4	19E889	O-ring seal (4 required)

Removal and Installation

1. Recover the refrigerant. For additional information, refer to Section 412-00 .
2. Remove the RH quarter trim panel. For additional information, refer to Section 501-05 .
3. Remove the thermostatic expansion valve (TXV) fitting bolt and disconnect the fitting.
   - Discard the O-ring seals.
4. Remove the 2 TXV bolts.

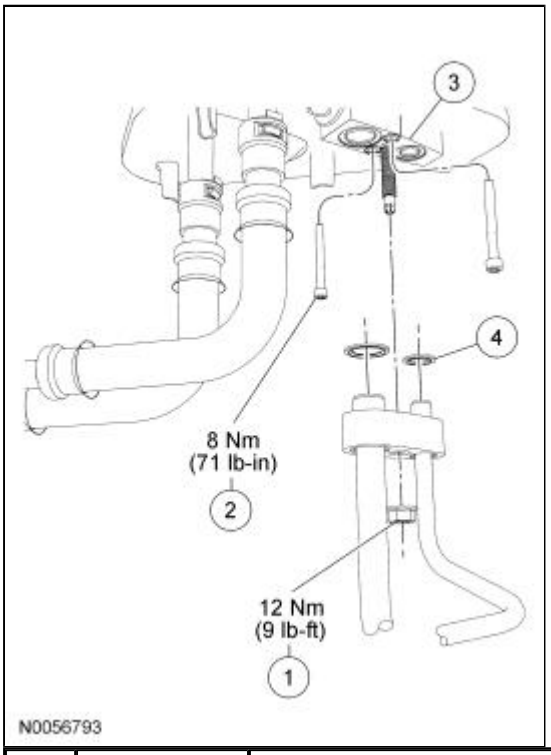
5. Remove the TXV.
    - Discard the O-ring seals.

6. To install, reverse the removal procedure.
    - Install new O-ring seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

7. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Thermostatic Expansion Valve — Expedition EL

Printable View (98 KB)



Item	Part Number	Description
1	W520413	Auxiliary evaporator outlet and inlet line rear fitting nut
2	—	Thermostatic expansion valve (TXV) bolt (2 required)
3	19849	TXV
4	19B558	Gasket seal (2 required)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00 .

3. Remove the auxiliary evaporator outlet and inlet line rear fitting nut.
   - Discard the gasket seals.
   - To install, tighten to 12 Nm (9 lb-ft).

4. Remove the 2 thermostatic expansion valve (TXV) bolts and the TXV.
   - Discard the O-ring seals.
   - To install, tighten to 8 Nm (71 lb-in).

5. To install, reverse the removal procedure.
   - Install new O-ring seals and gasket seals.

- Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Section 412-00 .

6. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00 .

Instrument Cluster and Panel Illumination

Printable View (63 KB)

The instrument cluster and panel illumination is used to provide backlighting to the instrument panel, switches, and control components when the headlamp switch is in either the PARKING LAMP or HEADLAMP ON position.

For Expedition, the level of intensity is adjustable by rotating the instrument panel dimmer switch either up to increase intensity or down to decrease intensity.

For Navigator, rotate the instrument panel dimmer switch to the right to increase intensity or to the left to decrease intensity.

The instrument cluster and panel lighting system illuminates the following components:

- Automatic four wheel drive (4WD) mode switch
- Adjustable pedal switch
- Ash receptacle
- Cigar lighter
- Manual A/C control assembly
- Electronic automatic temperature control (EATC)
- Auxiliary climate control (front, rear)
- Electric clock (Navigator only)
- Headlamp switch
- Heated back window switch and light
- Instrument cluster
- Message center switch
- Exterior rear view mirror control
- Power door lock switches (front left, front right)
- Power window switches
- Power rear quarter window switches
- Sliding roof panel switch
- Audio unit
- Steering wheel switches
- Floor shifter

Instrument Cluster and Panel Illumination

Printable View (198 KB)

Special Tool(s)

ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

Dimmable Backlighting

When the parking lamps or the headlamps are in the ON position the smart junction box (SJB) monitors the input from the instrument panel dimmer switch. The SJB sends a pulse-width modulated (PWM) voltage to the dimmable components and switches based on input received from the instrument panel dimmer switch.

The SJB also sends a message over the controller area network (CAN) to the audio unit, the DVD player, the electronic automatic temperature control (EATC) module, and the instrument cluster to indicate the backlighting intensity level.

Fixed Backlighting

When the accessory delay relay is energized, switched voltage is supplied to the non-dimmable components and switches.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Smart junction box (SJB) fuse 10 (15A) • Bulb(s) • Circuitry • Illumination source(s) • Auxiliary climate control switches (if equipped) • Door lock control switches • Window control switches • Headlamp switch • Electronic automatic temperature control (EATC) module • Audio unit • SJB • Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool release software.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test.
   - If the scan tool responds with no communication with the SJB, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB and the instrument cluster.

9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B2112	Panel Dim Switch Out of Range	Go To Pinpoint Test F .
B2A32	LED Backlighting Output Circuit Open	Go To Pinpoint Test D .
B2A33	LED Backlighting Output Circuit Short to Ground	Go To Pinpoint Test D .

B29B7	White lighting Output Circuit Open	Go To Pinpoint Test D .
B29B8	White lighting Output Circuit Short to Ground	Go To Pinpoint Test D .
All other DTCs	—	REFER to Section 419-10 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the instrument cluster	• Fuse(s) • Circuitry • Instrument cluster	• REFER to Section 418-00 .
• No communication with the smart junction box (SJB)	• Fuse(s) • Circuitry • SJB	• REFER to Section 418-00 .
• The control illumination is inoperative	• Fuse • SJB	• Go To Pinpoint Test A .
• The control illumination is always on	• Circuitry • SJB	• Go To Pinpoint Test E .
• The instrument cluster illumination is inoperative	• Instrument cluster	• INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
• The audio unit illumination is inoperative	• Audio unit	• REMOVE the audio unit. REFER to Section 415-01 . SEND it to an authorized repair facility. TEST the system for normal operation after the repair.
• The electronic automatic temperature control (EATC) unit illumination is inoperative	• EATC unit	• INSTALL a new EATC unit. REFER to Section 412-01 . TEST the system for normal operation.
• The digital versatile disc (DVD) player illumination is inoperative	• DVD player	• REMOVE the DVD player. REFER to Section 415-07 . SEND it to an authorized repair facility. TEST the system for normal operation after the repair.
• The auxiliary climate control illumination is inoperative	• Circuitry • Auxiliary climate control	• Go To Pinpoint Test B .
• The window control switch illumination is inoperative	• Window control switch	• CHECK the operation of the power windows. ▪ If the power windows operate correctly, INSTALL a new window control switch. REFER to Section 501-11 . TEST

		the system for normal operation. ■ If the power windows do not operate correctly, REFER to Section 501-11 .
• The steering wheel control illumination is inoperative	• Circuitry • Steering wheel control switch(es) • Steering wheel control switch harness • Clockspring	• Go To Pinpoint Test C .
• One or more module-controlled illumination source(s) is inoperative	• Circuitry • Illumination source • SJB	• Go To Pinpoint Test D .
• The instrument panel illumination does not dim	• Circuitry • Instrument panel dimmer switch • SJB	• Go To Pinpoint Test F .

Pinpoint Tests

Pinpoint Test A: The Control Illumination Is Inoperative

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a pulse-width modulated (PWM) voltage to the dimmable illumination sources based on input received from the instrument panel dimmer switch.

The SJB also sends a message over the controller area network (CAN) to the audio unit, the DVD player, the electronic automatic temperature control (EATC) module, and the instrument cluster to indicate the backlighting intensity level.

Possible Causes

- Fuse
- SJB

PINPOINT TEST A: THE CONTROL ILLUMINATION IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take

A1 CHECK THE EXTERIOR LAMP OPERATION	
• Place the headlamp switch in the PARKING LAMPS ON position. • **Are the parking lamps illuminated?**	**Yes** VERIFY the SJB fuse 10 (15A) is OK. IF OK, GO to A2 . **No** REFER to Section 417-01 .
A2 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Carry out the component test for the instrument panel dimmer switch. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the instrument panel dimmer switch OK?**	**Yes** GO to A3 . **No** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. CLEAR the DTCs. REPEAT the self-test.
A3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: The Auxiliary Climate Control Illumination Is Inoperative

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The smart junction box (SJB) supplies a pulse-width modulated (PWM) voltage to the auxiliary climate control illumination on circuit VLN18 (BU/WH). Ground is provided by circuit GD143 (BK/VT).

Possible Causes

- Circuit VLN18 (BU/WH) open
- Circuit GD143 (BK/VT) open
- Auxiliary climate control

PINPOINT TEST B: THE AUXILIARY CLIMATE CONTROL ILLUMINATION IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
B1 CHECK CIRCUIT VLN18 (BU/WH) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Auxiliary Climate Control C3198. • Place the headlamp switch to the PARKING LAMPS ON position. • Rotate the instrument panel dimmer switch to the full illumination position. • Key in ON position. • Measure the voltage between the auxiliary climate control C3198-1, circuit VLN18 (BU/WH), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to B2 . **No** REPAIR circuit VLN18 (BU/WH) for an open. TEST the system for normal operation.
B2 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the auxiliary climate control C3198-3, circuit GD143 (BK/VT), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new auxiliary climate control. REFER to Section 412-02 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test C: The Steering Wheel Control Illumination Is Inoperative

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a pulse-width modulated (PWM) voltage to the steering wheel controls through circuit VLN04 (VT/GY) (Navigator) or VLN18 (BU/WH) (Expedition) to the clockspring. The voltage passes through the clockspring to the steering wheel control switch harness and on to the steering wheel controls. Ground is supplied through the clockspring and circuit GD133 (BK).

Possible Causes

- Circuit VLN04 (VT/GY) open
- Circuit VLN18 (BU/WH) open
- Circuit GD133 (BK) open

- Steering wheel control switch harness
- Steering wheel control switch(es)
- Clockspring

PINPOINT TEST C: THE STEERING WHEEL CONTROL ILLUMINATION IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
C1 CHECK CIRCUIT VLN04 (VT/GY) (NAVIGATOR) OR VLN18 (BU/WH) (EXPEDITION) FOR AN OPEN • Depower the supplemental restraint system (SRS). Refer to Section 501-20B . • Disconnect: Clockspring C218. • Key in ON position. • Place the headlamp switch in the PARKING LAMPS ON position. • Rotate the instrument panel dimmer switch to the full illumination position. • Measure the voltage between the clockspring C218-16, circuit VLN04 (VT/GY) (Navigator) or VLN18 (BU/WH) (Expedition), harness side and ground.  N0026444 • **Is the voltage greater than 10 volts?**	**Yes** TURN the headlamp switch off. GO to C2 . **No** REPAIR the circuit. REPOWER the SRS. REFER to Section 501-20B . TEST the system for normal operation.
C2 CHECK CIRCUIT GD133 (BK) FOR AN OPEN • Measure the resistance between the clockspring C218-5, circuit GD133 (BK), harness side and ground.  N0026446 • **Is the resistance less than 5 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuit. REPOWER the SRS. REFER to Section 501-20B . TEST the system for normal operation.
C3 CHECK THE CLOCKSPRING FOR AN OPEN • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring Connector. • Measure the resistance between the clockspring C218 pin 16, component side and the upper clockspring connector pin 7,	**Yes** GO to C4 . **No**

component side; and between the clockspring C218 pin 7, component side and the upper clockspring connector pin 2, component side.  N0026971 • **Are the resistances less than 5 ohms?**	INSTALL a new clockspring. REFER to Section 501-20B . INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation.
C4 CHECK THE STEERING WHEEL CONTROL SWITCH HARNESS	
• Inspect the steering wheel control switch harness for shorts, opens, or any damage. • **Is the steering wheel control switch harness OK?**	**Yes** INSTALL new steering wheel controls. REFER to Section 310-03 or Section 415-01 as necessary. INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation. **No** REPAIR or INSTALL a new steering wheel control switch harness. INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation.

Pinpoint Test D: One Or More Module-Controlled Illumination Source(s) Is Inoperative

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The smart junction box (SJB) sends a pulse-width modulated (PWM) voltage to the dimmable components through circuits VLN04 (VT/GY) (Navigator) and VLN18 (BU/WH) (Expedition). Ground is provided through circuits GD133 (BK), GD138 (BK/WH), GD143 (BK/VT) and GD150 (BK/WH).

DTC B2A32 — sets when the SJB detects an open, or short to voltage on the LED backlighting output circuit.

DTC B2A33 — sets when the SJB detects a short to ground on the LED backlighting output circuit.

DTC B29B7 — sets when the SJB detects an open on the white lighting output circuit.

DTC B29B8 — sets when the SJB detects a short to ground on the white lighting output circuit.

Possible Causes

- Circuit VLN04 (VT/GY) open, short to ground or voltage
- Circuit VLN18 (BU/WH) open, short to ground or voltage
- Circuit GD133 (BK) open
- Circuit GD138 (BK/WH) open
- Circuit GD143 (BK/VT) open
- Circuit GD150 (BK/WH) open
- Four wheel drive (4WD) switch
- Adjustable pedals switch
- Message center switch
- Headlamp switch
- LH door lock control switch
- RH door lock control switch
- Power liftgate/traction control/hazard switch
- Overhead console switch
- Clock (Navigator only)
- Floor shifter
- SJB

PINPOINT TEST D: ONE OR MORE MODULE-CONTROLLED ILLUMINATION SOURCE(S) IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

<table>

Pinpoint Test E: The Control Illumination Is Always On

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The smart junction box (SJB) then supplies a pulse-width modulated (PWM) voltage signal to the dimmable illumination sources on circuit VLN04 (VT/GY) (Navigator) and VLN18 (BU/WH) (Expedition).

DTC B2A32 — sets when the SJB detects an open, or short to voltage on the LED backlighting output circuit.

DTC B29B7 — sets when the SJB detects an open, or short to voltage on the white lighting output circuit.

Possible Causes

- Circuit VLN04 (VT/GY) short to voltage
- Circuit VLN18 (BU/WH) short to voltage
- SJB

PINPOINT TEST E: THE CONTROL ILLUMINATION IS ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
E1 RETRIEVE THE RECORDED DTCs FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Check for recorded DTCs from the continuous and on-demand self-tests. • **Are any DTCs present?**	**Yes** If DTC B2A32 or B29B7 is retrieved, GO to E3 . **No** GO to E2 .
E2 CHECK THE EXTERIOR LIGHTING	
• Key in OFF position. • Observe the exterior lighting components. • **Are any exterior lighting components illuminated?**	**Yes** REFER to Section 417-01 . **No** GO to E3 .
E3 CHECK CIRCUITS VLN04 (VT/GY) (NAVIGATOR) AND VLN18 (BU/WH) (EXPEDITION) FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280g. • **Do any dimmable backlighted components continue to illuminate?**	**Yes** RUN the on-demand self-test (required to clear certain DTCs). CORRECT any unresolved DTCs. CLEAR all DTCs. TEST the system for normal operation **No** GO to E4 .
E4 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The instrument panel Illumination Does Not Dim

Refer to Wiring Diagrams Cell 71 , Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The smart junction box (SJB) monitors the input from the instrument panel dimmer switch by sending a voltage reference signal through circuit CLN27 (WH/BN) to the instrument panel dimmer switch. The return signal is sent through circuit RLN29 (WH/OG) back to the SJB. Based on the return signal intensity, the SJB sends a pulse-width modulated (PWM) voltage signal to the dimmable illumination sources. If the SJB detects a concern with the circuitry to the instrument panel dimmer switch, the SJB defaults the backlighting to a full intensity level.

DTC B2212 — sets when the SJB detects an out of range condition on the dimmer input switch circuit.

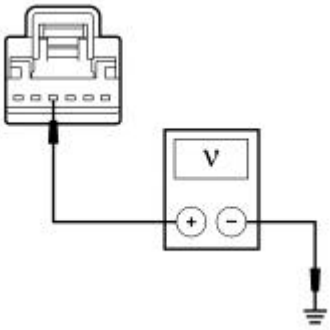
Possible Causes

- Circuit RLN29 (WH/OG) open, short to ground or voltage
- Circuit CLN27 (WH/BN) open, short to ground or voltage
- Instrument panel dimmer switch
- SJB

PINPOINT TEST F: THE INSTRUMENT PANEL ILLUMINATION DOES NOT DIM

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
F1 RETRIEVE THE RECORDED DTCs FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Check for recorded DTCs from the continuous and on-demand self-tests. • **Are any DTCs present?**	**Yes** If DTC B2212 is retrieved, GO to F3 . **No** GO to F2 .
F2 CHECK CIRCUIT RLN29 (WH/OG) FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280e. • Disconnect: Instrument Panel Dimmer Switch C2065. • Key in ON position. • Measure the voltage between the instrument panel dimmer switch C2065-4, circuit RLN29 (WH/OG), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to F3 .



N0026447

- **Is any voltage indicated?**

F3 CHECK CIRCUIT CLN27 (WH/BN) FOR A SHORT TO VOLTAGE	
• Measure the voltage between the instrument panel dimmer switch C2065-6, circuit CLN27 (WH/BN), harness side and ground.  N0026448 • **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to F4 .
F4 CHECK CIRCUIT RLN29 (WH/OG) FOR AN OPEN OR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the instrument panel dimmer switch C2065-4, circuit RLN29 (WH/OG), harness side and the SJB C2280e-33, circuit RLN29 (WH/OG), harness side; and between the instrument panel dimmer switch C2065-4, circuit RLN29 (WH/OG), harness side and ground.  N0053581 • **Is the resistance less than 5 ohms between the instrument panel dimmer switch and the SJB, and greater than 10,000 ohms between the instrument panel dimmer switch and ground?**	**Yes** GO to F5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F5 CHECK CIRCUIT CLN27 (WH/BN) FOR AN OPEN OR A SHORT TO GROUND	
• Measure the resistance between the instrument panel dimmer switch C2065-6, circuit CLN27 (WH/BN), harness side and the SJB C2280e-34, circuit CLN27 (WH/BN), harness side; and between the instrument panel dimmer switch C2065-6, circuit CLN27 (WH/BN), harness side and ground.	**Yes** GO to F6 . **No** REPAIR the circuit. CLEAR the DTCs.

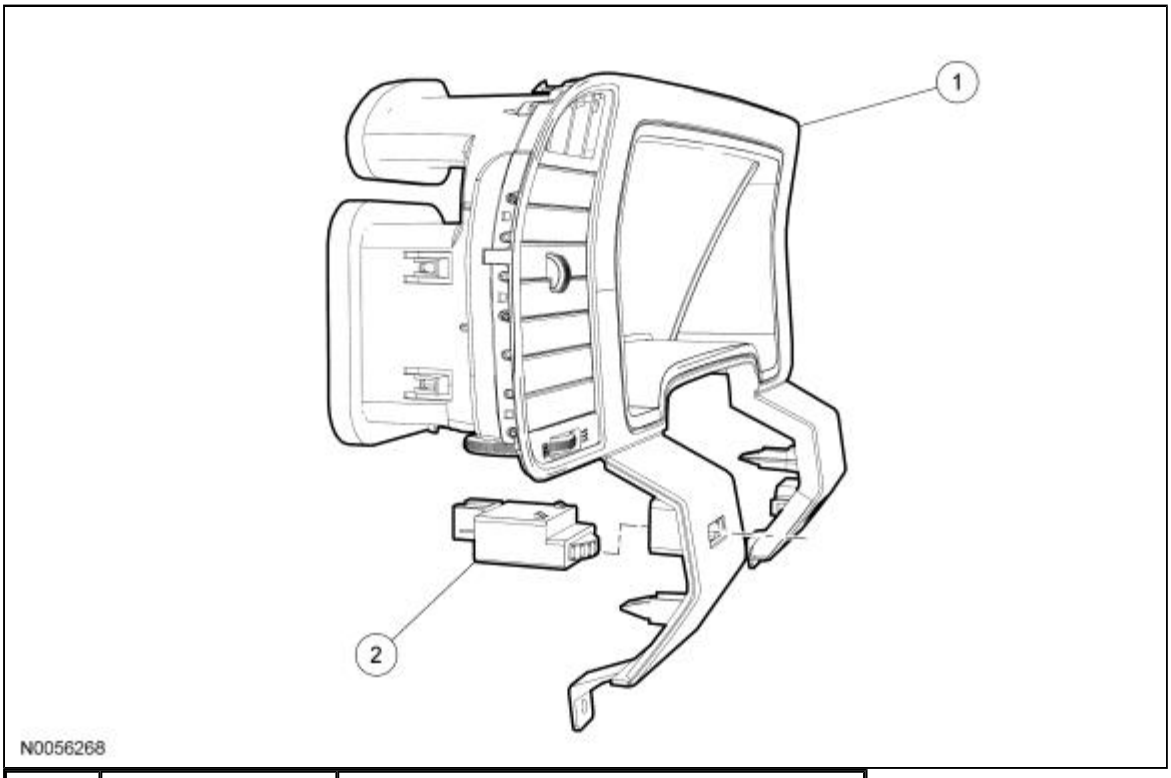
 • **Is the resistance less than 5 ohms between the instrument panel dimmer switch and the SJB, and greater than 10,000 ohms between the instrument panel dimmer switch and ground?**	REPEAT the self-test.
F6 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Carry out the component test for the instrument panel dimmer switch. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the instrument panel dimmer switch OK?**	**Yes** GO to F7 . **No** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation.
F7 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Instrument Panel Dimmer Switch

Printable View (138 KB)

NOTE: Navigator shown, Expedition similar.



Item	Part Number	Description
1	011201	Instrument panel finish panel
2	11691	Instrument panel dimmer switch

Removal and Installation

1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .
2. Press the tabs and remove the instrument panel dimmer switch.
3. To install, reverse the removal procedure.

Instrument Cluster

Printable View (69 KB)

The instrument cluster contains gauges, informational indicators, warning indicators and reconfigurable telltale indicators that are designed to provide the driver with system status and to alert the driver that certain conditions exist in the vehicle.

The instrument cluster uses a 2-line vacuum fluorescent display for display of basic informational items such as the odometer and trip odometer and for the message center display information.

All indicator lamps and warning indicator lamps are light-emitting diodes (LED), which are not replaceable.

Gauges

Gauges provide information to the driver indicating the status of systems. The systems that use gauges are as follows:

- Charging system
- Engine coolant temperature
- Engine oil pressure
- Engine rpm
- Fuel level
- Vehicle speed

Informational Indicators

Informational indicators provide information to the driver of conditions that exist in the vehicle. The indicators include:

- Turn signal
- High beam
- Speed control
- Transmission overdrive (O/D) off
- Anti-theft

Warning Indicators

Warning indicators provide information to the driver of conditions that could potentially cause personal injury or alter vehicle performance. The systems that use warning indicators include:

- Anti-lock brake system (ABS)
- Brake system (indicating low brake fluid, parking brake applied or other ABS brake system concerns)
- Safety belt buckle status
- Supplemental restraints system (SRS)
- Tire pressure monitoring system (TPMS)
- Powertrain

Reconfigurable Telltale Indicators

Reconfigurable telltale indicators illuminate in the message center and replace the typical indicator and

warning lamps and use the same iconic representation that were previously viewed as indicators or warning indicators in the instrument cluster. The systems that use reconfigurable telltale indicators include:

- Powertrain malfunction
  - Transmission (wrench)
  - Electronic throttle control (wrench)
  - 4x4 (wrench)
- Charging (battery)
- Engine oil pressure
- Engine over-temperature (failsafe)
- Low fuel
- Check fuel cap
- Low windshield washer fluid
- Traction control
- Four wheel drive (4WD)
  - 4x4 LOW
  - 4x4
  - 4x4 AUTO
- Door ajar

Hardwired Inputs

The hardwired inputs are provided from the following systems or components:

- Ambient temperature sensor (if equipped)
- Engine oil pressure switch
- Fuel level
- Low washer fluid switch
- Message center switch

Messaged Inputs

Module messaging has increased dramatically over time and is slowly becoming the standard for sending and receiving information required to operate the instrument cluster. For additional information and a complete list of module messages with the message origination sources, refer to Section 418-00 .

The status and information messages that the instrument cluster requires from other vehicle systems are as follows:

- Vehicle speed
- Engine temperature
- Engine rpm
- ABS
- 4WD
- Transmission range
- O/D status
- TPMS
- SRS
- Brake fluid level
- Parking brake status
- Engine emission system
- Electronic throttle control (ETC)

Instrument Cluster

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST1473-A	Instrument Gauge System Tester 014-R1063 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: When installing a new instrument cluster, it is necessary to upload the module configuration to the scan tool. Following installation of the instrument cluster, download the module configuration from the scan tool into the new instrument cluster. Refer to Section 418-01 to carry out programmable module installation (PMI). It is also necessary to carry out a parameter reset procedure whenever a new instrument cluster or powertrain control module (PCM) is installed. Refer to Section 419-01 .

The instrument cluster is a hybrid electronic cluster (HEC) that utilizes a microprocessor to control the gauge and indicator functions. Data is sent to the instrument cluster over the high speed controller area network (HS-CAN) bus lines and through hardwired circuitry from individual components. The instrument cluster uses each input to output an action to the gauges or indicators.

It is very important to understand:

- where the input originates.
- all the information necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- does the module which received the input control the output of the feature, or does it output a message over the communication network to another module.

- which module controls the output of the feature.

Instrument Cluster Gateway Function

The instrument cluster acts as a gateway module by receiving information in one format and transmitting it to other modules using another format. For example, the instrument cluster receives the vehicle speed data from the PCM over the high speed controller area network (HS-CAN), converts the data into a MS-CAN message and sends (gateways) the message to other network modules such as the electronic automatic temperature control (EATC), the tire pressure monitoring system (TPMS), the parking aid module, and the smart junction box (SJB). This enables network communication between modules that do not communicate using the same network (HS-CAN or the MS-CAN).

Instrument Cluster Messages

NOTE: Whenever a message is suspected as missing and confirmed by a missing message DTC (U-code), it is important to look for other symptoms that may also be present in the instrument cluster and throughout the vehicle. Once a DTC is set in the instrument cluster it may be helpful to review the complete message list available in Section 418-00 to see what other modules also rely on the same message and run the self-test for those modules. If the message is missing from other modules, the same DTC may also be set in those modules. Confirmation of missing messages common to multiple modules may indicate that the originating module is the source of the concern or the communication network may be experiencing some problems.

The instrument cluster uses input messages from other modules to control the gauges, informational indicators, warning indicators and reconfigurable telltale indicators over the communication networks. If a required message is missing or invalid for less than 5 seconds, the gauge or indicator that requires the message remains at the last commanded state based upon the last known good message. For example, if the O/D off status message is missing the for less than 5 seconds and the O/D off indicator was ON (O/D cancelled), the indicator remains in the ON state until the next good message is received. If the message remains missing or invalid for greater than 5 seconds, the instrument cluster sets a U-code DTC and the output becomes a default action for the indicator or gauge. Each indicator or gauge utilizes a different default strategy depending on the nature of the indication. Refer to the normal operation descriptions located before each individual pinpoint test for further description of the default action specific to each indicator or gauge. If the messaged input to the cluster returns at any time, the normal function of the gauge or indicator resumes.

Instrument Cluster Configuration

The instrument cluster contains items that are configurable. While some configurable items are customer preference items, most items are configured at the end of the line production and only available for configuration using As-Built data. Refer to Section 418-01 for additional information on As-Built data and module configuration. The configurable instrument cluster customer preference items are as follows:

- Overspeed warning (gulf coast country [GCC] only)
- Reverse warning chime
- Outside air units
- Gallon display type
- Metric display type
- Language
- Oil life warning threshold
- Autolocks
- Easy entry/exit
- Safety belt timer (belt minder)

Instrument Cluster Prove-Out

The instrument cluster and other vehicle modules carry out a display prove-out to verify that all module controlled warning/indicator lamps and monitored systems are functioning correctly within the instrument cluster. When the ignition switch is cycled to the ON position with the engine off, the indicators illuminate

to prove-out according the following table:

Indicator	Controlling Module	Indicator Type	Prove-Out Duration
Air bag	Restraints control module (RCM)	Warning	6 seconds
Anti-lock brake system (ABS)	Instrument cluster	Warning	3 seconds
Anti-theft indicator	Instrument cluster	Indicator	3 seconds
Brake	Instrument cluster	Warning	3 seconds
Malfunction indicator lamp (MIL)	Powertrain control module (PCM)	Warning	Engine startup
Safety belt	RCM	Warning	65 seconds if the safety belt is unbuckled, turns off when the safety belt is buckled
Speed control	PCM	Indicator	No prove-out
Tire pressure monitoring system (TPMS)	Instrument cluster	Warning	3 seconds
High beam	Instrument cluster	Indicator	No prove-out
Overdrive off	Transmission control module (TCM)	Indicator	No prove-out
RH/LH turn signals	Instrument cluster	Indicator	No prove-out

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Accessory drive belt
• Correct tire size
• Washer fluid level
• Engine oil level
• Engine coolant level
• Door adjustment
• Brake fluid level
• Fuel tank
• Fuel evaporative system
	• Smart junction box (SJB) fuse(s):

	  ▪ 29 (5A)
	• Circuitry
	• Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test:
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the instrument cluster and the smart junction box (SJB).

9. If the DTCs retrieved are related to the concern, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart or the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Instrument Cluster Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1202	Fuel Sender Circuit Open	Go To Pinpoint Test A .
B1204	Fuel Sender Circuit Short to Ground	Go To Pinpoint Test A .
B1213	Anti-Theft Number of Programmed Keys is Below Minimum	REFER to Section 419-01 .
B1255	Air Temperature External Sensor Circuit Open	REFER to Section 413-08 .
B1257	Air Temperature External Sensor Circuit Short to Ground	REFER to Section 413-08 .
B1317	Battery Voltage High	REPEAT the self-test. CLEAR the DTC. If DTC B1317 is retrieved, REFER to Section 414-00 .
B1318	Battery Voltage Low	REPEAT the self-test. CLEAR the DTC. If DTC B1318 is retrieved, REFER to Section 414-00 .
B1342	ECU is Faulted	REPAIR all other DTCs first. REPEAT the self-test. CLEAR the DTC. If DTC B1342 is retrieved, INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
B1868	Lamp Air Bag Warning	REPEAT the self-test. CLEAR the DTC. If DTC B1868 is

	Indicator Circuit Failure	retrieved, INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
B1915	Air Bag Driver Circuit Failure	REPEAT the self-test. CLEAR the DTC. If DTC B1915 is retrieved, INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
B2097	Compass Module Failure	REFER to Section 413-08 .
B2103	Antenna Not Connected	REFER to Section 419-01 .
B2141	NVM Configuration Failure	CARRY out a parameter reset. REFER to Section 419-01 . REPEAT the self-test. CLEAR the DTCs.
B2143	NVM Memory Failure	REPEAT the self-test. CLEAR the DTC. If DTC B2143 is retrieved, INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
B2431	Transponder Programming Failed	REFER to Section 419-01 .
B2477	Module Configuration Failure	RECONFIGURE the instrument cluster. REFER to Section 418-01 . REPEAT the self-test. CLEAR the DTCs.
B2627	Fuel Sender Circuit Open #2	DISREGARD the DTC. Not applicable to this vehicle.
B2628	Fuel Sender Circuit Short to Ground #2	DISREGARD the DTC. Not applicable to this vehicle.
B2879	Fuel Tank Jet Pump Fault	DISREGARD the DTC. Not applicable to this vehicle.
C1945	Park Switch Indicates Park with Vehicle Moving	Go To Pinpoint Test V .
C2784	RAM Checksum Failure	REPEAT the self-test. CLEAR the DTC. If DTC C2784 is retrieved, INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
U0100	Lost Communication With ECM/PCM	Go To Pinpoint Test AH .
U0101	Lost Communication With TCM	REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0101 returns, REFER to Section 418-00 to diagnose no communication with the TCM.
U0102	Lost Communication With Transfer Case Control Module	REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0102 returns, REFER to Section 418-00 to diagnose no communication with the four wheel drive (4WD) control module.
U0121	Lost Communication With Anti-Lock Brake System (ABS) Control Module	REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0121 returns, REFER to Section 418-00 to diagnose no communication with the ABS module.
U0122	Lost Communication With Vehicle Dynamics Control Module	REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0122 returns, REFER to Section 418-00 to diagnose no communication with the air suspension module.
U0140	Lost Communication With Body Control Module (GEM)	Go To Pinpoint Test AI .

U0151	Lost Communication With Restraints Control Module	REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0151 returns, REFER to Section 418-00 to diagnose no communication with the restraints control module (RCM).
U0159	Lost Communication With Parking Assist Control Module (PAM)	REFER to Section 413-13 .
U0164	Lost Communication With HVAC Control Module (EATC)	REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0164 returns, REFER to Section 418-00 to diagnose no communication with the climate control module.
U0208	Lost Communication With Seat Control Module (DSM)	REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0208 returns, REFER to Section 418-00 to diagnose no communication with the DSM.
U0230	Lost Communication With Rear Gate Module	REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0230 returns, REFER to Section 418-00 to diagnose no communication with the rear liftgate module.
U0244	Lost Communication With Running Board Control Module	REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0244 returns, REFER to Section 418-00 to diagnose no communication with the running board control module.
U2013	Compass Module is Not Responding	REFER to Section 413-08 .
U2023	Fault Received From External Node	INSTALL a new smart junction box (SJB) for tire pressure monitoring system (TPMS) concern module. REFER to Section 419-10 . TEST the system for normal operation.
U2050	No Application Present	REFER to Section 418-01 .
U2051	One or More Calibration Files Missing/Corrupt	REFER to Section 418-01 .
U2199	Invalid Engine Coolant Temperature Data	For temperature gauge concerns, Go To Pinpoint Test D . For over engine temperature reconfigurable telltale concerns, Go To Pinpoint Test Z .
U2472	Unexpected Ignition State	Go To Pinpoint Test AJ .
U2510	CAN-Invalid Data for Vehicle Security	REFER to Section 419-01 .
U2511	CAN-Data Mis-Match (received data does not match expected)	REFER to Section 419-01 .
U261A	CAN Data/Configuration Setup Mismatch	REFER to Section 418-01 .
All other DTCs	—	REFER to Section 419-10 .

Smart Junction Box (SJB) Trouble Code (DTC) Chart

DTC	Description	Action
B2479	Park Brake Switch Circuit Short to Ground	Go To Pinpoint Test M .
C1125	Brake Fluid Level Sensor Input Circuit Failure	Go To Pinpoint Test M .
All other DTCs	—	REFER to Section 419-10 .

Powertrain Control Module (PCM) Trouble Code (DTC) Chart

DTC	Description	Action
P0457	Evaporative Emission System Leak Detected (fuel cap loose/off)	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
All other DTCs	—	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Instrument Cluster Dealer Test Mode

To enter the instrument cluster dealer test mode with the engine off, press and hold the odometer reset button (base cluster) or the message center RESET button (message center cluster). Turn the ignition switch to the RUN position and hold until the display indicates ENGINEERING TEST MODE usually within 5-6 seconds. Press the reset button once to advance to each stage of the self-test.

To exit the instrument cluster dealer test mode, press and hold the odometer reset button (base cluster) or the message center RESET button (message center cluster) for approximately 5-8 seconds or turn the ignition to the OFF position.

Instrument Cluster Dealer Test Mode

Display-First Row	Display-Second Row	Description
GAUGE	TEST	Carries out gauge sweep of all gauges, then displays the present gauge values.
SEGMENTS	—	Illuminates all segments in the vacuum fluorescent (VF) display area.
TELLTALE	TEST	Illuminates all micro-controlled LEDs and automatically scrolls through the reconfigurable telltale indicators beginning with the highest priority telltale.
PART #	xxxx-xx	Returns all micro-controlled lamps and LEDs to normal operation. Displays alpha numeric part number.
ROM CHECKSUM	$xxxxx	Displays hexadecimal value for read-only memory (ROM) level (used when requesting assistance from the Hotline).
NVM LEVEL	$xxxxx	Displays hexadecimal ROM level and type as stored in non-volatile memory (NVM).
MANUFACTURE	xx-xx-xxxx	Displays final manufacturing test date.
B&A CONFIG	xx-xx-xx	Displays hexadecimal coding of second byte of module configuration (option content) settings
MANUF CONFIG	xxx-xxx-xxx	Displays hexadecimal coding of non-volatile memory (NVM) module configuration settings.
CONTINUOUS	$xxxx	Displays a 16-bit DTC in hexadecimal format. DTCs displayed are

DTC		those detected in continuous operation, not during self-test.
VEHICLE SPD	xxx.x MPH	Displays English speed value being input, speedometer indicates present filtered speed. VEHICLE SPD MIS MPH displayed if the input message is missing for greater than 5 seconds. VEHICLE SPD INV MPH displayed if the input message is invalid data.
VEHICLE SPD	xxx.x KM/H	Displays metric speed value being input, speedometer indicates present filtered speed. VEHICLE SPD MIS KMH displayed if the input message is missing for greater than 5 seconds. VEHICLE SPD INV KMH displayed if the input message is invalid data.
TACHOMETER	xxxx RPM	Displays the tachometer value being input to the instrument cluster. Tachometer indicates present rpm. TACHOMETER MIS RPM displayed if the input message is missing for greater than 5 seconds. TACHOMETER INV RPM displayed if the input message is invalid data.
FUEL LEVEL	xxx INST	Displays present fuel level analog/digital ratio input in decimal. 000-009 = short circuit. 10-254 = normal range. 255 = open circuit.
FUEL LVL %	STATUS xxx	Displays present weighted fuel level percent status in decimal. 000-254 = normal range. 255 = open/short detected for 33 seconds.
INSTANT DTE	xxx MILES	Displays instantaneous calculated distance to empty (DTE) in miles.
FUEL ON/OFF Z	xxx / xxx / xxx	Displays key-on, key-off, and zero speed fuel level values (average of instant).
F#S ON/OFF Z	xxx / xxx / xxx	Displays key-on, key-off, and zero speed fuel number of samples (average of instant).
COOLANT TEMP	xxx C	Displays last temperature gauge input value from high speed controller area network (HS-CAN), temperature gauge indicates present filtered temperature. COOLANT TEMP MIS C displayed if input message is missing for greater than 5 seconds.
ODOMETER	xxx COUNTS	Displays the odometer input received through HS-CAN in decimal. ODOMETER MIS COUNTS displayed if input message is missing for greater than 5 seconds.
TRIP A ODO	xxx.x MI	Displays the current mileage reading for the trip A odometer stored in random access memory (RAM).
TRIP B ODO	xxx.x MI	Displays the current mileage reading for the trip B odometer stored in RAM.
BATTERY	xx.x VOLTS	Displays current VBAT analog/digital reading in volts, compensated to yield voltage at the instrument cluster connector terminal pin.
PRKDETSW	x	Displays current state of the park detect switch position. G = ground O = open
DIMMING CMD	xx	Displays input status for smart junction box (SJB) dimming in decimal, 0-254. 0 = dimming off. 255 = invalid data.

		DIMMING CMD MIS = dimming command not received since MS-CAN initialization or dimming command missing for greater than 5 seconds.
DIMMING STEP	xx	Displays current dimming step in decimal. 0-21 for cluster with 21 step dimming or 0-25 for cluster with 25 step dimming. 0 = dimming off.
M/C SWITCH	xxx A/D CNTS	Displays current message center switch input analog/digital counts in decimal. Less than 20 = short to ground. 100-190 = INFO button pressed. 400-550 = move on to next. 600-750 = SETUP button pressed. Greater than 830 = no button pressed.
LWF OPS OAT	x / x / xxx	Displays the present low washer fluid, oil pressure switch and outside air temperature input analog/digital counts in decimal.
COMPASS	xx	Displays present compass input from the compass module in decimal.
LAST CHIME	SOUNDED xx	Displays either the last chime sounded by the cluster or the chime that is currently sounding, this excludes the trip reset button press chime.
GAUGE	TEST	Returns to the gauge sweep.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the instrument cluster	• Fuse(s) • Circuitry • Instrument cluster	• REFER to Section 418-00 .
• Incorrect fuel gauge indication	• Circuitry • Fuel level sensor • Fuel pump module • Fuel tank • Instrument cluster	• Go To Pinpoint Test A .
• Incorrect voltage gauge indication	• Charging system • Instrument cluster	• Go To Pinpoint Test B .
• Incorrect oil pressure gauge indication	• Circuitry • Engine oil pressure switch • Base engine concern • Instrument cluster	• Go To Pinpoint Test C .
• Incorrect temperature gauge	• Powertrain control module	• Go To Pinpoint Test D .

indication	(PCM) • Instrument cluster	
• The speedometer is inoperative	• Instrument cluster	• Go To Pinpoint Test E .
• The speedometer is inaccurate	• PCM • Instrument cluster	• Go To Pinpoint Test F .
• The odometer is inoperative	• Instrument cluster	• Go To Pinpoint Test G .
• The tachometer is inoperative	• Instrument cluster	• Go To Pinpoint Test H .
• Inaccurate tachometer indication	• PCM • Instrument cluster	• Go To Pinpoint Test I .
• The safety belt warning indicator is never/always on	• Restraints control module (RCM) • Instrument cluster	• Go To Pinpoint Test J .
• The anti-lock brake system (ABS) warning indicator is never/always on	• Instrument cluster • ABS module	• Go To Pinpoint Test K .
• The brake warning indicator is never on	• Circuitry • Master cylinder (brake fluid level switch) • Parking brake switch • Smart junction box (SJB) • Instrument cluster	• Go To Pinpoint Test L .
• The brake warning indicator is always on	• Circuitry • Brake fluid level switch • Parking brake switch • SJB • ABS module • Instrument cluster	• Go To Pinpoint Test M .
• Malfunction indicator lamp (MIL) is never/always on	• PCM • Instrument cluster	• Go To Pinpoint Test N .
• The air bag warning indicator is never/always on	• RCM • Instrument cluster	• Go To Pinpoint Test O .
• The high beam indicator is never/always on	• SJB • Instrument cluster	• Go To Pinpoint Test P .
• The LH/RH turn indicator is never/always on	• SJB • Instrument cluster	• Go To Pinpoint Test Q .
• The speed control	• PCM	• Go To Pinpoint Test R .

indicator is never/always on	• Instrument cluster	
• The tire pressure monitoring system (TPMS) warning indicator is never/always on	• TPMS concern • SJB • Instrument cluster	• Go To Pinpoint Test S .
• The O/D OFF indicator is never/always on	• Transmission control module (TCM) • Instrument cluster	• Go To Pinpoint Test T .
• The anti-theft indicator is never/always on	• Instrument cluster	• Go To Pinpoint Test U .
• The integrated circuit display is inoperative	• Instrument cluster	• VERIFY that the instrument cluster functions correctly and that the odometer, message center (if equipped), and reconfigurable telltale indicators are all inoperative and the display segments are all blank. ▪ If the instrument cluster is inoperative, Go To Pinpoint Test AG . ▪ If the odometer, message center, reconfigurable telltale indicators and the display segments are all blank, INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
• The PRNDL indicator is never/always on (if equipped)	• Circuitry • Brake shift interlock • Instrument cluster	• Go To Pinpoint Test V .
• The wrench reconfigurable telltale indicator is never/always on	• Electronic throttle concern • Transmission concern • Four wheel drive (4WD) concern (if equipped) • Instrument cluster	• Go To Pinpoint Test W .
• The charge reconfigurable telltale indicator is never/always on	• Charging system concern • Instrument cluster	• Go To Pinpoint Test X .
• The low oil pressure reconfigurable telltale indicator is never/always on	• Circuitry • Engine oil pressure switch • Base engine concern	• Go To Pinpoint Test Y .

	• Instrument cluster	
• The engine over temperature reconfigurable telltale indicator is never/always on	• PCM • Instrument cluster	• Go To Pinpoint Test Z .
• The low fuel reconfigurable telltale indicator is never/always on (if equipped)	• Instrument cluster	• Go To Pinpoint Test AA .
• The check fuel cap reconfigurable telltale indicator is never/always on	• PCM • Instrument cluster	• Go To Pinpoint Test AB .
• The low washer fluid reconfigurable telltale indicator is never/always on (if equipped)	• Circuitry • Washer fluid level switch • Instrument cluster	• Go To Pinpoint Test AC .
• The traction control reconfigurable telltale indicator is never/always on	• ABS module • Instrument cluster	• Go To Pinpoint Test AD .
• The 4x4, 4x4 LOW or 4x4 AUTO reconfigurable telltale indicator is never/always on	• 4WD control module • Instrument cluster	• Go To Pinpoint Test AE .
• The door ajar reconfigurable telltale indicator is never/always on	• SJB • Instrument cluster	• Go To Pinpoint Test AF .
• The instrument cluster is inoperative	• Fuse(s) • Circuitry • Instrument cluster	• Go To Pinpoint Test AG .

Pinpoint Tests

Pinpoint Test A: Incorrect Fuel Gauge Indication

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The fuel level sender receives a reference voltage signal from the instrument cluster through circuit VMC11 (YE/VT), and returns the fuel level signal to the instrument cluster through circuit RMC32 (GN/BU). As the fuel level changes, a float actuates a variable resistor that alters the fuel level signal voltage. The instrument cluster interprets this signal voltage and commands the fuel gauge to sweep to the correct level.

The instrument cluster uses 4 different operating modes to calculate the fuel level:

- Anti-slosh (default mode)
- Key OFF fueling
- Key ON fueling
- Recovery

After a fuel fill up, the time for the fuel gauge to move from empty (E) to full (F) ranges from 2 seconds to 55 minutes depending on which operating mode the fuel gauge is in.

The default fuel gauge mode is called the anti-slosh mode. To prevent fuel gauge changes from fuel slosh (gauge instability due to changes in fuel sender readings caused by fuel moving around in the tank), the fuel gauge takes approximately 55 minutes to go from empty (E) to full (F).

The key OFF fueling mode (2 seconds to read empty [E] to full [F]) requires 3 conditions be met:

- The key must be in the OFF position throughout the entire refueling of the vehicle.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.
- The instrument cluster must receive a valid key ON fuel sender reading within 1 second of the key being put into the RUN position. The key ON sample readings are considered valid if the fuel sender reading is between 15 ohms ± 2 ohms and 160 ohms ± 4 ohms. If these conditions are not met, the fuel gauge stays in the anti-slosh mode, which results in a slow to read full (F) event.

The key ON fueling mode (approximately 90 seconds to read empty [E] to full [F]) requires 3 conditions be met:

- The transmission is in PARK (P).
- The key is in the RUN position.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.

In key ON fueling mode, a 30-second timer activates after the transmission is put into the PARK (P) position. When the 30 second time has elapsed and at least 15% of the vehicle's fuel capacity has been added, the fuel gauge response time is 90 seconds to read from empty (E) to full (F). When the transmission is shifted out of PARK (P), the fuel gauge strategy reverts to the anti-slosh mode. The key ON fueling mode prevents slow to read full events from happening if the customer refuels the vehicle with the key in the RUN position.

Recovery mode is incorporated into the instrument cluster strategy to recover from a missing fuel level input during a refueling event. Missing fuel level inputs result from intermittent opens in the fuel sender or its circuits. Recovery mode (empty [E] to full [F] approximately 20 minutes) is initiated when the following 2 conditions are met:

- The instrument cluster is in the anti-slosh (default) mode.
- The actual fuel level in the tank is greater than what is being displayed by the fuel gauge.

DTC B1202 — is a continuous and on-demand DTC that sets if the instrument cluster detects an out of range input caused by an open or short to voltage on circuit VMC11 (YE/VT).

DTC B1204 — is a continuous and on-demand DTC that sets if the instrument cluster detects an out of range input caused by a short to ground on circuit VMC11 (YE/VT).

Possible Causes

- Circuit VMC11 (YE/VT) open, short to ground or voltage
- Circuit RMC32 (GN/BU) open or short to voltage
- Fuel level sensor
- Fuel pump module
- Fuel tank
- Instrument cluster

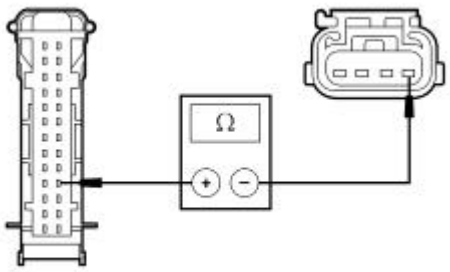
PINPOINT TEST A: INCORRECT FUEL GAUGE INDICATION

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: The fuel pump module may also be called the fuel sender or fuel tank unit.

Test Step	Result / Action to Take
A1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Key in OFF position. • Check for recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Are any instrument cluster DTCs recorded?**	**Yes** For DTC B1202, GO to A3 . For DTC B1204, GO to A7 . For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to A2 .
A2 CARRY OUT THE INSTRUMENT CLUSTER FUEL GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster fuel gauge FUEL active command and scroll the fuel gauge level at 0%, 20%, 80% and 100%. • **Does the fuel gauge display empty (E) with 0%, approximately 1/4 tank with 20%, 3/4 tank with 80% and full (F) with 100%?**	**Yes** GO to A9 . **No** GO to A12 .
A3 CHECK THE FUEL PUMP MODULE FOR AN OPEN	
• Disconnect: Fuel Pump Module C433. • Connect a fused (5A) jumper wire between the fuel pump module C433-2, circuit VMC11 (YE/VT), harness side and the fuel pump module C433-1, circuit RMC32 (GN/BU), harness side.  N0057125 • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Self-Test. • Wait one minute.	**Yes** REMOVE the jumper wire. GO to A11 . **No** REMOVE the jumper wire. GO to A4 .

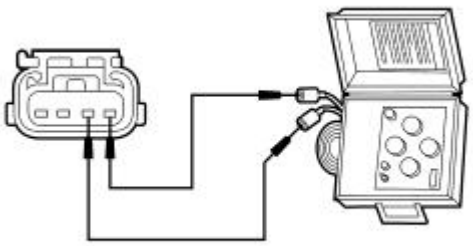
• **NOTE:** It may be normal for DTC B1202 to be present when carrying out this test step and should be ignored. • Clear the instrument cluster DTCs. Repeat the instrument cluster self-test • **Is DTC B1204 retrieved?**	
A4 CHECK CIRCUITS VMC11 (YE/VT) AND RMC32 (GN/BU) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Key in ON position. • Measure the voltage between the instrument cluster C220-16, circuit VMC11 (YE/VT), harness side and ground and between the instrument cluster C220-17, circuit RMC32 (GN/BU), harness side and ground.  N0057126 • **Is any voltage present?**	**Yes** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs. **No** GO to A5 .
A5 CHECK CIRCUIT VMC11 (YE/VT) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the instrument cluster C220-16, circuit VMC11 (YE/VT), harness side and the fuel pump module C433-2, circuit VMC11 (YE/VT), harness side.  N0057127 • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
A6 CHECK CIRCUIT RMC32 (GN/BU) FOR AN OPEN	
• Measure the resistance between the instrument cluster C220-17, circuit RMC32 (GN/BU), harness side and the fuel pump module C433-1, circuit RMC32 (GN/BU), harness side.	**Yes** GO to A12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.



N0057128

- **Is the resistance less than 5 ohms?**

A7 CHECK THE FUEL PUMP MODULE FOR A SHORT TO GROUND	
• Disconnect: Fuel Pump Module C433. • Wait one minute. • **NOTE:** It may be normal for DTC B1204 to be present when carrying out this test step and should be ignored. • Clear the instrument cluster DTCs. Repeat the instrument cluster self-test. • **Is DTC B1202 retrieved?**	**Yes** GO to A11 . **No** GO to A8 .
A8 CHECK CIRCUIT VMC11 (YE/VT) FOR A SHORT TO GROUND	
• Disconnect: Instrument Cluster C220. • Measure the resistance between the instrument cluster C220-16, circuit VMC11 (YE/VT), harness side and ground.  N0057129 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A9 CHECK THE FUEL GAUGE OPERATION	
NOTE: Since the instrument cluster may be in anti-slosh fuel indication mode, the PID values may not match the fuel gauge readings. The actual gauge indication should be disregarded during this test step. • Key in OFF position. • Disconnect: Fuel Pump Module C433. • Connect one lead of the instrument gauge tester to the fuel pump module C433-2, circuit VMC11 (YE/VT), harness side and the other lead of the instrument gauge tester to the fuel pump module C433-1, circuit RMC32 (GN/BU), harness side.	**Yes** DISCONNECT the instrument gauge tester. GO to A10 . **No** DISCONNECT the instrument gauge tester. GO to A12 .



N0057130

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PIDs.
- **NOTE:** It is extremely important to confirm the gauge tester settings with an ohmmeter to ensure that the gauge tester is in the correct position. Failure to follow this check may result in inaccurate test results.
- Monitor the fuel level PID Fuel with the gauge tester set at 180 ohms, 90 ohms, 55 ohms, 30 ohms and 0 ohms.
- **Does the PID begin at approximately 0%, move to 25%, 50%, 75% then 100%?**

A10 CHECK THE FUEL TANK	
• Check the fuel tank for any damage or deformation. • **Is the fuel tank OK?**	**Yes** GO to A11 . **No** VERIFY the fuel level sensor and the fuel pump module are OK. INSTALL a new fuel tank. REFER to Section 310-01 . CLEAR the DTCs. REPEAT the self-test.
A11 CHECK THE FUEL LEVEL SENSOR	
NOTE: The fuel level sensor resistance measures between 10 ohms ± 2 ohms at the upper stop position and 180 ohms ± 4 ohms at the lower stop position. • Remove the fuel pump module. Refer to Section 310-01 . • **NOTE:** Disconnect the fuel level sensor input wire from the fuel level sensor for this measurement. • Measure the resistance between the fuel level sensor input wire and the fuel level sensor ground while slowly moving the float arm between the upper and lower stop position.  A0030535 • **Does the resistance slowly increase from approximately 10 ohms at the upper stop to 180 ohms at the lower stop?**	**Yes** INSTALL a new fuel pump module. REFER to Section 310-01 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new fuel level sensor. CLEAR the DTCs. REPEAT the self-test.
A12 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test B: Incorrect Voltage Gauge Indication

Normal Operation

The voltage gauge displays the system battery voltage as measured at the instrument cluster run input, circuit SBP26 (YE/RD). The voltage input is filtered within the instrument cluster to eliminate minor fluctuations in the voltage measurement due to minor variations in the input voltage.

Possible Causes

- Charging system
- Instrument cluster

PINPOINT TEST B: INCORRECT VOLTAGE GAUGE INDICATION

Test Step	Result / Action to Take
B1 CHECK THE CHARGING SYSTEM OPERATION	
• Key in START position. • Check the charging system. Refer to Section 414-00 . • **Does the charging system operate correctly?**	**Yes** GO to B2 . **No** REPAIR the charging system. REFER to Section 414-00 .
B2 CARRY OUT THE INSTRUMENT CLUSTER VOLTMETER ACTIVE COMMAND USING THE SCAN TOOL	
NOTE: The voltmeter should be register in the mid-range with approximately 12-14 volts. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster voltmeter active command VOLT_GAUGE and scroll the voltmeter beginning at 0 volts then approximately 12.8 volts, and approximately 20 volts. • **Does the voltmeter start at L (low) when at 0 volts, move to the mid-range at 12.8 volts, and H (high) at 20 volts?**	**Yes** GO to B3 . **No** GO to B4 .
B3 CARRY OUT THE INSTRUMENT CLUSTER DEALER	

TEST MODE	
• Key in ON position. • Enter the instrument cluster dealer test mode. Scroll through the displays until BATTERY is displayed and note the voltage value. • **Does the self-test input voltage match the voltmeter indication?**	**Yes** The system is operating correctly at this time. **No** GO to B4 .
B4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: Incorrect Oil Pressure Gauge Indication

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The instrument cluster is hardwired to the normally open engine oil pressure switch through circuit CMC24 (GY). The instrument cluster provides a reference voltage to the engine oil pressure switch when the ignition key is in the RUN position. When there is low or no oil pressure, the engine oil pressure switch remains open. The instrument cluster detects no change in the reference voltage and the oil pressure gauge remains in low oil pressure of the gauge. When the engine is running with sufficient oil pressure the engine oil pressure switch closes, providing a ground, which pulls the reference voltage from the instrument cluster low, the instrument cluster commands the oil pressure gauge to the normal oil pressure area of the gauge.

Possible Causes

- Circuit CMC24 (GY) open, short to ground or voltage
- Engine oil pressure switch
- Base engine concern
- Instrument cluster

PINPOINT TEST C: INCORRECT OIL PRESSURE GAUGE INDICATION

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
C1 CARRY OUT THE INSTRUMENT CLUSTER OIL PRESSURE GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command.	**Yes** If the oil pressure gauge always reads in the normal

• Select the instrument cluster oil pressure gauge active command OIL_POS on and off to sweep the gauge. • **Does the engine oil pressure gauge sweep to the high (H) when commanded on and return to low (L) when commanded off?**	range, GO to C2 . If the oil pressure gauge always reads low (L) and does not register any oil pressure, GO to C4 . **No** GO to C8 .
C2 CHECK FOR A STUCK CLOSED ENGINE OIL PRESSURE SWITCH	
• Key in OFF position. • Disconnect: Engine Oil Pressure Switch C103. • Key in ON position. • Observe the engine oil pressure gauge. • **Does the engine oil pressure gauge indicate low (L) oil pressure?**	**Yes** INSTALL a new engine oil pressure switch. REFER to Section 303-01 . TEST the system for normal operation. **No** GO to C3 .
C3 CHECK CIRCUIT CMC24 (GY) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Measure the resistance between the instrument cluster C220-18, circuit CMC24 (GY), harness side and ground.  N0057131 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C8 . **No** REPAIR the circuit. TEST the system for normal operation.
C4 CHECK FOR A STUCK OPEN ENGINE OIL PRESSURE SWITCH	
• Key in OFF position. • Disconnect: Engine Oil Pressure Switch C103. • Connect a fused (5A) jumper wire between the engine oil pressure switch, C103-1, circuit CMC24 (GY), harness side and ground.  N0002760 • Key in ON position. • Observe the engine oil pressure gauge. • **Does the engine oil pressure gauge indicate normal oil pressure?**	**Yes** REMOVE the jumper wire. GO to C7 . **No** REMOVE the jumper wire. GO to C5 .

C5 CHECK CIRCUIT CMC24 (GY) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Key in ON position. • Measure the voltage between the instrument cluster C220-18, circuit CMC24 (GY), harness side and ground.  N0057217 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to C6 .
C6 CHECK CIRCUIT CMC24 (GY) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the instrument cluster C220-18, circuit CMC24 (GY), harness side and the engine oil pressure switch C103-1, circuit CMC24 (GY), harness side.  N0057132 • **Is the resistance less than 5 ohms?**	**Yes** GO to C8 . **No** REPAIR the circuit. TEST the system for normal operation.
C7 CHECK THE OIL PRESSURE	
• Carry out the engine oil pressure test. Refer to Section 303-00 . • **Is the oil pressure within specification?**	**Yes** INSTALL a new engine oil pressure switch. REFER to Section 303-01 . TEST the system for normal operation. **No** REFER to Section 303-00 to continue diagnosis of the engine oil pressure.
C8 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating

	correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test D: Incorrect Temperature Gauge Indication

Normal Operation

The powertrain control module (PCM) receives the engine coolant temperature status through hardwired circuitry to the cylinder head temperature (CHT) sensor. The PCM sends the engine coolant temperature data to the instrument cluster over the high speed controller area network (HS-CAN) communication bus. The engine temperature data received from the PCM is filtered by the cluster to reduce gauge fluctuations. There are two separate strategies that the PCM and instrument cluster use to control the temperature gauge. The first strategy is basic engine temperature, which provides gradual changes in the temperature gauge based upon changing engine temperature. The second strategy is the failsafe cooling mode, which commands the gauge to the hot (H) stop position. If the instrument cluster does not receive the engine temperature status or if the temperature data is deemed invalid by the instrument cluster for more than 5 seconds, the message is considered missing and the instrument cluster sets DTC U0100 and defaults the temperature gauge to the cold (C) stop.

DTC U2199 — is a continuous DTC that sets if the instrument cluster receives invalid engine temperature data from the PCM. The instrument cluster defaults the temperature gauge to the cold (C) stop.

Possible Causes

- PCM
- Instrument cluster

PINPOINT TEST D: INCORRECT TEMPERATURE GAUGE INDICATION

Test Step	Result / Action to Take
D1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH . **No** GO to D2 .
D2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS	
• Check for recorded PCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to D3 .
D3 CARRY OUT THE INSTRUMENT CLUSTER TEMPERATURE GAUGE ACTIVE COMMAND USING THE SCAN TOOL	

• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster temperature gauge active command ENGCOOLNT and scroll in 3 increments 0°C (0° F), 105°C (221°F), and 134°C (273°F). • **Does the temperature gauge start at cold (C) when at 0° C (0°F), move to approximately half at 105°C (221°F), and full hot (H) at 134°C (273°F)?**	**Yes** GO to D4 . **No** GO to D5 .
D4 CARRY OUT THE INSTRUMENT CLUSTER DEALER TEST MODE	
• Key in START position. • Enter the instrument cluster dealer test mode with the key on and the engine running (KOER) by pressing and holding the odometer/trip odometer reset button (base cluster) or the message center switch RESET button (message center cluster) while starting the engine. Scroll through the displays until COOLANT TEMP is displayed and record the temperature value at different engine temperatures. • **Do the self-test temperature input values match the temperature gauge indication?**	**Yes** GO to D6 . **No** GO to D5 .
D5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

D6 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: The Speedometer Is Inoperative

Normal Operation

The instrument cluster receives the vehicle speed sensor (VSS) signal from the powertrain control module (PCM) over the controller area network (CAN) communication bus. The instrument cluster monitors the VSS input from the PCM and commands the speedometer with a corresponding movement of the pointer. If the instrument cluster does not receive the VSS data, or the data is deemed invalid by

the instrument cluster for more than 5 seconds, the message is considered missing and the instrument cluster sets DTC U0100 and defaults the speedometer to 0 km/h (0 mph).

Possible Causes

- Instrument cluster

PINPOINT TEST E: THE SPEEDOMETER IS INOPERATIVE

Test Step	Result / Action to Take
E1 CARRY OUT THE INSTRUMENT CLUSTER SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster speedometer active command SPD_IND and sweep the gauge in 10% increments. • **Does the speedometer start at 0 km/h (0 mph) and increase by 19.3 km/h (12 mph) for each 10% increase commanded?**	**Yes** GO to E2 . **No** GO to E3 .
E2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH . **No** GO to E3 .
E3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: The Speedometer Is Inaccurate

Normal Operation

The instrument cluster receives the vehicle speed sensor (VSS) signal from the powertrain control module (PCM) over the controller area network (CAN) communication bus. The instrument cluster monitors the VSS input from the PCM and commands the speedometer with a corresponding movement of the pointer. If the instrument cluster does not receive the VSS data, or the data is deemed invalid by the instrument cluster for more than 5 seconds, the message is considered missing and the instrument cluster sets DTC U0100 and defaults the speedometer to 0 km/h (0 mph).

Possible Causes

- PCM
- Instrument cluster

PINPOINT TEST F: THE SPEEDOMETER IS INACCURATE

Test Step	Result / Action to Take
F1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS	
• Check for recorded PCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to F2.
F2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH. **No** GO to F3.
F3 OBSERVE THE SPEEDOMETER POINTER POSITION	
• Key in START position. • Observe the speedometer while driving the vehicle at various speeds and stopping frequently. • **Does the speedometer begin at 0 km/h (0 mph) and fully return to the 0 km/h (0 mph) position when the vehicle is stopped?**	**Yes** GO to F4. **No** GO to F7.
F4 CARRY OUT THE INSTRUMENT CLUSTER SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster speedometer active command SPD_IND and scroll in 10% increments. • **Does the speedometer start at 0 km/h (0 mph) and increase by 19.3 km/h (12 mph) for each 10% increase commanded?**	**Yes** GO to F5. **No** GO to F7.
F5 CARRY OUT THE INSTRUMENT CLUSTER DEALER TEST MODE	
NOTE: This step may require the use of an assistant to monitor and record the instrument cluster self-test and the speedometer readings. • Key in START position. • Enter the instrument cluster dealer test mode with the key on and the engine running (KOER) by pressing and holding the odometer/trip odometer reset button (base cluster) or the message center switch RESET button (message center cluster) while starting the engine. Scroll through the displays until VEHICLE SPD is displayed.	**Yes** GO to F6. **No** GO to F7.

• Drive the vehicle at varying speeds. • Monitor the vehicle speed input with the speedometer reading. • **Do the self-test vehicle speed input values match the speedometer indication?**	
F6 CHECK THE PCM VSS SIGNAL INPUT	
NOTE: This step may require the use of an assistant to monitor and record the instrument cluster dealer test mode and the speedometer readings. • Key in START position. • Enter the following diagnostic mode on the diagnostic tool: PCM PIDs. • Monitor the PCM vehicle speed sensor PID VSS while driving the vehicle at varying speeds. • **Does the PCM PID match the speedometer indication?**	**Yes** The system is operating correctly at this time. VERIFY that the VSS signal to the PCM is correct by comparing vehicle speeds with a good known vehicle. **No** GO to F8 .
F7 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

F8 CHECK FOR CORRECT PCM OPERATION	

• Disconnect the all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: The Odometer Is Inoperative

Normal Operation

The odometer is displayed in the message center vacuum fluorescent display. The instrument cluster receives the odometer rolling count data from the powertrain control module (PCM) over the high speed controller area network (HS-CAN) communication bus and displays the data in the odometer display area of the message center. If the instrument cluster does not receive the vehicle rolling count message from the PCM or the rolling count data is deemed invalid by the instrument cluster, the instrument cluster sets DTC U0100.

NOTE: If DTC U0100 is set in the instrument cluster, other observable symptoms may be an inoperative speedometer, tachometer and temperature gauge.

Possible Causes

- Instrument cluster

PINPOINT TEST G: THE ODOMETER IS INOPERATIVE

Test Step	Result / Action to Take
G1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH . **No** GO to G2 .
G2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: The Tachometer Is Inoperative

Normal Operation

The instrument cluster receives the tachometer data from the powertrain control module (PCM) over the high speed controller area network (HS-CAN) communication bus and commands the tachometer according to the data. If the instrument cluster does not receive the engine rpm data or the data received is deemed invalid by the instrument cluster for more the 5 seconds, the instrument cluster sets DTC U0100.

NOTE: If DTC U0100 is set in the instrument cluster, other observable symptoms may be an inoperative speedometer, tachometer and temperature gauge.

Possible Causes

- Instrument cluster

PINPOINT TEST H: THE TACHOMETER IS INOPERATIVE

Test Step	Result / Action to Take
H1 CARRY OUT THE INSTRUMENT CLUSTER TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the	**Yes** GO to H2 .

diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster tachometer active command TACH_IND and sweep the gauge in 10% increments. • **Does the tachometer start at 0 rpm and increase by 700 rpm for each 10% increase commanded?**	**No** GO to H3 .
H2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH . **No** GO to H3 .
H3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: Inaccurate Tachometer Indication

Normal Operation

The instrument cluster receives the tachometer data from the powertrain control module (PCM) over the high speed controller area network (HS-CAN) communication bus and commands the tachometer according to the data. If the instrument cluster does not receive the engine rpm data or the data received is deemed invalid by the instrument cluster for more the 5 seconds, the instrument cluster sets DTC U0100.

NOTE: If DTC U0100 is set in the instrument cluster, other observable symptoms may be an inoperative speedometer, tachometer and temperature gauge.

Possible Causes

- PCM
- Instrument cluster

PINPOINT TEST I: INACCURATE TACHOMETER INDICATION

Test Step	Result / Action to Take
I1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test.	**Yes** Go To Pinpoint Test AH .

• **Is DTC U0100 recorded?**	**No** GO to I2 .
I2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS	
• Check for recorded PCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to I3 .
I3 OBSERVE THE TACHOMETER POINTER POSITION	
• Key in START position. • Observe the tachometer while increasing the engine speed between 0 and 2,000 rpm. • Key in OFF position. • **Does the tachometer begin at 0 rpm, increase with engine rpm then return to 0 rpm with the engine off?**	**Yes** GO to I4 . **No** GO to I7 .
I4 CARRY OUT THE INSTRUMENT CLUSTER TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster tachometer active command TACH_IND and scroll in 10% increments. • **Does the tachometer start at 0 rpm and increase by 700 rpm for each 10% increase commanded?**	**Yes** GO to I5 . **No** GO to I7 .
I5 CARRY OUT THE INSTRUMENT CLUSTER DEALER TEST MODE	
• Key in START position. • Enter the instrument cluster dealer test mode with the key on and the engine running (KOER) by pressing and holding the odometer/trip odometer reset button (base cluster) or the message center switch RESET button (message center cluster) while starting the engine. Scroll through the displays until TACHOMETER is displayed. • Operate the engine at 1,000 rpm, 1,500 rpm and 2,000 rpm. • Monitor and compare the engine rpm input with the tachometer reading. • **Do the self-test engine rpm input values match the tachometer indication?**	**Yes** GO to I6 . **No** GO to I7 .
I6 CHECK THE PCM RPM SIGNAL INPUT	
• Key in START position. • Enter the following diagnostic mode on the diagnostic tool: PCM PIDs. • Monitor the PCM vehicle speed sensor PID RPM while operating the engine at 1,000 rpm, 1,500 rpm and 2,000 rpm. • **Does the PCM PID match the tachometer indication?**	**Yes** The system is operating correctly at this time. **No** GO to I8 .
I7 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

I8 CHECK FOR CORRECT PCM OPERATION	

• Disconnect the all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: The Safety Belt Warning Indicator Is Never/Always On

Normal Operation

The restraints control module (RCM) monitors the safety belt position through the safety belt buckle switch. The RCM provides the safety belt buckle status to the instrument cluster over the high speed controller area network (HS-CAN) communication bus. If the instrument cluster does not receive the safety belt buckle switch status from the RCM or the message is deemed invalid by the instrument cluster for greater than 5 seconds, the instrument cluster sets DTC U0151 and defaults the safety belt warning indicator off.

Possible Causes

- RCM
- Instrument cluster

PINPOINT TEST J: THE SAFETY BELT WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
J1 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster safety belt warning indicator active command SBLT_LMP on and off. • **Does the safety belt warning indicator turn on when commanded on and turn**	**Yes** GO to J2 . **No** GO to J4 .

off when commanded off?	
J2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0151 recorded?**	**Yes** REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0151 returns, REFER to Section 418-00 to diagnose no communication with the RCM. For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to J3 .
J3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND RCM SELF-TESTS	
• Check for recorded RCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to Section 501-20B . **No** GO to J5 .
J4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

J5 CHECK FOR CORRECT RCM OPERATION	

• Disconnect all the RCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a RCM. REFER to Section 501-20B . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test K: The Anti-Lock Brake System (ABS) Warning Indicator Is Never/Always On

Normal Operation

The ABS module provides the ABS status to the instrument cluster over the high speed controller area network (HS-CAN) communication bus. If a fault condition exists in the ABS, the ABS module sends the instrument cluster a command to either flash the ABS warning indicator or to turn it on. If the instrument cluster does not receive the ABS status message from the ABS module or the message is deemed invalid by the instrument cluster for greater than 5 seconds, the instrument cluster sets DTC U0121 and defaults the ABS warning indicator on.

Possible Causes

- ABS module
- Instrument cluster

PINPOINT TEST K: THE ANTI-LOCK BRAKE SYSTEM (ABS) WARNING INDICATOR IS ALWAYS ON

Test Step	Result / Action to Take
K1 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster ABS warning indicator active command ABS on then off. Observe the ABS warning indicator. • **Does the ABS warning indicator turn off when commanded off?**	**Yes** GO to K2 . **No** GO to K4 .
K2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0121 recorded?**	**Yes** REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0121 returns, REFER to Section 418-00 to diagnose no communication with the ABS module. For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to K3 .
K3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND ABS MODULE SELF-TESTS	
• Check for recorded ABS module DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** GO to K5 .
K4 CHECK FOR CORRECT INSTRUMENT	

CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

K5 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect all the ABS module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the ABS module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a ABS module. REFER to Section 206-09 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test L: The Brake Warning Indicator Is Never On

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The instrument cluster uses 3 basic messaged inputs to control the brake warning indicator. The first 2 are the parking brake switch and brake fluid level switch. The third is for the electronic brake distribution, controlled by the anti-lock brake system (ABS). The parking brake switch and the brake fluid level switch status are sent from the smart junction box (SJB) over the medium speed controller area network (MS-CAN) communication bus. The electronic brake distribution message is sent from the ABS module over the HS-CAN communication bus lines. The parking brake switch is hardwired to the SJB through circuit CCB01 (VT/BN). The brake fluid level switch is hardwired to the SJB through signal circuit CMC19 (GY/VT) and return circuit RMC19 (YE/GY). When the parking brake is applied, the parking brake switch closes to ground through circuit GD143 (BK/VT), providing a ground to the SJB and pulling circuit CCB01 (VT/BN) low. When a low brake fluid level condition exists, the low brake fluid level switch closes to ground through circuit GD120 (BK/GN), pulling circuit CMC19 (GY/VT) low. The SJB monitors the parking brake and low brake fluid level inputs and sends the instrument cluster a message to turn on the brake warning indicator when the parking brake is applied or the brake fluid is low. When the ABS module detects a base brake system concern or other ABS related concerns that affect the electronic brake distribution function, the ABS module sends a message to the instrument cluster to illuminate both the ABS warning indicator and the brake warning indicator.

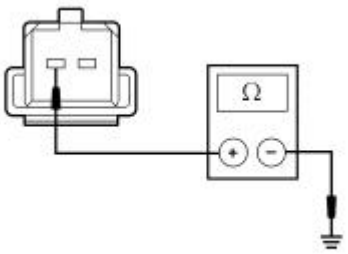
Possible Causes

- Circuit CCB01 (VT/OG) open
- Circuit GD120 (BK/GN) open
- Circuit GD143 (BK/VT) open
- Master cylinder (brake fluid level switch)
- Brake fluid level switch
- SJB
- Instrument cluster

PINPOINT TEST L: THE BRAKE WARNING INDICATOR IS NEVER ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
L1 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster brake warning indicator active command BRK_LAMP on. Observe the brake warning indicator. • **Does the brake warning indicator illuminate when commanded on?**	**Yes** GO to L2 . **No** GO to L9 .
L2 CHECK THE PARKING BRAKE SWITCH PID	
• Enter the following diagnostic mode on the diagnostic tool: SJB PID. • Monitor the SJB PID PRK_BRAKE while applying the parking brake. • **Does the PID agree with the parking brake position?**	**Yes** GO to L6 . **No** GO to L3 .
L3 CHECK THE PARKING BRAKE SWITCH	
• Disconnect: Parking Brake Switch C2015. • Connect a fused (5A) jumper wire between the parking brake switch C2015-2, circuit GD143 (BK/VT), harness side and the parking brake switch C2015-1, circuit CCB01 (VT/BN), harness side.  N0002774 • **Does the brake warning indicator illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new parking brake switch. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to L4 .
L4 CHECK CIRCUIT GD143 (BK/VT) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the parking brake switch C2015-2, circuit GD143 (BK/VT), harness side and ground.	**Yes** GO to L5 . **No** REPAIR the circuit. TEST the system for normal operation.



N0057133

- **Is the resistance less than 5 ohms?**

L5 CHECK CIRCUIT CCB01 (VT/BN) FOR AN OPEN	
• Key in OFF position. • Disconnect: SJB C2280D. • Measure the resistance between the SJB C2280D-1, circuit CCB01 (VT/BN), harness side and the parking brake switch C2015-1, circuit CCB01 (VT/BN), harness side and ground.  N0060120 • **Is the resistance less than 5 ohms?**	**Yes** GO to L10 . **No** REPAIR the circuit. TEST the system for normal operation.
L6 CHECK THE BRAKE FLUID LEVEL SWITCH OPERATION	
• Key in OFF position. • Disconnect: Brake Fluid Level Switch C124. • Key in ON position. • **Does the brake warning indicator illuminate?**	**Yes** GO to L7 . **No** GO to L10 .
L7 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the brake fluid level switch C124-1, circuit GD120 (BK/GN), harness side and ground.  N0027596 • **Is the resistance less than 5 ohms?**	**Yes** GO to L8 . **No** REPAIR the circuit. TEST the system for normal operation.
L8 CHECK THE BRAKE FLUID LEVEL SWITCH	
• Key in ON position. • **CAUTION: Do not spill brake fluid onto painted or plastic surfaces. If spilled, wipe up immediately before**	**Yes** GO to L10 . **No**

damage to the painted or plastic surface occurs. • Remove the brake fluid from the reservoir to allow the brake fluid level switch to fall to the bottom of the reservoir. • Measure the resistance between the brake fluid level switch C124 pin 3, component side and the brake fluid level switch C124 pin 1, component side.  N0057135 • **Does the resistance less than 5 ohms?**	INSTALL a new master cylinder. REFER to Section 206-06 . TEST the system for normal operation.
L9 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

L10 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test M: The Brake Warning Indicator Is Always On

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The instrument cluster uses 3 basic messaged inputs to control the brake warning indicator. The first 2

are the parking brake switch and brake fluid level switch. The third is for the electronic brake distribution, controlled by the anti-lock brake system (ABS). The parking brake switch and the brake fluid level switch status are sent from the smart junction box (SJB) over the medium speed controller area network (MS-CAN) communication bus. The electronic brake distribution message is sent from the ABS module over the HS-CAN communication bus lines. The parking brake switch is hardwired to the SJB through circuit CCB01 (VT/BN). The brake fluid level switch is hardwired to the SJB through signal circuit CMC19 (GY/VT) and return circuit RMC19 (YE/GY). When the parking brake is applied, the parking brake switch closes to ground through circuit GD143 (BK/VT), providing a ground to the SJB and pulling circuit CCB01 (VT/BN) low. When a low brake fluid level condition exists, the low brake fluid level switch closes to ground through circuit GD120 (BK/GN), pulling circuit CMC19 (GY/VT) low. The SJB monitors the parking brake and low brake fluid level inputs and sends the instrument cluster a message to turn on the brake warning indicator when the parking brake is applied or the brake fluid is low. When the ABS module detects a base brake system concern or other ABS related concerns that affect the electronic brake distribution function, the ABS module sends a message to the instrument cluster to illuminate both the ABS warning indicator and the brake warning indicator.

If the brake fluid level or parking brake status messages are missing or deemed invalid by the instrument cluster for more than 5 seconds, the instrument cluster sets DTC U0140 and defaults the brake warning indicator on. If the electronic brake distribution message is missing or invalid, the instrument cluster sets DTC U0121 and defaults the brake warning indicator on. If the instrument cluster does not receive the ABS status message from the ABS module or the message is deemed invalid by the instrument cluster for greater than 5 seconds, the instrument cluster sets DTC U0121 and defaults the ABS warning indicator on.

DTC B2479 — sets on-demand if the SJB detects a short to ground on the parking brake input circuit CCB01 (VT/BN) during the module self-test.

DTC C1125 — is a continuous and on-demand DTC that sets in the SJB if an open is detected on the brake fluid level input circuit CMC19 (GY/VT) or return circuit RMC19 (YE/GY) or if a short to ground is detected on the input circuit CMC19 (GY/VT).

NOTE: If DTC U0140 is set in the instrument cluster, other symptoms may also be present such as tire pressure monitoring system (TPMS), instrument panel backlighting, and door ajar indication.

NOTE: Both the ABS warning indicator and the brake warning indicator illuminate if the input to turn on the brake warning indicator is received from the anti-lock brake system (ABS) module.

Possible Causes

- Circuit CCB01 (VT/BN) open or short to ground
- Circuit CMC19 (GY/VT) open or short to ground
- Circuit RMC19 (YE/GY) open
- Parking brake switch
- Master cylinder (brake fluid level switch)
- ABS module
- SJB
- Instrument cluster

PINPOINT TEST M: THE BRAKE WARNING INDICATOR IS ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
M1 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS INSTRUMENT CLUSTER SELF-TEST	

• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0140 recorded?**	**Yes** Go To Pinpoint Test AI . **No** If DTC U0121 is recorded, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. GO to M2 .
M2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND ABS MODULE SELF-TESTS	
• Check for recorded ABS module DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** GO to M3 .
M3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SJB SELF-TESTS	
• Check for recorded SJB DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** If DTC B2479 is retrieved, GO to M5 . If DTC C1125 is retrieved, GO to M8 . **No** GO to M4 .
M4 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster brake warning lamp active command on and off. Observe the brake warning indicator. • **Does the brake warning indicator turn off when commanded off?**	**Yes** GO to M13 . **No** GO to M11 .
M5 CHECK THE PARKING BRAKE SWITCH PID	
• Enter the following diagnostic mode on the diagnostic tool: SJB PID. • Monitor the SJB PID PRK_BRAKE while applying and releasing the parking brake. • **Does the PID agree with the parking brake position?**	**Yes** GO to M12 . **No** GO to M6 .
M6 CHECK THE PARKING BRAKE SWITCH	
• Disconnect: Parking Brake Switch C2015. • Observe the brake warning indicator. • **Does the brake warning indicator continue to illuminate?**	**Yes** GO to M7 . **No** INSTALL a new parking brake switch. REPEAT the self-test. CLEAR

	the DTCs.
M7 CHECK CIRCUIT CCB01 (VT/BN) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: SJB C2280D. • Measure the resistance between the SJB C2280D-1, circuit CCB01 (VT/BN), harness side and ground.  N0060121 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M12 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.
M8 CHECK THE ANTI-LOCK BRAKE SYSTEM (ABS) MODULE OPERATION	
• Key in OFF position. • Disconnect: Brake Fluid Level Switch C124. • Connect a fused (5A) jumper wire between the brake fluid level switch C124-3, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-2, circuit RMC19 (YE/GY), harness side.  N0002771 • Key in ON position. • **Does the brake warning indicator turn off?**	**Yes** INSTALL a new master cylinder. REFER to Section 206-06 . REPEAT the self-test. CLEAR the DTCs. **No** REMOVE the jumper wire. GO to M9 .
M9 CHECK CIRCUITS CMC19 (GY/VT) AND RMC19 (YE/GY) FOR AN OPEN	
• Key in OFF position. • Disconnect: SJB C2280B. • Measure the resistance between the SJB C2280B-9, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-3, circuit CMC19 (GY/VT), harness side; and between the SJB C2280B-22, circuit RMC19 (YE/GY), harness side and the brake fluid level switch C124-2, circuit RMC19 (YE/GY), harness side.  N0057137	**Yes** GO to M10 . **No** REPAIR the circuit in question. TEST the system for normal operation.

• **Are the resistances less than 5 ohms?**	
M10 CHECK CIRCUITS CMC19 (GY/VT) AND RMC19 (YE/GY) FOR A SHORT TO GROUND	
• Measure the resistance between the SJB C2280B-9, circuit CMC19 (GY/VT), harness side and ground; and between the SJB C2280B-22, circuit RMC19 (YE/GY), harness side and ground.  N0060122 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to M12 . **No** REPAIR the circuit in question. TEST the system for normal operation.
M11 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify that the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

M12 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify that the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

M13 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect the ABS module connector. • Check for: ▪ corrosion	**Yes** INSTALL a new ABS module.

▪ damaged pins ▪ pushed-out pins • Connect the ABS module connector and make sure it seats correctly. • Operate the system and verify that the concern is still present. • **Is the concern still present?**	REFER to Section 206-09 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test N: The Malfunction Indicator Lamp (MIL) Is Never/Always On

Normal Operation

The malfunction indicator lamp (MIL) is illuminated when a mis-fire condition exists or an emission-related concern is detected by the powertrain control module (PCM). The instrument cluster receives the MIL data from the PCM over the high speed controller area network (HS-CAN) communication bus. If an emissions concern exists, the PCM sets a DTC and sends a message to the instrument cluster to illuminate the MIL. If a mis-fire condition exists, the PCM sets a DTC and sends the instrument cluster a message to flash the MIL. If the MIL message is missing or if the data is deemed invalid by the instrument cluster for greater than 5 seconds, the instrument cluster sets DTC U0100 and defaults the MIL on.

NOTE: If U0100 is set in the instrument cluster other symptoms may also be present such as an inoperative speedometer, tachometer or temperature gauge.

Possible Causes

- PCM
- Instrument cluster

PINPOINT TEST N: THE MALFUNCTION INDICATOR LAMP (MIL) IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
N1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH . **No** GO to N2 .
N2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS	
• Check for recorded PCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to N3 .
N3 CARRY OUT THE INSTRUMENT CLUSTER	

INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster MIL active command MIL_IC on and off. Observe the MIL. • **Does the MIL illuminate when commanded on and turn off when commanded off?**	**Yes** GO to N5 . **No** GO to N4 .
N4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

N5 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Air Bag Warning Indicator Is Never/Always On

Normal Operation

The instrument cluster receives the supplemental restraint system (SRS) status from the restraints control module (RCM) over the high speed controller area network (HS-CAN) communication bus. If an air SRS concern is detected, the RCM sets a DTC and sends a message to the instrument cluster to turn on the air bag warning indicator. If the SRS status message is missing or is deemed invalid for greater than 5 seconds, the instrument cluster sets DTC U0151 and defaults the air bag warning indicator on.

Possible Causes

- RCM
- Instrument cluster

PINPOINT TEST O: THE AIR BAG WARNING INDICATOR IS NEVER/ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
O1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0151 recorded?**	**Yes** REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0151 returns, REFER to Section 418-00 to diagnose no communication with the RCM. For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to O2 .
O2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND RESTRAINT CONTROL MODULE (RCM) SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Are any RCM DTCs recorded?**	**Yes** REFER to Section 501-20B to continue diagnosis of the restraint system. **No** GO to O3 .
O3 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster air bag warning indicator active command AIRBAG on and off. Observe the air bag warning indicator. • **Does the air bag warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to O5 . **No** GO to O4 .
O4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. ACTIVATE the air bag system. REFER to Section 501-20B . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ACTIVATE the air bag system. REFER to Section 501-20B .

O5 CHECK FOR CORRECT RCM OPERATION	

• Disconnect all the RCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the RCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RCM. REFER to Section 501-20B . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. ACTIVATE the air bag system. REFER to Section 501-20B .

Pinpoint Test P: The High Beam Indicator Is Never/Always On

Normal Operation

The instrument cluster receives the high beam status from the smart junction box (SJB) over the medium speed controller area network (MS-CAN) communication bus. When the high beams have been selected, the SJB sends a message to the instrument cluster to turn on the high beam indicator. If the high beam status message is missing for more than 5 seconds, the instrument cluster sets DTC U0140 and defaults the high beam indicator off.

NOTE: Navigators equipped with high intensity discharge (HID) headlamps do not illuminate the high beam indicator when in flash-to-pass mode.

NOTE: If DTC U0140 is set in the SJB, other symptoms may also be present such as tire pressure monitoring system (TPMS), instrument panel backlighting, and door ajar indication.

Possible Causes

- SJB
- Instrument cluster

PINPOINT TEST P: THE HIGH BEAM INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
P1 VERIFY THE HIGH BEAM OPERATION	
• Verify the high beam headlamps operation. • **Do the high beam headlamps operate correctly?**	**Yes** GO to P2 . **No** REFER to Section 417-01 .
P2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0140 recorded?**	**Yes** Go To Pinpoint Test AI . **No** GO to P3 .
P3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SJB SELF-TESTS	

• Check for recorded SJB DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 , Diagnostic Trouble Code (DTC) Chart for correct navigation of the DTC. **No** GO to P4 .
P4 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster high beam indicator active command HIGH_BEAM on and off. Observe the high beam indicator. • **Does the high beam indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to P6 . **No** GO to P5 .
P5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

P6 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify that the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Q: The LH/RH Turn Indicator Is Never On

Normal Operation

The instrument cluster receives the LH and RH turn signal/hazard status from the smart junction box (SJB) over the medium speed controller area network (MS-CAN) communication bus. When the LH or RH turn signal or hazards have been selected, the SJB sends a message to the instrument cluster to turn on the LH or RH turn indicator. If the LH or RH turn status message is missing for more than 5 seconds, the instrument cluster sets DTC U0140 and defaults the turn indicators off.

NOTE: If DTC U0140 is set in the SJB, other symptoms may also be present such as tire pressure monitoring system (TPMS), instrument panel backlighting, and door ajar indication.

Possible Causes

- SJB
- Instrument cluster

PINPOINT TEST Q: THE LH/RH TURN INDICATOR IS NEVER ON

Test Step	Result / Action to Take
Q1 CHECK THE TURN SIGNAL OPERATION	
• Verify the turn signal operation. • **Does the LH and RH turn signals operate correctly?**	**Yes** GO to Q2 . **No** REFER to Section 417-01 .
Q2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0140 recorded?**	**Yes** Go To Pinpoint Test AI . **No** GO to Q3 .
Q3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SJB SELF-TESTS	
• Check for recorded SJB DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 , Diagnostic Trouble Code (DTC) Chart for correct navigation of the DTC. **No** GO to Q4 .
Q4 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster all lamps active command ALL_LAMP on and off. Observe the LH and RH turn indicators. • **Do the LH and RH turn indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to Q6 . **No** GO to Q5 .
Q5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded

	connector.
Q6 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify that the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test R: The Speed Control Indicator Is Never/Always On

Normal Operation

The instrument cluster receives the speed control signal from the powertrain control module (PCM) over the high speed controller area network (HS-CAN) communication bus. When the speed control is engaged, the PCM sends a message to the instrument cluster to illuminate the speed control indicator. If the speed control message is missing or if the data is deemed invalid by the instrument cluster for greater than 5 seconds, the instrument cluster sets DTC U0100 and defaults the speed control off.

NOTE: If U0100 is set in the instrument cluster other symptoms may also be present such as an inoperative speedometer, tachometer or temperature gauge.

Possible Causes

- PCM
- Instrument cluster

PINPOINT TEST R: THE SPEED CONTROL INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
R1 CHECK SPEED CONTROL OPERATION	
• Test drive the vehicle and operate the speed control. • **Does the speed control operate correctly?**	**Yes** GO to R2 . **No** REFER to Section 310-03 .
R2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH . **No** GO to R3 .
R3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS	
• Check for recorded PCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

	No GO to R4 .
R4 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster speed control active command CRUISE on and off. Observe the speed control indicator. • **Does the speed control indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to R6 . **No** GO to R5 .

R5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION
• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

R6 CHECK FOR CORRECT PCM OPERATION
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test S: The Tire Pressure Monitoring System (TPMS) Warning Indicator Is Never/Always On

Normal Operation

The instrument cluster receives the TPMS messages from the smart junction box (SJB) over the medium speed controller area network (MS-CAN) communication bus. If the SJB determines that the tire pressure has exceeded the limits, a message is sent to the instrument cluster to turn on the TPMS warning indicator. If a TPMS fault condition exists, the SJB sends a message to the instrument cluster to flash the TPMS warning indicator. If the TPMS status message is missing or deemed invalid by the instrument cluster for more than 5 seconds, the instrument cluster sets DTC U0140 and flashes the TPMS indicator for 60 seconds then turns the indicator on.

NOTE: If DTC U0140 is set in the SJB, other symptoms may also be present such as high beam indicator, RH/LH turn indicators, instrument panel backlighting, and door ajar indication.

Possible Causes

- TPMS concern
- SJB
- Instrument cluster

PINPOINT TEST S: THE TIRE PRESSURE MONITORING SYSTEM (TPMS) WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
S1 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS INSTRUMENT CLUSTER SELF-TEST	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0140 recorded?**	**Yes** Go To Pinpoint Test AI . **No** GO to S2 .
S2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SJB SELF-TESTS	
• Check for recorded SJB DTCs from the continuous and on-demand self-tests. • **Are any SJB DTCs recorded?**	**Yes** REFER to Section 419-10 , Diagnostic Trouble Code (DTC) Chart for correct navigation of the DTC. **No** GO to S3 .
S3 CARRY OUT THE INSTRUMENT INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster TPMS active command TIRE_PRES on and off. Observe the TPMS warning indicator. • **Does the TPMS warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to S5 . **No** GO to S4 .
S4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

S5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for:	**Yes** INSTALL a new SJB. REFER to Section

■ corrosion ■ damaged pins ■ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify that the concern is still present. • **Is the concern still present?**	419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test T: The O/D Off Indicator Is Never/Always On

Normal Operation

The instrument cluster receives the overdrive (O/D) off signal from the transmission control module (TCM) over the high speed controller area network (HS-CAN) communication bus. The O/D off switch is hardwired to the TCM. When the transmission O/D is selected off, the O/D off switch provides a ground signal to the TCM. The TCM upon receipt of the O/D off ground signal, provides an O/D off message to the instrument cluster and the instrument cluster illuminates the O/D off indicator. If the O/D off message is missing or invalid for greater than 5 seconds, the instrument cluster sets DTC U0101 and defaults the O/D off indicator off.

Possible Causes

- TCM
- Instrument cluster

PINPOINT TEST T: THE O/D OFF INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
T1 CHECK O/D OPERATION	
• Test drive the vehicle and turn the O/D function off and on again. • **Does the O/D function operate correctly?**	**Yes** GO to T2 . **No** REFER to Section 307-05 .
T2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0101 recorded?**	**Yes** REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0101 returns, REFER to Section 418-00 to diagnose no communication with the TCM. For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to T3 .
T3 RETRIEVE THE RECORDED DTCs FROM	

BOTH THE CONTINUOUS AND ON-DEMAND TCM SELF-TESTS	
• Check for recorded TCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to Section 307-01A or Section 307-01B . **No** GO to T4 .
T4 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster O/D active command OVERDRV on and off. Observe the O/D off indicator. • **Does the O/D off indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to T6 . **No** GO to T5 .
T5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

T6 CHECK FOR CORRECT TCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new TCM. REFER to Section 307-01A , Main Control Valve Body or Section 307-01B , Mechatronic Assembly. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test U: The Anti-Theft Indicator Is Never/Always On

Normal Operation

The instrument cluster controls the passive anti-theft system (PATS) with the powertrain control module (PCM) and receives the anti-theft key status from the hardwired PATS module. If there is a PATS concern, the instrument cluster anti-theft indicator glows steadily for one minute then flashes a 4-digit fault code 10 times when the ignition switch is turned to the ON position. The PATS also flashes the theft indicator approximately every 2 seconds at ignition OFF to act as a visual theft deterrent. Refer to Section 419-01 for addition PATS information.

Possible Causes

- Instrument cluster

PINPOINT TEST U: THE THEFT INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
U1 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster anti-theft indicator active command THEFT_LMP on and off. Observe the anti-theft indicator. • **Does the anti-theft off indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to U2 . **No** GO to U3 .
U2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Are any DTCs recorded?**	**Yes** For all PATS related DTCs, REFER to Section 419-01 . For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to U3 .
U3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test V: The PRNDL Indicator is Never/Always On (If Equipped)

Normal Operation

The instrument cluster receives the transmission range status from the transmission control module (TCM) over the high speed controller area network (HS-CAN) communication bus. Column shift vehicles use a park detect switch (part of the brake shift interlock) to signal the instrument cluster that the shift lever is fully seated in the park position. The instrument cluster compares the park detect switch input with the transmission range status sent from the TCM. The instrument cluster provides a reference voltage to the brake shift interlock on circuit CET53 (BU/OG). When the gearshift is in PARK (P), the

brake shift indicator routes the reference voltage to ground, pulling the circuit low to the instrument cluster. When the gearshift is moved out of PARK (P), the brake shift interlock opens the ground sending the reference voltage high. If the PRNDL information is missing from the TCM, the instrument cluster sets DTC U0101 or if the instrument cluster sees a signal from the park detect switch indicating the shifter is in PARK (P) with a conflicting PRNDL input, the instrument cluster defaults the PRNDL display to blank (no PRNDL display).

NOTE: If U0101 is set, other symptoms may include the O/D off indicator or the wrench reconfigurable telltale indicator ON.

NOTE: The PRNDL is only available on column shift vehicles.

DTC C1945 — is a continuous memory DTC that sets if the instrument cluster detects a short to ground on the park detect switch input, circuit CET53 (BU/OG), pulling the circuit low with a vehicle speed sensor (VSS) input over 16 km/h (10 mph), indicating that the vehicle is in motion.

Possible Causes

- Circuit CET53 (BU/OG) open or short to ground
- Brakeshift interlock
- Instrument cluster

PINPOINT TEST V: THE PRNDL INDICATOR IS NEVER/ALWAYS ON (IF EQUIPPED)

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
V1 CHECK THE PRNDL DISPLAY PARK OPERATION	
• Key in ON position. • Shift the selector lever through the different gear positions while observing the PRNDL display. • Place the selector lever in the PARK (P) position. • Key in OFF position. • Observe the PRNDL display immediately after turning the key off. • **Does the PRNDL display the different ranges according to the selector lever position then display P for approximately 5 seconds when the key is turned off?**	**Yes** The system is functioning correctly at this time. **No** GO to V2 .
V2 RETRIEVE AND RECORD THE INSTRUMENT CLUSTER DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** For all DTCs, REPEAT the self-test. CLEAR the DTCs. DRIVE the vehicle above 16 km/h (10 mph) for more than 5 seconds. If DTC C1945 returns, GO to V6 . If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system.

	If DTC U0101 returns, REFER to Section 418-00 to diagnose no communication with the TCM module. **No** GO to V3.
V3 RETRIEVE AND RECORD THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to V4.
V4 RETRIEVE AND RECORD THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND TCM SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Are any TCM DTCs recorded?**	**Yes** REFER to Section 307-01A or Section 307-01B. **No** GO to V5.
V5 CARRY OUT THE INSTRUMENT CLUSTER DEALER TEST MODE	
• Key in ON position. • Verify that the transmission selector lever is fully seated in the PARK (P) position. • Enter the instrument cluster dealer test mode. Scroll through the displays until PRKDETSW is displayed and note the park detect switch status. • **Does the self-test indicate G?**	**Yes** GO to V6. **No** GO to V8.
V6 CHECK THE BRAKE SHIFT INTERLOCK OPERATION	
• Key in OFF position. • Disconnect: Brake Shift Interlock C2008. • Clear the DTCs. DRIVE the vehicle above 16 km/h (10 mph) for more than 5 seconds. Retrieve the instrument cluster continuous memory DTCs. • **Is DTC C1945 still present?**	**Yes** GO to V7. **No** INSTALL a new brake shift interlock. TEST the system for normal operation.
V7 CHECK CIRCUIT CET53 (BU/OG) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Disconnect: Brake Shift Interlock C2008. • Measure the resistance between the instrument cluster C220-26, circuit CET53 (BU/OG), harness side and the brake shift interlock C2008-2, circuit CET53 (BU/OG), harness side; and between the instrument cluster C220-26, circuit CET53 (BU/OG), harness side and ground.	**Yes** GO to V8. **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

 N0057139 • **Is the resistance less than 5 ohms between the instrument cluster and the brake shift interlock, and greater than 10,000 ohms between the instrument cluster and ground?**	
V8 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test W: The Wrench Reconfigurable Telltale Indicator Is Never/Always On

Normal Operation

The wrench reconfigurable telltale can be turned on by any one of three modules. The powertrain control module (PCM) provides the electronic throttle control status, the transmission control module (TCM) provides transmission status and the four wheel drive (4WD) control module (if equipped) provides a status of the 4WD system to the instrument cluster. Each module monitors the powertrain for their respective function and provides the instrument cluster with the operating status over the high speed controller area network (HS-CAN) communication bus. When a fault condition exists in any of the monitored systems, the PCM, TCM or 4WD (if equipped) control modules provide the instrument cluster with a message to turn on the wrench warning indicator.

If the electronic throttle control message is missing or if the data is deemed invalid by the instrument cluster for greater than 5 seconds, the instrument cluster sets DTC U0100 and defaults the wrench reconfigurable telltale ON. If the O/D off message is missing or invalid for greater than 5 seconds, the instrument cluster sets DTC U0101 and defaults the wrench reconfigurable telltale ON. If equipped with 4WD and the 4WD status message is missing or invalid for more than 5 seconds, the instrument cluster sets DTC U0102 and defaults the wrench reconfigurable telltale ON.

NOTE: If U0100 is set in the instrument cluster other symptoms may also be present such as an inoperative speedometer, tachometer or temperature gauge. If U0101 is set, other symptoms may include the O/D off indicator ON. If DTC U0102 is set, other symptoms may include the 4x4, 4x4 LOW or 4x4 AUTO reconfigurable telltales may be inoperative.

Possible Causes

- Electronic throttle control concern
- Transmission concern
- 4WD concern (if equipped)
- Instrument cluster

PINPOINT TEST W: THE WRENCH RECONFIGURABLE TELLTALE IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
W1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Are any DTCs recorded?**	**Yes** For all DTCs, REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0101 returns, REFER to Section 418-00 to diagnose no communication with the TCM module. If DTC U0100 returns, Go To Pinpoint Test AH . If DTC U0102 returns, REFER to Section 418-00 to diagnose no communication with the 4WD control module. For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to W2 .
W2 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster wrench indicator reconfigurable telltale active command WR_LMP on and off. • **Does the wrench indicator reconfigurable telltale turn on when commanded on and turn off when commanded off?**	**Yes** GO to W3 . **No** GO to W6 .
W3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND TCM SELF-TESTS	
• Check for recorded TCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to Section 307-01A or Section 307-01B . **No**

	GO to W4 .
W4 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS	
• Check for recorded PCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** If equipped with 4WD, GO to W5 . If not equipped with 4WD, GO to W6 .
W5 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND 4WD CONTROL MODULE SELF-TESTS	
• Check for recorded 4WD control module DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to Section 308-07A . **No** GO to W6 .
W6 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test X: The Charge Reconfigurable Telltale Indicator Is Never/Always On

Normal Operation

The instrument cluster receives the charging system signal from the powertrain control module (PCM) over the high speed controller area network (HS-CAN) communication bus. If the charging system is functioning correctly once the engine is started, the PCM sends the instrument cluster a message to turn off the charge indicator. When a charging system concern is detected, the PCM sends a message to the instrument cluster to turn on the charge reconfigurable telltale indicator. If the charging system message is missing or if the data is deemed invalid by the instrument cluster for greater than 5 seconds, the instrument cluster sets DTC U0100 and defaults the charge reconfigurable telltale ON.

NOTE: If U0100 is set in the instrument cluster other symptoms may also be present such as an inoperative speedometer, tachometer or temperature gauge.

Possible Causes

- Charging system concern
- Instrument cluster

PINPOINT TEST X: THE CHARGE RECONFIGURABLE TELLTALE INDICATOR IS NEVER/ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
X1 CHECK THE CHARGING SYSTEM • Check the charging system operation. Refer to Section 414-00 . • **Is the charging system operating correctly?**	**Yes** GO to X2 . **No** REFER to Section 414-00 .
X2 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster charging system reconfigurable telltale active command CHARGE_LMP on and off. • **Does the charging system reconfigurable telltale turn on when commanded on and turn off when commanded off?**	**Yes** GO to X3 . **No** GO to X5 .
X3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS • Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH . **No** GO to X4 .
X4 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS • Check for recorded PCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to X5 .

X5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION
• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test Y: The Low Oil Pressure Reconfigurable Telltale Indicator Is Never/Always On

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The instrument cluster uses engine rpm data, sent from the powertrain control module (PCM) over the high speed controller area network (HS-CAN) communication bus, to determine whether the engine is running. The normally open engine oil pressure switch is hardwired to the instrument cluster through circuit CMC24 (GY). The instrument cluster provides a reference voltage to the engine oil pressure switch when the ignition key is in the RUN position. When there is low or no oil pressure, the engine oil pressure switch remains open, the instrument cluster detects no change in the reference voltage, and the low oil pressure reconfigurable telltale is turned on. When the engine is running with sufficient oil pressure, the PCM sends an rpm status message to the cluster and the engine oil pressure switch closes, providing a ground, which pulls the reference voltage from the instrument cluster low, turning on the low oil pressure reconfigurable telltale. If the engine rpm status message is missing or if the data is deemed invalid by the instrument cluster for greater than 5 seconds, the instrument cluster sets DTC U0100 and defaults the low oil pressure reconfigurable telltale on.

NOTE: If U0100 is set in the instrument cluster other symptoms may also be present such as an inoperative speedometer, tachometer or temperature gauge.

Possible Causes

- Circuit CMC24 (GY) open, short to ground or voltage
- Engine oil pressure switch
- Base engine concern
- Instrument cluster

PINPOINT TEST Y: THE LOW OIL PRESSURE RECONFIGURABLE TELLTALE IS NEVER/ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
Y1 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster low oil pressure reconfigurable telltale active command OIL_P_L on and off . • **Does the low oil pressure reconfigurable telltale turn on when commanded on and turn off when commanded off?**	**Yes** GO to Y2 . **No** GO to Y10 .
Y2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH . **No** GO to Y3 .

Y3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS	
• Check for recorded PCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** If the low oil pressure reconfigurable telltale indicator is always on, GO to Y4 . If the low oil pressure reconfigurable telltale indicator is never on, GO to Y6 .
Y4 CHECK FOR A STUCK CLOSED ENGINE OIL PRESSURE SWITCH	
• Key in OFF position. • Disconnect: Engine Oil Pressure Switch C103. • Key in ON position. • Observe the engine oil pressure gauge. • **Does the engine oil pressure gauge indicate low (L) oil pressure?**	**Yes** INSTALL a new engine oil pressure switch. REFER to Section 303-01 . TEST the system for normal operation. **No** GO to Y5 .
Y5 CHECK CIRCUIT CMC24 (GY) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Measure the resistance between the instrument cluster C220-18, circuit CMC24 (GY), harness side and ground.  N0057131 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Y10 . **No** REPAIR the circuit. TEST the system for normal operation.
Y6 CHECK FOR A STUCK OPEN ENGINE OIL PRESSURE SWITCH	
• Key in OFF position. • Disconnect: Engine Oil Pressure Switch C103. • Connect a fused (5A) jumper wire between the engine oil pressure switch, C103-1, circuit CMC24 (GY), harness side and ground.	**Yes** REMOVE the jumper wire. GO to Y9 . **No** REMOVE the jumper wire. GO to Y7 .

 N0002760 • Key in START position. • Observe the low oil pressure reconfigurable telltale. • **Does the low oil pressure reconfigurable telltale turn off?**	
Y7 CHECK CIRCUIT CMC24 (GY) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Key in ON position. • Measure the voltage between the instrument cluster C220-18, circuit CMC24 (GY), harness side and ground.  N0057217 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to Y8 .
Y8 CHECK CIRCUIT CMC24 (GY) FOR AN OPEN	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Measure the resistance between the instrument cluster C220-18, circuit CMC24 (GY), harness side and the engine oil pressure switch C103-1, circuit CMC24 (GY), harness side.  N0057132 • **Is the resistance less than 5 ohms?**	**Yes** GO to Y10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
Y9 CHECK THE OIL PRESSURE	
• Carry out the engine oil pressure test. Refer to Section 303-00 . • **Is the oil pressure within specification?**	**Yes** INSTALL a new engine oil pressure switch. REFER to Section 303-01 . TEST the

	system for normal operation. **No** REFER to Section 303-00 to continue diagnosis of the engine oil pressure.
Y10 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test Z: The Engine Over Temperature Reconfigurable Telltale Indicator Is Never/Always On

Normal Operation

There are basically 3 separate situations when the instrument cluster receives a message to turn on the engine over temperature reconfigurable telltale indicator; a high engine temperature condition, failsafe cooling 1 or failsafe cooling 2 state. The powertrain control module (PCM) sends the applicable message to the instrument cluster over the high speed controller area network (HS-CAN) communication bus whenever any of the 3 conditions exist. The PCM receives the engine coolant temperature status through hardwired circuitry to the cylinder head temperature (CHT) sensor. If a high engine temperature condition exists, the PCM sends a message to the instrument cluster to turn on the engine over temperature reconfigurable telltale indicator. If a failsafe warning condition exists, the PCM sends a message to the instrument cluster to flash the engine over temperature reconfigurable telltale indicator.

If the instrument cluster does not receive the engine temperature or failsafe cooling status or if the data is deemed invalid by the instrument cluster for more than 5 seconds, the message is considered missing and the instrument cluster sets DTC U0100 and defaults the temperature gauge to the cold (C) stop and the engine over temperature reconfigurable indicator on.

DTC U2199 — is a continuous DTC that sets if the instrument cluster receives invalid engine temperature data from the PCM. The instrument cluster defaults the temperature gauge to the cold (C) stop and turns on the engine over temperature reconfigurable telltale.

Possible Causes

- PCM
- Instrument cluster

PINPOINT TEST Z: THE ENGINE OVER TEMPERATURE RECONFIGURABLE TELLTALE INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take

Z1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH . If both U0100 and U2199 are recorded, REFER to Section 418-00 to diagnose the communication network. **No** If DTC U2199 is recorded, GO to Z2 .
Z2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PCM SELF-TESTS	
• Check for recorded PCM DTCs from the continuous and on-demand self-tests. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to Z3 .
Z3 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster engine over temperature reconfigurable telltale active command OVTEMP_LMP on and off. • **Does the engine over temperature reconfigurable telltale turn on when commanded on and turn off when commanded off?**	**Yes** GO to Z5 . **No** GO to Z4 .
Z4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Z5 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AA: The Low Fuel Reconfigurable Telltale Indicator Is Never/Always On (If Equipped)

Normal Operation

The low fuel reconfigurable telltale illuminates when the distance to empty (DTE) calculation reaches 80 km (50 miles) or less. The DTE is calculated internally by the instrument cluster from data received from the powertrain control module and fuel gauge. When the instrument cluster receives the data, the fuel gauge indicates low fuel and the instrument cluster turns on the low fuel reconfigurable telltale.

Possible Causes

- Instrument cluster

PINPOINT TEST AA: THE LOW FUEL RECONFIGURABLE TELLTALE INDICATOR IS NEVER/ALWAYS ON (IF EQUIPPED)

Test Step	Result / Action to Take
AA1 CHECK THE FUEL GAUGE OPERATION • Key in ON position. • Access and observe the informational display or message center display distance to empty (DTE) displayed mileage. • **Does the DTE display indicate 80 km (50 miles) or less until empty?**	**Yes** GO to AA2 . **No** The system is operating correctly at this time. The low fuel warning message does not appear until the DTE is 80 km (50 miles) or less.

AA2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION
• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AB: The Check Fuel Cap Reconfigurable Telltale Indicator Is Never/Always On

Normal Operation

The powertrain control module (PCM) monitors the fuel tank evaporative emission system for significant leaks that occur following refueling of the vehicle. Once the PCM detects a fuel vapor leak, the PCM sends the instrument cluster a message over the communication network to turn on the check fuel cap reconfigurable telltale indicator. DTC P0457 sets in the PCM following a successful cruise test, which is initiated when the vehicle is driven at a steady speed above 64 km/h (40 mph) for a duration of approximately 4-5 minutes. If the PCM is unable to successfully run the cruise test, the instrument cluster does not receive the check fuel cap message and the check fuel cap reconfigurable telltale indicator remains off.

DTC P0457 — sets in the PCM if a fuel tank pressure change greater than -23.7 kPa (-7 in-Hg) of vacuum within 30 seconds after refueling occurs, or there is an excessive purge (fuel vapor) flow of greater than 454 g (1.0 lb) per minute.

Possible Causes

- Instrument cluster

PINPOINT TEST AB: THE CHECK FUEL CAP RECONFIGURABLE TELLTALE INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AB1 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster indicator lamp control active command FUEL_CAP. Command the check fuel cap reconfigurable telltale indicator on and off. Observe the check fuel cap reconfigurable telltale indicator. • **Does the check fuel cap reconfigurable telltale indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to AB2 . **No** GO to AB5 .
AB2 RETRIEVE THE RECORDED DIAGNOSTIC TROUBLE CODES (DTCs) FROM BOTH CONTINUOUS AND ON-DEMAND PCM SELF-TESTS	
• Check for recorded PCM DTCs from the continuous and on-demand self-tests. • **Is PCM DTC P0457 recorded?**	**Yes** If the check fuel cap warning indicator is illuminated, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If the check fuel cap warning indicator is not illuminated, GO to AB4 . **No** GO to AB3 .
AB3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0100 recorded?**	**Yes** Go To Pinpoint Test AH . **No** GO to AB4 .
AB4 CHECK THE INSTRUMENT CLUSTER OPERATION	
• Monitor the instrument cluster check fuel cap reconfigurable telltale indicator. • **Is the instrument cluster check fuel cap reconfigurable telltale indicator always on?**	**Yes** GO to AB5 . **No** The system is operating normally at this time. If the fuel cap was left off and the check fuel cap

	warning indicator did not turn on, driving conditions may not have allowed for the PCM to run the cruise test and message the instrument cluster to turn on the check fuel cap warning indicator.

AB5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION
• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AC: The Low Washer Fluid Reconfigurable Telltale Indicator Is Never/Always On (If Equipped)

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The instrument cluster provides a reference voltage to the washer fluid switch through circuit CMC20 (VT). The washer fluid switch is grounded through circuit GD123 (BK/GY). When the washer fluid is low, the washer fluid switch closes to ground, pulling the reference voltage low. When the instrument cluster detects the washer fluid input pulled low, it turns on the low washer fluid reconfigurable telltale indicator.

Possible Causes

- Circuit CMC20 (VT) open or short to ground
- Circuit GD123 (BK/GY) open
- Washer fluid level switch
- Instrument cluster

PINPOINT TEST AC: THE LOW WASHER FLUID RECONFIGURABLE TELLTALE INDICATOR IS NEVER/ALWAYS ON (IF EQUIPPED)

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
AC1 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster indicator lamp control active command WASHFLLMP. Command the low washer fluid reconfigurable telltale indicator on and off. Observe the low washer fluid reconfigurable telltale indicator.	**Yes** GO to AC2 . **No** GO to AC8 .

• **Does the low washer fluid reconfigurable telltale indicator illuminate when commanded on, and turn off when commanded off?**	
AC2 CHECK THE LOW WASHER FLUID RECONFIGURABLE TELLTALE INDICATOR OPERATION	
• Make sure that the washer fluid level is full. • Key in ON position. • Observe the low washer fluid reconfigurable telltale indicator. • **Is the low washer fluid reconfigurable telltale on?**	**Yes** If the low washer fluid reconfigurable telltale indicator is always on, GO to AC6 . **No** If the low washer fluid reconfigurable telltale indicator is never on, GO to AC3 .
AC3 CHECK THE LOW WASHER FLUID RECONFIGURABLE TELLTALE	
• Key in OFF position. • Disconnect: Washer Fluid Level Switch C138. • Connect a fused (5A) jumper wire between the washer fluid level switch C138-1, circuit CMC20 (VT), harness side and ground.  N0057140 • Key in ON position. • Wait one minute. • Observe the low washer fluid reconfigurable telltale indicator. • **Is the low washer fluid reconfigurable telltale on?**	**Yes** REMOVE the jumper wire. GO to AC4 . **No** REMOVE the jumper wire. GO to AC5 .
AC4 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the washer fluid level switch C138-2, circuit GD123 (BK/GY), harness side and ground.  N0057141 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new washer fluid level switch. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
AC5 CHECK CIRCUIT CMC20 (VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: Instrument Cluster C220.	**Yes** GO to AC8 .

• Measure the resistance between the instrument cluster C220-9, circuit CMC20 (VT), harness side and the washer fluid level switch C138-1, circuit CMC20 (VT), harness side.  N0057142 • **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. TEST the system for normal operation.
AC6 CHECK THE WASHER FLUID SWITCH	
• Key in OFF position. • Disconnect: Washer Fluid Level Switch C138. • Key in ON position. • Wait one minute. • Observe the low washer fluid reconfigurable telltale indicator. • **Did the low washer fluid reconfigurable telltale turn off?**	**Yes** INSTALL a new washer fluid level switch. TEST the system for normal operation. **No** GO to AC7 .
AC7 CHECK CIRCUIT CMC20 (GY/BK) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Measure the resistance between the instrument cluster C220-9, circuit CMC20 (GY/BK), harness side and ground.  N0057143 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC8 . **No** REPAIR the circuit. TEST the system for normal operation.
AC8 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AD: The Traction Control Reconfigurable Telltale Indicator Is Never/Always On

Normal Operation

The traction control reconfigurable telltale indicator flashes when the vehicle traction control is in active mode or is being controlled by the anti-lock brake system (ABS) module. The instrument cluster receives the traction control data from the ABS module over the high speed controller area network (HS-CAN) communication bus. The instrument cluster monitors the traction control message and when the ABS module detects a traction control concern, the instrument cluster illuminates the traction control reconfigurable telltale indicator. If the traction control message is missing for greater than 5 seconds, the instrument cluster sets DTC U0121 and defaults the traction control reconfigurable telltale indicator on.

Possible Causes

- ABS module
- Instrument cluster

PINPOINT TEST AD: THE TRACTION CONTROL RECONFIGURABLE TELLTALE INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AD1 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster traction control reconfigurable telltale indicator active command TC_IVD_RSC_LMP on and off. Observe the traction control reconfigurable telltale indicator. • **Does the traction control reconfigurable telltale indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to AD2 . **No** GO to AD3 .
AD2 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0121 recorded?**	**Yes** REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0121 returns, REFER to Section 418-00 to diagnose no communication with the ABS module. For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No**

	GO to AD4 .
AD3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Make sure all other system connectors are fully seated.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

AD4 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect the ABS module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Correct the ABS module connector and make sure it seats correctly.
• Operate the system and verify that the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AE: The 4x4, 4x4 LOW Or 4x4 AUTO Reconfigurable Telltale Indicator Is Never/Always On (If Equipped)

Normal Operation

The instrument cluster receives the 4x4, 4x4 LOW and 4x4 AUTO reconfigurable telltale indicator status from the four wheel drive (4WD) control module over the high speed controller area network (HS-CAN) communication bus. If the instrument cluster receives a message that the 4WD system in the process of shifting from two wheel drive (2WD) to either 4WD high or 4WD low, the message center displays the message 4x4 SHIFT IN PROGRESS and the appropriate 4x4, 4x4 LOW or 4x4 AUTO reconfigurable telltale indicator is turned off. If the instrument cluster receives a message that the 4WD system in not in the process of completing a 4WD shift or the shift event has ended, the message center cancels the displayed message and the 4x4, 4x4 LOW or 4x4 AUTO reconfigurable telltale indicator is turned on. If the 4x4 status message is missing for greater than 5 seconds, the instrument cluster sets DTC U0102 and defaults the 4x4 AUTO reconfigurable telltale indicator off.

Possible Causes

- 4WD control module
- Instrument cluster

PINPOINT TEST AE: THE 4X4, 4X4 LOW OR 4X4 AUTO RECONFIGURABLE TELLTALE INDICATOR IS NEVER/ALWAYS ON (IF EQUIPPED)

Test Step	Result / Action to Take
AE1 CHECK 4WD SYSTEM OPERATION	
• Test drive the vehicle and operate the 4WD system.	**Yes**

• **Does the 4WD system operate correctly?**	GO to AE2 . **No** REFER to Section 308-07A .
AE2 CARRY OUT THE INSTRUMENT CLUSTER INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the inoperative instrument cluster 4x4 reconfigurable telltale indicator active command 4X4_AUTO_LMP, 4X4_LOW_LMP or 4X4_HIGH_LMP on and off. Observe the applicable 4x4 reconfigurable telltale indicator. • **Does the 4x4 reconfigurable telltale indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to AE3 . **No** GO to AE4 .
AE3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0102 recorded?**	**Yes** REPEAT the self-test. CLEAR the DTCs. If DTC B1317 or B1318 returns, REFER to Section 414-00 to diagnose the charging system. If DTC U0102 returns, REFER to Section 418-00 to diagnose no communication with the ABS module. For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to AE5 .
AE4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Make sure all other system connectors are fully seated.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

AE5 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION	
• Disconnect the 4WD control module connector. • Check for: ▪ corrosion	**Yes** INSTALL a new 4WD control module. REFER to Section 308-

■ damaged pins ■ pushed-out pins • Correct the 4WD control module connector and make sure it seats correctly. • Operate the system and verify that the concern is still present. • **Is the concern still present?**	07A . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AF: The Door Ajar Reconfigurable Telltale Indicator Is Never/Always On

Normal Operation

The instrument cluster receives the door ajar status for the LH front door, RH front door, LH rear door, RH rear door, liftgate, and liftgate glass ajar switch status from the smart junction box (SJB) over the medium speed controller area network (MS-CAN) communication bus. When the instrument cluster receives a message from the SJB that one or more doors are open or ajar, the instrument cluster turns on the door ajar reconfigurable telltale indicator. If the door ajar status message is missing for greater than 5 seconds, the instrument cluster sets DTC U0140 and defaults the door ajar reconfigurable telltale indicator on.

NOTE: If DTC U0140 is set in the SJB, other symptoms may also be present such as high beam indicator, RH/LH turn indicators, instrument panel backlighting and tire pressure monitoring system (TPMS).

Possible Causes

- SJB
- Instrument cluster

PINPOINT TEST AF: THE DOOR AJAR RECONFIGURABLE TELLTALE INDICATOR IS NEVER/ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
AF1 CHECK THE INTERIOR LIGHTING OPERATION	
• **NOTE:** The interior lamp switch must not be in the dome defeat position. • Open and close each door, liftgate and liftgate glass while monitoring the interior lamps. • **Do the interior lamps operate correctly with each door, liftgate and liftgate glass?**	**Yes** GO to AF2 . **No** REFER to Section 417-02 .
AF2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS INSTRUMENT CLUSTER SELF-TEST	
• Check for recorded instrument cluster DTCs from the continuous self-test. • **Is DTC U0140 recorded?**	**Yes** Go To Pinpoint Test AI . **No** GO to AF3 .
AF3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SJB	

SELF-TESTS	
• Check for recorded SJB DTCs from the continuous and on-demand self-tests. • **Are any SJB DTCs recorded?**	**Yes** REFER to Section 419-10 , Diagnostic Trouble Code (DTC) Chart for correct navigation of the DTC. **No** GO to AF4 .
AF4 CARRY OUT THE INSTRUMENT INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster door ajar active command DRAJLMP on and off. Observe the door ajar reconfigurable telltale indicator. • **Does the door ajar reconfigurable telltale indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to AF6 . **No** GO to AF5 .
AF5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

AF6 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify that the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AG: The Instrument Cluster Is Inoperative

Normal Operation

With the ignition switch in the START or RUN position, the instrument cluster receives voltage from the smart junction box (SJB) through circuit CBP29 (WH/VT). With the ignition switch in the OFF position, the instrument cluster receives its keep-alive voltage from the SJB through circuit SBP26 (YE/RD). The instrument cluster grounding is through circuit GD133 (BK).

Possible Causes

- Fuse(s)

- Circuit CBP29 (WH/VT) open or short to ground
- Circuit SBP26 (YE/RD) open or short to ground
- Circuit GD133 (BK) open
- Instrument cluster

PINPOINT TEST AG: THE INSTRUMENT CLUSTER IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
AG1 CARRY OUT THE NETWORK TEST	
NOTE: If the medium speed controller area network (MS-CAN) is damaged or disconnected, the instrument cluster may appear inoperative, the vehicle may not start and the theft indicator will appear to be functioning correctly. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Network Test. • Carry out the vehicle network test. • **Do all modules communicate on the MS-CAN network?**	**Yes** GO to AG2 . **No** REFER to Section 418-00 to diagnose the communication network.
AG2 CHECK THE INSTRUMENT CLUSTER VOLTAGE SUPPLY	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Key in ON position. • Measure the voltage between the instrument cluster C220-1, circuit SBP26 (YE/RD), harness side and ground; and between the instrument cluster C220-14, circuit CBP29 (WH/VT), harness side and ground.  N0057215 • **Are the voltages greater than 10 volts?**	**Yes** GO to AG3 . **No** VERIFY SJB fuse 26 (10A) and fuse 29 (5A) are OK. If OK, REPAIR the circuit in question. TEST the system for normal operation.
AG3 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the instrument cluster C220-6, circuit GD133 (BK), harness side and ground.	**Yes** GO to AG4 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0057216 • **Is the resistance less than 5 ohms?**	

AG4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION
• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AH: DTC U0100 — Lost Communication With ECM/PCM

Normal Operation

The instrument cluster sets DTC U0100 if data messages for following systems or data types are missing:

- Passive anti-theft system (PATS)
- Speed control
- Accelerator pedal position
- Transmission type
- Engine coolant temperature
- Odometer rolling count
- Fuel flow
- Malfunction indicator lamp (MIL)
- Fail safe cooling mode
- Electronic throttle control
- Charging system
- Check fuel cap
- AC clutch engaged
- Engine rpm
- Vehicle identification number (VIN)

Once the instrument cluster sets DTC U0100, multiple gauges or indicators are likely to be inoperative in the cluster. Other modules that require data from the instrument cluster all set communication DTCs and may also exhibit system function concerns.

Possible Causes

- Low battery voltage
- Communication network
- PCM

PINPOINT TEST AH: DTC U0100 — LOST COMMUNICATION WITH ECM/PCM

Test Step	Result / Action to Take
AH1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Is DTC B1318 recorded?**	**Yes** REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to AH2 .
AH2 RECHECK THE INSTRUMENT CLUSTER DTCs	
• Repeat the instrument cluster self-test. • Clear the DTCs. • **Is DTC U0100 still present?**	**Yes** GO to AH3 . For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.
AH3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND TCM AND ABS MODULE SELF-TESTS	
• Check for recorded TCM and ABS module DTCs from the continuous and on-demand self-tests. • **Is DTC U0100 recorded?**	**Yes** REFER to Section 418-00 to diagnose no communication with the PCM. **No** GO to AH4 .
AH4 CHECK THE NETWORK OPERATION	
• Carry out the network test. • **Does the PCM pass the network test?**	**Yes** GO to AH5 . **No** REFER to Section 418-00 to diagnose no communication with the PCM.
AH5 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this

• Operate the system and verify the concern is still present. • **Is the concern still present?**	time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AI: DTC U0140 — Lost Communication With Body Control Module (GEM)

Normal Operation

The instrument cluster sets DTC U0140 if data messages for following systems or data types are missing:

- Ignition switch position
- Key-in-ignition switch
- Tire pressure system
- Backlighting dimmer
- Door ajar status
- Headlamp on warning command
- Key-in-ignition warning command
- Parking brake status
- Parking brake chime request
- Brake warning indicator request
- High beam indicator request
- Daytime running lamps
- Brake fluid level low
- RF low beam circuit
- LF low beam circuit
- Fog lamp relay circuit
- Autolamp switch status
- Parking lamps circuit
- Brake lamp on status

Once the instrument cluster sets DTC U0140, multiple indicators are likely to be inoperative in the cluster. Other modules that require data from the instrument cluster will all set communication DTCs and may also exhibit system function concerns.

Possible Causes

- Low battery voltage
- Communication network
- SJB

PINPOINT TEST AI: DTC U0140 — LOST COMMUNICATION WITH BODY CONTROL MODULE (GEM)

Test Step	Result / Action to Take
AI1 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Is DTC B1318 recorded?**	**Yes** REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section.

	No GO to AI2 .
AI2 RECHECK THE INSTRUMENT CLUSTER DTCs	
• Repeat the instrument cluster self-test. • Clear the DTCs. • **Is DTC U0140 still present?**	**Yes** GO to AI3 . For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.
AI3 RETRIEVE THE RECORDED DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND AUDIO UNIT AND CLIMATE CONTROL UNIT SELF-TESTS	
• Check for recorded audio unit and climate control unit DTCs from the continuous and on-demand self-tests. • **Is DTC U0140 recorded?**	**Yes** REFER to Section 418-00 to diagnose no communication with the SJB. **No** GO to AI4 .
AI4 CHECK THE NETWORK OPERATION	
• Carry out the network test. • **Does the SJB pass the network test?**	**Yes** GO to AI5 . **No** REFER to Section 418-00 to diagnose no communication with the PCM.
AI5 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify that the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AJ: DTC U2472 — Unexpected Ignition State

Normal Operation

The instrument cluster sets DTC U2472 when it detects a descrepancy between the hardwired voltage input and the messaged ignition state inputs from the smart junction box (SJB). With the ignition switch in the START or RUN position, the instrument cluster receives voltage from the SJB through circuit CBP29 (WH/VT). With the ignition switch in the OFF position, the instrument cluster receives its keep-alive voltage from the SJB through circuit SBP26 (YE/RD).

Possible Causes

- Fuse(s)
- Circuit CBP29 (WH/VT) open or short to ground
- Circuit SBP26 (YE/RD) open or short to ground

- Instrument cluster

PINPOINT TEST AJ: DTC U2472 — UNEXPECTED IGNITION STATE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
AJ1 CHECK THE INSTRUMENT CLUSTER VOLTAGE SUPPLY • Key in OFF position. • Disconnect: Instrument Cluster C220. • Key in ON position. • Measure the voltage between the instrument cluster C220-1, circuit SBP26 (YE/RD), harness side and ground; and between the instrument cluster C220-14, circuit CBP29 (WH/VT), harness side and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to AJ2 . **No** VERIFY the SJB fuse 26 (10A) and fuse 29 (5A) are OK. If OK, REPAIR the circuit in question. TEST the system for normal operation.
AJ2 CHECK THE INSTRUMENT CLUSTER DTCs • Repeat the instrument cluster self-test. • Clear the DTCs. • **Is DTC U2472 still present?**	**Yes** GO to AJ3 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.
AJ3 CHECK THE SJB INPUT PIDs FROM THE IGNITION SWITCH • Enter the following diagnostic mode on the diagnostic tool: SJB PIDs. • Monitor the SJB PIDs IGN_A_ECU, IGN_O_ECU, IGN_R_ECU, and IGN_S_ECU while cycling the ignition switch from ACC, OFF, RUN and START. • **Do the SJB PIDs match the ignition switch position?**	**Yes** GO to AJ4 . **No** REFER to Section 211-05 to diagnose the ignition switch outputs to the SJB.

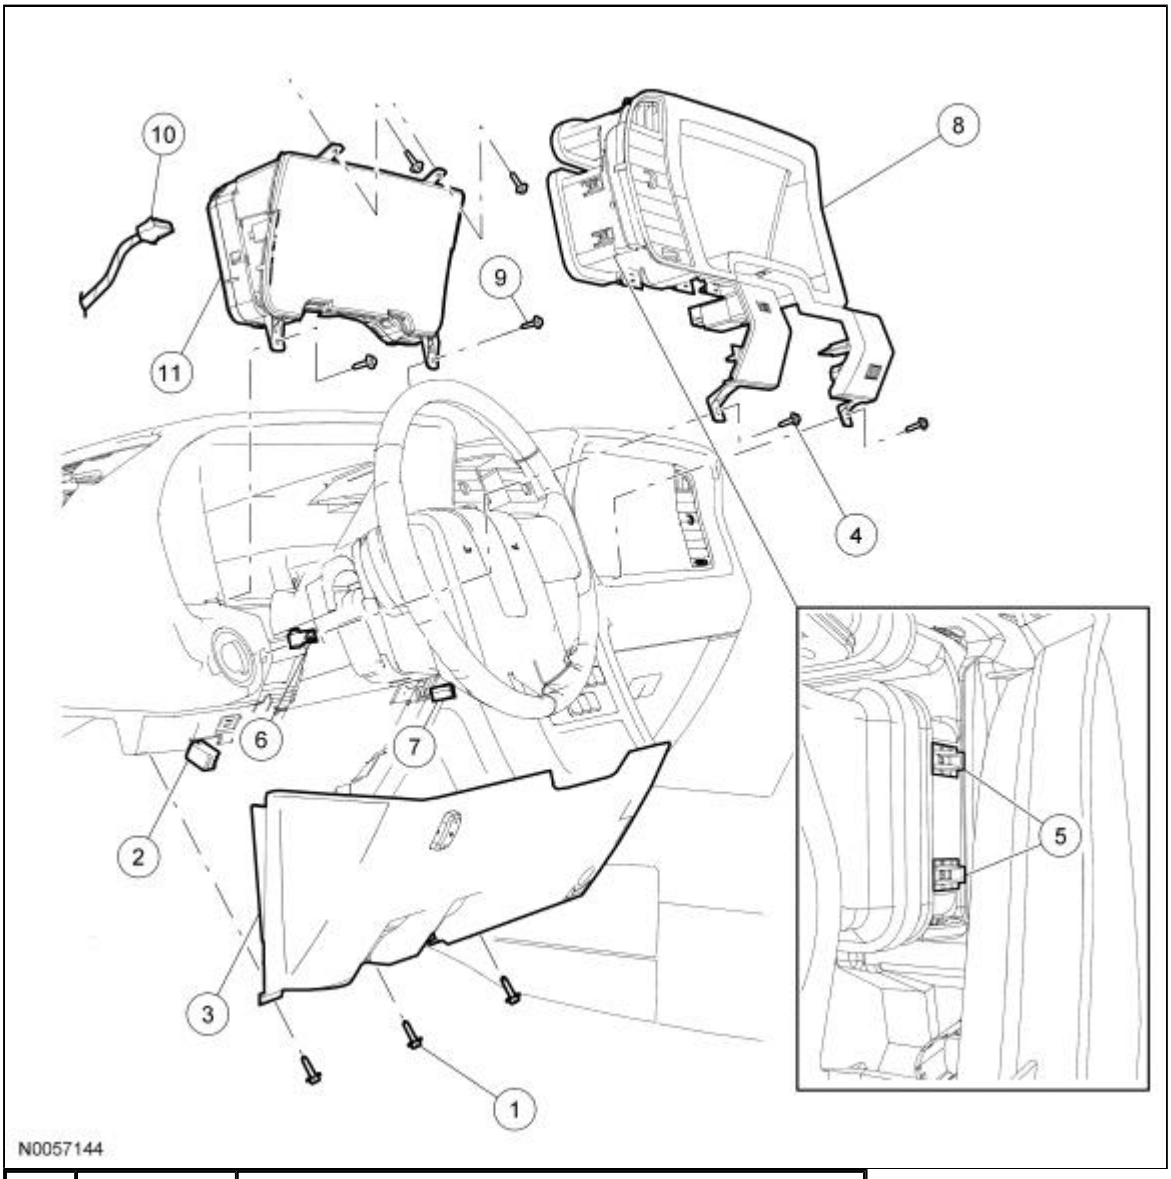
AJ4 CHECK FOR CORRECT SJB OPERATION
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.

correctly. ● Operate the system and verify that the concern is still present. ● **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Instrument Cluster

Printable View (231 KB)

NOTE: Navigator shown, Expedition similar.



Item	Part Number	Description
1	W707628	Lower steering column cover screws (3 required)
2	—	Adjustable pedal switch electrical connector (if equipped) (part of 14401)
3	78044F08	Lower steering column cover
4	W707628	Instrument cluster finish panel screws (2 required)
5	—	A/C register release tabs (part of 78044D70)
6	—	Dimmer switch electrical connector (part of 14401)
7	—	Ambient air temperature sensor electrical connector

		(if equipped) (part of 14401)
8	78044D70	Instrument cluster finish panel
9	W707628	Instrument cluster screws (4 required)
10	—	Electrical connector (part of 14401)
11	10849	Instrument cluster

Removal

All vehicles

1. If installing a new instrument cluster, upload the instrument cluster configuration information to the scan tool. For additional information, refer to Section 418-01 , Programmable Module Installation (PMI).

2. Lower the steering column to the lowest position.

3. Remove the 3 screws and the lower steering column cover.
   - Disconnect the electrical connector for the brake pedal switch (if equipped).

Navigator

4. Remove the 2 center instrument cluster finish panel screws.

5. **CAUTION: The 2 tabs on the LH A/C register must be pressed to release the LH side of the A/C register from the instrument panel or damage to the center instrument cluster finish panel will occur.**

   NOTE: The 2 tabs that retain the LH A/C register can be accessed from the backside of the instrument panel with the lower steering column cover removed.

   Press the 2 tabs on the outer edge of the LH A/C register while pulling the instrument cluster finish panel out from the instrument panel.

Expedition

6. Remove the 2 screws and pull the center instrument cluster finish panel straight out to release the retainers.

All vehicles

7. Disconnect the dimmer switch electrical connector.

8. If equipped, disconnect the ambient air temperature sensor electrical connector and air tube from the instrument cluster finish panel and remove the finish panel.

9. Remove the 4 screws and the instrument cluster.
   - Disconnect the electrical connector.

Installation

1. Position the instrument cluster and install the 4 screws.
   - Connect the electrical connector.

2. Position the instrument cluster finish panel and install the ambient air temperature sensor electrical connector and air tube.

3. Connect the dimmer switch electrical connector.

4. Install the instrument cluster finish panel and the 2 screws.

5. Position the lower steering column cover and install the 3 screws.
   - Connect the electrical connector for the brake pedal switch (if equipped).

6. If installing a new instrument cluster, upload the instrument cluster configuration information to the scan tool. For additional information, refer to Section 418-01 , PMI.

7. **NOTE:** If a new instrument cluster is installed, the instrument cluster and the powertrain control module (PCM) require a parameter reset to allow the instrument cluster and the PCM to recognize each other. Failure to carry out the parameter reset to the instrument cluster and the PCM may result in a no start condition.

   NOTE: If equipped, the vehicles passive anti-theft system (PATS) keys must be programmed to the new instrument cluster.

   Carry out the parameter reset and key programming procedure. For additional information, refer to Section 419-01 .

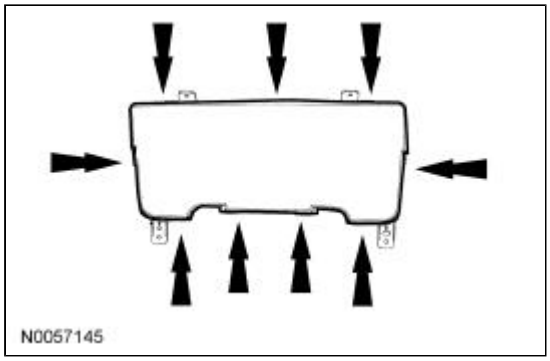
Instrument Cluster Lens

Printable View (88 KB)

Removal and Installation

1. Remove the instrument cluster. For additional information, refer to Instrument Cluster in this section.

2. Release the 9 retaining tabs and remove the instrument cluster lens.



3. **CAUTION: Be sure that all the tabs are correctly located to avoid damage to the new lens and fully locked in place to reduce the potential for noise.**

   To install, reverse the removal procedure.

Horn

Printable View (63 KB)

The horn system consists of the following components:

- Horn switch (part of the driver air bag module)
- Clockspring
- Horn relay (part of the smart junction box [SJB])
- Horn

For removal and installation of the driver air bag module, refer to Section 501-20B .

Horn

Printable View (168 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

The smart junction box (SJB) supplies the switched and control voltage to the horn relay (part of the SJB). When the horn switch (part of the steering wheel) is pressed, ground is supplied to the SJB through the clockspring. The SJB then energizes the horn relay sending voltage to the horn, enabling the horn to sound.

The SJB provides a momentary ground to the horn relay when the anti-theft system is armed, and an on then off ground when an intrusion is detected or the panic button is pressed on the remote keyless entry (RKE) key fob.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Horn • Horn switch (part of the steering wheel)	• Smart junction box (SJB) fuse 24 (20A) • Circuitry

	• Clockspring • SJB

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The horn is inoperative	• Fuse • Circuitry • Steering wheel switch harness • Horn • Clockspring • Horn switch (part of the steering wheel) • Smart junction box (SJB)	• Go To Pinpoint Test A .
• The horn is always on	• Circuitry • Steering wheel switch harness • Clockspring • Horn switch (part of the steering wheel) • SJB	• Go To Pinpoint Test B .

Pinpoint Tests

Pinpoint Test A: The Horn Is Inoperative

Refer to Wiring Diagrams Cell 44 , Horn/Cigar Lighter for schematic and connector information.

Normal Operation

The smart junction box (SJB) supplies the switched and control voltage to the horn relay (part of the SJB). When the horn switch (part of the steering wheel) is pressed, the switch closes and ground is applied from the steering wheel switch harness through the clockspring to the horn relay through circuit SRH01 (YE/RD). The horn relay is then energized, applying voltage to the horn through circuit CRH02 (BU/WH), enabling the horn to sound. Ground for the horn is supplied through circuit GD120 (BK/GN).

Possible Causes

- Fuse
- Circuit CRH02 (BU/WH) open
- Circuit GD120 (BK/GN) open
- Circuit GD133 (BK) open
- Circuit SRH01 (YE/RD) open
- Steering wheel switch harness
- Horn
- Clockspring
- Horn switch (part of the steering wheel)
- SJB

PINPOINT TEST A: THE HORN IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
A1 CHECK THE SJB OUTPUT	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: SJB Active Commands. • Select the SJB horn active command. Command the horn active command on and then off. • **Does the horn sound when commanded on?**	**Yes** GO to A2. **No** GO to A6.
A2 CHECK CIRCUIT SRH01 (YE/RD) FOR AN OPEN	
• Depower the supplemental restraint system (SRS). Refer to Section 501-20B. • Disconnect: SJB C2280g. • Disconnect: Clockspring C218. • Measure the resistance between the clockspring C218-8, circuit SRH01 (YE/RD), harness side and the SJB C2280g-41, circuit SRH01 (YE/RD), harness side.  N0053601 • **Is the resistance less than 5 ohms?**	**Yes** GO to A3. **No** REPAIR the circuit. REPOWER the SRS. REFER to Section 501-20B. CLEAR the DTCs. REPEAT the self-test.
A3 CHECK THE CLOCKSPRING FOR AN OPEN	
• Remove the driver air bag module. Refer to Section 501-20B. • Disconnect: Upper Clockspring Connector. • Measure the resistance between the clockspring C218 pin 8, component side and the upper clockspring connector pin 1, component side.  N0053602 • **Is the resistance less than 5 ohms?**	**Yes** GO to A4. **No** INSTALL a new clockspring. INSTALL the driver air bag module. REFER to Section 501-20B. CLEAR the DTCs. REPEAT the self-test.
A4 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Measure the resistance between the clockspring C218A-5, circuit GD133 (BK), harness side and ground.	**Yes** GO to A5.

 N0026446 • **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. REPOWER the SRS. REFER to Section 501-20B . TEST the system for normal operation.
A5 CHECK THE STEERING WHEEL SWITCH HARNESS FOR DAMAGE OR OPENS • Inspect the steering wheel switch harness for damage or opens. • **Is the steering wheel switch harness OK?**	**Yes** INSTALL a new steering wheel. REFER to Section 211-04 . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR or INSTALL a new steering wheel switch harness. CLEAR the DTCs. REPEAT the self-test.
A6 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN • Key in OFF position. • Disconnect: Horn C131. • Measure the resistance between the horn C131-1, circuit GD120 (BK/GN), harness side and ground.  A0032815 • **Is the resistance less than 5 ohms?**	**Yes** GO to A7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A7 CHECK CIRCUIT CRH02 (BU/WH) FOR VOLTAGE • Measure the voltage between the horn C131-2, circuit CRH02 (BU/WH), harness side, and the horn C131-1, circuit GD120 (BK/GN), harness side, while pressing the horn switch.  N0013171	**Yes** INSTALL a new horn. CLEAR the DTCs. REPEAT the self-test. **No** VERIFY the SJB fuse 24 (20A) is OK. If OK, GO to A8 .

• **Is the voltage greater than 10 volts?**	
A8 CHECK CIRCUIT CRH02 (BU/WH) FOR AN OPEN	
• Disconnect: SJB C2280a. • Measure the resistance between the SJB C2280a-5, circuit CRH02 (BU/WH), harness side, and the horn C131-2, circuit CRH02 (BU/WH), harness side.  N0053603 • **Is the resistance less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A9 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: The Horn Is Always On

Refer to Wiring Diagrams Cell 44 , Horn/Cigar Lighter for schematic and connector information.

Normal Operation

The smart junction box (SJB) supplies the switched and control voltage to the horn relay (part of the SJB). When the horn switch (part of the steering wheel) is pressed, the switch closes and ground is applied from the steering wheel switch harness through the clockspring to the horn relay through circuit SRH01 (YE/RD). The horn relay is then energized, applying voltage to the horn through circuit CRH02 (BU/WH), enabling the horn to sound.

Possible Causes

- Circuit CRH02 (BU/WH) short to voltage
- Circuit SRH01 (YE/RD) short to ground
- Steering wheel switch harness
- Clockspring
- Horn switch (part of the steering wheel)
- SJB

PINPOINT TEST B: THE HORN IS ALWAYS ON

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
B1 CHECK CIRCUIT CRH02 (BU/WH) FOR A SHORT TO VOLTAGE • Key in OFF position. • Disconnect: SJB C2280a. • **Does the horn continue to sound?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B2 .
B2 CHECK THE HORN SWITCH INPUT • Disconnect: SJB C2280g. • Connect: SJB C2280a. • **Does the horn continue to sound?**	**Yes** GO to B6 . **No** GO to B3 .
B3 CHECK CIRCUIT SRH01 (YE/RD) FOR A SHORT TO GROUND • Depower the supplemental restraint system (SRS). Refer to Section 501-20B . • Disconnect: Clockspring C218. • Measure the resistance between the clockspring C218-8, circuit SRH01 (YE/RD), harness side and ground.  N0026775 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit. REPOWER the SRS. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
B4 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND • Remove the driver air bag module. Refer to Section 501-20B . • Connect: Clockspring C218. • Measure the resistance between the SJB C2280g-41, circuit SRH01 (YE/RD), harness side and ground.	**Yes** GO to B5 . **No** INSTALL a new clockspring. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.

 N0053604 • **Is the resistance greater than 10,000 ohms?**	
B5 CHECK THE STEERING WHEEL SWITCH HARNESS FOR DAMAGE OR SHORTS • Inspect the steering wheel switch harness for damage or shorts. • **Is the steering wheel switch harness OK?**	**Yes** INSTALL a new steering wheel. REFER to Section 211-04 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new steering wheel switch harness. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
B6 CHECK FOR CORRECT SJB OPERATION • Disconnect all the SJB connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Clock

Printable View (62 KB)

The stand-alone electric analog clock, available in the Navigator only, is centrally located on the instrument panel and displays time in a 12-hour format. The clock is backlit when the headlamps and parking lamps are on. The Expedition clock is integrated into the radio.

Clock

Printable View (119 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Clock	• Smart junction box (SJB) fuse 14 (10A) • Circuitry • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, verify the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The clock operation is inoperative	• Fuse • Circuitry • Clock • Smart junction box (SJB)	• Go To Pinpoint Test A .

• The clock operation is erratic	• Clock	• INSTALL a new clock. REFER to Clock in this section.

Pinpoint Tests

Pinpoint Tests A: The Clock Operation Is Inoperative

Refer to Wiring Diagrams Cell 44 , Horn/Cigar Lighter for schematic and connector information.

Normal Operation

The clock receives battery voltage from the smart junction box (SJB) through circuit SBP14 (BN/RD). Ground for the clock is supplied through circuit GD138 (BK/WH).

Possible Causes

- Fuse
- Circuit SBP14 (BN/RD) open
- Circuit GD138 (BK/WH) open
- Clock
- SJB

PINPOINT TEST A: THE CLOCK OPERATION IS INOPERATIVE

CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

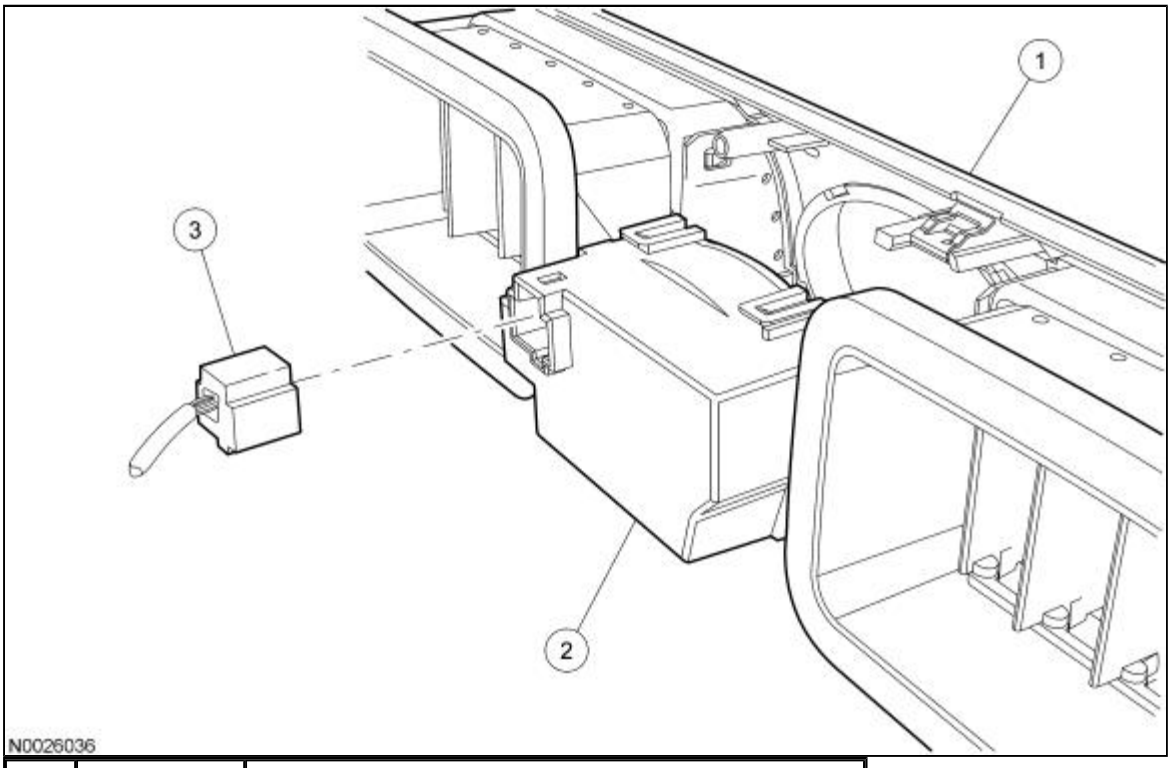
Test Step	Result / Action to Take
A1 CHECK CIRCUIT SBP14 (BN/RD) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Clock C2016. • Measure the voltage between the clock C2016-6, circuit SBP14 (BN/RD), harness side and ground.  A0039279 • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** VERIFY that SJB fuse 14 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If the system is still inoperative, GO to A3 .
A2 CHECK CIRCUIT GD138 (BK/WH) FOR AN OPEN	
• Measure the resistance between the clock C2016-5, circuit GD138 (BK/WH), harness side and ground.	**Yes** INSTALL a new clock. REFER to Clock in this section. TEST the system for normal operation.

 A0039280 • **Is the resistance less than 5 ohms?**	**No** REPAIR the circuit. TEST the system for normal operation.
A3 CHECK CIRCUIT SBP14 (BN/RD) FOR AN OPEN	**Yes** GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.
• Disconnect: SJB C2280g. • Measure the resistance between the SJB C2280g-4, circuit SBP14 (BN/RD), harness side and the clock C2016-6, circuit SBP14 (BN/RD), harness side.  N0057152 • **Is the resistance less than 5 ohms?**	
A4 CHECK FOR CORRECT SJB OPERATION	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**	

Clock

Printable View (131 KB)



Item	Part Number	Description
1	04320	Instrument cluster center finish panel
2	15000	Clock
3	—	Clock electrical connector (part of 14401 wiring harness)

Removal and Installation

1. Remove the instrument cluster center finish panel. For additional information, refer to Section 501-12 .
2. Disconnect the electrical connector.
3. Release the retaining clips and remove the clock from the instrument cluster center finish panel.
4. To install, reverse the removal procedure.

Information And Message Center

Printable View (72 KB)

The message center display is a green (Expedition) or white (Navigator) vacuum fluorescent, fixed format, 2-line display integrated into the center of the instrument cluster and is controlled by the message center switches. Refer to the Owner's Literature for operating instructions.

The message center provides the following features:

- Information displays
- Setup displays
- System check messages
- System warning messages

The message center information can be selected through a set of 3 buttons:

- INFO
- SETUP
- RESET

Message Center Configuration

The message center has the capability to configure items such as oil life, language, units (English or metric), autolamp delay, to enable/disable a variety of options such as easy entry/easy exit (if equipped) and air suspension (if equipped), or to carry out calibrations/settings on items such as the compass. The oil life is displayed in percent and is preset to a maximum of approximately 8,000 km (5,000 miles) or 180 days. For additional information on configuration of the oil life, refer to Message Center Configuration in this section. For additional information on other configurable items, refer to the Owner's Literature.

On configurable items such as parking aid on/off and air suspension on/off (if equipped) the message center indicates the appropriate selection (ON/OFF) by bracketing the selection. An example is as follows: PARKING AID <ON> OFF. The parking aid is enabled or on in the previous example. If the driver selects the parking aid off, the display would be: PARKING AID ON <OFF>.

Reconfigurable Telltale Indicators

The message center displays reconfigurable telltale indicators in the RH side of the display area. Reconfigurable telltale indicators replace indicators that have been typically displayed in the instrument cluster and use the same iconic representation. For additional information, refer to Section 413-01 .

Compass and Outside Air Temperature Displays

The message center provides a compass display and uses directional information sent from a compass module, located on the underside of the inside rear view mirror.

The message center provides an outside air temperature display on vehicles that are not equipped with electronic automatic temperature control (EATC). For additional information, refer to Section 412-00 .

Information Displays

The information displays are non-timed modes. The selected mode remains on until the driver presses a message center button to change the mode or it is overridden by another mode.

The information display modes are:

- Odometer
- Trip odometer
- Outside air temperature display (if equipped)
- Compass
- Distance to empty (DTE)
- Average fuel economy
- Instantaneous fuel economy
- Blank display

For additional information on the odometer and trip odometer, refer to Section 413-01 .

Setup Displays

The setup displays are timed modes and terminate after a finite interval. The setup display modes are:

- System check
- Oil life
- Units English/metric
- Autolamp delay in seconds (if equipped)
- Easy entry/easy exit seat on/off (if equipped)
- Air suspension on/off (if equipped)
- Autolocks on/off (if equipped)
- Power liftgate on/off (if equipped)
- Power running boards auto/off/out (if equipped)
- Compass zone
- Compass calibration
- Language

System Check

The system check provides a check of all the monitored systems on the vehicle. The system check scrolls through each of the monitored systems and provides a visual indication to report out the status of each system. The message center displays OK for approximately 2 seconds if the system check does not detect a fault in the system and displays a warning message for approximately 2 seconds if the system check detects a fault in the system. Press the RESET button to scroll through the system check messages.

The system check messages are:

- OIL LIFE
- CHARGING SYSTEM
- WASHER FLUID LOW
- DOOR STATUS
- LIFTGATE/GLASS
- BRAKE FLUID LEVEL
- TIRE PRESSURE SYSTEM (if equipped)
- AIR SUSPENSION SYSTEM (if equipped)
- FUEL LEVEL

System Warning Messages

The system warning messages alert the operator to possible problems or malfunctions in the vehicle operating systems. The message center displays the last selected feature if there are no additional

warning messages. Once a warning message has been displayed, the message must be acknowledged to allow full functionality of the message center. Press the RESET to acknowledge and clear the warning message. The warning messages are divided into 4 categories:

- Cannot be cleared until the condition is corrected.
- Reappear on the display 10 minutes from the reset if the condition has not been corrected.
- Do not reappear until an ignition OFF-ON cycle has been completed.
- Reappear if the condition clears then reoccurs within the same ignition cycle ON-OFF cycle.

The warning display that cannot be reset is:

- PARK AID ON/OFF

The warning messages that reoccur after 10 minutes are:

- CHECK BRAKE SYSTEM
- XXX MILES (km) TO E FUEL LOW
- PARK BRAKE ENGAGED

The warning messages that display whenever the ignition switch is turned from the OFF position to the ON position are:

- BRAKE FLUID LEVEL LOW
- CHECK PARK BRAKE
- WASHER FLUID LEVEL LOW
- OIL CHANGE REQUIRED
- XXX% OIL LIFE CHANGE SOON
- CHECK AIR SUSPENSION SYSTEM (if equipped)

The warning messages that return after a condition has cleared then reoccurs within the same ignition ON-OFF cycle are:

- DRIVER DOOR AJAR
- PASSENGER DOOR AJAR
- REAR LEFT DOOR AJAR
- REAR RIGHT DOOR AJAR
- LIFTGATE/GLASS AJAR
- CHECK CHARGING SYSTEM
- TIRE PRESSURE SENSOR FAULT (if equipped)
- LOW TIRE PRESSURE (if equipped)
- TIRE PRESSURE MONITOR FAULT (if equipped)
- 4X4 SHIFT IN PROGRESS (if equipped)
- AIR SUSPENSION OFF (if equipped)

The message center displays warning messages that indicate a system state during the operation of the four wheel drive (4WD) system (late build only). The displayed warning messages are as follows:

- FOR 4X4 STOP VEHICLE (if equipped)
- FOR 4X4 LOW APPLY BRAKE (if equipped)
- FOR 4X4 LOW SHIFT TO N (if equipped)
- TO EXIT 4X4 LOW STOP VEHICLE (if equipped)
- TO EXIT 4X4 LOW APPLY BRAKE (if equipped)
- TO EXIT 4X4 LOW SHIFT TO N (if equipped)

The message center displays warning messages that indicate a system state during repair procedures

related to the tire pressure monitoring system (TPMS). The displayed warning messages are as follows:

- TRAIN LEFT TIRE (if equipped)
- TRAIN LEFT REAR TIRE (if equipped)
- TRAIN RIGHT FRONT TIRE (if equipped)
- TRAIN RIGHT REAR TIRE (if equipped)
- TRAIN SPARE TIRE (if equipped)
- TRAINING COMPLETE (if equipped)
- TIRES NOT TRAINED-REPEAT (if equipped)

The message center displays warning messages that indicate a system state during repair procedures related to the compass display. The displayed warning messages are as follows:

- RESET FOR ZONE SETTING
- ZONE XX RESET = CHANGE
- RESET FOR CALIBRATION
- CIRCLE SLOWLY TO CALIBRATE
- CALIBRATION COMPLETED
- COMPASS DATA ERROR

The message center displays warning messages that indicate a system state during repair procedures related to the oil life and oil life start value. The displayed warning messages are as follows:

- OIL LIFE XXX% HOLD RESET = NEW
- OIL LIFE SET TO XXX%

Information And Message Center

Printable View (215 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The message center is an integral part of the instrument cluster that receives and acts upon much of the same information that is input and used to operate the instrument cluster gauges, indicators, warning indicators and reconfigurable telltale indicators. The message center, located in the center of the instrument cluster is a vacuum fluorescent 2-line display. The message center electronic functions use both hardwired, and the controller area network (CAN) circuitry to transmit and receive information.

Whenever conditions are present that require a warning message, the message center replaces the last selected display with the new warning display. Once the message is reset or cleared, the message center returns to the last selected display. If multiple warnings are present, the message center displays each warning for approximately 4 seconds. Warning messages are also generally associated with other observable instrument cluster indications. For example, when the LH front door is opened, the message center displays the message DRIVER DOOR AJAR along with the door ajar reconfigurable telltale indicator. This allows the message center to be a more informative supplement to the instrument cluster gauges and indicators.

It is very important to understand:

- where the input (command) originates.
- all the information (messages) necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- if the module that received the input (message) controls the output of the feature, or if it outputs a message over the CAN to another module.
- which module controls the output of the feature.

Instrument Cluster Messages

NOTE: Whenever a message is suspected as missing, confirmed by a missing message DTC, it is important to look for other symptoms that may also be present in the instrument cluster and throughout the vehicle. Once a DTC is set in the instrument cluster it may be helpful to review the complete message list available in Section 418-00 to see what other modules also rely on the same message and run the self-test for those modules. If the message is missing from other modules, the same DTC may also be set in those modules. Confirmation of missing messages common to multiple modules may

indicate that the originating module is the source of the concern or the communication network may be experiencing some problems.

The instrument cluster uses input messages from other modules to control the gauges, informational indicators, warning indicators and reconfigurable telltale indicators over the communication networks. If a required message is missing or invalid for less than 5 seconds, the gauge or indicator that requires the message remains at the last commanded state based upon the last known good message. For example, if the message is missing the O/D off status for less than 5 seconds and the O/D off indicator was ON (O/D cancelled), the indicator remains in the ON state until the next good message is received. If the message remains missing or invalid for greater than 5 seconds, the instrument cluster sets a U-code DTC and the output becomes a default action for the indicator or gauge. Each indicator or gauge utilizes a different default strategy depending on the nature of the indication. Refer Section 413-01 for further descriptions of the default action specific to each indicator or gauge. If the messaged input to the cluster returns at any time, the normal function of the gauge or indicator resumes.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Brake fluid level
• Engine coolant level
• Engine oil level
• Fuel level
• Washer fluid level
• Fuel tank
• Accessory drive belt
• Tire pressure
	• Smart junction box (SJB) fuse(s):
	  ▪ 26 (10A)
	  ▪ 29 (5A)
	  ▪ 31 (10A)
	• Circuitry
	• Compass module
	• Message center switch
	• Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test:
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the instrument cluster.

9. If the DTCs retrieved are related to the concern, refer to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Instrument Cluster Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1255	Air Temperature External Sensor Circuit Open	Go To Pinpoint Test E .
B1257	Air Temperature External Sensor Circuit Short to Ground	Go To Pinpoint Test E .
B2097	Compass Module Failure	Go To Pinpoint Test C .
U2013	Compass Module Is Not Responding	Go To Pinpoint Test C .
All other DTCs	—	REFER to Section 413-01 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The message center is not operating correctly	• Message center switches • Instrument cluster	• If equipped with a message center cluster, Go To Pinpoint Test A . • If equipped with a base instrument cluster, VERIFY that the instrument cluster is operating correctly. ▪ If the instrument cluster operates correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ▪ If the instrument cluster is not operating correctly, REFER to Section 413-01 .
• The message center display is blank	• Message center	• PRESS the INFO button on the message center

	• display setting • Instrument cluster	to make sure the display is not set to a blank display. ▪ If the message center display turns on, the system is operating normally at this time. The message center display was set to a blank display. ▪ If the message center display is still blank, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
• Not all segments of the display illuminate	• Instrument cluster	• INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
• The message center switch does not operate correctly	• Circuitry • Message center switch • Instrument cluster	• Go To Pinpoint Test B .
• The compass is inoperative	• Fuse • Circuitry • Compass sensor module	• Go To Pinpoint Test C .
• The compass is inaccurate	• Zone setting • Calibration • Compass sensor module	• Go To Pinpoint Test D .
• The outside air temperature sensor does not operate correctly	• Circuitry • Outside air temperature sensor • Instrument cluster	• Go To Pinpoint Test E .
• The distance to empty (DTE)/average/instantaneous fuel economy display is inoperative	• Instrument cluster	• CHECK the operation of the speedometer, the fuel gauge and the odometer. ▪ If the speedometer, the fuel gauge and the odometer do not operate correctly, REFER to Section 413-

		01 . ■ If the speedometer, the fuel gauge and the odometer operate correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
• The PARKING AID ON/OFF warning is inoperative	• Instrument cluster configuration • Parking aid system • Instrument cluster	• Go To Pinpoint Test F .
• The XXX MILES/KM TO E FUEL LOW warning is inoperative	• Fuel gauge • Instrument cluster	• VERIFY that the fuel gauge operates correctly and that there is less than approximately 3 gallons of fuel in the tank. ■ **NOTE:** The miles to empty warning only displays at 80 km (50 miles) to empty which is equal to approximately 3-5 gallons of fuel remaining. This is a learned strategy based on fuel economy and changes from its default setting. If the fuel gauge operates correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If the fuel gauge does not operate correctly, REFER to Section 413-01 .
• The CHECK BRAKE SYSTEM, CHECK PARK BRAKE, PARK BRAKE ENGAGED, or BRAKE	• Parking brake switch • Brake fluid	• OBSERVE the brake warning indicator. ■ If the brake

FLUID LEVEL LOW warning is inoperative	level switch • Smart junction box (SJB) • Instrument cluster	warning indicator operates correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If the brake warning indicator does not operate correctly, REFER to Section 413-01 .
• The WASHER FLUID LEVEL LOW warning is inoperative	• Circuitry • Washer fluid level switch • Instrument cluster	• OBSERVE the low washer fluid level reconfigurable telltale indicator. ■ If the low washer fluid level reconfigurable telltale indicator operates correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If the low washer fluid level reconfigurable telltale indicator does not operate correctly, REFER to Section 413-01 .
• The XXX% OIL LIFE CHANGE OIL SOON or OIL CHANGE REQUIRED warning is inoperative	• Instrument cluster	• INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
• The CHECK AIR SUSPENSION SYSTEM or AIR SUSPENSION OFF warning is inoperative (if equipped)	• Instrument cluster configuration • Air suspension system • Air suspension module • Instrument cluster	• Go To Pinpoint Test G .
• The DRIVER DOOR, PASSENGER DOOR, REAR LEFT DOOR, REAR RIGHT DOOR or LIFTGATE/GLASS	• Interior lamps • SJB	• OPEN and CLOSE each door, liftgate and liftgate glass and VERIFY that the interior lamps

AJAR warning is inoperative		operate correctly. ■ If the interior lamps do not operate correctly from each door, liftgate and liftgate glass, REFER to Section 417-02 .
	• Instrument cluster	• VERIFY that the door ajar reconfigurable telltale indicator operates correctly. ■ If the door ajar reconfigurable telltale indicator operates correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If the door ajar reconfigurable telltale indicator does not operate correctly, REFER to Section 413-01 .
• The CHECK CHARGING SYSTEM warning is inoperative	• Instrument cluster	• VERIFY that the charge reconfigurable telltale indicator operates correctly. ■ If the charge reconfigurable telltale indicator operates correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If the charge reconfigurable telltale indicator does not operate correctly, REFER to Section 413-01 .
• The TIRE PRESSURE SENSOR FAULT, LOW TIRE PRESSURE or TIRE PRESSURE MONITOR FAULT warning is inoperative (if equipped)	• Instrument cluster	• VERIFY that the tire pressure monitoring system (TPMS) warning indicator operates correctly. ■ If the TPMS

		reconfigurable telltale indicator operates correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If the TPMS reconfigurable telltale indicator does not operate correctly, REFER to Section 413-01 .
• The 4X4 SHIFT IN PROGRESS warning is inoperative	• Instrument cluster configuration • Four wheel drive (4WD) system • 4WD control module • Instrument cluster	• Go To Pinpoint Test H .

Pinpoint Tests

Pinpoint Test A: The Message Center Is Not Operating Correctly

Normal Operation

The message center is located in the center of the instrument cluster between the tachometer and the speedometer in the vacuum fluorescent display area. The message center is integral to the instrument cluster and uses the same voltage supply as the instrument cluster. The RUN/START voltage is supplied to the instrument cluster on circuit CBP29 (WH/VT) and the keep alive B+ voltage is received on circuit SBP26 (YE/RD). The instrument cluster ground is received through circuit GD133 (BK). The message center functionality is controlled through the message center switches, which are hardwired to the instrument cluster through the input circuit CMC29 (GN/VT) and the return circuit VMC29 (YE).

Possible Causes

- Message center switches
- Instrument cluster

PINPOINT TEST A: THE MESSAGE CENTER IS NOT OPERATING CORRECTLY

Test Step	Result / Action to Take
A1 CHECK THE INSTRUMENT CLUSTER ODOMETER OPERATION	

• Key in ON position. • Observe the odometer display in the message center. • **Is the odometer displayed?**	**Yes** If the display is blank, PRESS the INFO button to see if the message center was previously set to the blank display. If the display remains blank, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. If individual messages are inoperative, GO to Symptom Chart . If the INFO, SETUP or RESET buttons are inoperative, Go To Pinpoint Test B . **No** REFER to Section 413-01 .

Pinpoint Test B: The Message Center Switch Does Not Operate Correctly

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

The message center functionality is controlled through the message center switch, which is hardwired to the instrument cluster through the input circuit CMC29 (GN/VT) and the return circuit VMC29 (YE). There are 3 message center switch buttons with each button operating a switch that uses different resistance values. The instrument cluster sends out a reference voltage to the message center switch on the input circuit and monitors the input voltage when a message center switch button is pressed. The input voltage will vary depending upon the resistance of each button, providing a specific indication to the instrument cluster which switch is pressed.

Possible Causes

- Circuit CMC29 (GN/VT) open or short to ground
- Circuit VMC29 (YE) open or short to ground
- Message center switch
- Instrument cluster

PINPOINT TEST B: THE MESSAGE CENTER SWITCH DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
B1 CHECK THE MESSAGE CENTER SWITCH PIDs	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Select and monitor the instrument cluster PID INFOSW, SETUPSW, and RES_SW, while pressing each message center switch button (INFO, SETUP and RESET). • **Does the PID agree with the button position?**	**Yes** GO to B4 . **No** GO to B2 .
B2 CHECK CIRCUIT CMC29 (GN/VT) FOR AN OPEN AND SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Disconnect: Message Center Switch C253. • Measure the resistance between the instrument cluster C220-	**Yes** GO to B3 . **No**

19, circuit CMC29 (GN/VT), harness side and the message center switch C253-3, circuit CMC29 (GN/VT), harness side; and between the instrument cluster C220-19, circuit CMC29 (GN/VT), harness side and ground.  N0057204 • **Is the resistance less than 5 ohms between the instrument cluster and the message center switch, and greater than 10,000 ohms between the instrument cluster and ground?**	REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B3 CHECK CIRCUIT VMC29 (YE) FOR AN OPEN AND SHORT TO GROUND	
• Measure the resistance between the instrument cluster C220-20, circuit VMC29 (YE), harness side and the message center switch C253-2, circuit VMC29 (YE), harness side; and between the instrument cluster C220-20, circuit VMC29 (YE), harness side and ground.  N0057205 • **Is the resistance less than 5 ohms between the instrument cluster and the message center switch, and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** INSTALL a new message center switch. REFER to Message Center Switch in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test C: The Compass Is Inoperative

Normal Operation

The compass sensor module receives voltage from the smart junction box (SJB) through circuit CBP31 (BU/OG) and is grounded through circuit GD133 (BK). The compass sensor module communicates the vehicle direction to the instrument cluster through the compass communication data plus circuit VMC31 (YE/GN) and compass communication data minus circuit VMC30 (BU/GY).

DTC B2097 — sets in continuous memory if the instrument cluster detects invalid data sent from the compass module.

DTC U2013 — is a continuous memory and on-demand DTC that sets if the instrument cluster is missing the compass data from the compass module. If the instrument cluster fails to receive the compass data, the instrument cluster sets DTC U2013 and defaults the compass display to (----).

Possible Causes

- Fuse
- Circuit CBP31 (BU/OG) open
- Circuit GD133 (BK) open
- Circuit VMC30 (BU/GY) open or short to ground
- Circuit VMC31 (YE/GN) open or short to ground
- Compass sensor module

PINPOINT TEST C: THE COMPASS IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
C1 RETRIEVE THE RECORDED DTCs FROM THE INSTRUMENT CLUSTER CONTINUOUS AND ON-DEMAND SELF-TESTS	
• Check for instrument cluster DTCs from the continuous and on-demand self-tests. • **Is DTC B2097 recorded?**	**Yes** INSTALL a new compass module. REPEAT the self-test. CLEAR the DTCs. **No** If DTC U2013 is recorded, GO to C2 . For all other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Chart in this section.
C2 CHECK CIRCUIT CBP31 (BU/OG) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Compass Sensor Module C909. • Key in ON position. • Measure the voltage between the compass sensor module C909-3, circuit CBP31 (BU/OG), harness side and ground.	**Yes** GO to C3 . **No** VERIFY the SJB fuse 31 (10A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 GK9616-A • **Is the voltage greater than 10 volts?**	
C3 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the compass sensor module C909-4, circuit GD133 (BK), harness side and ground.  GK9617-A • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C4 CHECK CIRCUIT VMC31 (YE/GN) FOR AN OPEN AND SHORT TO GROUND	
• Disconnect: Instrument Cluster C220. • Measure the resistance between the instrument cluster C220-10, circuit VMC31 (YE/GN), harness side and the compass sensor module C909-1, circuit VMC31 (YE/GN), harness side; and between the instrument cluster C220-10, circuit VMC31 (YE/GN), harness side and ground.  N0058802 • **Is the resistance less than 5 ohms between the instrument cluster and the compass sensor module, and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** GO to C5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C5 CHECK CIRCUIT VMC30 (BU/GY) FOR AN OPEN AND SHORT TO GROUND	
• Measure the resistance between the instrument cluster C220-11, circuit VMC30 (BU/GY), harness side and the compass sensor module C909-2, circuit VMC30 (BU/GY), harness side; and between the instrument cluster C220-11, circuit VMC30 (BU/GY), harness side and ground.	**Yes** INSTALL a new compass sensor module. SET the zone. REFER to Compass Zone Adjustment — With Message

 • **Is the resistance less than 5 ohms between the instrument cluster and the compass sensor module, and greater than 10,000 ohms between the instrument cluster and ground?**	Center or Compass Zone Adjustment — Without Message Center in this section. CALIBRATE the compass. REFER to Compass Calibration — With Message Center or Compass Calibration — Without Message Center in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Compass Is Inaccurate

Normal Operation

The compass sensor module communicates the vehicle direction to the instrument cluster through the compass communication data plus circuit VMC31 (YE/GN) and compass communication data minus circuit VMC30 (BU/GY). The magnetic fields generated by the earths north and south poles are divided into zones that differ from each other with respect to how the magnetic fields appear. The magnetic north can change by up to 4 degrees between zones and become noticeable across multiple zones. The compass zone must be set to the correct zone for the compass to read accurately. Factors within the vehicle may affect the ability of the compass module to accurately read the magnetic north. Calibrating the compass allows the compass module to compensate for vehicle factors that influence the accuracy of the compass.

NOTE: Outside factors such as bridges, steel structures, tall buildings and power lines also affect compass accuracy.

Possible Causes

- Compass sensor module
- Zone setting
- Calibration

PINPOINT TEST D: THE COMPASS IS INACCURATE

Test Step	Result / Action to Take
D1 CHECK THE COMPASS ZONE SETTING AND CALIBRATION	
• Set the zone. Refer to Compass Zone Adjustment — With Message Center or Compass Zone Adjustment — Without Message Center in this section. • Calibrate the compass. Refer to Compass Calibration — With Message Center or Compass Calibration — Without	**Yes** The compass is OK. **No** INSTALL a new compass sensor module. SET the zone. REFER to Compass Zone Adjustment — With Message Center or Compass Zone Adjustment — Without Message Center in this section. CALIBRATE the compass. REFER to Compass Calibration — With Message Center or Compass Calibration — Without Message Center in this section. TEST the system for normal operation.

Message Center in this section. • **Does the compass calibrate correctly?**	

Pinpoint Test E: The Outside Air Temperature Sensor Does Not Operate Correctly

Normal Operation

The outside air temperature sensor is mounted on the radiator core support in front of the radiator and A/C condenser and is hardwired to the instrument cluster through input circuit VH407 (YE/GN) and return circuit VMC29 (YE). The instrument cluster provides a reference voltage to the ambient air temperature sensor and monitors the change in voltage resulting from changes in resistance as determined by outside air temperature. When the engine has been off for 2 hours, or the engine temperature is cold, the instrument cluster displays the current outside air temperature as measured by the ambient air temperature sensor. When the time is less than 2 hours, or if the engine is not cold, the instrument cluster takes a reading of the current temperature and compares the current reading against the last reading at key off. If the temperature is less than the last key off temperature reading, the instrument cluster displays the current temperature. If the temperature is greater than the last key off temperature reading, the instrument cluster displays the last key off temperature reading until the ambient air temperature has had time to stabilize with vehicle movement.

DTC B1255 — is a continuous and on-demand DTC that sets if the instrument cluster detects an open on the outside air temperature sensor input, circuit VH407 (YE/GN). If the instrument cluster detects an open on the outside air temperature input, the instrument cluster defaults the display to 23.89°C (75°F).

DTC B1257 — is a continuous and on-demand DTC that sets if the instrument cluster detects a short to ground on the outside air temperature sensor input, circuit VH407 (YE/GN). If the instrument cluster detects a short to ground on the outside air temperature input, the instrument cluster defaults the display to 23.89°C (75°F).

Possible Causes

- Circuit RH111 (GY/BU) open
- Circuit VH407 (YE/GN) open, short to voltage or ground
- Circuit VMC29 (YE) open or short to voltage
- Outside air temperature sensor
- Instrument cluster

PINPOINT TEST E: THE OUTSIDE AIR TEMPERATURE SENSOR DOES NOT OPERATE CORRECTLY

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
E1 MONITOR THE OUTSIDE AIR TEMPERATURE DISPLAY	
NOTE: If equipped with electronic automatic temperature control (EATC), the outside air temperature display is located in the EATC display. • Observe the instrument cluster integrated circuit display and monitor the outside air temperature display. • **Does the integrated display show the outside air temperature as 23.89°C (75°F)?**	**Yes** GO to E2 . **No** If the outside air temperature display does not display, VERIFY that the vehicle is not

	equipped with EATC and that the instrument cluster is configured for the outside air temperature display. REFER to Section 418-01 . If the outside air temperature display is inaccurate, INSTALL a new ambient air temperature sensor. REFER to Section 412-01 . TEST the system for normal operation. If the integrated circuit display is inoperative, INSTALL a new instrument cluster. REFER to Section 413-01 .
E2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS AND ON-DEMAND INSTRUMENT CLUSTER SELF-TESTS	
• Check for recorded instrument cluster DTCs from the continuous and on-demand self-tests. • **Is instrument cluster DTC B1255 or B1257 recorded?**	**Yes** GO to E3 . **No** VERIFY that the vehicle has been driven to eliminate any potential heat soak condition and cool off the sensor. If the outside air temperature display is still inaccurate, INSTALL a new ambient air temperature sensor. REFER to Section 412-01 . TEST the system for normal operation.
E3 CLEAR THE DTCs AND RECHECK THE SYSTEM	
• Clear the DTCs and repeat the instrument cluster self-test. • **Is instrument cluster DTC B1255 or B1257 recorded?**	**Yes** GO to E4 . **No** The system is operating normally at this time.
E4 CHECK CIRCUIT VH407 (YE/GN) AND VMC29 (YE) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Instrument Cluster C220. • Key in ON position. • Measure the voltage between the instrument cluster C220-22, circuit VH407 (YE/GN), harness side and ground; and between the instrument cluster C220-20, circuit VMC29 (YE), harness side and ground.	**Yes** REPAIR the circuit in question. REPEAT the self-test. CLEAR the DTCs. **No** GO to E5 .

 N0057208 • **Is any voltage present?**	
E5 CHECK CIRCUIT VH407 (YE/GN) FOR AN OPEN AND SHORT TO GROUND	
• Key in OFF position. • Disconnect: Ambient Air Temperature Sensor C132. • Measure the resistance between the instrument cluster instrument cluster C220-22, circuit VH407 (YE/GN), harness side and the ambient air temperature sensor C132-2, circuit VH407 (YE/GN), harness side; and between the instrument cluster instrument cluster C220-22, circuit VH407 (YE/GN), harness side and ground.  N0057209 • **Is the resistance less than 5 ohms between the instrument cluster and the ambient air temperature sensor, and greater than 10,000 ohm between the instrument cluster and ground?**	**Yes** GO to E6 . **No** REPAIR the circuit. TEST the system for normal operation.
E6 CHECK CIRCUIT VMC29 (YE) AND RH111 (GY/BU) FOR AN OPEN	
• Measure the resistance between the instrument cluster instrument cluster C220-20, circuit VMC29 (YE), harness side and the ambient air temperature sensor C132-1, circuit RH111 (GY/BU), harness side.  N0058840 • **Is the resistance less than 5 ohms?**	**Yes** GO to E7 . **No** REPAIR the circuit in question. REPEAT the self-test. CLEAR the DTCs.
E7 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all the instrument cluster connectors. • Check for:	**Yes** INSTALL a new

■ corrosion ■ damaged pins ■ pushed-out pins • Connect all the instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test F: The PARKING AID ON/OFF Warning Is Inoperative

Normal Operation

The parking aid on/off status is sent from the parking aid module to the instrument cluster over the medium speed controller area network (MS-CAN) communication bus lines. When the RESET button is pressed, the instrument cluster sends a query to the parking aid module, requesting a system status. The parking aid module responds to the instrument cluster with the status of the system, either on or off. If the return status message is missing or corrupted, the instrument cluster does not display the brackets around either the ON or OFF selection.

Possible Causes

- Instrument cluster configuration
- Parking aid system
- Instrument cluster

PINPOINT TEST F: THE PARKING AID ON/OFF WARNING IS INOPERATIVE

Test Step	Result / Action to Take
F1 VERIFY THE INSTRUMENT CLUSTER CONFIGURATION	
NOTE: Parking aid configuration in the instrument cluster is not a customer preference item that is configurable and must be configured using As-Built data. When the instrument cluster is configured for the parking aid system, the instrument cluster begins to query the parking aid module for parking aid status. Do not confuse the customer preference ON/OFF configuration with the instrument cluster parking aid system present configuration. • Key in ON position. • Verify that the vehicle is equipped with parking aid and the instrument cluster is configured for parking aid. Refer to Section 418-01 for additional information on using As-Built data. • **Is the vehicle equipped with parking aid and is the instrument cluster configured for parking aid?**	**Yes** GO to F2 . **No** CONFIGURE the instrument cluster. REFER to Section 418-01 .
F2 CHECK THE PARKING AID SYSTEM OPERATION	
• Operate the parking aid system and check for correct operation when the feature is selected on and off. Refer to the Owner's Literature for additional information on selecting the parking aid system on or off. • **Does the parking aid system operate correctly when the feature is selected on then off?**	**Yes** GO to F3 . **No** REFER to Section 413-13 .
F3 CHECK THE PARKING AID DISPLAY IN THE MESSAGE	

CENTER	
• Press the SETUP button repeatedly and verify that the instrument cluster displays PARKING AID ON OFF. • **Does the message center display PARKING AID ON OFF?**	**Yes** GO to F4 . **No** GO to F5 .
F4 CHECK THE MESSAGE CENTER ON/OFF DISPLAY	
• Press the SETUP button until PARKING AID ON OFF is displayed. • **Does the ON or OFF have the < > brackets around it indicating the desired selection?**	**Yes** PRESS the RESET button to allow the instrument cluster to query the parking aid module again. If the display is still incorrect, REFER to Section 418-00 to diagnose no communication with the parking aid module. **No** The system is operating normally at this time. The problem may have been caused by a momentary loss of communication with the parking aid module.
F5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: The CHECK AIR SUSPENSION or AIR SUSPENSION OFF Warning Is Inoperative

Normal Operation

The air suspension on/off status is sent from the air suspension module to the instrument cluster over the high speed controller area network (HS-CAN) communication bus lines. When the RESET button is pressed, the instrument cluster sends a query to the air suspension module, requesting a system status. The air suspension module responds to the instrument cluster with the status of the system, either on or off. If the return status message is missing or corrupted, the instrument cluster does not display the brackets around either the ON or OFF selection.

Possible Causes

- Instrument cluster configuration
- Air suspension system
- Air suspension module
- Instrument cluster

PINPOINT TEST G: THE CHECK AIR SUSPENSION OR AIR SUSPENSION OFF WARNING IS INOPERATIVE

Test Step	Result / Action to Take
G1 VERIFY THE INSTRUMENT CLUSTER CONFIGURATION	
NOTE: Air suspension system configuration in the instrument cluster is not a customer preference item that is configurable and must be configured using As-Built data. When the instrument cluster is configured for the parking aid system, the instrument cluster begins to query the parking aid module for parking aid status. Do not confuse the customer preference ON/OFF configuration with the instrument cluster parking aid system present configuration. • Key in ON position. • Verify that the vehicle is equipped with air suspension and that the instrument cluster is configured for air suspension. Refer to Section 418-01 for additional information on using As-Built data. • **Is the vehicle equipped with air suspension and is the instrument cluster configured for air suspension?**	**Yes** GO to G2 . **No** CONFIGURE the instrument cluster. REFER to Section 418-01 .
G2 CHECK THE AIR SUSPENSION SYSTEM OPERATION	
• Operate the air suspension system and check for correct operation when the feature is selected on and off. Refer to the Owner's Literature for additional information on selecting the parking aid system on or off. • **Does the air suspension system operate correctly when the feature is selected on then off?**	**Yes** If the AIR SUSPENSION OFF warning is inoperative, GO to G3 . If the CHECK SUSPENSION SYSTEM warning is inoperative, GO to G5 . **No** REFER to Section 204-05 .
G3 CHECK THE AIR SUSPENSION DISPLAY IN THE MESSAGE CENTER	
• Press the SETUP button repeatedly and verify that the instrument cluster displays AIR SUSPENSION ON OFF. • **Does the message center display AIR SUSPENSION ON OFF?**	**Yes** GO to G4 . **No** GO to G6 .
G4 CHECK THE MESSAGE CENTER ON/OFF DISPLAY	
• Press the SETUP button until AIR SUSPENSION ON OFF is displayed. • **Does the ON or OFF have the < > brackets around it indicating the desired selection?**	**Yes** PRESS the RESET button to allow the instrument cluster to query the air suspension module again. If the display is still incorrect, REFER to Section 418-00 to diagnose no communication with the parking aid module. **No** The system is operating normally at this time. The problem may have been caused by a momentary loss of communication with the parking aid module.
G5 CHECK FOR CORRECT AIR SUSPENSION MODULE	

OPERATION	

• Disconnect all the air suspension module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the air suspension connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new air suspension module. REFER to Section 204-05 . TEST the system for normal operation.
	
	If the CHECK AIR SUSPENSION or AIR SUSPENSION OFF warning indicator is still inoperative, GO to G6 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

G6 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The 4X4 SHIFT IN PROGRESS Warning Is Inoperative

Normal Operation

The four wheel drive (4WD) control module sends the instrument cluster a message over the high speed controller area network (HS-CAN) communication bus lines when the 4WD system is in the process of shifting out of two wheel drive (2WD) and has not yet fully shifted into 4x4 high, 4x4 low or 4x4 auto. Once the shift is completed, the 4WD control module removes the 4x4 shift in progress message and sends a new message to turn on the applicable reconfigurable telltale indicator.

Possible Causes

- Instrument cluster configuration
- 4WD system
- 4WD control module
- Instrument cluster

PINPOINT TEST H: THE 4X4 SHIFT IN PROGRESS WARNING IS INOPERATIVE

Test Step	Result / Action to Take
H1 VERIFY THE INSTRUMENT CLUSTER	

CONFIGURATION	
NOTE: 4WD configuration in the instrument cluster is not a customer preference item that is configurable and must be configured using As-Built data. • Key in ON position. • Verify that the vehicle is equipped with 4WD and the instrument cluster is configured for 4WD. Refer to Section 418-01 for additional information on using As-Built data. • **Is the vehicle equipped with 4WD and is the instrument cluster configured for 4WD?**	**Yes** GO to H2 . **No** CONFIGURE the instrument cluster. REFER to Section 418-01 .
H2 CHECK THE 4WD SYSTEM	
• Operate the vehicle in 4WD and verify that the vehicle shifts from 2WD to 4WD correctly. • **Does the 4WD system shift correctly from 2WD to 4WD?**	**Yes** GO to H3 . **No** REFER to Section 308-07A .
H3 CHECK FOR CORRECT 4WD CONTROL MODULE OPERATION	

• Disconnect the 4WD control module connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the 4WD control module and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a 4WD control module. REFER to Section 308-07A . TEST the system for normal operation.
	
	If the 4X4 SHIFT IN PROGRESS warning message still does not operate, GO to H4 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

H4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Message Center Configuration

Printable View (78 KB)

Oil Life Reset

1. **NOTE:** The oil life calculation is set at a maximum of approximately 8,000 km (5,000 miles) or 180 days.

   Press and release the SETUP button until the message center displays OIL LIFE = XXX% HOLD RESET = NEW.

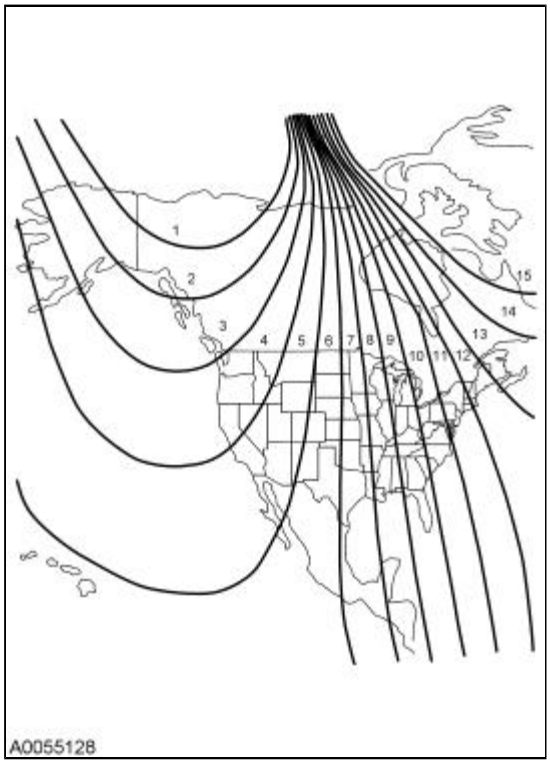
2. Press and hold the RESET button for 2 seconds and release when the message center displays OIL LIFE SET TO 100%.

3. Press and release the SETUP button to exit the procedure.

Compass Zone Adjustment — With Message Center

Printable View (122 KB)

1. Determine which magnetic zone you are in for your geographic location.



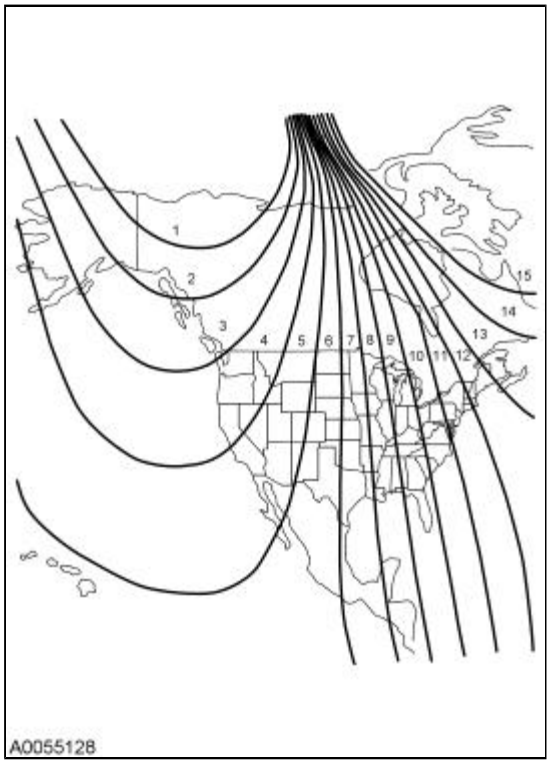
2. Start the engine.
3. Press the message center SETUP button until RESET FOR ZONE SETTING is displayed.
4. Press and release the RESET button until ZONE XX RESET = CHANGE is displayed.
5. **NOTE:** The zone selection increases with each subsequent button press with a range of zones from 1 to 15 scrolling back to the beginning.

   Press and release the RESET button until the desired zone appears in the message center display.
6. To exit the zone setting mode and lock in the changes, press and release either the RESET or SETUP button or simply wait 4 seconds and the message center locks in the zone.

Compass Zone Adjustment — Without Message Center

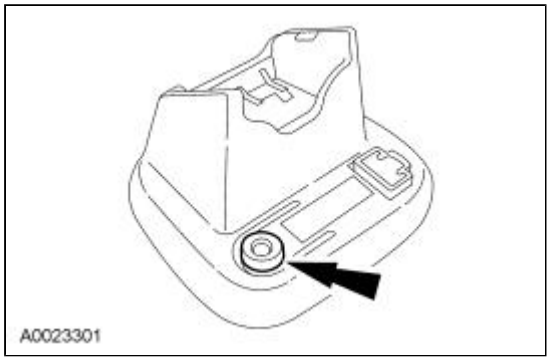
Printable View (136 KB)

1. Determine which magnetic zone you are in for your geographic location.



2. Start the engine.

3. Locate the reset button on the top of the compass module at the base of the interior rear view mirror.



4. Press and hold the reset button for 6 seconds and release when ZONE appears in the instrument cluster display.

5. **NOTE:** The zone selection increases with each subsequent button press with a range of zones from 1 to 15 scrolling back to the beginning.

   Press and release the reset button until the desired zone number appears.

6. When the desired zone number appears in the instrument cluster display, do not press the reset button. The instrument cluster locks in the zone setting and returns to normal operation when the reset button is not pressed for approximately 4 seconds.

Compass Calibration — With Message Center

Printable View (79 KB)

1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (heated rear window, heater, A/C, map lamps, wiper, etc.) and make sure all the doors are closed.

   Start the vehicle.

2. Press the message center SETUP button until RESET FOR CALIBRATION is displayed.

3. **NOTE:** The message center displays CIRCLE SLOWLY TO CALIBRATE in the calibration function.

   Press the RESET control button to start the compass calibration function.

4. **NOTE:** This step may require up to 5 circles to complete the calibration.

   NOTE: If the RESET button is pressed during the calibration or 3 minutes has elapsed since the beginning of the calibration without driving the vehicle, the message center reverts back to normal operation and the INFO displays CAL until a successful calibration is carried out.

   Slowly drive the vehicle in a circle less than 5 km/h (3 mph) until the CIRCLE SLOWLY TO CALIBRATE display changes to CALIBRATION COMPLETED.

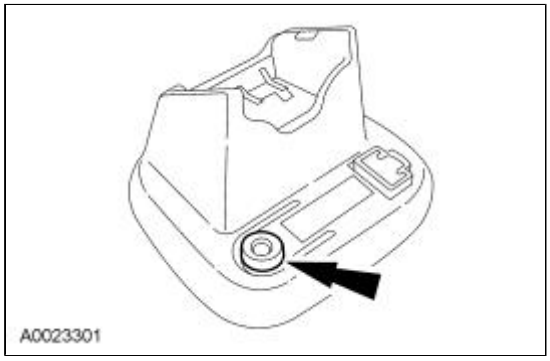
Compass Calibration — Without Message Center

Printable View (93 KB)

1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (heated rear window, heater, A/C, map lamps, wiper, etc.) and make sure all the doors are closed.

   Start the vehicle.

2. Locate the reset button on the top of the compass module at the base of the interior rear view mirror.



3. Press and hold the reset button for 8 seconds and release when CAL appears in the instrument cluster display.

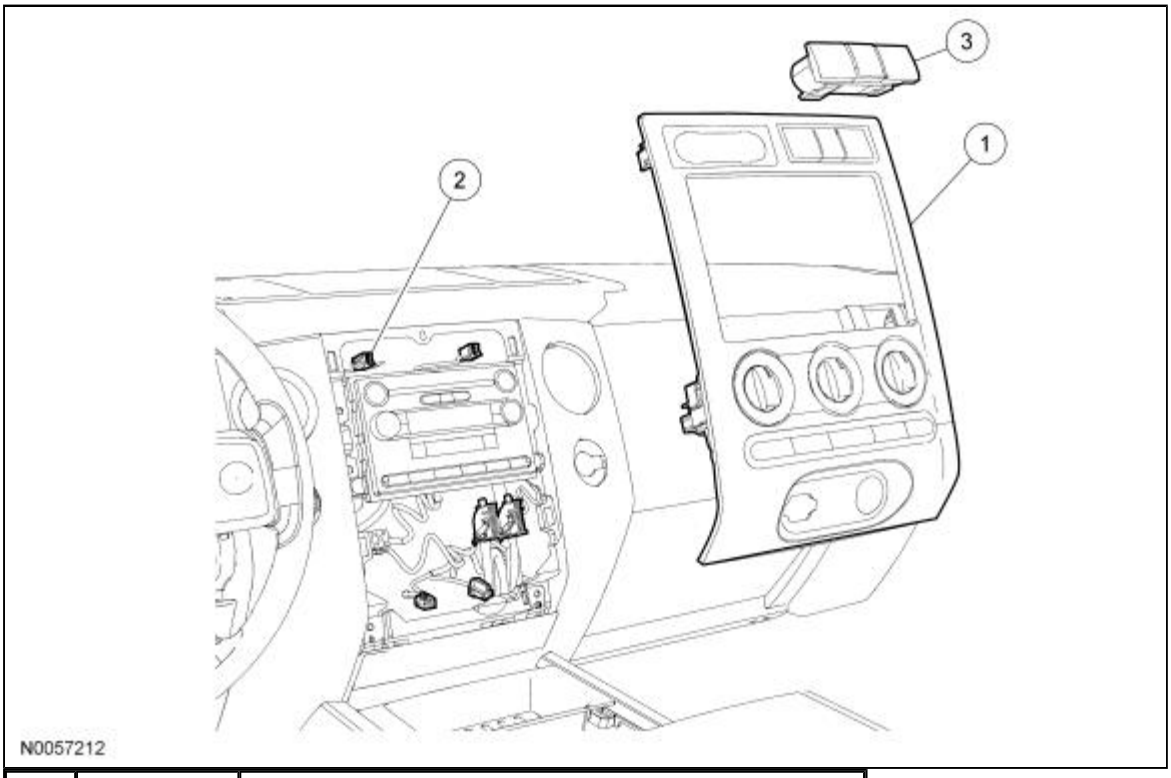
4. **NOTE:** This step may require up to 5 circles to complete the calibration.

   Slowly drive the vehicle in a circle at no more than 5 km/h (3 mph) until CAL turns off in the instrument cluster display.

Message Center Switch

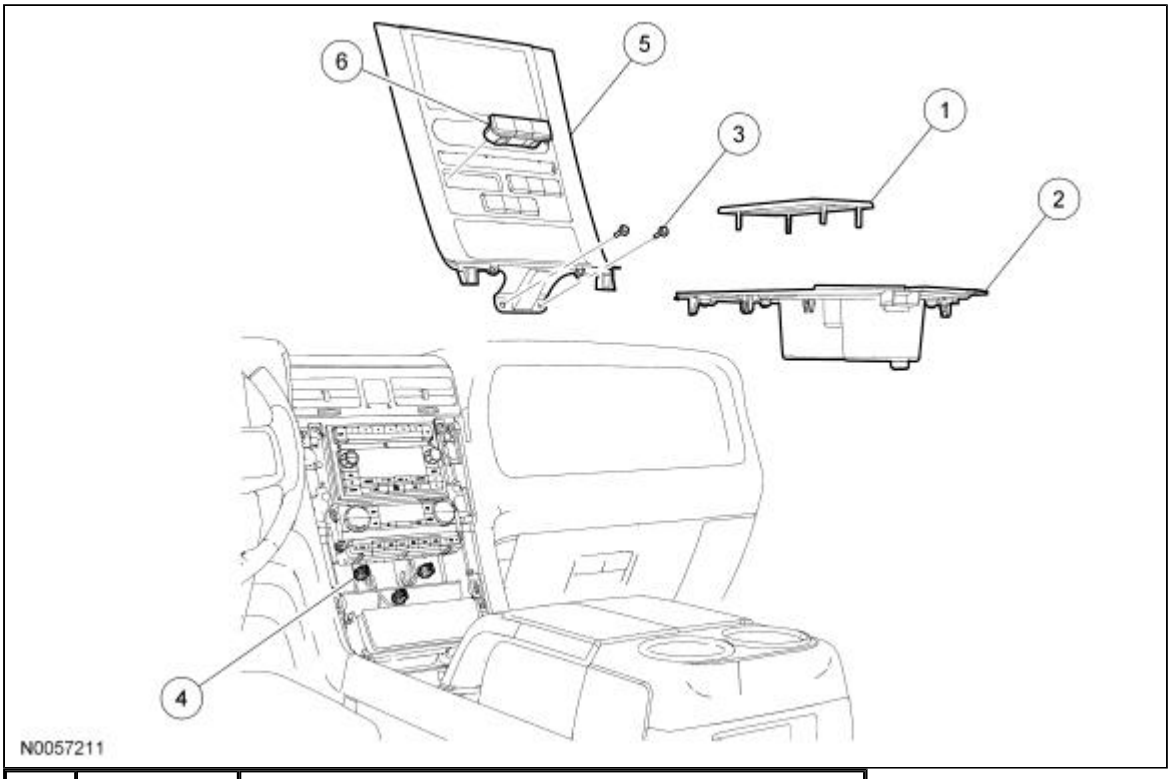
Printable View (233 KB)

Expedition



Item	Part Number	Description
1	78044D70	Instrument panel center finish panel
2	—	Instrument panel center finish panel electrical connectors (part of 14401)
3	10D889	Message center switch

Navigator



Item	Part Number	Description
1	7E391	Transmission range selector bezel
2	78044J76	Floor console finish panel
3	W707628	Instrument panel center finish panel screws (2 required)
4	—	Instrument panel center finish panel electrical connectors (part of 14401)
5	78044D70	Instrument panel center finish panel
6	10D889	Message center switch

Removal and Installation

Expedition

1. Pull the instrument panel center finish panel straight out to release the retaining clips.

Navigator

2. **NOTE:** The transmission selector lever bezel is held in place by 4 tabs that are located in the shifter assembly.

   Remove the transmission selector lever bezel.

3. Open the floor console compartment door and pull the floor console finish panel straight up to release the retainer clips.

4. Remove the 2 screws and pull the instrument panel center finish panel straight out to release the retainer clips.
   - Position the instrument panel center finish panel aside.

All vehicles

5. Disconnect the electrical connectors.

6. Press the 4 retaining tabs and remove the message center switch from the center instrument panel finish panel.

7. To install, reverse the removal procedure.

Warning Devices

Printable View (63 KB)

The warning chimes are designed to provide the driver with an audible warning that acts as a supplemental alert. The only deviation from this strategy is the air bag chime which is used to alert the driver that the primary alerting system does not operate. The instrument cluster controls all warning chimes based on messages received from external modules.

The warning device system consists of the following:

- Instrument cluster
- Safety belt warning indicator switch (part of the safety belt buckle)
- Door ajar switch
- Liftgate ajar switch
- Liftgate glass ajar switch
- Key-in-ignition warning switch (part of the ignition switch)
- Smart junction box (SJB)

The following chimes are controlled by the instrument cluster:

- Safety belt warning
- Air bag warning
- Key-in-ignition
- Turn signal left on
- Door ajar
- Turn signal indicator
- Headlamps on
- Message center
- Parking brake applied
- Belt minder

Warning Devices

Printable View (137 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The instrument cluster uses inputs that are both hardwired to individual components and messages that are sent from the other modules over the high speed or medium speed controller area networks (HS-CAN or MS-CAN) to control the warning chime functions.

It is very important to understand:

- where the input (command) originates.
- all the information (messages) necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- if the module that received the input (message) controls the output of the feature, or if it outputs a message over the CAN to another module.
- which module controls the output of the feature.

Instrument Cluster Messages

NOTE: Whenever a message is suspected as missing, confirmed by a missing message DTC, it is important to look for other symptoms that may also be present in the instrument cluster and throughout the vehicle. Once a DTC is set in the instrument cluster it may be helpful to review the complete message list available in Section 418-00 to see what other modules also rely on the same message and run the self-test for those modules. If the message is missing from other modules, the same DTC may also be set in those modules. Confirmation of missing messages common to multiple modules may indicate that the originating module is the source of the concern or the communication network may be experiencing some problems.

The instrument cluster uses input messages from other modules to control the gauges, informational indicators, warning indicators and reconfigurable telltale indicators over the communication networks. If a required message is missing or invalid for less than 5 seconds, the gauge or indicator that requires the message remains at the last commanded state based upon the last known good message. For example, if the O/D off status message is missing for less than 5 seconds and the O/D off indicator was ON (O/D cancelled), the indicator remains in the ON state until the next good message is received. If the message remains missing or invalid for greater than 5 seconds, the instrument cluster sets a U-code DTC and the output becomes a default action for the indicator or gauge. Each indicator or gauge utilizes

a different default strategy depending on the nature of the indication. Refer to the normal operation descriptions located before each individual pinpoint test for further description of the default action specific to each indicator or gauge. If the messaged input to the cluster returns at any time, the normal function of the gauge or indicator resumes.

Warning Chime Characteristics

Each warning chime has unique characteristics that help to identify and differentiate each warning chime. The warning chimes use volume, chime frequency, length of time the chime sounds and the number of chime tones to identify which chime is sounding. The instrument cluster prioritizes the chimes according to a preset hierarchy programmed into the instrument cluster software. When more than one chime request is received by the instrument cluster, the most important chime sounds. If a lower priority chime is currently sounding, the higher priority request takes over and replaces the lower priority chime.

There are 3 different chimes as listed below:

- Repetitive
- Single tone
- Tic-toc

The following table provides a summary of the chime characteristics including the chime priority.

Instrument Cluster Chime Characteristics/Priority

Chime Name	Priority	Number of Chime Tones	Condition Description
Safety belt	1	6	On for as long as the safety belt is unbuckled and the instrument cluster receives the chime on command.
Air bag	2	5	Five sequences of 1 second ON and 1 second OFF (10 seconds total)
Key-in-ignition	3	Repetitive	On for as long as the key is in the ignition with the door ajar and the instrument cluster receives the chime on command.
Turn signal left on	4	Repetitive	On for as long as the RH or LH turn signal is on and the instrument cluster receives the chime on command.
Door ajar	5	Single tone (1)	This is a single tone chime that sounds when the key is in the RUN position and a door changes from closed to ajar.
Turn signal	6	Repetitive tic-toc	On for as long as the RH or LH turn signal or hazards are on and the instrument cluster receives the chime on command.
Headlamps on	7	Repetitive	On for as long as the headlamps are on and the instrument cluster receives the chime on command.
Message center (if equipped)	8	Single tone (1)	This is a single tone chime that sounds once per ignition cycle whenever the instrument cluster receives a new message commanding on one of the message center warnings.
Parking brake on	9	Repetitive	On for as long as the parking brake is applied and the instrument cluster receives the chime on command.
Belt minder	10	6	This chime provides 4 series of 6 one-quarter second tone bursts (total of 24 one-quarter second tones).

Safety Belt Warning Chime

The safety belt warning chime warns that the driver safety belt is not fastened. The safety belt warning chime sounds when the driver safety belt is not fastened and the ignition switch is turned to the RUN or START position.

The safety belt warning chime stops sounding when the:

- driver safety belt is fastened.
- ignition switch is turned to the OFF/LOCK or ACC position.
- chime has sounded 6 times.

The safety belt warning chime inputs are the:

- Ignition switch RUN/START position
- Ignition switch RUN/ACC position
- Driver safety belt switch message from the restraints control module (RCM)

Air Bag Warning Chime

The air bag warning chime warns that a fault is present within the air bag warning indicator circuit. The RCM provides the air bag warning indicator message to the instrument cluster. The instrument cluster monitors the internal air bag warning indicator circuitry and turns on the air bag warning chime if a fault is present.

The air bag warning chime input is the air bag warning indicator request from the RCM.

Key-In-Ignition Warning Chime

The key-in-ignition warning chime warns that the key is in the ignition when the LH front door is ajar. The key-in-ignition warning chime sounds when all the following conditions are met:

- The LH front door is ajar
- The key is in the ignition lock cylinder
- The ignition switch is in the OFF/LOCK or ACC position

The key-in-ignition warning chime will stop sounding when the:

- LH front door is closed.
- key is removed from the ignition lock cylinder.
- ignition switch is turned to the RUN position.

The key-in-ignition warning chime inputs are the:

- Ignition switch RUN/START position
- Ignition switch RUN/ACC position
- Key-in-ignition warning switch message from the smart junction box (SJB)
- LH front door ajar switch

Turn Signal Left On Warning Chime

The turn signal left on warning chime warns that the turn signals have been left on. The turns signals must have been on continuously for more than 3.2 km (2.0 miles).

The turn signal left on warning chime inputs are the:

- Odometer rolling count message from the powertrain control module (PCM)
- RH or LH turn signal message from the SJB

Door Ajar Warning Chime

The door ajar warning chime warns that a door is ajar. The door ajar warning chime is a single chime with a 1 second duration. The door ajar chime sounds when the driver or passenger door, liftgate or liftgate glass becomes ajar while the ignition switch is in the RUN position.

The door ajar warning chime inputs are the:

- Ignition switch RUN position
- Door ajar, liftgate or liftgate glass message from the SJB

Turn Signal Chime

Since the turn and hazard flasher is an electronic function of the SJB, the on/off sound that used to be present with standard bi-metal flashers is no longer present. To provide an audible sound and indicate that the RH/LH TURN or HAZARD indicators are on, the instrument cluster provides an tic-toc tone along with the visual turn signal indicators.

The turn signal on warning chime inputs are the:

- RH/LH TURN or HAZARD signal messages from the SJB

Headlamps On Warning Chime

The headlamp on warning chime warns that the headlamps are on while the driver door is ajar. The headlamp on warning chime sounds when all the following conditions are met:

- The driver door is ajar
- The headlamp switch is in the PARK or HEADLAMPS position
- The ignition switch is in the OFF/LOCK position
- The key is out of the ignition lock cylinder

The headlamp on warning chime stops sounding when any one of the conditions are met:

- The driver door is closed
- The headlamp switch is turned off
- The ignition switch is placed in the RUN position

The headlamp on warning chime inputs are the:

- Ignition switch voltage
- Headlamp switch status message from the SJB
- LH front door ajar switch message from the SJB
- Key-in-ignition switch status message from the SJB

Message Center Warning Chime (If Equipped)

The message center warning chime sounds when the instrument cluster receives a new message to be displayed in the message center. The chime tone sounds once per ignition cycle for each message that is received. If there are multiple messages present upon key on, the instrument cluster provides a single, 1.0 second tone, for each message that displays. The message may remain visible, but the chime only sounds once.

The message center warning chime inputs are the message center warning messages received from external sensors and other modules. For additional information on the message center message displays and the associated inputs, refer to Section 413-08 .

Parking Brake On Warning Chime

The parking brake warning chime is controlled by the SJB and warns that the parking brake is applied with the vehicle in motion.

The parking brake warning chime input is the parking brake chime request from the SJB.

Belt Minder Warning Chime

The safety belt minder feature is configurable. For additional information, refer to Section 418-01 . To configure without using a scan tool, refer to Safety Belt Minder Deactivating/Activating in this section.

The safety belt minder feature is controlled by a message sent to the instrument cluster from the RCM and supplements the safety belt warning chime and the safety belt warning indicator functions. The safety belt minder reminds the driver that his/her safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning lamp in the instrument cluster. The safety belt minder feature is enabled after the safety belt warning chime is complete and the vehicle speed has exceeded 4.8 km/h (3 mph). While activated, the safety belt minder alternates the chime and safety belt warning indicator from ON for 6 seconds to OFF for 30 seconds then the sequence repeats. If the belt minder remains active after 3 repetitions, the sound level and the speed of the chimes increase.

The safety belt minder warning chime inputs are the:

- Ignition switch RUN/START position
- Ignition switch RUN/ACC position
- Driver safety belt switch message from the RCM

The safety belt minder reminder stops when:

- the driver safety belt is buckled.
- the ignition switch is turned to the OFF or ACC position.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Circuitry • Key-in-ignition switch (part of the ignition switch) • Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

5. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground

from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM:

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM.
- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

7. Carry out the network test:
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the instrument cluster.

9. If the DTCs retrieved are related to the concern, go to the Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Smart Junction Box (SJB) Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1352	Ignition Key-In Circuit Failure	If the chime sounds with the door ajar and no key in the ignition, Go To Pinpoint Test A . If the key-in-ignition chime is inoperative, Go To Pinpoint Test B .
All other DTCs	—	REFER to Section 413-01 .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• All chimes are inoperative	• Instrument cluster	• INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
• The chime sounds when the driver door is ajar (no key in ignition and headlamps off)	• Circuitry • Ignition switch • Smart junction box (SJB)	• Go To Pinpoint Test A .
• The safety belt	• Instrument	• VERIFY the safety belt warning

warning chime is inoperative	cluster	indicator operates correctly. ■ If the safety belt warning indicator operates correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If the safety belt warning indicator does not operate correctly, REFER to Section 413-01 .
• The air bag warning chime is inoperative	• Instrument cluster • Restraints control module (RCM)	• VERIFY DTC B1868 is present in the instrument cluster. ■ If DTC B1868 is present, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If DTC B1868 is not present, the system is operating normally.
• The key-in-ignition warning chime is inoperative	• Circuitry • Key-in-ignition switch (part of the ignition switch) • SJB	• Go To Pinpoint Test B .
• The turn signal left on warning chime is inoperative	• Instrument cluster	• VERIFY the turn signal indicators and speedometer operate correctly. ■ If the turn signal indicators and speedometer operate correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If the turn signal indicators or speedometer do not operate correctly, REFER to Section 413-01 .
• The door ajar warning chime is inoperative	• Instrument cluster	• VERIFY the door ajar indicator operates correctly. ■ If the door ajar indicator operates correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If the door ajar indicator does not operate correctly, REFER to Section 413-01 .
• The turn signal chime is inoperative	• Instrument cluster	• VERIFY the turn signal indicators operate correctly. ■ If the turn signal indicators operate correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ■ If the turn signal indicators do not operate correctly, REFER to Section 413-01 .

• The headlamps on warning chime is inoperative	• Door ajar indication • SJB	• Go To Pinpoint Test C .
• The message center warning chime is inoperative	• Instrument cluster	• VERIFY the message center operates correctly. ▪ If the message center operates correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ▪ If the message center does not operate correctly, REFER to Section 413-08 .
• The parking brake on warning chime is inoperative	• Instrument cluster	• VERIFY the brake warning indicator and the speedometer operate correctly. ▪ If the brake warning indicator and the speedometer operate correctly, INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. ▪ If the brake warning indicator and the speedometer do not operate correctly, REFER to Section 413-01 .
• The safety belt minder feature is not operating correctly	• Safety belt minder deactivated • RCM	• ACTIVATE the safety belt minder. ▪ To activate using a scan tool, REFER to Section 418-01 . ▪ To activate without using a scan tool, REFER to Safety Belt Minder Deactivating/Activating in this section. • INSTALL a new RCM. REFER to Section 501-20B . TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: The Chime Sounds When The Driver Door Is Ajar (No Key In Ignition And Headlamps Off)

Refer to Wiring Diagrams Cell 60 , Instrument Cluster for schematic and connector information.

Normal Operation

When the key is inserted into the ignition lock cylinder, the key-in-ignition switch (part of the ignition switch) closes, providing a voltage signal to the smart junction box (SJB) through circuit CDC30 (BU/GY). The key-in-ignition and door ajar status is communicated to the instrument cluster from the SJB over the medium speed communication area network (MS-CAN). If the instrument cluster detects that the ignition switch is in the OFF or ACC position and the SJB communicates to the instrument cluster that the driver door is ajar and the key is in the ignition, the key-in-ignition warning chime sounds. The SJB also communicates to the instrument cluster that the headlamps or parking lamps are on and the driver door is opened for the headlamps on warning chime. The headlamps on warning chime sounds when the driver door is opened with the ignition switch in the OFF position, the key is not in the ignition lock cylinder, and the headlamp switch is in the PARK or HEADLAMP ON position.

DTC B1352 — is an on-demand DTC that sets if the SJB detects an open or short to ground on the key-in-ignition switch input, circuit CDC30 (BU/GY) or if the SJB detects ignition START, RUN/START or RUN/ACC inputs without the key-in-ignition input.

Possible Causes

- Circuit CDC30 (BU/GY) short to voltage
- Ignition switch
- SJB

PINPOINT TEST A: THE CHIME SOUNDS WHEN THE DRIVER DOOR IS AJAR (NO KEY IN IGNITION AND HEADLAMPS OFF)

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
A1 CHECK THE INSTRUMENT CLUSTER ILLUMINATION	
• Verify the instrument cluster is not illuminated with the headlamp switch off. • **Does the instrument cluster illumination operate correctly?**	**Yes** GO to A2 . **No** REFER to Section 413-00 .
A2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS AND ON-DEMAND SJB SELF-TESTS	
• Check the recorded DTCs from the SJB self-tests. • **Are any DTCs present?**	**Yes** For DTC B1352, GO to A3 . For all other DTCs, REFER to Section 419-10 . **No** GO to A4 .
A3 CHECK THE SJB INPUT PIDs FROM THE IGNITION SWITCH	
• Enter the following diagnostic mode on the diagnostic tool: SJB PIDs. • Monitor the SJB PIDs IGN_A_ECU, IGN_O_ECU, IGN_R_ECU, and IGN_S_ECU while cycling the ignition switch from ACC, OFF, RUN and START. • **Do the SJB PIDs match the ignition switch position?**	**Yes** GO to A6 . **No** REFER to Section 211-05 to diagnose the ignition switch outputs to the SJB.
A4 CHECK CIRCUIT CDC30 (BU/GY) FOR VOLTAGE	
• Key in OFF position. • Disconnect: SJB C2280H. • Measure the voltage between the SJB C2280H-35, circuit CDC30 (BU/GY), harness side and ground.	**Yes** GO to A5 . **No** GO to A6 .

 N0057328 • **Is any voltage present?**	
A5 CHECK CIRCUIT CDC30 (BU/GY) FOR A SHORT TO VOLTAGE	
• Disconnect: Ignition Switch C250. • Measure the voltage between the SJB C2280H-35, circuit CDC30 (BU/GY), harness side and ground.  N0057328 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new ignition switch. REFER to Section 211-05 . TEST the system for normal operation.
A6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ▪ corrosion ▪ damaged pins ▪ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: The Key-In-Ignition Warning Chime Is Inoperative

Normal Operation

The instrument cluster receives the key-in-ignition warning status from the smart junction box (SJB) over the medium speed controller area network (MS-CAN). The key-in-ignition warning switch (part of the ignition switch) is hardwired to the SJB through circuit CDC30 (BU/GY). When the key is inserted into the ignition lock cylinder, the key-in-ignition switch closes and supplies voltage to the SJB. The SJB monitors the door ajar input from the LH front door and the key-in-ignition switch status. When the key is inserted into the ignition lock cylinder and the driver door is open or ajar, the SJB sends the instrument cluster a chime request message to sound the key-in-ignition warning chime.

DTC B1352 — is an on-demand DTC that sets if the SJB detects an open or short to ground on the key-in-ignition switch input, circuit CDC30 (BU/GY) or if the SJB detects ignition START, RUN/START or

RUN/ACC inputs without the key-in-ignition input.

Possible Causes

- Circuit CDC30 (BU/GY) open or short to ground
- Key-in-ignition switch (part of the ignition switch)
- SJB

PINPOINT TEST B: THE KEY-IN-IGNITION WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
B1 CHECK THE INTERIOR LIGHTS OPERATION • Key in OFF position. • Open then close the driver door while observing the interior lights. • **Do the interior lights operate correctly?**	**Yes** GO to B2. **No** REFER to Section 417-02.
B2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS AND ON-DEMAND SJB SELF-TESTS • Check the recorded DTCs from the SJB self-tests. • **Is DTC B1352 present?**	**Yes** GO to B3. **No** GO to B4.
B3 CHECK THE IGNITION SWITCH • Disconnect: Ignition Switch C250. • Carry out the ignition switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the ignition switch OK?**	**Yes** REPAIR circuit CDC30 (BU/GY) for an open or short to ground. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new ignition switch. REFER to Section 211-05. CLEAR the DTCs. REPEAT the self-test.

B4 CHECK FOR CORRECT SJB OPERATION
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Headlamps On Warning Chime Is Inoperative

Normal Operation

The smart junction box (SJB) receives the headlamp switch status from the headlamp switch and the LH front door ajar status from the LH door ajar switch through hardwired circuitry. The headlamps on warning chime sounds when the LH front door is opened with the ignition switch in the OFF position, the

key is not in the ignition lock cylinder, and the headlamp switch is in the PARK or HEADLAMP ON position. The SJB communicates to the instrument cluster when the headlamps or parking lamps are on and the driver door is opened. The autolamps feature must not be selected for the headlamps on warning chime to operate.

Possible Causes

- Door ajar indication
- SJB

PINPOINT TEST C: THE HEADLAMPS ON WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
C1 CHECK THE EXTERIOR LAMPS OPERATION • Key in OFF position. • Place the headlamp switch in the PARK or HEADLAMP ON position. • **Do the headlamps or parking lamps operate?**	**Yes** GO to C2 . **No** REFER to Section 417-01 .
C2 CHECK THE DOOR AJAR RECONFIGURABLE INDICATOR OPERATION • Key in ON position. • Open then close the LH front door while observing the door ajar reconfigurable indicator in the instrument cluster message center or the integrated display. • **Does the door ajar reconfigurable indicator operate correctly?**	**Yes** GO to C3 . **No** REFER to Section 413-01 .

C3 CHECK FOR CORRECT SJB OPERATION
• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new SJB. REFER to Section 419-10 . TEST the system for normal operation.
	
	If the concern remains, REINSTALL the original SJB and GO to C4 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

C4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION
• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Safety Belt Minder Deactivating/Activating

Printable View (79 KB)

Preparation

1. Set the parking brake.
2. Place the transmission in PARK (P).
3. Turn the ignition switch to the OFF position.
4. Close all the vehicle doors.
5. Unbuckle the driver and passenger safety belts.

Deactivating/Activating

1. Turn the ignition switch to the RUN position (do not start the engine).
2. Wait until the safety belt warning indicator turns off (approximately 1 minute).
3. **NOTE:** Step 3 must be completed within 50 seconds after the safety belt warning indicator turns off or the procedure must be repeated.

   Buckle then unbuckle the safety belt 9 times, ending with the safety belt unbuckled.
4. **NOTE:** After Step 3, the air bag warning indicator lamp illuminates for 3 seconds.

   Within 10 seconds of the air bag warning indicator turning on, buckle then unbuckle the safety belt.
   - This disables the safety belt minder feature if it is currently enabled. As confirmation, the air bag warning indicator flashes 4 times per second for 3 seconds.
   - This enables the safety belt minder feature if it is currently disabled. As confirmation, the air bag warning indicator flashes 4 times per second for 3 seconds followed by a second series of 4 flashes per second for 3 seconds.
5. After confirmation, the deactivation/activation procedure is complete.

General Specifications

Item	Specification
Azimuth system check object position 1 (P1) and position 5 (P5), distance from sensor	46 cm (18 in) rear 50 cm (20 in) side
Azimuth system check object position 2 (P2), 3 (P3) and 4 (P4), distance from sensor	274 cm (9 ft)

Parking Aid

Printable View (62 KB)

The parking aid radar sensor is integral to the parking aid module and no additional sensors are used. The parking aid module is located in the center of the rear bumper between the bumper isolator and the bumper cover. The parking aid speaker is located in the LH C-pillar area.

The parking aid system consists of the following:

- Radar sensor and module assembly
- Parking aid speaker (audible warning tone)
- Parking aid disable feature (integral to the instrument cluster message center)

Parking Aid

Printable View (191 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025C or equivalent

Principles of Operation

NOTE: The liftgate must be closed for correct operation of the parking aid system.

The parking aid radar sensor is integral to the parking aid module and no additional sensors are used. The parking aid module is located in the center of the rear bumper between the bumper isolator and the bumper cover. The parking aid speaker is located in the LH C-pillar area.

With the ignition switch in the RUN position, the parking aid module detects objects behind the vehicle when the vehicle is in REVERSE (R). The parking aid module does this by calculating the distance to an object within the azimuth field by the use of a radar sensor mounted in the rear bumper. The azimuth field is a 170 degree semicircular area emitted around the rear of the vehicle.

- At speeds under 4 km/h (2.5 mph), the system reports multiple beeps at ranges of up to 2.6 m (9 ft) A solid tone will be reported if an object is within approximately 0.5 m (1.5 ft).
- At speeds 4-8 km/h (2.5-5 mph), the system reports objects up to 5 m (16 ft).
- At speeds above 8 km/h (5 mph), the system reports objects up to 5 m (16 ft) and reports a fast beep alarm indicating time to collision is less than 1.5 seconds.
- The system is not effective at speeds greater than 10 km/h (6 mph) and may not detect certain angular or moving objects.

The parking aid system is disabled if any fault is detected, and the message center indicates the parking aid is disabled. The parking aid system is also disabled when the operator selects parking aid disable through the message center. The parking aid system remains disabled until either the ignition key is cycled from OFF to RUN, or parking aid enable is selected through the message center.

The parking aid module communicates with the scan tool, the smart junction box (SJB) and the

instrument cluster. The following chart describes network messages used by the parking aid module:

Parking Aid Module Network Communication Messages

NOTE: Both medium speed controller area network (MS-CAN) and high speed controller area network (HS-CAN) are used for intermodule communication. A gateway message is transferred from one network to another through the instrument cluster. Refer to Section 418-00 for further explanation.

Broadcast Message	Originating Module	Network Type	Receiving Module
Ignition switch position	Smart junction box (SJB)	MS-CAN	Parking aid module
Parking aid disable switch status	Instrument cluster	MS-CAN	Parking aid module
Parking aid system status	Parking aid module	MS-CAN	Instrument cluster
Transmission selector range (PRNDL)	Transmission control module (TCM)	HS-CAN	Instrument cluster
Transmission selector range (PRNDL) (gateway)	Instrument cluster	MS-CAN	Parking aid module
Vehicle speed	PCM	HS-CAN	Instrument cluster
Vehicle speed (gateway)	Instrument cluster	MS-CAN	Parking aid module

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical and electrical damage.

   Visual Inspection Chart

Mechanical	Electrical
• Rear bumper height and alignment	• Smart junction box (SJB) fuse 35 (10A) • Circuitry • Parking aid module and sensor

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. Carry out the Azimuth System Check and Elevation System Check. Refer to Azimuth System Check and Elevation System Check in this section.
5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the data link connector (DLC).
6. **NOTE:** The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

If the scan tool does not communicate with the VCM:

- Check the VCM connection to the vehicle.
- Check the scan tool connection to the VCM.
- Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

8. Carry out the network test:
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

9. Clear the continuous DTCs and carry out the self-test diagnostics for the parking aid module.

10. If the DTCs retrieved are related to the concern, go to the Parking Aid Module Diagnostic Trouble Code (DTC) Chart. For all other DTCs, refer to Section 419-10 .

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Parking Aid Module Diagnostic Trouble Code (DTC) Chart

DTC	Description	Action
B1317	Battery Voltage High	CLEAR the DTCs. REPEAT the parking aid module self-test. If DTC B1317 is retrieved again, REFER to Section 414-00 .
B1318	Battery Voltage Low	Go To Pinpoint Test B .
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the parking aid module self-test. If DTC B1342 is retrieved again, INSTALL a new parking aid module. REFER to Parking Aid Module in this section. CLEAR all DTCs. REPEAT the self-test.
B2477	Module Communication Failure	REFER to Section 418-01 .
C1742	Rear Sounder Circuit Failure	Go To Pinpoint Test C .
C1743	Rear Sounder Circuit Short To Vbatt	Go To Pinpoint Test C .
U0140	Lost Communication with Body Control Module (GEM)	CARRY OUT the network test. REFER to Section 418-00 .
U0155	Lost Communication with Instrument Cluster	CARRY OUT the network test. REFER to Section 418-00 .
U2023	Fault Received From External Node	DISREGARD this DTC. RETRIEVE and FOLLOW the other parking aid module DTCs.
U2471	Unexpected PRNDL State	Go To Pinpoint Test D .
U2472	Unexpected Ignition State	Go To Pinpoint Test E .
U2473	Unexpected Vehicle Speed (VSS)	Go To Pinpoint Test F .

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the parking aid module	• Fuse • Circuitry • Parking aid module	• REFER to Section 418-00 .
• The parking aid is inoperative	• Circuitry • Parking aid module	• Go To Pinpoint Test A .
• Continuous or intermittent tone when no obstacles or fault codes are present	• Dirty or iced over rear bumper cover	• CLEAN the rear bumper with high-pressure water.
	• Aftermarket add-ons located on the rear bumper cover including but not limited to trailer hitches, emblems, and metallic stickers • Rear bumper cover impact damage, alignment or obstruction concerns	• REMOVE the aftermarket equipment or REPAIR the rear bumper cover damage as necessary.
	• Parking aid module	• Go To Pinpoint Test G .

Pinpoint Tests

Pinpoint Test A: The Parking Aid Is Inoperative

Normal Operation

The parking aid system is disabled if any fault is detected, and the message center indicates the parking aid is disabled. The parking aid system is also disabled when the operator selects parking aid disable through the message center. The parking aid system remains disabled until either the ignition key is cycled from OFF to RUN, or parking aid enable is selected through the message center. The parking aid module communicates with the scan tool, the smart junction box (SJB) and the instrument cluster on the medium speed controller area network (MS-CAN).

Possible Causes

- Circuit GD133 (BK) open
- Circuit CBP35 (YE/GY) open
- Parking aid module

PINPOINT TEST A: THE PARKING AID IS INOPERATIVE

Test Step	Result / Action to Take

A1 VERIFY THE PARKING AID MODULE COMMUNICATES WITH THE SCAN TOOL	
• Key in ON position. • Carry out the network test. • **Does the parking aid module communicate with the scan tool?**	**Yes** GO to A2 . **No** REFER to Section 418-00 .
A2 CHECK THE DTCs FROM THE PARKING AID MODULE ON-DEMAND SELF-TEST	
• Retrieve the DTCs from the parking aid module on-demand self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Parking Aid Module Diagnostic Trouble Code (DTC) Chart in this section. **No** GO to A3 .
A3 CHECK THE MESSAGE CENTER DISPLAY	
• Observe the message center. • **Does the message center display PARK AID OFF?**	**Yes** ENABLE parking aid in the message center. REPEAT the on-demand self test. **No** GO to A4 .
A4 CHECK FOR CORRECT PARKING AID MODULE OPERATION	

• Disconnect the parking aid module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the parking aid module connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new parking aid module. REFER to Parking Aid Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC B1318 — Battery Voltage Low

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

Normal Operation

Voltage is supplied to the parking aid module on circuit CBP35 (YE/GY). Circuit GD133 (BK) provides ground.

DTC B1318 — is a continuous and on-demand DTC that sets if available voltage to the parking aid module drops below 8 volts for 3 or more seconds.

Possible Causes

- Circuit GD133 (BK) high resistance
- Circuit CBP35 (YE/GY) high resistance
- Charging system concern

PINPOINT TEST B: DTC B1318 — BATTERY VOLTAGE LOW

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
B1 CHECK THE PARKING AID MODULE VOLTAGE SUPPLY CIRCUIT	
• Key in OFF position. • Disconnect: Parking Aid Module C4226. • Key in ON position. • Measure the voltage between the parking aid module C4226-18, circuit CBP35 (YE/GY), harness side and ground.  N0056190 • **Is the voltage greater than 10 volts?**	**Yes** GO to B2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B2 CHECK THE PARKING AID MODULE GROUND CIRCUIT	
• Key in OFF position. • Measure the resistance between the parking aid module C4226-6, circuit GD133 (BK), harness side and ground.  N0056191 • **Is resistance less than 5 ohms?**	**Yes** REFER to Section 414-00 to diagnose the low battery voltage concern. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTC C1742 — Rear Sounder Circuit Failure and DTC C1743 — Rear Sounder Circuit Short To Vbatt

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

Normal Operation

With the ignition switch in the RUN position and the gear selector in REVERSE (R), the parking aid system calculates the distance to an object by the use of a radar sensor. A 750 Hz variable warning tone is generated by the parking aid sounder.

The parking aid speaker tone is controlled by the parking aid module through circuit CLS03 (GN/WH). Circuit GD149 (BK/GY) provides ground. The parking aid sounder is located in the LH C-pillar area.

DTC C1742 — is a continuous and on-demand DTC that sets if the parking aid module detects a short to ground or open on the rear speaker circuit CLS03 (GN/WH) when the vehicle is in REVERSE (R) and a detectable object is within the azimuth field.

DTC C1743 — is a continuous and on-demand DTC that sets if the parking aid module detects a short to voltage on the rear speaker circuit CLS03 (GN/WH) when the vehicle is in REVERSE (R) and a detectable object is within the azimuth field.

Possible Causes

- Circuit CLS03 (GN/WH) open, short to voltage or ground
- Circuit GD149 (BK/GY) open
- Parking aid speaker
- Parking aid module

PINPOINT TEST C: DTC C1742 — REAR SOUNDER CIRCUIT FAILURE AND DTC C1743 — REAR SOUNDER CIRCUIT SHORT TO VBATT

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
C1 CHECK CIRCUIT CLS03 (GN/WH) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Parking Aid Module C4226. • Key in ON position. • Measure the voltage between the parking module C4226-15, circuit CLS03 (GN/WH), harness side and ground.  N0057165 • **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to C2 .
C2 CHECK CIRCUIT CLS03 (GN/WH) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Parking Aid Speaker C4015. • Measure the resistance between the parking aid module C4226-15, circuit CLS03 (GN/WH), harness side and ground.	**Yes** GO to C3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0057166 • **Is the resistance greater than 10,000 ohms?**	
C3 CHECK CIRCUIT CLS03 (GN/WH) FOR AN OPEN	
• Measure the resistance between the parking aid module, C4226-15, circuit CLS03 (GN/WH), harness side and the parking aid speaker C4015-2, circuit CLS03 (GN/WH), harness side.  N0057167 • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C4 CHECK CIRCUIT GD149 (BK/GY) FOR AN OPEN	
• Disconnect: Parking Aid Speaker C4015. • Measure the resistance between the parking aid speaker C4015-1, circuit GD149 (BK/GY), harness side and chassis ground.  N0058854 • **Is the resistance less than 5 ohms?**	**Yes** GO to C5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C5 CHECK THE PARKING AID SPEAKER	
• Connect: Parking Aid Module C4226. • Install a known good parking aid speaker and repeat the on-demand self-test. • **Is DTC C1742 or C1743 still present?**	**Yes** INSTALL the original parking aid speaker. GO to C6 . **No** INSTALL a new parking aid speaker. REFER to Parking Aid Speaker in this section. CLEAR the DTCs. REPEAT the self-test.

C6 CHECK FOR CORRECT PARKING AID MODULE OPERATION	

• Disconnect the parking aid module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the parking aid module connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new parking aid module. REFER to Parking Aid Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTC U2471 — Unexpected PRNDL State

Normal Operation

The parking aid module receives the PRNDL state from the instrument cluster as a gateway message from the transmission control module (TCM).

DTC U2471 — is a continuous and on-demand DTC that sets when the parking aid module receives an unknown PRNDL state message from the instrument cluster.

Possible Causes

- Instrument cluster
- Networked data fault

PINPOINT TEST D: DTC U2471 — UNEXPECTED PRNDL STATE

Test Step	Result / Action to Take
D1 CHECK THE DTCs FROM THE ON-DEMAND SELF-TEST	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Parking Aid Module Self-Test. • Clear the DTCs. Repeat the parking aid module on-demand self-test. • **Are any DTCs present?**	**Yes** If DTCs U2471 and U0155 are both present, REFER to Section 418-00 to diagnose no communication with the instrument cluster. For DTC U2471 only, GO to D2 . **No** System is operating normally at this time.
D2 VERIFY THE INSTRUMENT CLUSTER PRNDL DISPLAY FUNCTIONS PROPERLY	
• Monitor the instrument cluster PRNDL display while moving the gearshift lever through the range of positions. • **Does the PRNDL match all range positions?**	**Yes** GO to D3 . **No** REFER to Section 413-01 to diagnose the PRNDL.
D3 CHECK FOR CORRECT INSTRUMENT	

CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 .
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: DTC U2472 — Unexpected Ignition State

Normal Operation

The parking aid module receives the ignition switch state from the smart junction box (SJB) as a network message.

DTC U2472 — is a continuous and on-demand DTC that sets when the parking aid module receives an unknown ignition switch state message.

Possible Causes

- SJB
- Networked data fault

PINPOINT TEST E: DTC U2472 — UNEXPECTED IGNITION STATE

Test Step	Result / Action to Take
E1 CHECK THE DTCs FROM THE ON-DEMAND SELF-TEST	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Parking Aid Module Self-Test. • Clear the DTCs. Repeat the parking aid module on-demand self-test. • **Is DTC U2472 present?**	**Yes** GO to E2 . **No** System is operating normally at this time.
E2 CHECK THE DTCs FROM THE ON-DEMAND SELF-TEST	
• Enter the following diagnostic mode on the diagnostic tool: SJB Self-Test. • Carry out the SJB self-test. • **Is DTC B1359, B1363 and/or B1555 present?**	**Yes** REFER to Section 211-05 . **No** GO to E3 .
E3 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors.
• Check for:
  ▪ corrosion
  ▪ damaged pins
	Yes
	INSTALL a new SJB. REFER to Section 419-10 .
	TEST the system for normal operation.

■ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC U2473 — Unexpected Vehicle Speed

Normal Operation

The parking aid module receives the vehicle speed from the instrument cluster as a gateway message from the powertrain control module (PCM).

DTC U2473 — is a continuous and on-demand DTC that sets when the parking aid module receives an unknown vehicle speed message.

Possible Causes

- Instrument cluster fault
- Networked data fault

PINPOINT TEST F: U2473 — UNEXPECTED VEHICLE SPEED

Test Step	Result / Action to Take
F1 CHECK THE DTCs FROM THE PARKING AID MODULE ON-DEMAND SELF-TEST	
• Key in ON position. • Clear the DTCs. Repeat the parking aid module on-demand self-test. • **Are any DTCs present?**	**Yes** GO to F2 . **No** System is operating normally at this time.
F2 CHECK FOR MULTIPLE DTCs FROM THE PARKING AID MODULE ON-DEMAND SELF-TEST	
• Record the DTCs from the parking aid module self-test. • **Are both DTCs U2473 and U0155 recorded?**	**Yes** REFER to Section 418-00 . **No** GO to F3 .
F3 CHECK THE DTCs FROM THE PCM ON-DEMAND SELF-TEST	
• Record the DTCs from the PCM self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to F4 .
F4 CHECK THE DTCs FROM THE INSTRUMENT CLUSTER ON-DEMAND SELF-TEST	
• Record DTCs from the instrument cluster self-test.	**Yes** REFER to Section 413-01 .

• **Are any DTCs recorded?**	**No** GO to F5 .
F5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect the instrument cluster connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the instrument cluster connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: Continuous or Intermittent Tone When No Obstacles or Fault Codes Are Present

Refer to Wiring Diagrams Cell 131 , Parking Aid for schematic and connector information.

Normal Operation

With the ignition switch in the RUN position and the gear selector in REVERSE (R), the parking aid system calculates the distance to an object by the use of a radar sensor. A 750 Hz variable warning tone is generated by the parking aid sounder. The sounder increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 46 cm (18 in) of the vehicle, the warning tone becomes continuous.

Possible Causes

- Rear bumper cover impact damage, alignment or obstruction concerns
- Parking aid module

PINPOINT TEST G: CONTINUOUS OR INTERMITTENT TONE WHEN NO OBSTACLES OR FAULT CODES ARE PRESENT

Test Step	Result / Action to Take
G1 CARRY OUT THE REAR BUMPER COVER VISUAL INSPECTION	

• Visually inspect the rear bumper cover for any of the following conditions:
  ▪ Dirty or iced over rear bumper cover
  ▪ Rear bumper cover impact damage
  ▪ Rear bumper height or alignment incorrect
  ▪ Rear bumper cover aftermarket add-ons present including but not limited to trailer hitches, emblems, and metallic stickers
• **Are any of the above conditions present?**
	Yes
	REMOVE the aftermarket equipment or REPAIR the rear bumper cover damage as necessary.
	
	No
	GO to G2 .

G2 CARRY OUT THE AZIMUTH AND ELEVATION SYSTEM CHECKS	
• Carry out the Azimuth System Check and the Elevation System Check in this section.	**Yes** The system is operating correctly at this

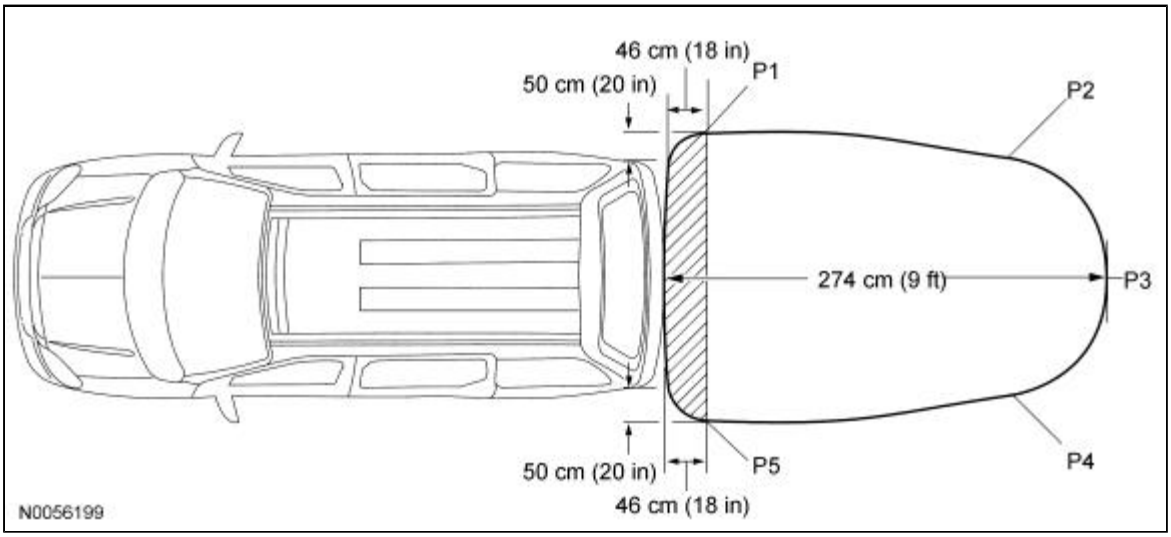
• **Does the parking aid system pass both system checks?**	time. **No** GO to G3 .
G3 CHECK FOR CORRECT PARKING AID MODULE OPERATION	

• Disconnect the parking aid module connector.
• Check for:
  ▪ corrosion
  ▪ damaged pins
  ▪ pushed-out pins
• Connect the parking aid module connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new parking aid module. REFER to Parking Aid Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Azimuth System Check

Printable View (116 KB)

Minimum Detectable Object Locations



1. **NOTE:** The object used in this system check can be fabricated from 9 cm O.D. (3 in I.D.) plastic pipe 100 cm (39 in) length (available as PVC pipe, or similar from a hardware or plumbing supply).

   NOTE: The following system check should be carried out with the vehicle on a level surface.

   NOTE: The parking aid system will default to on when the ignition key is cycled from OFF to ON.

   Turn the ignition to the ON position, engine off.

2. Set the parking brake on.

3. Place the gearshift in REVERSE (R).

4. Verify that the parking aid system detects the specified object when placed within the 5 specified locations (P1, P2, P3, P4, P5). These zones are shown ideally and are not absolute. Pipe should be inside of the locations.
   - The sounder should beep slowly when objects are detected on the outer edges of the detection zone, and increase as the object is moved closer to the vehicle. When the object is within 46 cm (18 in) of the rear bumper, the sounder should be on continuously.

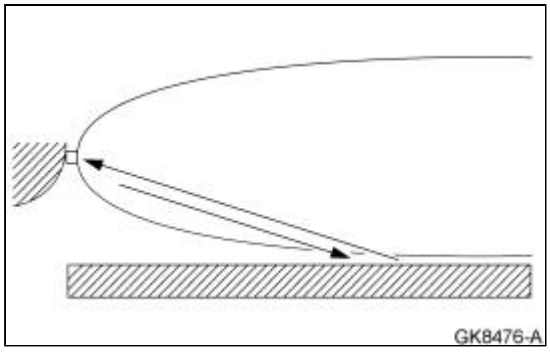
5. Using the scan tool, monitor the parking aid distance PID. The distance PID reads between 0 and 274 cm (0 and 9 ft) on a properly functioning system.

Elevation System Check

Printable View (85 KB)

NOTE: The following system check should be carried out with the vehicle on a 3.0 m wide by 4.5 m deep (10 ft wide by 15 ft deep) smooth concrete surface, free of all obstacles and noise from fan and pneumatic tools.

1. Turn the ignition to the ON position, engine off.



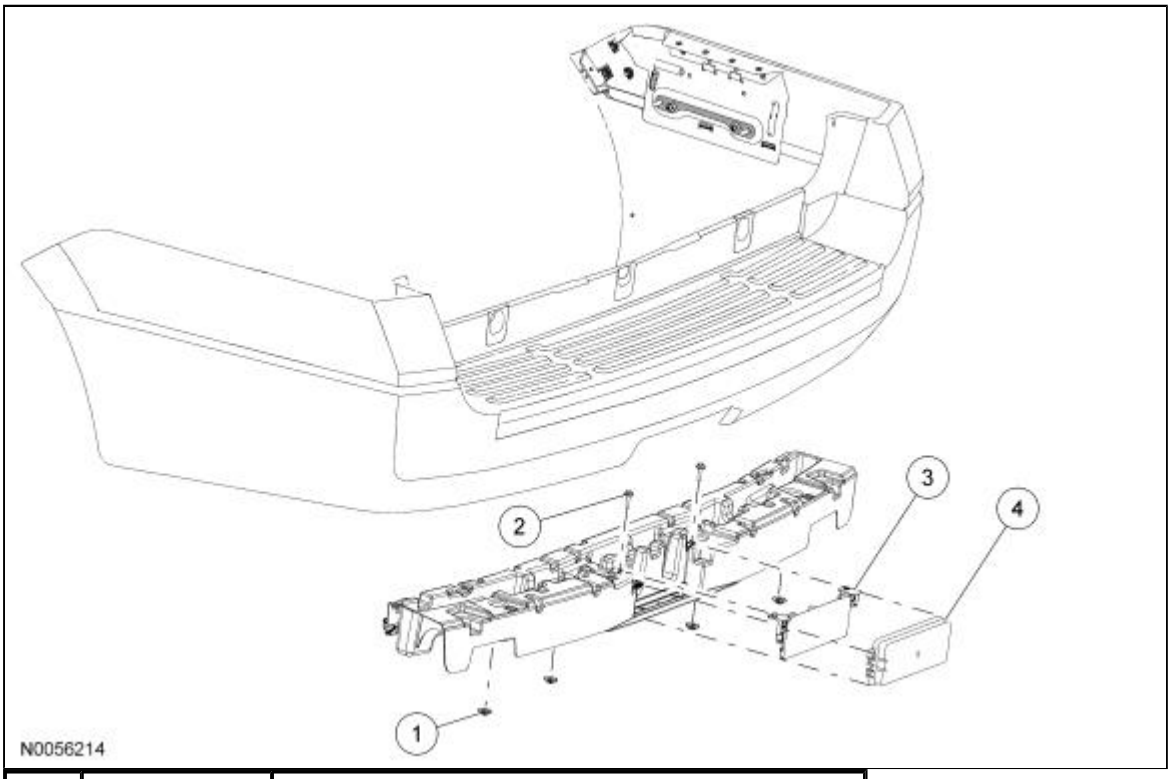
2. Set the parking brake.

3. Place the gearshift in REVERSE (R).

4. Verify that no audible alerts are heard. If audible alerts are heard, check to make sure the bumper is correctly installed and is not tilted downward so that the sensor is pointing at the ground.

Parking Aid Module

Printable View (133 KB)



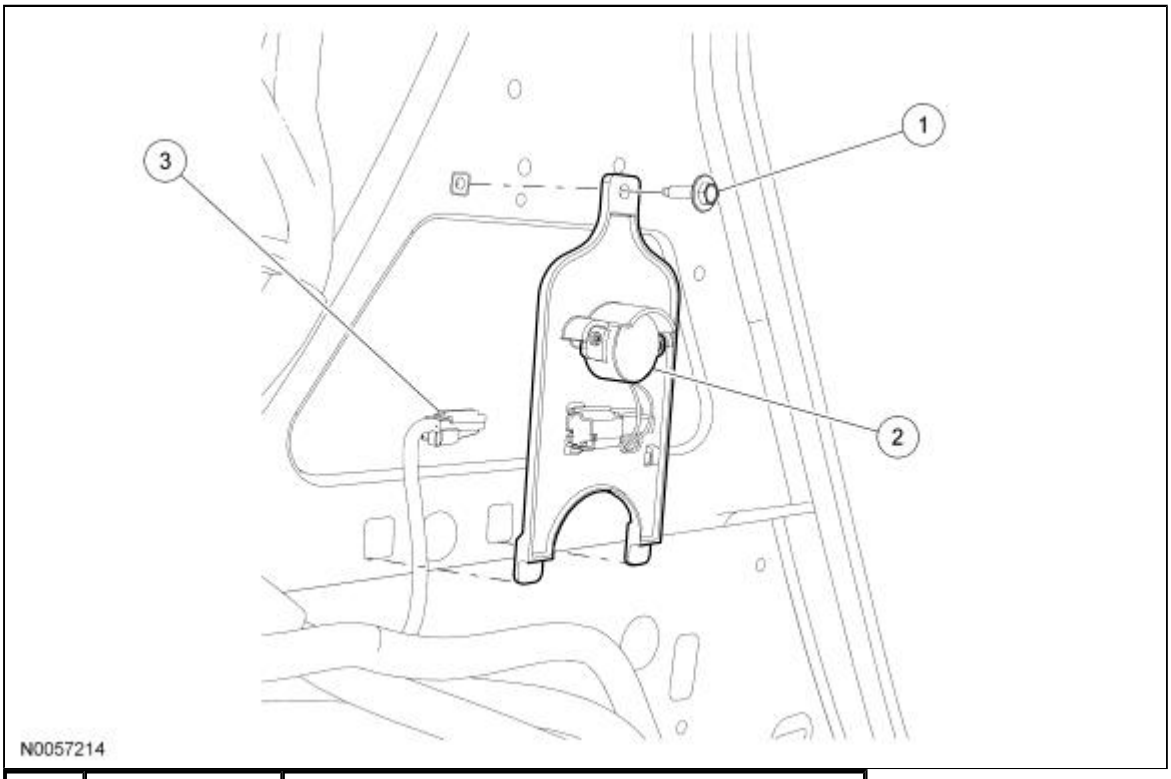
Item	Part Number	Description
1	—	Insulator-to-bumper cover nuts (4 required)
2	W505425-S	Parking aid module bracket bolts (2 required)
3	—	Parking aid module bracket
4	15K859	Parking aid module

Removal and Installation

1. Disconnect the parking aid module sub-harness from the body harness.
2. Remove the rear bumper cover. For additional information, refer to Section 501-19 .
3. Remove the 4 insulator-to-bumper cover nuts and the insulator from the bumper cover.
4. Disconnect the parking aid module sub-harness from the parking aid module.
5. Remove the 2 parking aid module bracket bolts.
6. Remove the parking aid module bracket assembly.
7. Release the module tabs from the bracket and remove the module from the bracket.
8. To install, reverse the removal procedure.

Parking Aid Speaker

Printable View (125 KB)



Item	Part Number	Description
1	—	Parking aid speaker bracket bolt
2	—	Parking aid speaker and bracket assembly
3	—	Parking aid speaker electrical connector

Removal and Installation

1. Remove the LH quarter trim panel. For additional information, refer to Section 501-05 .
2. Remove the bolt and the speaker and bracket assembly.
   - Disconnect the electrical connector.
3. To install, reverse the removal procedure.

Printable View (62 KB)

General Specifications

Item	Specification
Voltage	12 volts
Generator amps	89/157 amp (max) @ 1,800-6,000 generator rpm, approximately 500-2,000 engine rpm

Charging System

Printable View (63 KB)

The charging system is a negative ground system. The generator (including an internal voltage regulator) is belt-driven by the engine accessory drive system. When the engine is started, the generator begins to generate alternating current (AC), which is internally converted to direct current (DC). This current is then supplied to the vehicle electrical system through the output (B+) terminal of the generator.

Battery

The battery is a 12-volt DC source connected in a negative ground system. The battery case is sealed with 2 vent holes to release gases. The battery has 3 major functions:

- Engine cranking power source
- Voltage stabilizer for the electrical system
- Temporary power source when electrical loads exceed the generator output current

Charging System

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2173-A	SABRE Premium Battery & Electrical System Tester 010-00736 or equivalent
ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
ST2574-A	Flex Probe Kit 105-R025B or equivalent

Principles of Operation

The powertrain control module (PCM) controlled charging system determines the optimal voltage setpoint for the charging system and communicates this information to the voltage regulator. This system is unique in that it has 2 unidirectional communication lines between the PCM and the generator/regulator. Both of these communication lines are pulse-width modulated (PWM). The generator communication (GEN COM) line communicates the desired setpoint from the PCM to the voltage regulator. The generator monitor (GEN MON) line communicates the generator load and error conditions to the PCM. The third pin on the voltage regulator, the A circuit pin, is a dedicated battery voltage sense line.

The charging system voltage is controlled by the PCM. The generator charges the battery, and at the same time supplies power for all of the electrical loads that are required. The battery is more effectively charged with a higher voltage when the battery is cold and a lower voltage when the battery is warm. The PCM is able to adjust the charging voltage according to the battery temperature by using a signal from the intake air temperature (IAT) sensor. This means the voltage setpoint is calculated by the PCM and communicated to the regulator by a communication link.

The PCM simultaneously controls and monitors the output of the generator. When the current consumption is high or the battery is discharged, the system is able to increase the idle speed.

To minimize drag when starting the engine, the PCM controls the generator. The generator does not produce any output until the engine has started. The PCM then progressively increases the generator output.

The PCM controls the charging system warning indicator in the instrument cluster. The PCM turns the charging system warning indicator off after the engine is started and illuminates it under fault conditions (when the generator is not generating the correct amount of current with the engine running). The charging system warning indicator is also illuminated by the PCM at key ON engine OFF (KOEO), and stall condition.

This is a System 4 charging system, which uses the GEN MON and GEN COM lines to control and monitor the charging system through the PCM. System 4 charging systems are identical and share the same diagnostics. The circuit numbers and colors may be different, but the functions are the same. System 4 charging systems may use any type of generator, as the generator type usually depends on the engine packaging and/or output requirements versus cost.

Circuit Description

Positive Battery Output (B+) Terminal Circuit SDC02 (RD)

The generator output voltage is supplied to the battery and electrical system through the positive battery output (B+) terminal circuit SDC02 (RD) on the rear of the generator.

A Circuit SDC02 (RD)

This is the A terminal battery voltage sense circuit and is used to sense battery voltage.

Circuit CDC15 (VT)

The generator monitor (GEN MON) circuit communicates the generator load and error conditions to the PCM.

Circuit CDC10 (BU/OG)

This is the generator communication (GEN COM) circuit. The PCM determines the optimal voltage setpoint for the charging system and communicates this information to the voltage regulator on the GEN COM circuit.

Inspection and Verification

WARNING: Batteries contain sulfuric acid. Avoid contact with skin, eyes, or clothing. Also, shield your eyes when working near batteries to protect against possible splashing of the acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in personal injury.

WARNING: Batteries normally produce explosive gases. Therefore, do not allow flames, sparks or lighted substances to come near the battery. When charging or working near a battery, always shield your face and protect your eyes. Always provide ventilation. Failure to follow these instructions may result in personal injury.

WARNING: When lifting a battery, excessive pressure on the end walls could cause acid to spew through the vent caps, resulting in personal injury, damage to the vehicle or battery. Lift with a battery carrier or with your hands on opposite corners. Failure to follow these instructions may result in personal injury.

CAUTION: Do not make jumper connections except as directed. Incorrect connections may damage the voltage regulator test terminals, fuses, or fusible links.

CAUTION: Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.

NOTE: While carrying out any pinpoint test, disregard any diagnostic trouble codes (DTCs) set while following a specific pinpoint test. After the completion of a test, be sure to clear all codes in the PCM.

NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery • Generator drive belt • Generator pulley	• Circuitry • Cables • Generator • PCM • Charging system warning indicator • Fusible links

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. Verify the battery condition. Refer to Section 414-01 .

5. Check the operation of the charging system warning indicator (instrument cluster). Normal operation is as follows:
   - With the key OFF, the charging system warning indicator should be off.
   - With the key ON and the engine OFF, the charging system warning indicator should be on.
   - With the engine running, the charging system warning indicator should be off.

6. Turn off the headlamps and the A/C system (if equipped). Turn the climate control blower to low/off. Check the battery voltage before and after starting the engine to determine if the battery voltage increases.

7. **NOTE:** Make sure to use the latest scan tool software release.

   If the concern is not visually evident, connect the scan tool to the data link connector (DLC).

8. **NOTE:** The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

   If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no communication with the scan tool.

9. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to Section 418-00 to diagnose no response from the powertrain control module (PCM).

10. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record continuous memory diagnostic trouble codes (DTCs).

11. If the DTCs retrieved are related to the concern, go to the Powertrain Control Module (PCM) Diagnostic Trouble Code (DTC) Chart.

12. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

NOTE: DTC P0622 may be set by the loss of the communication lines between the generator and the PCM. The charging system warning indicator then illuminates until the engine is operated at greater than 4,500 rpm (approximately wide open throttle [WOT]) for a minimum of 3 seconds. At this time, the generator self-excites. The charging system warning indicator remains illuminated, and the generator operates in a default mode (approximately 13.5 volts) until the engine is turned off.

Pinpoint Tests

Pinpoint Test A: The Battery is Discharged or Battery Voltage is Low

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

The generator output is supplied through the positive battery output (B+) circuit SDC02 (RD) terminal on the rear of the generator to the battery and electrical system. During normal operation the charging system warning indicator is off with the key in the ON position and the engine running. The charging system warning indicator is on with the key in the ON position and the engine off.

Possible Causes

- Circuitry
- High key-off current drain(s)
- Battery
- Generator

PINPOINT TEST A: THE BATTERY IS DISCHARGED OR BATTERY VOLTAGE IS LOW

Test Step	Result / Action to Take

A1 CHECK THE BATTERY CONDITION	
• Carry out the Battery — Condition Test to determine if the battery can hold a charge and is OK for use. Refer to Section 414-01 . • **Does the battery pass the condition test?**	**Yes** GO to A2 . **No** INSTALL a new battery. REFER to Section 414-01 . TEST the system for normal operation.
A2 CHECK THE GENERATOR OUTPUT	
• Carry out the Generator On-Vehicle Load Test and No Load Test. Refer to Component Tests in this section. • **Does the generator pass the component tests?**	**Yes** GO to A3 . **No** INSTALL a new generator. REFER to Section 414-02 . TEST the system for normal operation.
A3 CHECK FOR CURRENT DRAINS	
• Carry out the Battery — Drain Testing. Refer to Component Tests in this section. • **Are any circuits causing excessive current drains?**	**Yes** REPAIR as necessary. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK THE VEHICLE GROUNDS	
• Key in START position. • Measure the voltage drop between the generator housing and the negative battery terminal.  • **Is the voltage drop less than 0.1 volt?**	**Yes** GO to A5 . **No** CHECK the engine ground, generator ground, and the battery ground for corrosion. TEST the system for normal operation.
A5 CHECK THE VOLTAGE DROP IN B+ CIRCUIT SDC02 (RD)	
• Measure the voltage drop between the generator B+ C102b, circuit SDC02 (RD) and the positive battery terminal.  • **Is the voltage drop less than 0.1 volt?**	**Yes** DETERMINE if the customer left any component(s) on or if there is an intermittent excessive battery draw. TEST the system for normal operation. **No** CHECK for any corrosion in the B+ circuit SDC02 (RD) positive battery cable and/or connections. REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test B: The Charging System Warning Indicator is On With the Engine Running (the Charging System Voltage Does Not Increase)

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

With the engine running, the charging system warning indicator is off. The sense A circuit to the generator field coil is 13-15 volts. The S (stator) circuit (internal to the generator) is used to feed back a voltage signal from the generator to the voltage regulator. This voltage is used by the powertrain control module (PCM) to turn off the charging system warning indicator. The positive battery output (B+) circuit SDC02 (RD) is the generator output supplied to the battery and electrical system.

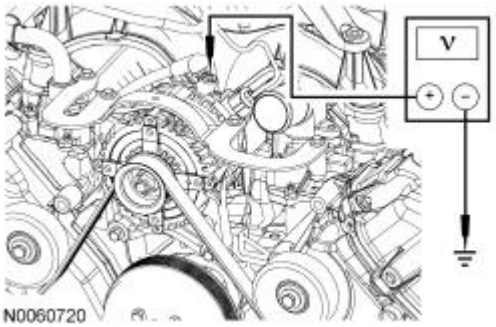
Possible Causes

- Circuitry
- Generator
- PCM

PINPOINT TEST B: THE CHARGING SYSTEM WARNING INDICATOR IS ON WITH THE ENGINE RUNNING (THE CHARGING SYSTEM VOLTAGE DOES NOT INCREASE)

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

Test Step	Result / Action to Take
B1 CHECK THE FAULT CODES IN THE POWERTRAIN CONTROL MODULE (PCM)	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM DTCs. • Check the recorded PCM DTCs from the continuous and on-demand self tests. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If referred here by the Powertrain Control/Emissions Diagnosis (PC/ED) manual, GO to B2 . **No** GO to B2 .
B2 CHECK THE GENERATOR B+ CIRCUIT SDC02 (RD) FOR VOLTAGE	
• Key in OFF position. • Measure the voltage between generator C102b, circuit SDC02 (RD), and ground.	**Yes** GO to B3 . **No** REPAIR the circuit. TEST the system for normal operation.



- **Is the voltage approximately equal to positive battery voltage?**

B3 CHECK THE GENERATOR INTEGRITY	
• Disconnect: Generator C102a. • Key in ON position, engine OFF. • Measure and record the battery voltage.  AJ0210-A • Key in START position. • **NOTE:** If the generator communication lines are disconnected (DTC P0622 may set), the generator self-excites if it is operated at greater than 4,500 rpm (approximately wide open throttle [WOT]) for a minimum of 3 seconds. It then operates in a default mode at approximately 13.5 volts until the engine is turned off. • With the engine running (after the brief WOT has been carried out), measure the battery voltage.  AJ0210-A • **Does the battery voltage increase a minimum of 0.5 volt from the key ON, engine OFF measurement to the key ON, engine running measurement (after the brief WOT or snap acceleration has been carried out)?**	**Yes** GO to B4 . **No** INSTALL a new generator. REFER to Section 414-02 . TEST the system for normal operation.
B4 CHECK CIRCUIT CDC10 (BU/OG) FOR AN OPEN OR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: PCM C175b. • Measure the resistance between the generator C102a-2, circuit CDC10 (BU/OG), harness side and the PCM C175b-22, circuit CDC10 (BU/OG), harness side; and between the	**Yes** GO to B5 . **No** REPAIR the circuit. TEST

generator C102a-2, circuit CDC10 (BU/OG), harness side and ground.  A0075055 • **Is the resistance less than 5 ohms between the generator and the PCM, and greater than 10,000 ohms between the generator and ground?**	the system for normal operation.
B5 CHECK CIRCUIT CDC15 (VT) FOR AN OPEN OR A SHORT TO GROUND	
• Measure the resistance between the generator C102a-1, circuit CDC15 (VT), harness side and the PCM C175b-23, circuit CDC15 (VT), harness side; and between the generator C102a-1, circuit CDC15 (VT), harness side and ground.  N0026125 • **Is the resistance less than 5 ohms between the generator and the PCM, and greater than 10,000 ohms between the generator and ground?**	**Yes** GO to B6 . **No** REPAIR the circuit. TEST the system for normal operation.
B6 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . REPEAT the self-test. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test C: The Charging System Overcharges (Battery Voltage is Greater Than 15.5 Volts)

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

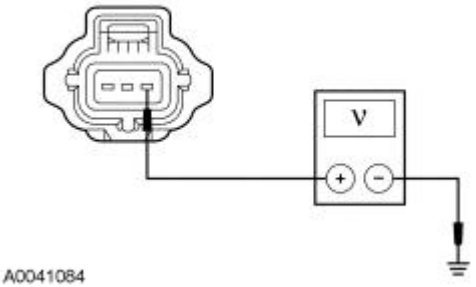
The generator output is determined by the voltage of the A circuit SDC02 (RD). The A circuit voltage is compared to a set voltage internal to the regulator, and the regulator controls the generator field current to maintain the correct generator output. The set voltage varies with temperature and is typically higher in cold temperatures and lower in warm temperatures.

Possible Causes

- A circuit SDC02 (RD) open or high resistance
- Generator
- Powertrain control module (PCM)

PINPOINT TEST C: THE CHARGING SYSTEM OVERCHARGES (BATTERY VOLTAGE IS GREATER THAN 15.5 VOLTS)

Test Step	Result / Action to Take
C1 CHECK THE FAULT CODES IN THE POWERTRAIN CONTROL MODULE (PCM)	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM DTCs. • Check for recorded PCM DTCs from the continuous and on-demand self tests. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If referred here by the Powertrain Control/Emissions Diagnosis (PC/ED) manual, GO to C2 . **No** GO to C2 .
C2 CHECK THE BATTERY VOLTAGE	
• Key in START position. • With the engine running and all the accessories turned off, measure the voltage at the battery while varying the engine rpm.  AJ0210-A • **Is the voltage greater than 15.5 volts?**	**Yes** GO to C3 . **No** GO to C4 .
C3 CHECK FOR A VOLTAGE DROP IN CIRCUIT SDC02 (RD)	
• Key in OFF position. • Disconnect: Generator C102a. • Measure the voltage between the generator C102a-3, circuit SDC02 (RD), harness side and ground.	**Yes** CONNECT the generator C102a. GO to C4 . **No** REPAIR the circuit for high resistance. TEST the system for normal operation.



A0041084

- **Is the voltage within 0.5 volt of the battery voltage?**

C4 CHECK THE GENERATOR PIDS	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Monitor PCM PIDs. • Monitor the PID GEN_COM in the PCM. • **Does the GEN_COM PID read YES?**	**Yes** GO to C5 . **No** GO to C6 .
C5 CHECK THE GENERATOR INTEGRITY	
• Key in OFF position. • Disconnect: Generator C102a. • Key in ON position, engine OFF. • Measure and record the battery voltage.  AJ0210-A • Key in START position. • **NOTE:** If the generator communication lines are disconnected (DTC P0622 may be set), the generator self-excites if it is operated at greater than 4,500 rpm (approximately wide open throttle [WOT]) for a minimum of 3 seconds. It then operates in a default mode at approximately 13.5 volts until the engine is turned off. • With the engine running (after the brief WOT has been carried out), measure the battery voltage.  AJ0210-A • **Does the battery voltage increase a minimum of 0.5 volt from the key ON, engine OFF measurement to the key ON, engine running measurement (after the brief WOT or snap acceleration has been carried out)?**	**Yes** GO to C6 . **No** INSTALL a new generator. REFER to Section 414-02 . TEST for normal operation.

C6 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: The Charging System Warning Indicator is On With the Engine Running (the Battery Increases Voltage)

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

With the engine running, the charging system warning indicator is off. The sense A circuit SDC02 (RD) to the generator field coil is 13-15 volts. The S (stator) circuit (internal to the generator) is used to feed back a voltage signal from the generator to the voltage regulator. This voltage is monitored by the powertrain control module (PCM) to turn off the charging system warning indicator. The positive battery output (B+) circuit SDC02 (RD) is the generator output supplied to the battery and electrical system.

Possible Causes

- Generator
- PCM

PINPOINT TEST D: THE CHARGING SYSTEM WARNING INDICATOR IS ON WITH THE ENGINE RUNNING AND THE BATTERY INCREASES VOLTAGE

Test Step	Result / Action to Take
D1 CHECK THE FAULT CODES IN THE POWERTRAIN CONTROL MODULE (PCM)	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM DTCs. • Check the recorded PCM DTCs from the continuous and on-demand self tests. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If referred here by the Powertrain Control/Emissions Diagnosis (PC/ED) manual, GO to D2 . **No** GO to D2 .
D2 CHECK THE SYSTEM FOR OVERCHARGING	
• Key in START position. • With the engine running and all accessories off, measure the voltage at the battery terminals while varying the engine rpm.	**Yes** Go To Pinpoint Test C . **No**

 AJ0210-A • **Is the voltage greater than 15.5 volts?**	GO to D3 .
D3 CHECK THE PCM PIDS	
• Enter the following diagnostic mode on the diagnostic tool: Monitor PCM PIDs. • With the engine running, monitor the generator output fault PID in the PCM. • **Does the PID read YES?**	**Yes** GO to D4 . **No** REFER to Section 413-01 to diagnose the charging system warning indicator.
D4 CHECK THE GENERATOR OUTPUT	
• Verify the generator output. Refer to Component Tests, Generator On-Vehicle Tests in this section. • **Did the generator pass the component tests?**	**Yes** GO to D5 . **No** INSTALL a new generator. REFER to Section 414-02 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D5 CHECK FOR CORRECT PCM OPERATION	

• Key in OFF position.
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . REPEAT the self-test. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test E: The Charging System Warning Indicator is Off With the Ignition Switch in the RUN Position and the Engine Off

Refer to Wiring Diagrams Cell 12 , Charging System for schematic and connector information.

Normal Operation

Under normal operation, the charging system warning indicator is on with the key ON and the engine off.

Possible Causes

- Powertrain control module (PCM)

PINPOINT TEST E: THE CHARGING SYSTEM WARNING INDICATOR IS OFF WITH THE IGNITION SWITCH IN THE RUN POSITION AND THE ENGINE OFF

Test Step	Result / Action to Take
E1 CHECK THE CHARGING SYSTEM WARNING INDICATOR OPERATION	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Active Commands. • Using Active Commands, turn on the charging system warning indicator in the instrument cluster. • **Is the charging system warning indicator on?**	**Yes** GO to E2 . **No** REFER to Section 413-01 to diagnose the charging system warning indicator.
E2 CHECK FOR CORRECT PCM OPERATION	

• Key in OFF position.
• Disconnect all the PCM connectors.
• Check for:
  ▪ corrosion.
  ▪ pushed-out pins.
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . REPEAT the self-test. TEST the system for normal operation.
